A gradiometer survey was carried out on the site. Three phases of activity were identified. The earliest phase consisted of a series of linear and circular features. The second phase comprised a medieval ridge and furrow system, which was replaced by a later field system. [Au(abr)]

*Work undertaken by:* GSB Prospection

A gradiometer survey carried on from a previous survey in the area in 2001. The results revealed two possible clusters of former occupation activity which included pit clusters, enclosures and field systems. Linear anomalies were also identified which could be archaeological or a result of agricultural disturbance. [Au(adp)]

*Work undertaken by:* GSB Prospection

There is magnetic disturbance along the northern and eastern edge of the survey area due to a pipe and a fence. A broad curving ditch-type anomaly has been identified within the data that may be of archaeological interest. However, the response is weak and diffuse and could be agricultural or natural in origin. A more diffuse linear response has been recorded and is thought to be probably natural. elsewhere a few pit type responses and weak trends have been identified but an archaeological interpretation for these is tentative, many of the trends are aligned north-south which is consistent with recent cultivation. [Au(abr)]

A fluxgate gradiometer survey was carried out on the proposed development area. In areas A, B, C, and E palaeochannels and other natural features were identified. In area C, curvilinear, linear and rectilinear anomalies were identified. In area E a ditched enclosure with an associated outer bank was identified. The anomaly may also have represented an oxbow lake. [Au(abr)]
