Wilkins, B & Williamson, I Hertford : Archaeological Solutions, 2003, 17pp, figs, tabs, refs

Work undertaken by: Archaeological Solutions

Archaeological features were revealed in the less disturbed north-eastern corner of the site, and included two possible medieval burials. The latter were not examined further at this stage. Further excavation revealed significant disturbance by modern building activity associated with the snooker hall. Archaeological features were identified including the possible graves, but on full excavation these were found to contain articulated animal remains. Both features yielded post-medieval brick and ceramics, mixed with residual medieval pottery sherds. [Au(abr)]

Wilcox, W Norwich : Hale Allen Jones, 2003, 18pp, figs, refs

Work undertaken by: Hale Allen Jones

There was a low possibility that a flint wall found in the excavation could be a medieval wall (to a dwelling and possibly a retaining wall) that was aligned on an earlier Saxon boundary. The various tombs and crypts found dated from the late 1700s and related to a Baptist chapel which was built between 1778 and 1790 and a burial ground that was added after 1830. The burial ground probably became redundant after 1856 and both the Chapel and burial ground had been build over by 1914.

Work undertaken by: Norfolk Archaeological Unit

Two large shallow mound were examined in detail. The possible remains of hearths towards the centres of both mounds suggested that they were built as raised platforms for use in times of serious flooding, perhaps for livestock. The remains of possible post holes beneath both mound could indicate a structural element predating them. Also of interest was the discovery of a coin hoard on the eastern bank of the River Yare. It consisted of over two hundred 16th to 17th century silver coins. [Au(abr)]

Work undertaken by: Network Archaeology

Thirteen sites were confirmed by trench evaluation. Prehistoric activity was identified at nine sites. The most significant of these included: a Bronze Age burial mound which was apparently the focus for an Anglo-Saxon cemetery; a Bronze Age cremation cemetery; and at least three settlement sites. One of the settlements spanned the early Neolithic to Iron Age periods, one was late Neolithic to Early Bronze Age or Iron Age, and one was Iron Age. Another site yielded evidence of metal working which was either Iron Age or Anglo-Saxon in date. Evidence dating to the Roman period was found at only four sites and comprised the remains of an enclosed settlement, a corn drier and two enclosure systems. In addition to the Anglo-Saxon cemetery found in association with a Bronze Age burial mound and metal working dating to either the Iron Age or Anglo-Saxon period, possible Anglo-Saxon activity was found in the vicinity of the Roman corn drier. The medieval period was represented at eleven sites. Seven comprised purely agricultural enclosures and field systems. Four sites, including two farmsteads, were domestic in nature. [Au(abr)]

Wilkins, B, Roberts, B & O'Brien, L Hertford : Hertfordshire Archaeological Trust, 2003, 69pp, figs, tabs, refs

Work undertaken by: Hertfordshire Archaeological Trust

An archaeological strip, map and sample excavation in advance of mineral extraction revealed at least three phases of occupation dating mainly to the 2nd-4th century and a number of post-medieval and modern features. The majority of Roman features were located in the south-west half of site and related to settlement and industrial activity. The principle Romano-British structures comprised a large aisled timber building (feature 1170), a well (feature 1139) and part of an aspidal-ended building (feature 1213). A series of enclosure ditches on a north-east to south-west alignment were recorded. [Au(adp)]

Percival, J Norwich : Norfolk Archaeological Unit, 2004, 57pp, colour pls, figs, tabs, refs

Work undertaken by: Norfolk Archaeological Unit

One trench measuring 3m by 3.5 m was excavated to the rear of 9-11 London Street. The earliest phase of activity found was an Anglo-Norman timber building of unusual construction. This building lay on a shallow bank of soft sands adjacent to the presumed course of the Great Cockey, the largest of the now culverted streams of the Wensum. Thereafter the site was used as an open yard or garden to the 15th century stone building on the London Street frontage. Two vaulted side chambers in the existing basement are the surviving parts of this building. In the late 16th or early 17th century the building was replaced with the extant of the 9-11 London Street buildings. During this process the ground levels to the rear of the buildings was raised by c.2m. Towards the end of this phase of construction a brick and flint north-to-south nature of this feature only became apparent during a watching brief following the main phase of fieldwork. This culvert almost certainly carried the course of the Great Cockey during the 17th and much of the 18th centuries. From the 17th century the site was used as a yard or garden, being built up with a succession of outhouses and storerooms from the late 19th or early 20th centuries.

A third campaign in August 2003 saw a watching brief conducted during the excavation of a deep trench against the north wall of the Yarn Mill for air-conditioning units. The watching brief produced evidence for building works throughout the 20th century. Previous excavation produced evidence consistent with the Carmelite Friary. [Au(adp)]

Work undertaken by: Norfolk Archaeological Unit

The earliest activity on the site was in the form of two late Saxon pits. Evidence relating to the medieval buildings was present in one trench where the outer wall of the hosteiry building was revealed, surviving to a height of 0.6m. No contemporary medieval floor surfaces or occupation debris were dated. Both medieval and late Saxon occupation had been heavily truncated by post-medieval activity which consisted of refuse pits, walls and a well. [Au(abr)]

Work undertaken by: Norfolk Archaeological Unit

The principle results of the excavation relate to the prehistoric period, in particular finds of in situ flint scatters dated to the final Upper Palaeolithic period. This date is based on artefact typology and the Optically Stimulated Luminescence dating of associated deposits. The scatters, composed of flint cores, debitage and tools, included characteristic bruised blades. Other worked flint recovered during the excavation proved difficult to date. A small number of pits and post holes of potential prehistoric date were also retrieved. A coin of Iron Age date and a small quantity of Roman pottery are believed to indicate stray losses or later reposition. Medieval and post-medieval ditches were recorded. An early 19th century malt house standing on the redevelopment area was surveyed prior to its demolition. [Au(abr)]

The excavation revealed part of the Duke's palace complex including the remains of a bowling alley, believed to date from the early 17th century. Three surviving walls of the bowling alley and the areas of the bowling surface were recorded. Following the departure of the Duke of Norfolk in 1711, the bowling alley was converted to use as a workhouse, notable for being amongst the earliest in the country. Elements of the workhouse were also recorded, along the the remains of 19th century mercantile buildings. [Au(abr)]

A total of 18 test pits were machine and hand excavated at locations within the redevelopment footprint. A wall recorded in test pit 14 appeared to be a remnant of a formal post-medieval garden associated with Howard House. Test pits within the basement of Howard House and further pits in proximity to Dragon Hall confirmed that significant archaeological deposits were present at these locations. [Au(adp)]

The archaeological fieldwork revealed activity of Neolithic, Bronze Age, Iron Age, Roman and modern date. The early Neolithic activity took the form of pits, post holes, gullies and a building. The building was partly enclosed by a fence line and overlain by a buried soil. The later Neolithic/Early Bronze Age period was represented by a rectangular palisaded enclosure, pit groups, and two clusters of post holes. Numerous isolated pits of this period were also recorded. Several pits of Bronze Age date were present. A late Bronze Age cremation burial accompanied by two bronze axe heads, an iron awl and five small pieces of gold leaf were also present. Iron Age activity was represented by linear ditches, pits and a single ring ditch. Roman field systems, an enclosure ditch and a building were recorded. [Au(abr)]

LONGDEN HILLS, EASTON***An Archaeological Strip and Record Excavation at Longdell Hills, Easton, Norfolk. Interim report***

Boyle, M Norwich : Norfolk Archaeological Unit, 2004, 11pp, figs, tabs, refs

Work undertaken by: Norfolk Archaeological Unit

An archaeological strip and record excavation was carried out in advance of mineral extraction operations; the work constituted Phase 4 of a six phase programme to be carried out over a five year period. A significant number of archaeological features and deposits were recorded dating from the Earlier Neolithic, Bronze Age, Iron Age, Romano-British and medieval periods. These included pits, three gullies, one ditch and a structure comprising of post holes and a gully. Fifteen of the pits, containing charcoal rich primary fills, appeared to have been in situ firepits, they may have been medieval in date. Three Iron Age pits, a Neolithic post-pit and seven other undated pits were also recorded. The ditch remained undated, where as the gullies appeared to have been of prehistoric, Iron Age and Roman date. The structure consisted of a roughly circular arrangement of eleven post and stake holes, with five internal post holes or pits, two of which contained Iron Age pottery. To the north, adjacent, was a shallow slot or gully, with two contemporary post holes, the gully cut a post hole containing Bronze Age Pottery. [Au(adp)]

Work undertaken by: Norfolk Archaeological Unit

An archaeological watching brief was undertaken during topsoil stripping prior to Phase 5 of proposed gravel and sand extraction. Five pits, a hearth, a ditch and a solution hollow were recorded. One of the pits produced a sherd of 15-16th century pottery, and another contained a piece of burnt flint. The fills of a solution hollow produced a sherd of ceramic building material and a scraper. [Au(adp)]
