Nevell, M & Wilson, P Manchester : University of Manchester Archaeological Unit, 2003, 30pp, pls, figs, refs

Work undertaken by: University of Manchester Archaeological Unit

The centre of the study area was occupied by standing buildings relating to the 19th century Egerton Mill (including the remains of the weaving sheds, warehouses and dye works). To the north of these buildings were the remains of the mill pond which ran to Dewhurst Clough, whilst on the eastern edge of the redevelopment area lay the site of the 19th century Egerton Buildings. Work undertaken by: EC Harris

Use of the site through the 19th, 20th and 21st centuries indicated that much of the archaeology would have been disturbed, some to a depth of in excess of 4m. from ground level. [Au(abr)]

Mesolithic remains within the study area had the potential for providing information which would complement that provided by modern excavation and research elsewhere within the central Pennines. They also might cast light on the issue of site density and bias in the known distribution, by demonstrating whether the localised occurrences at present evidence in the study area reflect the true pattern of sites. There was some potential for the triangular area between the A57 and the paved lay-by to its south having been a site of late prehistoric/Romano-British settlement. The recommended form of mitigation was that the site should have been archaeologically evaluated through trial trenching. [Au(abr)]

Archaeological Unit, 2003, 18pp, colour pls, figs*Work undertaken by:* University of Manchester Archaeological Unit

The field walking survey recorded material pre-dominantly from the post-medieval period. The majority of artefacts found were dated to the 19th and 20th centuries, although there was a small number of artefacts from the 17th and 18th centuries, and one sherd of medieval pottery. Although the spread of pre-19th artefacts did not form closely linked groups which may have suggested settlement sites they did very tentatively suggest that one facet of the development site may have been used as agricultural land over the past 500 years. Archaeological Unit, 2003, 35pp, figs, refs*Work undertaken by:* University of Manchester Archaeological Unit

The study area was sited within Portwood, the site of a late medieval deer park, which in the late 18th century was transformed into an industrial suburb of the expanding town of Stockport. The west of the study area contained the site of the Portwood Mills, which were established in the late 18th century for cotton spinning. The south-east of the study area was crossed by a railway, its course survived as a high embankment. [Au(abr)]

Adams, M & Nevell, M Manchester : University of Manchester Archaeological Unit, 2003, 28pp, figs, refs

Work undertaken by: University of Manchester Archaeological Unit

There was the possibility that the study area contained below ground archaeological remains of regional significance which would have merited preservation by record. In particular the site of Brookside Farm had the potential for medieval and post-medieval settlement. The possible enclosure identified as a crop mark may have related to Iron Age or Romano-British settlement. The recommended form of mitigation was that these sites should be archaeologically evaluated through trial trenching. [Au(abr)]

Dawson, J Lancaster : Oxford Archaeology North, 2003, 42pp, colour pls, figs, tabs, refs

Work undertaken by: Oxford Archaeology North

A total of 18 sites of archaeological interest were identified. Many of the sites related to Westwood Park, and included buildings, gardens, associated farmsteads, cottages, a possible coal extraction site, a road and a railway. The visual inspection identified two small post-medieval industrial sites. The impact of the proposed development on the site of archaeological potential was not known, except for those which would be affected by the proposed road scheme, since no details were forthcoming for the proposed development.
