Bruce, G York : On Site Archaeology, 2003, 30pp, colour pls, figs, tabs, refs

Work undertaken by: On Site Archaeology

The evaluation has revealed a well preserved late medieval to early modern structural sequence. The earliest deposit recorded was a medieval dump, dated to the mid 12th century or later. This was followed by further dumping of probably late 14th century date, and a more complex structural sequence including a well preserved circular brick oven. The top of this oven survived to a maximum height of 0.6m below the modern ground surface. The demolition of the ovens was followed by the construction of a series of brick and limestone walls. These may either be of late medieval or early post-medieval date and two of them included large blocks of re-used worked masonry. These blocks are likely to have originally been parts of a substantial medieval building. [Au(abr)]

Three broad phases of archaeological activity were identified during the excavation. The earliest phase consisted of a series of medieval dump or tipped layers interspersed with several small cobbled surfaces. In the second phase, this sequence of tip layers had been cut away to the north by a large rectangular pit of post-medieval date, filled by a deposit of building rubble containing large quantities of broken decorative plaster mouldings. The final phase consisted of modern rubble and dump deposits sealing the post-medieval pits and a large live modern drain running along the western edge of the trench. [Au(abr)]

Johnson, J York : York Archaeological Trust, 2003, 46pp, colour pls, figs, tabs, refs

Work undertaken by: York Archaeological Trust

The archaeological evaluation involved the excavation of three small trenches, 3.12m x 1m, 2.35m x 1m, and 2m x 2m, each excavated to a depth of 1.25m or deeper, and the observation of seven window sampling boreholes, excavated by building contractors. The archaeological work followed on from an earlier watching brief in 2002 and excavations on the site in 1957-58 by Peter Wenham. The boreholes indicated that 5.0m-5.5m of stratified deposits survived at the site; the lower 1m related to the Roman period and included structural remnants. A significant depth of archaeological remains related to the medieval period, and was known to include structures as well as deposits more typical of backyard areas. Plentiful finds of mould fragments and slag attested to metalworking at the site during this period and leather offcuts also suggested the possibility of cobbling. Post-medieval and modern deposits composed the uppermost deposits at the site and again related to structures as well as pits and dumping. Anglo-Scandinavian activity was suggested by pottery assemblages and waterlogged deposits led to the preservation of organic remains. [Au(adp)]

Work undertaken by: On Site Archaeology

Over large area of the site 19th and 20th century truncation had removed all archaeological deposits down to the natural. Archaeological remains of Roman date were found within the west and south-west parts of the site. These included a number of linear ditches, occasional pits and evidence for a cemetery, in the form of at least one inhumation burial. Close to the western boundary edge of the site a series of foundations and robber trenches representing the lost medieval church of All Saints, Fishergate were discovered. Little of the church was excavated. A number of medieval pits were found cutting into the clay. A medieval ploughsoil survived the 19th century truncation and sealed a number of medieval features. Work undertaken by: York Archaeological Trust

Two small trenches were excavated; trench one measured 2.1m x 1.8m, 2.34m in depth and trench two, 2.1m x 2.2m and 1.6m in depth. The remains of a Roman road were present in the northern area of the trench, with a large roadside trench located in the second trench to the south. These features were sealed by a build-up of between 1.50m-2m of horticultural soils. which were in turn beneath modern service trenches and the present car park surface. [Au(adp)]

Work undertaken by: York Archaeological Trust

A programme of fieldwalking in three sessions, 26th-5th Dec 2002, 17th-4th March and 3rd-15th April 2003, revealed large numbers of finds dating from prehistory to the present day. Although significant volumes of archaeological materials were recovered there was little in the way of recognisable distribution patterns that would suggest anything more than possible small-scale prehistoric activity along the moraine and manuring of fields with domestic waste from the medieval periods onwards. [Au(adp)]

Work undertaken by: On Site Archaeology

Medieval deposits were covered by post-medieval dumping and drainage trenches, indicating the continuation of wet conditions across the site. During the 19th century a series of brick buildings were constructed on the site. One of the properties was an iron foundry and deposits found in trench one are almost certainly derived from this. The Walker Foundry was an important York industry and produced gates and railings for Kew Gardens and the British Museum. [Au(abr)]

Work undertaken by: Field Archaeology Specialists Ltd.

The evaluation revealed four distinct phases of activity from the Roman to the modern period. Roman activity was represented by a wide ditch running roughly parallel with Heworth Green, as well as fragments of cremated human bone and abraded sherds of Roman pottery suggesting the existence of a ploughed out cremation cemetery in the vicinity. Medieval activity was contacted in the form of several shallow furrows crossing the site as well as a possible boundary ditch. Sealing this were a number of post-medieval agricultural or horticultural layers as well as several modern deposits associated with the construction of a 19th century villa on the site. [Au(abr)]

Work undertaken by: Oxford Archaeology North

The programme of archaeological work comprised the excavation of nine evaluation trenches. Archaeological remains were encountered within three of the trenches placed across the northern part of the site. There remains included a small group of features that may pertain to the use of the site as a Roman burial ground. A group of pottery fragments recovered from these features indicated a late first/early second century date for this activity, which coincides with the dates ascribed to other Roman burials in the vicinity. Medieval activity on the site was represented by two shallow ditches and an isolated post hole. [Au(abr)]

Timms, S & Jackson, R York : Field Archaeology Specialists Ltd., 2003, 68pp, colour pls, figs, tabs, refs

Work undertaken by: Field Archaeology Specialists Ltd.

An archaeological investigation, consisting of five evaluation trenches, was undertaken on the site of a disused council depot. In the northern corner of the site a single grave was recorded, containing the remains of three individuals. This burial was associated with a ditch and a pit which were dated by pottery to the 3rd century AD and appeared to be on the periphery of a larger cemetery. Medieval activity was contacted in the form of a substantial boundary ditch cutting through the marsh possibly to drain or reclaim land. Three rubbish pits were dated to the 12th or 13th centuries. Post-medieval activity was contacted in the form of a substantial boundary ditch which had been cut along the line of Moss Street during the 17th century. [Au(abr)]

Work undertaken by: Ed Dennison Archaeological Services Ltd.

As expected the excavation of the five test pits within the body of the church uncovered large quantities of disarticulated human bone. These deposits, together with other medieval and late post-medieval material are probably associated with the documented raising of the floor levels in the 18th and 19th centuries. The partial remains of several brick vaults were also uncovered by the excavations, but it would appear that any articulated in situ burials lie at depths greater than 0.9m below the existing floor levels.
