DRYHAM LANE QUARRY EXTENSION, NORTH CAVE*Dryham Lane Quarry Extension, North Cave, East Riding of Yorkshire*

Brigham, T Kingston Upon Hull : Humber Field Archaeology, 2005, 40pp, pls, colour pls, figs, refs

Work undertaken by: Humber Field Archaeology

Fifteen archaeological sites, or findspots, were located within the study area, some consisting of a single artefact or crop mark, but several comprising extensive areas of Iron Age/ Romano-British field systems. Coupled with the results of excavations and watching briefs in the area, this has served to highlight the fact the site lies in an area of archaeological importance. Four crop mark sites were in the areas to be affected by quarrying activity, including the western part of a small nucleated settlement excavated in 1986-7. [Au(abr)]

Jobling, D. J. Kingston Upon Hull : Humber Field Archaeology, 2003, 21pp, colour pls, figs, tabs, refs

Work undertaken by: Humber Field Archaeology

The three trenches excavated provided evidence for the accumulation of natural deposits and the formation of a peat horizon layer underlying the topsoil, evidence for the decayed remains of a former alder and oak woodland habitat. The site lay within an area of archaeological activity as shown by a pair of undated parallel ditches which lay towards the south of the site as well as other enclosures and a possible Iron Age settlement which was located to the west and north of the current site. STAMFORD BRIDGE WATER PIPELINE***Stamford Bridge Water Pipeline: Archaeological Watching Brief and Excavation Post-excavation Assessment Report***

Northern Archaeological Associates

Barnard Castle : Northern Archaeological Associates,

2005, 165pp, colour pls, figs, tabs, refs

Work undertaken by: Northern Archaeological Associates

The watching brief was undertaken along the entire pipeline route identifying three areas where archaeological features were concentrated. Area C was located along the base of the hill slope where it bisected the line of a Roman Road. The site comprised the remains of a road embankment with an associated roadside ditch where the road approached a presumed former river crossing. Pottery recovered during excavation dated the agger to the Romano-British period. Area D was located some 80m to the east. The site comprised a concentration of settlement related features, which extended over length of 260m along the pipeline corridor. The complex of features comprised a series of enclosure ditches, 'corn drying' kilns and watering holes as well as a small number of human inhumations and cremations. Initially two phases of activity were identified within the settlement, one dated from the 1st to early 3rd centuries, the second from the late 2nd to early 4th centuries. All of these features had been truncated by medieval farming activity. Some 400m further to the east a 'burnt mound' and a number of associated pits dating to the Bronze Age were encountered. Also, sections of a former cobbled road, probably Romano-British, were encountered. [Au(abr)]

Tibbles, J

Kingston Upon Hull : Humber Field Archaeology, 2004, 27pp, figs, tabs, refs

Work undertaken by: Humber Field Archaeology

Evaluation Trench 1 revealed the remains of the 19th century dumping either undertaken to raise the land, possibly against flooding, and/or in preparation for the construction of the 19th century gardens and associated boundary walls that occupied the site. The second trench to the south revealed probable 12th to 13th century field boundaries. A series of undated pits, a ditch and a substantial early-mid 19th century gravel quarry partially destroyed the earlier features. This was itself sealed by a chalk levelling/foundation layer associated with a brick wall forming part of the late gardens. The strip footing of a second wall was found nearby. [Au(abr)]

CROSSHILL, SNAITH***Crosshill, Snaith, Yorkshire East Riding: Archaeological Evaluation***

Ramsey, J

Lincoln : Lindsey Archaeological Services, 2005, 34pp, figs, tabs, refs

Work undertaken by: Lindsey Archaeological Services

Evaluation comprised the excavation of a single trench. Modern pits, Victorian buildings and yards with associated pits and post holes, 17th-18th century layers, two post holes of unknown date and one pit, possibly dating from the 14th-16th century were recorded. No evidence for any medieval buildings on the street frontage was seen within the evaluation trench. Given the low density of features encountered and their depth in relation to the modern ground surface, the potential impact of the development was considered to be low. [Au(abr)]

Archaeological Evaluation 14 Bishop Lane and 33 Lowgate, Hull, East Yorkshire

Spall, C York : Field Archaeology Specialists Ltd., 2006, 171pp, colour pls, figs, tabs, refs, CD

Work undertaken by: Field Archaeology Specialists Ltd.

The excavation of a single evaluation trenches encountered a rich, stratified sequence dating from the 14th to the 20th century. A total of 15 phases of activity were encountered. The earliest occupation consisted of the construction and occupation of a building, possibly in the late 13th century, but certainly by the early 14th century. During the late 14th to early 15th century, the building was demolished, the site was levelled and a brick built boundary wall was erected and remained standing until the early post-medieval period. Activity to either side of the wall was dominated by refuse disposal, alongside concerted efforts at sanitary yard maintenance. This activity continued until the late 18th century and included a large assemblage of glaziers waste of likely early 17th century date. During the early modern periods activity slowed and following a possible hiatus, activity of late 19th century date was characterised by the erection of buildings against the historic property boundary. These buildings appear to have related to light industry being a large open warehouse of cavity wall construction and brick building with bitumen lined cellar. During the 20th century these Victorian buildings were demolished. [Au(abr)]

An Archaeological Watching Brief at St. Nicholas Drive, Beverley

Humber Field Archaeology Kingston Upon Hull : Humber Field Archaeology, 2003, 35pp,
colour pls, figs, tabs, refs

Work undertaken by: Humber Field Archaeology

During an archaeological watching brief, the remains of a medieval building were revealed during the removal of topsoil from the north part of the site, on the north side of a watercourse. The remains consisted of four pairs of chalk filled foundation pits, sections of sill walls, two central hearths and floor surfaces, an external yard surface and possible boundary ditch. Artefacts recovered from within the building suggest that it was occupied in the late 13th to mid 14th century. Monitoring of the site strip over the remainder of the site revealed the presence of some 19th century buildings. Extremely poor ground conditions made the identification of features in this area virtually impossible and no features, deposits or artefacts dating from pre-19th century deposits were identified. Work undertaken by: Humber Field Archaeology

Monitoring of the site strip and excavation of the foundation/service trench systems revealed several archaeological features including two wells, a plot boundary ditch and a pit. Pottery recovered from one of the wells dated from the late 12 century through to the late 14th or 15th century putting it securely within the medieval period. The boundary ditch was sealed below a layer containing a jug handle dating from the 13th to 14th century and contained the bones of an eel, stickleback and vole. The pit contained pottery dating mainly from the 19th century and butchered animal bone. [Au(abr0)]

Work undertaken by: Ed Dennison Archaeological Services Ltd.

The watching brief uncovered a section of north-south brick wall and evidence for the repair and partial rebuilding of the presumed 14th century fabric of the former chancel, although it was difficult to date these interventions without further detailed survey. A modern coffin was partially revealed in a new soakaway pit to the east of the chapel. [Au(abr)]

Work undertaken by: Humber Field Archaeology
Monitoring of the excavation of the foundation trench systems revealed several archaeological features cutting in to the natural sands. A system of south-west to north-east aligned property boundary ditches truncated possible domestic activity associated features and could collectively be dated from the 17th century to the 19th century. In addition, another re-worked boundary ditch, this time aligned north to south, was also identified, however, the lack of any artefacts from this ditch precluded any dating. [Au(abr)]

Monitoring of the site and strip and excavation of the foundation trench systems for the bungalow and the garage revealed a sequence of probable late Bronze Age archaeological deposits in the form of ditches, pits and post holes underlying the hillside top and subsoil. A small assemblage of flint artefacts associated with the archaeological features was recovered and their type and form indicated a manufacture date from the Bronze Age and later periods. [Au(abr)]

The watching brief identified the location of several archaeological features in the form of possible refuse pits cutting in to the underlying deposits. Artefacts recovered from the fills of some of these features suggest they were in use in the medieval period and indicated occupation in the vicinity sometime between the 13th and the 15th century. Monitoring of the excavation of the foundation trench systems revealed a sequence of archaeological deposits, which demonstrated the presence of additional structures that had once been attached to the Dunoon house to the west. The garage foundations did not show any archaeological deposits to be present in the southern area of the site. Two diagnostic brick samples from the aforementioned structures were dated to the 18th and 19th centuries. [Au(abr)]

Humber Field Archaeology Kingston Upon Hull : Humber Field Archaeology, 2004, 25pp, colour pls, figs, refs

Work undertaken by: Humber Field Archaeology

Monitoring of the test pits and foundation trench systems revealed a sequence of archaeological deposits relating to 19th century development overlying the disturbed remains of a probable wooden revetment which may have been associated with a revetment encountered during the 2002 evaluation. Several glimpses of both sea walls were viewed during some areas of the site, revealing it lay, in some places, as little as 0.50m below the modern ground level. Additional deposits and finds of note included a substantial worked masonry timber post setting recovered on the south side of the position of the walls (hence in the water) as well as re-used sea wall limestone slabs, used in the foundations for the 19th century development. Work undertaken by: Humber Field Archaeology

The visible areas of stripped ground revealed phases of development related to the 19th and 20th centuries while the major foundations and some of the service trenches demonstrated the existence of early post-medieval ditches and pits/wells. The assemblage of archaeological artefacts recovered from the site included diagnostic examples of brick dating between 17th and 20th centuries and tile fragments which dated between 12th and the 18th centuries. LAND EAST OF ATWICK ROAD, HORNSEA***Geophysical Survey on an Area of Land East of Atwick Road, Hornsea, East Riding of Yorkshire***

Noel, M Castleside : GeoQuest Associates, 2003, 12pp, figs

Work undertaken by: GeoQuest Associates

A total of 4ha was mapped using a fluxgate magnetometer, representing a 40% sample of the circa 10ha proposal area. The geophysical data provide tentative evidence for a system of tile land drain and/or a pattern of ridge and furrow cultivation. A cluster of intense magnetic dipoles suggest a localised deposit of modern iron debris burnt material. The character of several of these anomalies is consistent with thermoremanent magnetisation within fired structures such as kilns or hearths or dumps of kiln waste. [Au(abr)]
