Robinson, G Barnard Castle : Northern Archaeological Associates, 2003, 11pp, colour pls, figs, tabs, refs

Work undertaken by: Northern Archaeological Associates

Archaeological observation of hand dug excavations, associated with gas mains replacement work, was undertaken within the boundary of Alavna Roman Fort and Vicus Scheduled Monument. The majority of the trenches were dug within the disturbance caused by previous service trenches. Where the excavations extended beyond this disturbance, only topsoil and natural deposits were encountered. [Au(adp)]

Masser, P Edingburgh : Headland Archaeology Ltd., 2003, 19pp, pls, colour pls, figs, tabs, refs

Work undertaken by: Headland Archaeology Ltd

A series of trenches were excavated within the gardens of the house, in order to investigate the past layout of the gardens. Within the trenches excavated across the lawns to the front of the house, spreads of gravel were identified at the edges of the lawns, indicating the position of paths that corresponded to cartographic evidence from the 1865 Ordnance Survey map. Layers of sand beneath the turf to either side of the central paved area suggested that the paving stones originally extended over a wider area. A trench was also excavated at one end of a raised walkway to the rear of the privy garden, and found evidence for the foundations of a small building shown there on a mid-19th century map of Cockermouth. Evans, H & Coward, D Cirencester : National Trust, 2004, 37pp, colour pls, figs, tabs, refs

Work undertaken by: National Trust, University of Sheffield

Archaeologists from the National Trust and the University of Sheffield undertook the rescue excavation of prehistoric occupation features associated with a previously collected lithic assemblage at Roanhead, Sandscale. The features were located on a shingle ridge revealed by the blow-out of a high sand dune close to the modern shoreline. The excavation of a trench located at the exposed profile of the shingle ridge and surrounding dune deposits revealed a post hole structure associated with a group of shallow pits. Although few finds were stratigraphically associated with the occupation features, the lithic assemblage was as whole suggestive of a Neolithic/Early Bronze Age date. As part of the excavation, aspects of the geomorphological significance of the shingle ridge were established, as were the effects of sand dune erosion on the archaeological record. [Au(abr)]

The watching brief identified several previously unrecorded features, all of which are attributed to the post-medieval period. Most of the features thought to be of this period, relate to old field boundaries or field drainage. A possible pre-parliamentary enclosure field boundary was noted. A further, more unusual feature, was a large beam of worked wood with associated iron artefacts, which had been laid in the subsoil near the river Caldew. Whilst probably quite late in date, and its precise function remained unclear, it may have been the remains of a temporary flood defence measure. [Au(abr)]

Miller, I Lancaster : Oxford Archaeology North, 2004, 79pp, colour pls, figs, tabs, refs
Work undertaken by: Oxford Archaeology North

The investigation was focused on a range of buildings that occupied the western part of the forge site, which were considered to have been ancillary to the centre of ironworking, and possibly represented offices. The excavation of these buildings revealed four distinct phases of activity, of which two may be attributed firmly to iron-working processes; an extensive deposit of smithing waste has been linked to a period of the site's use as a refinery forge after 1715. This deposit did not appear to be associated with primary iron-working, but the detritus generated from secondary processes, such as smithing. As such, it would appear that the forge complex incorporated a hitherto unsuspected element of iron-working. [Au(abr)]

SIR JOHN BARROW COTTAGE, DRAGLEY BECK, ULVERSTON*Excavations at Sir John Barrow Cottage, Dragley Beck, Ulverston, Cumbria*

Elsworth, D & Dawson, J Ulverston : DW Elsworth & J Dawson, 2003, 44pp, colour pls, figs, tabs, refs

Work undertaken by: Morecambe Bay Archaeological Society, Ulverston He

Excavations revealed a number of relatively recent features including a drain filled with refuse, and a water pipe. Two main deposits lay by the natural, the upper being dated by its finds to the mid-19th century, although there was evidence for prehistoric activity on the site. The finds numbered in excess of 3000, and dated mainly to the 19th century, with significant numbers from the 18th and 20th centuries. Finds of other periods included the butt end of a Neolithic polished stone axe and a coin from the mid sixteenth century. [Au(abr)]

SIZERGH FELL*Report on Archaeological Fieldwork Undertaken on Sizergh Fell, South Cumbria, July 2003*

Evans, H & Edmonds, M Cirencester : National Trust, 2003, 26pp, colour pls, figs, tabs ,refs

Work undertaken by: National Trust, University of Sheffield

The investigation took place as part of an ongoing research project concerned with the characterisation of landscape features and previously excavated cairns on the fell. The excavation of a prehistoric cairn, revealed the extent of previous extraction and the structural makeup of the feature. No finds were recovered. [Au(adp)]
