Work undertaken by: Babtie Group

Scheduled Monument Consent was received for the excavation of four trenches across the width of the carriageway within the scheduled area. A ragstone rubble construction set within a sandy gravel mortar was observed in three of the four trenches at a depth of between 200 and 300mm below the present road surface. A further five trenches were excavated to the south of the scheduled area with less conclusive results. In only one of these trenches was a ragstone construction recorded at approximately 400mm below the present road surface. No finds were retrieved. [Au(abr)]

Hiller, J Oxford : Oxford Archaeology, 2003, 2pp, figs

Work undertaken by: Oxford Archaeology

Immediately below the existing road surface, a deposit of friable greyish brown loamy silt was exposed. This layer contained many small to medium stone, brick and tile fragments as well as much charcoal and mortar flecking. Many animal bones were also recovered. No edges of any cuts were observed and suggested that this was a layer of disturbed/made ground rather than the fill of a rubbish pit. Examination of the brick and tile suggested a post-medieval date. [Au(abr)]

Archaeological Site Investigations Warminster : Archaeological Site Investigations, 2003, 11pp, colour pls, figs, refs

Work undertaken by: Archaeological Site Investigations

Observations of groundworks and internal opening-up were maintained during refurbishment of no. 12 St. Mary's Street at Wallingford in South Oxfordshire. The results indicated the building to have been wholly rebuilt during the late 19th century, with potentially earlier in situ fabric surviving only as ground floor partitions walls, The roof structure, in particular, though containing late medieval forms, was a 19th century reconstruction. Groundworks indicated the rear of the site to have been extensively disturbed to considerable depths, probably by cellaring. [Au(abr)]

Area excavation identified a range of boundary ditches associated with the first century BC and the late fourth century AD. Major boundary ditches associated with a sub-rectilinear enclosure appeared to have developed during the late Iron Age and, with some modification, maintained their significance in the early Roman period. By the late Roman period there were signs of a break with earlier organisation of the settlement. There was no evidence that the occupation continued beyond the end of the fourth century AD. An Archaeological Investigation at Stanton Harcourt Manor, Stanton Harcourt, Oxfordshire

John Moore Heritage Services Holton : John Moore Heritage Services, 2003, 17pp, figs, tabs, refs

Work undertaken by: John Moore Heritage Services

A watching brief was carried out during the excavation for the foundations of the western wing and the porch for the eastern wing. Several large pits of earlier medieval date, possibly for the extraction of gravel, were found in the area of the new west wing. Undated pits found in Trench 2 predated the large rectangular stone building, which was shown on maps dated 1665 and 1726. A smaller but wider rectangular brick and stone building was then added on to Harcourt House, which contained a kitchen.
