Work undertaken by: GSB Prospection

The survey identified a number of pit type anomalies. The most promising was a group of anomalies in the southwest corner of the area of investigation. Several curving trends in this block may also have been of archaeological interest. The group in the northern part of the investigation area were likely to have been part of a former field boundary. [Au(abr)]

Stephens, C Bradford : GSB Prospection, 2003, 27pp, figs, refs

Work undertaken by: GSB Prospection

A small circular feature was detected in the south west corner of the study area but the response was indistinct. All other anomalies comprised of pit type responses, most of which were weak and ill defined. No clear linear anomalies, suggestive of archaeological ditches were identified. A broad linear band of positive and negative responses in the southwestern corner of the site had the appearance of a natural feature but may have reflected part of a canalised stream or former boundary. [Au(abr)]
