Stevenson, J Ditchling : Archaeology South-East, 2003, 24pp, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

Archaeological evaluation of Phases Six and Seven at Brisley Farm (Chartfields), consisted of 29 trenches, 23 revealed archaeological remains. These remains seem to have been prehistoric in origin (some dated to the Late Bronze Age in Phase Seven) mostly being gullies, but pits, post holes and stake holes were also present. These remains may have been associated with a large prehistoric settlement excavated during Phases Three and Four of the development. [Au(abr)]

Stevenson, J Ditchling : Archaeology South-East, 2003, 29pp, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

A total of 39 trenches were excavated, 34 of which produced archaeological remains. These were mostly pits, post hole and gullies, several remains were thought to date from the Late Iron Age-Early Romano-British period. Several features of an earlier prehistoric date were also identified and also on possible Saxo-Norman gully. [Au(abr)]

Gollop, A Canterbury : Canterbury Archaeological Trust, 2003, 25pp, figs, tabs, refs

*Work undertaken by:* Canterbury Archaeological Trust

Seven trenches were cut, significant archaeological remains were identified in two of the trenches. The principal discovery was a series of grave-like features, tentatively dated to the Late Iron Age/Early Roman period. Other features dating to the Late Iron Age/Roman period were limited the south-eastern corner of the site and consisted of a single pit, a ditch and a gully. The presence of relatively frequent charcoal and charred cereal grains within these features suggested domestic or settlement activity. [Au(abr)]

*Work undertaken by:* Archaeology South-East

An evaluation consisting of 32 trenches was undertaken at the proposed site of a new school and associated infrastructure. A number of medieval features (including ditches, gullies and possible post holes) were located at the northern side of the site. Such evidence was considered to indicate the presence of a farmstead with occupation spanning the mid 12th to 14th centuries based on the ceramic evidence. No prehistoric pottery was found, although four flint waste flakes (two retouched) were located. Further features containing 20th century material were found in the eastern part of the site. [Au(abr)]

*Work undertaken by:* Canterbury Archaeological Trust

Evidence of burial within this portion of the churchyard, after the removal of the chapel, was revealed in Trench A. In this, one grave had been cut through the backfill deposits of the east walls robber trench, whilst another had cut through a series of deposits used to level the surrounding ground surface. These levelling deposits contained late nineteenth century pottery, suggesting that unmarked burials continued to be placed in this portion of the churchyard at last until the close of the nineteenth century. The few features of medieval date were concentrated in trench one near the current location of the small drain or stream. It is possible that the large ditch encountered in trench four and five was also associated with the Friary, perhaps part of a peripheral boundary. The silting of this ditch and similar smaller ditches encountered took place early in the post-medieval period. At the same time the establishment of other features such as the chalk metalled paths indicated continued occupation of the site in the context of the decline and robbing of the infrastructure of the Friary. *Work undertaken by:* Pre-Construct Archaeology Ltd.

Twenty-two trenches were arranged across the site. Only one archaeological feature was encountered on the site in the form of a ditch in trench nine. However, this ditch revealed no evidence of cultural activity and could therefore not be dated. Several modern field drains were also observed. [Au(abr)]

Two areas were investigated, one consisted of five trenches cut within the footprint of the proposed building annex; and the other consisted of two trenches cut near the entrance of the proposed car park. Trench one revealed a substantial though undated feature. Trenches two and four contained no features of archaeological significance. Trenches three and five contained a shallow, linear feature of late post-medieval date. Trench seven contained two features interpreted as inhumation burials. No dating evidence was recovered from the partially excavated burial. They were likely to date from the Anglo-Saxon period. [Au(abr)]

Archaeological features were identified in two of the three trenches excavated. Trench two contained a possible ditch terminal with pottery from the early Roman period. Trench three contained a feature that might be the corner of an enclosure ditch. A single section cut through the ditch contained pottery dating to the early-middle Iron Age, contemporary with that found in trench two. [Au(adp)]

*Work undertaken by:* Canterbury Archaeological Trust

The evaluation involved the cutting of sixty-eight trenches. The trenches revealed a sparse scatter of Late Bronze Age to Early Iron Age features across much of the site. These features included a small number of pits, a few gullies and some shallow linear features of uncertain interpretation. These features were found to contain a number of struck flints, a very small amount of coarse-tempered pottery and a quantity of marine shell. Though a clear pattern of settlement was not established, the features observed were sufficient to indicate the likelihood of such settlement in the vicinity. [Au(abr)]

*Work undertaken by:* Trust for Thanet Archaeology

Archaeological features were encountered in four out of the fifteen trenches excavated. A single narrow gully had been truncated by modern service trenches. A small fragment of pottery and fragments of worked flint within the gully suggest an Early Bronze Age date. Crop marks in the fields around the site indicate activity at this date. A lack of residual material was probably caused in part by the construction of the military bungalows on the site in the 1950's. It is possible that the absence of features reflects a real absence of archaeological activity on the site. [Au(adp)]

Thirteen evaluation trenches were excavated and excavation of two geotechnical test pits was monitored in the car park. Evidence of medieval activity was found. Undated pits and a gully were also located. In trench four, there was a large pit, probably a soil quarry, the backfill of which contained medieval roof tile and an iron bucket handle. In trench 12 there was a series of nine unlined, small, rubbish pits and one post hole. Pottery from these pits dates from 1050-1250, other finds from these contexts included metallic slag. [Au(abr)]
