Corner Farmhouse was an early 18th century two storey, three bay house, which was extended by the addition of a further two bays and second floor in the later 18th-century. Few original features survived inside due to recent fire damage and alterations and much of the upper storeys had been completely remodelled following the fire with only the ground floor showing any early features. Five service trenches were excavated around the interior of the house. Four were placed around the interior of Room 1 with one placed next to the north-west door to the garden in Room 2. Generally the five trenches revealed a similar stratigraphic sequence with the modern concrete flooring layer overlying a dark brown clay layer with chalk and charcoal inclusions. This layer likely represented an early flooring or foundation layer. One variation to this sequence was seen in the central services pit in Room 1 where a layer of yellow sand had been introduced over the chalky clay. This layer likely represented a modern levelling layer during the construction of the last concrete flooring. No finds were present so none of the layers were datable. [Au(abr)]

"Northamptonshire Archaeology conducted a watching brief throughout works to refurbish the house, outbuildings and grounds at Preston Capes Manor. This followed on from geophysical survey and trial trench excavation in 2004. The work was in fulfilment of a Planning Condition from Daventry District Council and Scheduled Monument Consent issued by the DCMS. It recorded a variety of structural features of potential medieval date and others of post-medieval origin, apparently connected with earlier manor layouts and the pre-existing motte and bailey castle. These may include part of the bailey defences and a possible manorial chapel." [OASIS]

*Work undertaken by:* Albion Archaeology

An initial trial trenching evaluation of the site had identified the remains of an extensive former field system. A number of ditches were discovered during the course of the groundwork. These ditches formed part of the same field system [possibly Roman in date] discovered during an earlier evaluation. The only artefactual evidence recovered from the ditches was a single post-medieval tile fragment, however, this could have been residual and as a result of ploughing been incorporated into the ditch fill. The field system remained undated as a whole. The watching brief identified further remains of the field system, however, no reliable evidence was recovered to confirm its putative Roman date. Carlyle, S Northamptonshire Archaeology : Northamptonshire Archaeology, Report: 08/118 2008, A4, blue spine, heat bound, clear cover  
*Work undertaken by:* Northamptonshire Archaeology

"A Romano-British 'ladder' enclosure was excavated at Milton Ham, Northampton. The earliest evidence for activity on the site dates to the late 2nd/early 3rd centuries AD and comprised a number of small gullies, possibly forming a series of livestock pens, and a small oven. Two human cremation burials, which are currently undated but probably date to the same period, were recovered from the southern part of the site. The 'ladder' enclosure, which dated to the 3rd and 4th centuries AD, consisted of a sub-rectangular enclosure, aligned north to south and measuring approximately 150m long and 35m wide, divided into a number of small sub-enclosures. There was a triangular annexe on the east side of the settlement, defined by two boundary ditches extending from the corners of the main enclosure. Access to the annexe and 'ladder' enclosure appears to be from the east. The settlement was probably primarily used to hold livestock, although the northern part of the settlement, which had been extensively modified, may have had other agricultural uses. There was no clear evidence for habitation within the enclosure or annexe, although the pottery, glass and building material recovered from the site suggest that there was a building, possibly a small villa, nearby. Medieval plough furrows and a possible headland were also identified." [OASIS]

*Work undertaken by:* Northamptonshire Archaeolog

"Archaeological excavations and a watching brief were undertaken during groundworks associated with the laying of a new Anglian Water pipeline between Thorpe Mandeville and Greatworth, Northamptonshire. Excavations were focused on two sites, one middle Iron Age and the other early Roman, which had been identified by previous geophysical survey. The scheme-wide watching brief yielded little more of interest. Analysis of the finds and site records indicate that peripheral elements of both sites were examined and that the material remains were not prolific and in generally poor condition. It is recommended that some further work is undertaken on the pottery and palaeo-environmental remains, and that the dating of the Iron Age site is supported by radiocarbon determinations. The overall results are worthy of a brief publication." [OASIS]

*Work undertaken by:* Trent & Peak Archaeological Unit

A watching brief was carried out during building works at the church. A substantial stone-built structure was located running parallel to the west end wall. This may have been intended to support a gallery that faced towards the chancel. A clerestory was unlikely as the west wall was unlit above ground floor level. The sleeper walls found beneath it may have helped to support heavy pews. This area may equally have held a side chapel, entered from a door in the west wall and lit by two windows. Further research for early plans of the church might confirm either suggestion. [Au(abr)]

*Work undertaken by:* Trent & Peak Archaeological Unit

During the course of the dredging of the pit, only one significant artefact was observed, a large timber beam. This was found close to the east side of the pond where it was deposited, it was drawn and photographed. Dating of the timber proved problematic, but it was thought to be related to a post-medieval building that had stood on the site. The examination of the silts after they had been deposited on the fields at Burroughs Farm yielded no significant artefacts or other dating evidence. [Au(abr)]

*Work undertaken by:* ARCUS

A watching brief was carried out during groundwork for a quarry extension, due to the site's proximity to a series of Roman "brick-work" field systems and associated enclosures. The watching brief recorded a series of linear ditches, predominantly oriented along an east-west axis, in addition to numerous smaller channels arranged upon multiple axes and a series of non-linear features. The majority of these features were thought to have related to 19th century land drainage, and were of little or no archaeological significance. A single V-shaped ditch feature was identified, and was thought to have related to the wider Roman landscape. [Au(adp)]

The exercise found no evidence of pre-19th century archaeological remains. A linear feature was recorded that was probably part of the earthworks shown on the 1889 Ordnance Survey map of the site, although the precise date of this feature could not be established. The feature may have been created by the formation of a platform observed in the north-eastern quarter of the site, the western edge of which seemed to be marked by a possible depression or hollow way located to the south-west that contained patches of a possible metalled surface. Artefactual evidence suggested that the feature had probably been backfilled in the first half of the 20th century. [Au(abr)]

The watching brief was carried out during the stripping of topsoil and prior to aggregate extraction. The entire site had been heavily wooded and the stripped area showed many irregular tree-boles and areas disturbed by roots. Two curving ditches were identified and investigated within the watching brief area. These were thought to be relatively recent in date as one of the ditches cut a probable field drain. One sub-circular shallow charcoal rich pit was identified and excavated. This undated pit was similar to features seen in previous archaeological work in this area. It was likely that it was associated with charcoal production. [Au(abr)]

Trimble, R Sleaford : Archaeological Project Services, Report: 112/08 2008, 123pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Project Services

A programme of archaeological excavation, evaluation and watching brief was undertaken at Lilac Farm, 19 Mill Lane, Cottesmore. The site was located within the medieval and post-medieval settlement core of Cottesmore village. An evaluation of the site, carried out in 2002, identified evidence of late Saxon and early medieval activity in the form of ditches, pits and gullies, as well linear alignments of limestone pieces, possibly representing the footings of timber framed buildings. Occurrences of tap slag in the finds assemblage indicated iron smelting in the immediate vicinity of the site. Most of the deposits identified as a result of the

2008 project related to late Saxon and medieval activity, although there was tenuous evidence for Romano-British deposits, in the form of a ditch, which was dated on the basis of a single coin. Features from the late Saxon/medieval periods included a track, ditches, pits, post holes and a stone wall or wall foundation. The track may have originated during an early phase in the development of the site, with the remaining features mostly attributable to the mid/late-12th to 14th century. While the ditches may have functioned as drains and/or property boundaries, deposits on the site generally contained domestic refuse [pottery, bone etc] indicative of proximity to areas of settlement. A relative lack of structural remains might have indicated that the areas investigated lay outside the main focus of settlement. Alternatively, the absence of structures may reflect the ephemeral nature of buildings of the period. Iron smelting slag from a wide range of features indicated that iron production was being carried out in the immediate vicinity. The excavation identified a low level of post-medieval and modern activity, probably reflecting a cessation of settlement in the area and the conversion of land to pastoral/agricultural use. The pottery assemblage from the excavation included a predominance of late Saxon and medieval material, as well as residual Bronze Age, Romano-British and early Saxon types. Fragments of quern stone, glass, metalwork, iron slag and clay pipe were also retrieved, together with an assemblage of animal bone, the latter considered too small to permit inferences to be made about diet or economy. However, cattle, sheep/goat, pig and horse bones were present in all phases. Environmental samples yielded charred cereal grain in small quantities, consistent with scattered or windblown waste rather than primary deposition. All of the samples contained a black, porous substance, identified as residue from organic materials, including cereals, fired at high temperature. [Au(abr)]

Sheppard, R Nottingham : Trent & Peak Archaeological Unit, 2008, 16pp, colour pls, figs, tabs, refs

*Work undertaken by:* Trent & Peak Archaeological Unit

It was proposed to refurbish and convert to domestic use several stone and brick-built agricultural buildings on the site. No evidence was found for earlier historic use of the site, certainly dating from before the 18th century. The boundary walling was not of great age, as the finding of brickwork in its core indicated. Having been a working farmyard, the only possible archaeological traces of earlier date would have shown up in clean areas of site clearance or during trenching, but due to circumstances the trenching for services was not monitored. The site itself may not have been used until the post-medieval period. Although close to the church, Preston was curious in that the church was situated at the village's south-west extreme, the hall [of possible 16th or 17th century date] was at the north-west extreme and the manor house [of similar date] was situated centrally. The focus of the village was likely to have been centred around the latter building, with farms situated on the village's periphery. The nearby farmhouse to the site was of 17th century date, but farm buildings of that date were often insubstantial structures which left few traces below-ground. It was therefore uncertain whether anything else of an archaeological nature would have been revealed during service trenching. [Au(abr)]

Lodoen, A Bedford : Albion Archaeology, Report: 2008/129 2008, 8pp, colour pls, figs, tabs, refs

*Work undertaken by:* Albion Archaeology

A watching brief was carried out during groundwork for the installation of a trench arch drain, manhole and pipes west and south of the tower of the church. During excavations for the trench arm drain, a broken undecorated limestone sarcophagus was discovered along with a quantity of semi-articulated and disarticulated human remains of a fragmented nature, shallow depth and orientation of the sarcophagus suggested the redeposition of a significantly disturbed burial. The sarcophagus was characteristic of a medieval tomb, but no other dating evidence was recovered to provide insight to its origin. The excavations for the manhole cover exposed an east-west orientated grave containing an in situ articulated human skeleton. The absence of a coffin indicated that it was not a recent inhumation, but a lack of associated finds limited further assessment or dating evidence. The pipe trench contained no archaeological remains. [Au(abr)]

Schofield, T. Hertford : Archaeological Solutions, Report: 3129 2008, A4 ring bound document

*Work undertaken by:* Archaeological Solutions

"In June 2008, Archaeological Solutions Limited (AS) carried out a programme of monitoring and recording on excavations on land at Appleby Farm 67 Church End, Renhold, Bedfordshire (NGR TL 0895 5282), prior to the construction of an outbuilding. The desk-based assessment recorded that post-medieval occupation in Renhold is evidenced by the construction of Tithe Farm at 63 Church End, an associated thatched barn at Church Farm and the timber-framed farmhouse at Church Farm, all of which date to the 17th century. Later post-medieval standing buildings comprise the Old Vicarage, a timber framed barn attached to Tithe Farm and the dovecote at Church Farm. The site of Appleby Farm comprises a 17th century timber framed farmhouse, which was formerly known as 'Little Church Farm'. The two-storeyed gabled porch with bargeboards on its front elevation and a 20th century addition to the east and rear. The archaeological monitoring and recording revealed the structural remains of an 18th -19th century pamment brick floor and possible wall towards the western end of the new outbuilding footprint. A Victorian service pipe with inspection chamber and associated cess pit and two modern rubbish pits were also present." [OASIS]

Lodoen, A Bedford : Albion Archaeology, Report: 2008/117 2008, 42pp, colour pls, figs, tabs, refs

*Work undertaken by:* Albion Archaeology

A watching brief was undertaken at Church Square during groundworks that were part of a series of streetscape improvements within the square. The site was in an archaeologically sensitive area, falling within the probable limits of the Saxon burgh. The observations of archaeological relevance were, soil layers dating from the middle 12th century to the early 19th century. Residual Saxo-Norman pottery, indicative of contemporary settlement in the area. The foundations of at least two 19th-century houses. A street surface predating the 1950s/1960s redevelopment, preserved beneath modern levelling and make-up layers. A modern linear feature that may represent recent destruction of a much older ditch or culvert. These observations demonstrated the potential for the survival of Saxo-Norman, medieval and post-medieval settlement remains in this part of Bedford. Though the presence of Saxo-Norman artefacts in some deposits was residual, the finds assemblage as a whole still demonstrated a continuity of settlement from the Saxo-Norman period until the present day in the area. The investigations demonstrated that traces of 19th century and later buildings and features were likely to survive under the current square, though heavily disturbed in places. Earlier layers and features were most likely to survive relatively undisturbed in the eastern part of Church Square. [Au(abr)]

Ingham, D Bedford : Albion Archaeology, Report: 2008/31 2008, 6pp, colour pls, figs, tabs, refs

*Work undertaken by:* Albion Archaeology

Excavation in the base of the tower revealed an earlier stone floor surface 0.3m below the current one. The floor was likely to have been raised at the same time as the tower's west door was blocked up, so that it was at same level as the nave. Excavation of the service trenches revealed a modern rubble deposit to the north of the church, this was likely to be associated with a masonry feature, probably a soakaway. A high quantity of ceramic building material and mortar was recorded. Articulated human remains were revealed at the base of the soakaway trench within a grave cutting subsoil and sealed by subsoil. Saxon and late medieval pottery fragments were recovered from the subsoil. No direct evidence was found of a predecessor to the current church. However, the close proximity of the cemetery remains to the western end of the church suggested that they were not contemporary, and the pottery recovered suggested activity on the site from the Saxon period onwards. Gregson, R Bedford : Albion Archaeology, Report: 2008/134 2008, 11pp, colour pls, figs, tabs, refs

*Work undertaken by:* Albion Archaeology

Archaeological monitoring and recording took place on the site during works to improve drainage on the south side of St. John the Baptist Church. Nine probable graves were identified, all aligned east-west. The greatest concentration of graves was found in the excavation for a soakaway to the south-east of the church. Five burials were encountered in this small pit with the shallowest being at around 0.73m below ground level. This density of burials was not reflected within the churchyard itself as no gravestones or markers were present in this area. Gravestones were present in the vicinity of soakaway to the south-west of the church, although only one burial was found in this excavation at a depth of 1.23m below ground level. The three shallowest burials were all found at a depth of around 0.20-0.25m below ground level. These burials were the closest to the church and were uncovered in the pipe trenches. The majority of the inhumations were undated although the two found associated with coffin remains were clearly relatively modern in date. It was also probable that the three shallow burials found close to the church were the oldest and may have represented medieval remains. [Au(abr)]

**IVEL FARM, SANDY QUARRY**

***Ivel Farm Sandy Quarry Bedfordshire; Archaeological Investigations on Extraction Phases 5 And 6: Interim Report***

Gregson, R Bedford : Albion Archaeology, Report: 2008/119 2008, 48pp, figs, tabs, refs

*Work undertaken by:* Albion Archaeology

The earliest evidence was an isolated pit. This contained burnt flint, worked flint and pottery. The pottery was dated to the Late Bronze Age/Early Iron Age, however, it may have been earlier. The majority of the evidence found in extraction area 5/6 related to Late Iron Age/Early Roman settlement. The settlement was situated within a rectilinear enclosure system directly adjacent to the river Ivel. Two excavation areas were opened uncovering a complex sequence of enclosures and other features. A complex sequence of driveway ditches and hollow ways formed an entrance to the settlement from the south-west inferring a degree of continuity. At the south-west corner of the settlement core a complex sequence of boundary and other features were discovered, including an annular ditch. The function of this feature remained enigmatic; it would have formed a substantial earthwork at the entrance to the settlement. The extensive recutting of the enclosure ditches and the complex interplay between ditches, river channels and possible terraces clearly demonstrated that the inhabitants went to some trouble to maintain their settlement close to a channel of the River Ivel. It may be presumed from this, that close proximity to the channel was desirable, a possible explanation is that they were using the river as a source of water and for transport. The latest diagnostic Roman pottery recovered consisted of only two sherds dated to the 3rd or 4th century. Similar results were obtained from an earlier excavation in the southern haul road. The settlement may have been no longer viable in its position next to the river due to environmental changes leading to increasingly wetland conditions. This was evidenced on site by the number of ditches and other features which became the foci for the formation of peaty deposits in the latest phase of the settlement. The excavation produced no evidence for activity in the Saxon or medieval periods. Earlier phases of excavation in extraction phases 1b and 2 showed Saxon occupation occurred further west, away from the river. A small amount of evidence for the post-medieval/modern use of the site was found in the form of a boundary ditch and small rectangular pits. Previous evaluation and excavation work indicated that the western margin of the Ivel Farm site had been subject to quarrying. The pits were interpreted as possible test pits associated with quarrying activity. [Au(abr)]

The groundworks were undertaken in close proximity to the late medieval house within the moated site. Archaeological remains, directly to the rear of the house were revealed and were likely to have been associated with the use of the property in the late medieval/ post-medieval period. However, given the shallow depth of the groundwork there remained a strong possibility that buried features and finds associated with the moated site still remained intact. [Au(abr)]

***All Saints Church, Sutton, Bedfordshire, Archaeological Investigation and Recording***

Wardill, R Bedford : Albion Archaeology, Report: SC1286 2008, 12pp, colour pls, figs, refs

*Work undertaken by:* Albion Archaeology

A watching brief was undertaken at the site, it identified a number of features indicative of the development of the building. Inside the remnants of a rubble wall stretching between the tower archway were likely to be the remains of the west wall of the nave which would have been demolished during construction of the tower in the 15th century. The external works revealed a deposit of brick and tile rubble adjacent to the northern wall footings of the tower. This material may have represented attempts to support or reinforce the foundations of the tower, and evidence of repairs known to have taken place in the 17th century. Overall few finds were identified in the excavations located within the churchyard, this was most likely due to the limited nature of the works and the narrowness of the trenches. [Au(abr)]

Philips, M Bedford : Albion Archaeology, Report: 2009/04 2008, 25pp, colour pls, figs, tabs, refs

*Work undertaken by:* Albion Archaeology

A watching brief was undertaken during groundwork. Previous evaluation in the north-western part of the development area identified a ditch, containing Roman artefacts, and the remains of a rutted trackway. In the eastern part of the development area, evaluation revealed that parts of the road frontage had been subject to intensive quarrying, removing any potential for the survival of archaeological remains. A single adult inhumation burial [probably of Roman date] represented the earliest remains found. The grave cut was aligned east-north-east to west-south-west and cut at least 0.4m into the chalk bedrock. The grave contained no dateable artefacts, although it predated a series of wheel ruts some of which cut into the upper fill of the grave. The wheel ruts formed an extensive group of parallel ruts, they represent the remains of a wide, un-metalled trackway. The alignment of the ruts was shared by that of present day West Street and they simply represent an earlier form of this road. A

single sherd of pottery, dated to the 15th/16th centuries was recovered from the upper fill of one of the ruts, a slight terrace was noted to the south of the ruts. The latest archaeological feature was a ditch situated on the boundary between the rutted track and the terrace slope. This contained modern (19th/20th century)debris. [Au(abr)]

### **DUNSTABLE DOWNS MULTI-USER ROUTE**

***Dunstable Downs Multi-User Route, Bedfordshire. A Programme of Archaeological Investigation***

Keir, W & Pilkinton, K Chicklade : AC archaeology, Report: 2008/102 2008, 71pp, colour pls, figs, tabs, refs

*Work undertaken by:* Albion Archaeology

The Downs were rich in archaeology dating from the Palaeolithic period to 20th century military remains. Two Scheduled Ancient Monuments lay at the north end of the scarp in close proximity to the multi-user route: the Five Knolls Bronze Age barrow cemetery [SAM 20422] and a pair of medieval pillow mounds [SAM 24409]. Located at the north end of the Downs and within the course of the multi-user route were a series of previously unrecorded linear earthworks, mostly aligned north to south. Remains of possible practice trenches dating to the First and Second World War were located near to the course of the Multi-User Route, as well as remains of quarry pitting probably dating to the post-medieval or modern period. Following excavation and survey, the series of linear earthworks visible at the north end of the Downs were shown to be old route ways or hollow ways containing wheel ruts within their bases. The number of hollow ways and their size suggested they were created over a period of many years. Some were likely to be precursors to the current B4541 Whipsnade Road, and probably dated back to at least the medieval period. It was also quite possible that they dated back to much earlier than this and therefore were considered to be at least of regional significance. They were possibly associated with the ancient Icknield Way. Several quarry pits were recorded during the survey and excavation. A raised earthwork platform was recorded on the top of the scarp and may have been associated with past military activity in the area. Evidence of Second World War gun emplacements had been found elsewhere on the Downs in recent years. [Au(abr)]

**FITZWILLIAM COLLEGE LIBRARY*****Fitzwilliam College Library, Cambridge. An Archaeological Excavation***

Slater, A Cambridge : Cambridge Archaeological Unit, Report: 817 2008, 20pp, colour pls, figs, refs

*Work undertaken by:* Cambridge Archaeological Unit

An archaeological excavation was undertaken in the grounds of Fitzwilliam College, Cambridge. One area of excavation, which corresponded with the footprint of the new library building, was mechanically stripped. This was carried out in two phases. The first involved the removal of topsoil to identify any features directly associated with the early 19th century Grove House, as well as to locate any sub-surface services, pipes and ducts. A second phase of stripping was then carried out to reduce the subsoil to a natural, geological level and expose any underlying archaeology. Several baulks were left across the site to protect still live services. In total, 14 features were revealed. Five were Bronze Age in date, one was potentially Late Iron Age or Roman, another was Roman, one was medieval and six were of post-medieval date. [Au(abr)]

**ST. JOHN'S TRIANGLE*****St. John's Triangle, Cambridge. An Archaeological Excavation and Watching Brief (2 Vols)***

Newman, R Cambridge : Cambridge Archaeological Unit, Report: 851 2008, 267pp, colour pls, figs, tabs, refs

*Work undertaken by:* Cambridge Archaeological Unit

Following on from two earlier phases of investigation at the St. John's Triangle site, nine trenches, covering a combined total of 41 square metres, were excavated within a 0.3 hectare area of land located in the centre of the historic core of Cambridge. In addition, a further ten areas of watching brief, covering a combined total of 147.44 square metres, were also monitored. The investigations primarily targeted backyard areas situated to the rear of the main frontage properties. The site, situated upon the northern tip of a gravel spur, immediately adjacent to the floodplain of the River Cam, contained the deepest stratigraphic sequence yet encountered within the city [at around 4.2m], and a significant history of occupation was revealed. Following probable agricultural usage in the late prehistoric period, evidence of a small extramural suburb [or "ribbon settlement"] was identified that had been established to the south of the main Roman town during the 2nd century AD. Numerous traces of domestic occupation were encountered, situated alongside the contemporary Colchester to Godmanchester road, beneath which lay a series of gravel quarries that had most probably been utilised during the initial construction of the roadway. This settlement appears to have been abandoned by the close of the 3rd century, when the area most probably returned to its former agricultural use. Subsequently, the promontory was reoccupied around the mid-10th century [disproving the existence of a putative late 9th to

early 10th century Danelaw settlement in this location] and up to six long narrow properties were established, closely resembling the field strips from which they had most probably originated. The new settlement appears to have expanded rapidly, and by the late-11th century it extended at least 600m to the south along the spine of the gravel ridge. Then, between c.1140 and 1275, the Triangle site became incorporated into the heart of the medieval Jewry and a number of stone buildings were known to have been constructed. Following the expulsion of the Jewish community in the late-13th century, the area continued to develop as a successful mercantile quarter and the original Saxo-Norman properties became increasingly subdivided, with at least eleven separate property plots in existence by the end of the medieval period. A fine quality late-13th or early 14th century anthropomorphic walrus ivory knife handle was associated with this phase. The nearby Hospital of St. John had also established a cemetery in the centre of the Triangle site by c.1250, and the disarticulated remains of at least 132 individuals, recovered from the backfill of a 19th century construction trench, most probably originated from here. The density of occupation, along with associated expansion of commercial premises, then continued to increase throughout the succeeding post-medieval and modern periods. Three metalworking workshops of 15th to 16th century date have been identified, along with a large pit containing late-16th/early 17th century tavern waste and several thousand fish bones derived from imported, processed cod. An early 18th century tavern deposit was also encountered, which was potentially derived from the same establishment. Most important of all, however, was the large clearance deposit that was recovered from a backfilled cellar. This represented the contents of a late-18th century coffee house and at least 288 ceramic and 68 glass vessels were represented, along with a variety of other artefacts. The continuing development of both domestic and commercial interests within the site over the past four hundred years was underlined by the existence of at least 23 separate properties by the end of the 19th century. ***The Kavli Institute for Cosmology, Cambridge. An Archaeological Excavation***

Newman, R Cambridge : Cambridge Archaeological Unit, Report: 820 2008, 41pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Cambridge Archaeological Unit

An archaeological excavation consisting of an open area and two additional soakaways was undertaken in advance of construction of the new Kavli Institute for Cosmology, in the grounds of the University Observatory on the west side of Cambridge. Three distinct phases of activity were identified at this site. The first of these was represented by residual sherds of late Iron Age and early Roman pottery, which were recovered from a series of intensive post-medieval gravel quarries. Although extraction activity most probably began on the site in the medieval period, it reached its apogee during the 17th century when at least 45 additional quarry pits were created. It was at this time that all in situ traces of earlier activity appeared to have been obliterated. Subsequently, during the 18th and 19th centuries, the area was used as rough pasture. In 1891, following the expansion of the University Observatory that had been established a little way to the north in 1822, a large telescope was erected on the site. This instrument, the Newall 25 inch refractor telescope, was to remain in use until 1955. It was subsequently donated to the National Observatory of Athens, at which time its former dome was demolished and a made-ground deposit was introduced above its remains. [Au(abr)]

Cambridge Archaeological Unit Cambridge : Cambridge Archaeological Unit, Report: 834 2008, 81pp, colour pls, figs, tabs, refs

*Work undertaken by:* Cambridge Archaeological Unit

An archaeological watching brief was undertaken on an intermittent basis along the route of the 33kv reinforcement cable. As part of this project, approximately 5.12 km of trenching was inserted along roads and across common ground on the northern and eastern sides of the City of Cambridge. Monitoring of this work revealed evidence of a possible 12th century channel, a 14th century laneway and the foundations of 17th century warehouses within the area of the new electricity substation at 24 Thompson's Lane, along with the remnants of 17th to 19th century cellars located beneath nearby St. John's Road. In addition, evidence of an extensive network of palaeochannels running across the Jesus Green and Midsummer Common area was uncovered. These were succeeded by numerous episodes of consolidation and ground raising activity, dating from the 17th to 20th centuries, along the southern bank of the River Cam. [Au(abr)]

Armour, N & Collins, M Cambridge : Cambridge Archaeological Unit, Report: 843 2008, 40pp, colour pls, figs, tabs, refs

*Work undertaken by:* Cambridge Archaeological Unit

The investigations represented the two final phases of works started in 2007. Site 4 revealed former field boundaries and drainage itches of post-medieval date. A series of 20th century pits, post holes and gullies identified on the site were linked to the agricultural shows that were held on the site from 1948 to the 1960s. Site 7 revealed a total of 41 individual features, of which 24 were ditches or ditch re-cuts, poorly dated by three stratifies and three unstratified potsherds to the Late Iron Age/Roman periods. A trackway and rectilinear field system was identified. Associated with these was a well or watering hole dated to the Iron Age, from which a fragment of saddle quern was retrieved. The remaining features consisted of eight undated rectilinear construction trenches, possibly part of a medieval warren, seven undated pits and one utilised tree throw. The importance of the excavations lay in their position within the landscape. They confirmed that historic and prehistoric occupation within the Hobson's Brook valley was largely confined to the valley sides and that associated field systems and tracks largely avoided that damper base. ***West End, Haddenham: Post-excavation Assessment***

Mc Nicol, D & Chrales, M Edgbaston : Birmingham Archaeology, Report: 1770 2008, 66pp, colour pls, figs, tabs, refs

*Work undertaken by:* Birmingham Archaeology

Excavation of land at West End, Haddenham was undertaken in March 2008. A previous archaeological evaluation, undertaken in 2007, had identified evidence of settlement activity in the form of ditches, gullies and pits dating from the Early to Middle Iron Age. The excavation uncovered evidence of small scale, temporary encampments during the Mesolithic and Neolithic periods, as well as settlement evidence, in the form of boundary and enclosure ditches, pits and post holes dating from the Early-Late Iron Age. The evidence suggested a small scale settlement being established during the Early Iron Age with expansion during the Mid-Late Iron Age, with the centre of the main settlement being located to the east of the site.

The settlement was most likely moved to the south and/or east during the Romano-British period with the features revealed during the excavation forming part of the settlement limits. Ploughing or drainage ditches were also uncovered showing continued use of the area, probably as part of a field system, during the post-medieval period. [Au(abr)]

***Land Adjoining 80 Wisbech Road, Littleport, Cambridgeshire. Archaeological Excavation Interim Report***

Greene, R Hertford : Archaeological Solutions Ltd, Report: 3008 2008, 32pp, colour pls, figs tabs, refs

*Work undertaken by:* Archaeological Solutions

The excavation followed a desk-based assessment and a trial trench evaluation conducted in 2005 at land adjoining 80 Wisbech Road. The evaluation revealed archaeological features of prehistoric, primarily Late Iron Age, date . A dense cluster of pits, post holes and ditch and gully terminal [almost of all of which were truncated] were all cut into the same deposit, on the higher ground of the southern part of the site. Two tree hollows were cut into the same deposit in the western part of the site. A waterlogged clay deposit in Trench 4 and the northern part of Trench 6, may have indicated a contemporary area of standing water north of the archaeological features. The excavation was conducted in the vicinity of Trench 6 [the southern transect that fronted Wisbech Road]. Two Late Iron Age ditches, two gullies, post holes, and numerous pits were identified. It was possible that some Late Iron Age ditches represented a single enclosure or land division system, however, it was also possible that they represented two non contemporary but successive field systems or enclosures. This evidence indicated that division and enclosure of land occurred even on the most marginal of land at the fen edge. Many of the other features recorded at the site appeared to be of natural origin. However, some were clearly deliberately cut features and may have had their locations influenced by the presence of the large boundary ditches. Finds recovered from the features comprised pottery, struck flint, flint tools, animal bone and burnt stone, all in a somewhat abraded condition. Finds were also recovered from overlying soil layers and comprised pottery of Roman and Late Iron Age date. [Au(abr)]

***Archaeological Evaluation & Excavation. Land North of Loves Farm, St. Neots, Cambridgeshire***

Wilson, N Milton Keynes : Archaeological Services & Consultancy Ltd., Report: 1009 2008, 60pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Services & Consultancy Ltd.

A programme of archaeological works to the north of St. Neots, along the route of a new water pipeline, was carried out. The route commenced at an existing reservoir and followed the western side of the east coast mainline railway for c.450m before passing under the railway and returning on the eastern side for 650m. Seventeen evaluation trenches were excavated. A number of ditches and gullies were revealed, mainly at the southern end of the route to the east of the railway. Pottery recovered from some of these features indicated that they were backfilled during the Roman period, others were clearly modern in origin. The upper fill of one ditch at the southern end of the route, contained several sherds of late Neolithic or Bronze Age pottery. Though only one isolated ditch from this period was located, it was likely that further Bronze Age features may have survived in the vicinity. Based on the results of the evaluation a 300m length of the easement at the south-eastern end of the pipeline route was subjected to a more detailed examination. Further undated ditches, and a large open well or pond of Roman date were revealed. It was concluded that some of the excavated features formed part of a Romano-British agricultural landscape associated with the recently excavated site at Loves Farm to the south of the pipelines route. The late Neolithic/Bronze Age pottery possibly indicated that pre-Roman activity remains undiscovered in the vicinity of the pipelines route. [Au(abr)]

Murrell, K Cambridge : Cambridge Archaeological Unit, 2008, 44pp, colour pls, figs, tabs, refs

*Work undertaken by:* Cambridge Archaeological Unit

An evaluation and subsequent excavation was carried out at the site in 2008. Seventeen trial trenches, followed by a small open area excavation and three further trenches were examined. The evaluation and excavation revealed late Bronze Age activity in the form of a four post structure and an eighteen post sub-circular structure, indicative of small scale or seasonal flux occupation. Later agricultural activity was indicated by a middle Iron Age curvilinear ditch and evidence of two alignments of post-medieval fields. The results of the excavation contradicted the traditional opinion that the Gault clay area north of Cambridge was not suitable for such prehistoric settlement, and suggested that the "blank" in the

archaeological record reflected an absence of evidence due to more limited fieldwork in these areas. [Au(abr)]

*Work undertaken by:* Oxford Archaeology East

An evaluation and subsequent excavation was undertaken on land adjacent to 52 Harlton Road. At least two phases of activity were identified with secure dating for the second phase to the post-medieval period. Archaeological remains included two different alignments of parallel ditches representing agricultural activity and possible enclosure boundaries as well as a series of pits, a quarry and a well. These remains indicated the likely existence of a domestic area within close proximity to the development area. The excavated area was stripped directly after the completion of the evaluation and represented an area within which the proposed buildings were to be constructed. Given the results of the evaluation this area was considered to be of high archaeological potential. [Au(abr)]

***The Over Narrows. Archaeological Investigations in Hanson's Needingworth Quarry***

Evans, C & Tabor, J Cambridge : Cambridge Archaeological Unit, Report: 864 2009, 125pp, colour pls, figs, tabs, refs

*Work undertaken by:* Cambridge Archaeological Unit

An open-area excavation was carried out as part of an ongoing programme at the site. The extent and quantity of the remains discovered were unexpected, and comprised very slight earlier Neolithic activity, followed by later Grooved Ware and Beaker-attributed pit clusters, as well as dispersed Collared Urn pits. While no contemporary structures were distinguished with any certainty, a possible roundhouse-suggestive configuration may have been of Beaker/Collared Urn date. While relatively little Deverel-Rimbury pottery was recovered [raising issues of an almost aceramic usage due to the "loss" of pottery through grog-tempering and, otherwise, displacement into "funerary" contexts], the site's main phase occurred during the middle Bronze Age. Laid out along the north side of a fragmentary ditched field/paddock system, this saw extensive settlement remains with roundhouses set amid fenced plots. Various pits and localised midden spreads were also recovered. Along the western end of the ridge, in what appeared to have been an embanked sub-square compound, was found a possible post-built longhouse setting, with evidence indicating a "distinguished household". Three crouched inhumations had been buried within the area of the site's settlement swathe, clearly resonating with the adjacent barrows' primary Beaker-associated inhumations. Although none of the ridge-top burials were accompanied by readily dateable grave goods, they were thought to be of late Neolithic/early Bronze Age date. [Au(adp)]

**THE GREEN, GREEN STREET, WILLINGHAM*****Watching Brief at The Green, Green Street, Willingham, Cambridgeshire***

Atkins, R Bar Hill : Oxford Archaeology East, Report: 1071 2008, 14pp, figs, tabs, refs  
*Work undertaken by:* Oxford Archaeology East

An archaeological watching brief was undertaken at The Green, Willingham, The monitoring was carried out during improvement works to The Green. The watching brief found a north to south tarmac road [this road had been recorded on all OS maps between 1885 and 1952]. The road had been grassed over about 40 or so years ago. Natural gravel and sands were exposed below this road as well as a late-19th or 20th century ceramic pipe which had run under it. Existing 20th century services running east to west directly to the south of Church Street were uncovered. Only the top part of the present east to west road through The Green was removed in the development and machining stopped at a layer of hardcore. [Au(abr)]

Whightman, A Colchester : Colchester Archaeological Trust, Report: 466 2008, 4pp, figs, tabs, refs

*Work undertaken by:* Colchester Archaeological Trust

The proposed development lay on the line of "The Deerbank", a 5-6ft high bank with an external ditch, which survived until 1895 and was designed to contain deer and cattle in the park. The place name evidence suggested that the woodland may have been enclosed prior to 1066. The bank dated to some time between 1201 and 1323. The wood was also used for military exercises during WWII. The excavation revealed modern post holes and tree throw holes, resulting from the removal of a hedge, observed in the subsoil but no archaeological features were found. No archaeological material or features were observed during the course of the excavation, nor were any finds recovered. No evidence of the medieval bank or ditch that delimited Norsey Wood was observed in the trench. [Au(abr)]

Pocock, M Chelmsford : Essex County Council Field Archaeology Unit, Report: 1796 2008, 3pp, tabs

*Work undertaken by:* Essex County Council Field Archaeology Unit

The investigation demonstrated that much of the site had been reduced into the natural sands during construction of both the nearby buildings and the current car park to a level of between 49.01m OD nearer the road frontage and 49.41m OD at the rear of the site. From this reduced level, the site was then built-up with a series of compacted layers that comprised building rubble, possibly from the demolished modern outbuilding to the north of the development, and other dumps of modern debris including concrete, engineer's bricks, and segments of metal roofing. The remains of the modern outbuilding consisted of a foundation trench, spreads of demolition debris, concrete surfaces and a few short internal wall alignments that were constructed of frogged bricks. Fortunately, the original undisturbed soil sequence was preserved in section at the eastern and southern edges of the development behind earth banks. Ground reduction had resulted in the truncation of any archaeological remains that may have once been present within the areas monitored, specifically of remains associated with the medieval or post-medieval High Street frontage but also regarding any earlier prehistoric or Roman activity. The lack even of residual artefacts may suggest no such remains had been present at this location. There was also no sign of any archaeological remains extending to the east or the south into adjacent plots of land where the degree of preservation seemed good, with little or no evidence for truncation or reworking of the underlying natural geology. The monitoring established that no archaeological remains survived the high level of truncation/ disturbance across the site and concluded that the development would have no impact upon the archaeological record. Germany, M Braintree : Essex County Council Field Archaeology Unit, Report: 1937 2008, 14pp, figs, tabs, refs

*Work undertaken by:* Essex County Council Field Archaeology Unit

Topsoil stripping of phase 4.2 at Bradwell Quarry was monitored for archaeological features and deposits. The stripping revealed a small quantity of unstratified worked flint and two small Middle Iron Age pits. The flint lay thinly scattered and there were no concentrations. The pits were intercutting and were uncovered at the far northern end of the investigated area. Both contained small quantities of burnt flint and Middle Iron Age pottery. The discovery of the two pits complimented earlier discoveries made at Bradwell Quarry of Middle Iron Age features and finds (Peachey 2003; Allen and Roy 2006; Ennis 2008). The combined evidence suggested that the area of the quarry was extensively settled during that period, although the 2008 evidence was isolated and small scale. [Au(abr)]

*Work undertaken by:* NAU Archaeology

Archaeological work was undertaken during the construction of a water pipeline between Cressing and Terling. Finds of struck flint suggested a background noise of low level Mesolithic, Bronze Age and Iron Age activity. Excavations at both White Notley and on the route of the pipeline indicated a hitherto unknown later Bronze Age presence comprising scattered pits perhaps dating to c. 900-800 BC. Excavation at White Notley was able to confirm that a soil mark enclosure previously identified by aerial photography was of Early Roman date and at Great Loys a vertical tile hearth located within the easement may mark the site of a putative medieval hall. A number of possible natural features were also investigated. [Au(abr)]

***Ayleswards Farm, Braintree Road, Essex. Archaeological Monitoring and Recording***

Germany, M Braintree : Essex County Council Field Archaeology Unit, Report: 1881 2008, 18pp, colour pls, figs, tabs, refs

*Work undertaken by:* Essex County Council Field Archaeology Unit

Groundwork for a new house on the former site of a 17th-century farmhouse at Aylewards Farm was monitored. The work revealed a ditch and three pits dating from the 12th/early 13th century, and the remains of the 17th-century farmhouse. The medieval features contained small amounts of medieval pottery, mostly Hedingham Coarse Ware. It was concluded from the presence of the medieval features and pottery that Aylewards Farm dated back to the 12th/early 13th century or earlier. It was thought likely that further archaeological remains relating to the development of the farm over the last eight centuries survived below ground level in the garden surrounding the site. Sparrow, P. Lally, M. and Davies, M. Hertford : Archaeological Solutions, Report: 3074 2008, A4 ring bound document

*Work undertaken by:* Archaeological Solutions

"During February and March 2008, Archaeological Solutions Ltd (AS) carried out a 'strip, map and sample' archaeological excavation on land to the rear of 32 High Street, Kelvedon, Essex. The excavation revealed evidence for four phases of activity at the site. The earliest evidence represented limited medieval activity, possibly related to 15th century structures

located to the west of the site. Phases 2 and 3 represented post-medieval backyard activity that is most likely related to the known post-medieval development immediately adjacent to the site. Later activity comprised the dumping of modern refuse. Residual late Iron Age and Romano-British pottery sherds recovered from a posthole are indicative of the known activity during these periods in the Kelvedon area but no features of this date were present on the site. The evidence recorded during the excavation is of limited research potential but can be considered to help characterise the nature of the activity that occurred in this part of Kelvedon in the medieval and post-medieval periods." *Work undertaken by:* Essex County Council Field Archaeology Unit

Monitoring of the excavation of foundation trenches for an extension on the north side of the nave of the parish church of St. Mary the Virgin was undertaken. The trenches had vertical sides and measured 0.5m wide and 1.5m deep. The excavation trenches revealed topsoil/grave earth above an undisturbed natural deposit of silt clay sand and gravel. No human remains were encountered, other than a small fragment of skull. The topsoil/grave earth comprised friable clay silt and gravel. It lay up to 0.6m deep and contained occasional pieces of peg tile. A dump of peg tile, granite kerb stones, iron guttering and modern concrete, more than 1.5m deep, was encountered in the section of trench near the north-east corner of the tower. No finds or human remains were retained. [Au(abr)]

Robertson, A Braintree : Essex County Council Field Archaeology Unit, Report: 1389 2008, 2pp, tabs, figs

*Work undertaken by:* Essex County Council Field Archaeology Unit

As part of the ongoing monitoring of groundwork associated with the construction of residential properties and associated parking on the High Street, South Benfleet, a monitoring exercise was undertaken on geotechnical pits excavated in the third phase of the development. The site lay in an area of high archaeological potential opposite the medieval parish church. The 1841 Tithe Map showed the development area as yards and gardens. In the latter part of the 19th century the yards had become amalgamated and built over. Modern industrial units were added in the 20th century. Two previous investigations to the south, at 23 and 21 High Street, identified Roman, medieval and post-medieval remains. A watching brief was maintained on the excavation of two geotechnical pits within the footprint of the proposed building. In both pits a significant build up of modern made ground was identified, below which was a layer of contaminated clay. No archaeological features or finds were identified in either of the pits. It seemed unlikely that any significant archaeological remains existed within the boundaries of the proposed site. It also seemed unlikely that the ground reduction would be sufficient to encounter the undisturbed natural geology. [Au(abr)]

***31 Mildmay Road, Chelmsford, Essex, Archaeological Trial Trenching and Excavation***

Germany, M Braintree : Essex County Council Field Archaeology Unit, Report: 1745 2008, 35pp, colour pls, figs, tabs, refs

*Work undertaken by:* Essex County Council Field Archaeology Unit

An archaeological investigation was undertaken at 31 Mildmay Road. Evidence for past activity consisted of a dense concentration of Roman pits dating from the mid-2nd to late 3rd/early 4th century AD. A small quantity of residual Late Mesolithic/Early Neolithic worked flint and Late Iron Age/Early Roman pottery was also found. The investigation took place in the north-eastern sector of Roman Chelmsford [formerly known as Caesaromagus], 30m south of the Roman road leading south-eastwards to Heybridge and Wickford, and outside the line of the later 2nd-century town defences. The pits were backfilled with domestic rubbish, but were probably originally dug as gravel quarries, while one pit was interpreted as a well. The pits were thought to have been located at the rear of an area of settlement alongside the Roman road in the mid-2nd and 3rd century. In the late 3rd and early 4th century the well was sealed over by an extensive rubbish deposit containing large quantities of pottery, as well as tile, metalwork and animal bone. The results of the investigation complemented previous archaeological work undertaken in the surrounding area. The combined information suggested that this part of the Roman town prospered during the mid-2nd to 3rd century, but declined in the 4th century. [Au(abr)]

***Salvation Army Site, 70 Baddow Road, Chelmsford, Essex, Archaeological Excavation***

Pocock, M Braintree : Essex County Council Field Archaeology Unit, Report: 1834 2008, 43pp, colour pls, figs, tabs, refs

*Work undertaken by:* Essex County Council Field Archaeology Unit

An archaeological excavation was undertaken on the building of the Salvation Army Citadel, Chelmsford. Archaeological trenching in 1971, when the previous Citadel was built, recorded a Roman pit and a linear feature running east-west across the site, interpreted as a post-medieval hollow way filled with alluvial flood deposits from the nearby river Can. The report on the 1971 trenching argued that the hollow-way perpetuated the line of a Roman road, a forerunner of Baddow Road, whose gravels had been washed away by flooding. The 2008 excavation aimed to supplement the earlier work by investigating areas that had not been disturbed by the 1971 building, concentrating particularly on understanding the hollow way and its relationship with episodes of river flooding. Trench 1 in the south-west of the site recorded a mixed alluvial deposit containing large amounts of Roman rubbish, mainly pottery, dating to the mid-2nd to mid 3rd century, with a few sherds of medieval pottery representing later disturbance. Residual Mesolithic flint tools were also recovered. This was consistent with evidence from the surrounding area, that the site lay in an area of rubbish disposal at the north-eastern limit of the Roman town, outside both the town defences and the extra mural temple precinct. **CHURCH OF ST. JAMES, CHIGNAL ST. JAMES**

***Church of St. James, Chignal St. James, Essex: Archaeological Monitoring and Recording***

Pocock, M Braintree : Essex County Council Field Archaeology Unit, Report: 1847 2008, 8pp, colour pls, figs,tabs, refs

*Work undertaken by:* Essex County Council Field Archaeology Unit

Archaeological monitoring and recording was undertaken on land adjacent to the Church of St. James. The church was situated some four miles from Chelmsford, off the A1060 Roxwell Road and was converted to residential use in 1987. It was originally thought to have been 13th or 14th century in date and may have formed a focus for a dispersed settlement pattern of medieval or earlier date. The development lay within the existing graveyard but the graveyard survey held at the former church showed that no known burials were present in this part of the site. The groundworks involved the excavation of trenches and the reduction of the ground levels within the footprint of the building by up to 0.3m for a concrete raft. Prior to the start of the investigation an old oil tank and concrete foundation slab located against the sites northern boundary and centrally within the footprint of the new build had been removed. No archaeological remains were encountered within the groundworks. Excavation of the new builds footprint reached a reworked subsoil/natural and modern debris horizon that likely derived from a combination of more recent activity and previous levelling across site. Finds included post-medieval or later brick and tile, none of which was retained. Overlying this was a 0.16m-thick garden topsoil. The investigation demonstrated that the construction level was insufficient to disturb archaeological levels and concluded that any future development on the site would have to exceed 0.60m before any potential archaeological remains were encountered. **STANWAY TO LAYER*****An Archaeological Watching Brief on the Stanway to Layer Anglian Water Pipeline, Colchester, Essex***

Crawley, P & Stocks, H Norwich : NAU Archaeology, Report: 1639 2008, 32pp, colour pls, figs, tabs, refs

*Work undertaken by:* NAU Archaeology

During 2007, and 2008, a watching brief was carried out along a length of water pipeline running from Stanway to Layer, to the south west of Colchester. The route of the pipeline took it close to the important Iron Age/Roman sites within the Colchester area including the site of Gosbecks Romano-British settlement. The route of the pipeline was designed to have the least impact on potentially important archaeology and yet remain in proximity to an existing water pipeline. Only nine features were encountered along the length of the stripped area, indicating that the placement of the pipeline achieved its purpose. A small probable cremation of Iron Age date was the most archaeologically significant feature uncovered during the survey and added to what was already known of Iron Age Colchester. [Au(abr)]

**9 EAST HILL, COLCHESTER*****Colchester Archaeological Trust CAT Report 469 :Essex Historic Environment Record/ Essex Archaeology and History Summary Sheet***

Wightman, A Colchester : Colchester Archaeological Trust, Report: 469 2008, 3pp, figs

*Work undertaken by:* Colchester Archaeological Trust

Footings were excavated for a new development on the site of a car-park on Priory Street between properties 52 and 54 and in front of 52a. The footprint of the new building overlay that of a building which once fronted onto Priory Street, the remains of which were observable as numerous layers of building demolition debris containing frequent brick, mortar, slate and glass fragments. A building on this plot of land could be seen on the 1923 Ordnance Survey map; the building had subsequently been demolished and replaced with a concreted car-parking area. The footprint of the new development extended beyond that of the old building in an easterly direction and here a post-Roman accumulation was observed containing charcoal, shells and peg-tile. Features of the old building were noted, including a north-south aligned brick drain seen in the boundary wall of the property to the north, and a possible cellar seen in the section of one of the footings trenches. To the east of the new development, on the north-facing wall of property 52a, shallow excavations for services uncovered an archway leading into what was once the cellar of this property. In the back garden of 9 East Hill, footings were dug for a new brick wall to enclose a garden attached to property 52a on Priory Street. These footings were excavated to 500mm below modern ground-level through topsoil and a sandy loam containing post-medieval pottery and tile but no archaeological features. A service trench from the back of 9 East Hill through to Priory Street was dug in the garden. Two modern wall foundations and a wall foundation of greater antiquity were identified. The deeper of the two foundations was constructed of mortar (60%), peg-tile (25%) and large pebbles (15%) and was observable only in the western trench section. The absence of any wall material in the spoil heaps and the solidity of the foundation suggested that the wall was not cut away when the service trench was dug. Hence it was likely that it was part of the end of a wall or perhaps a doorway. The peg-tile used in its construction and a closely associated fragment of Fabric 21a (Colchester-type ware) both suggested that the structure was late medieval or post-medieval in date. [Au(abr)]

***An Archaeological Watching Brief at the Central Clinic, High Street, Colchester, Essex***

Brooks, H & Spencer, P Colchester : Colchester Archaeological Trust, Report: 473 2008, 13pp, figs, tabs, refs

*Work undertaken by:* Colchester Archaeological Trust

The site lay in Insula 15/23 and 24 of the Roman town, and partially within a Scheduled Ancient Monument (Essex SAM No. 1). An evaluation in 2006 identified Roman buildings on the site, lying on either side of the Roman gravel street dividing Insula 15/23 and 24 [CAT Report 372]. A watching brief was held in 2007-8 on the removal of the footings of the Central Clinic main buildings, and on other works associated with the construction of new residential accommodation. The gravel surface of the Roman street was located at three points, but otherwise no significant strata were revealed. [Au(abr)]

**PHASE II DEVELOPMENT AT "TOPFIELD", RAWSTORN ROAD, COLCHESTER**

***An Archaeological Watching Brief on the Phase II Development at "Topfield", Rawstorn Road, Colchester, Essex***

Brooks, H Colchester : Colchester Archaeological Trust, Report: 480 2008, 12pp, figs, tabs, refs

*Work undertaken by:* Colchester Archaeological Trust

The Topfield site lay to the west of the walled Roman town, and immediately west of the former St. Mary's hospital site (now the Balkerne Heights residential development), where Roman burials and domestic activity had been recorded. There was a great depth of topsoil on this site, masking at least six Roman inhumation burials, probably outliers of the Roman cemetery at the adjacent St. Mary's hospital site, and a probable quarry-pit. The burials were all placed in the northern and more sloping part of the site, which may have been deliberate. Roman pottery from the 2008 watching brief confirmed the results of a previous evaluation, that there had been a Roman occupation site nearby. Although it could not be proven, a case can be made that the site was initially used for sand-quarrying, with some nearby domestic occupation, but was later used as an inhumation cemetery, probably after the mid-3rd century. This change in use may have been related to the contraction of the Roman suburbs, when sites previously built on became vacant and, in some cases, were used as burial grounds. [Au(abr)]

*Crierswood to Witham Pipeline, Hale's Farm, Little Braxted, Essex. Archaeological Monitoring Summary*

Germany, M Braintree : Essex County Council Field Archaeology Unit, Report: 1959 2008, 6pp, colour pls, tabs

*Work undertaken by:* Essex County Council Field Archaeology Unit

Archaeological monitoring was undertaken during construction of the central section of the Criers wood to Witham water pipeline. Six archaeological features were observed in the sides of the pipe trench. Reddened clay beneath the pit provided clear evidence of in situ burning, no finds were recovered. Two ditches, appearing in both sides of the trench section, were recorded towards the north-west end of the observed route. No finds were recovered from either feature. A large feature, probably an infilled pond, was recorded at the south-east end. One piece of peg tile was noted in section and an adjacent field drain was noted that may have drained into the pond when it was in use. This feature was therefore likely to be of post-medieval date. A second large feature was located in the centre of the route. No finds were recovered and the feature was poorly defined. It was most likely a large pit or pond although it did broadly align with a cropmark in the field to the north-east of the road and could have conceivably been an earlier field boundary ditch. With the exception of pond 14, none of the features was firmly dated. The monitoring was successful in that six new archaeological features were identified. However, the lack of dating evidence provided little help in determining the age of the adjacent cropmarks which clearly related to several phases of activity given the visible differences in alignment and intersection. *Crierswood to Witham Pipeline: Archaeological Monitoring Summary*

Ennis, T. Braintree : ECC Field Archaeology Unit, Report: 1959 2008, 5 pages, A4

*Work undertaken by:* ECC Field Archaeology Unit

"Archaeological monitoring was undertaken on the Crierswood to Witham Pipeline during September 2008. Monitoring was focused on the section west of Hale's Farm which had been identified as an area of archaeological significance during a prior desk-based assessment (Heppell 2008) due to the presence of a concentration of cropmarks (EHER 8870). Six archaeological features were observed in the sides of the pipe trench. All were undated apart from a probable post-medieval pond in the section of trench nearest to Hale's Farm. Two undated parallel ditches were recorded that might be the southerly continuation of a trackway. In the area closest to the cropmark concentration, two pits containing burnt material were recorded. One showed evidence of in situ burning and the other contained baked clay. A large feature located in the centre of the route may have been a large pit or pond." [OASIS]

Ennis, T Braintree : Essex County Council Field Archaeology Unit, Report: 1800 Rep 2008, 23pp, colour pls, figs, tabs, refs

*Work undertaken by:* Essex County Council Field Archaeology Unit

Although the site had been heavily disturbed by previous construction works, a small number of archaeological remains were able to be identified. At least two pits and an adjacent boundary ditch dating to the 13th-14th century were recorded in the north-western corner of the development area. It was likely that these features were located to the rear of a property that fronted onto Cromwell Hill, or its precursor, in the medieval period. One pit of probable post-medieval date was also identified, along with a curving area of truncation/terracing that predated the construction of the former Pump House. A short surviving fragment of 17th/18th century wall, that may have been a part of an earlier property boundary or structure, was recorded to the south of the development area. The fieldwork had increased knowledge of the development of the town of Maldon as evidence of medieval settlement had been identified in a part of the town where no medieval remains had previously been found. This settlement pre-dated, by c.150 years or more, the earliest recorded activity in this part of Maldon associated with the postulated construction of St. Helen's Chapel in the first half of the 16th century. Ennis, T Braintree : Essex County Council Field Archaeology Unit, Report: 1797 2008, 41pp, colour pls, figs, tabs, refs

*Work undertaken by:* Essex County Council Field Archaeology Unit

Archaeological monitoring and excavation was carried out along the route of the Fossetts Farm overhead line diversion, to the north of Southend-on-Sea, in the vicinity of the Scheduled Ancient Monument of Prittlewell Camp. The scheme involved the construction of a new underground electricity cable trench from the electricity sub-station in Shopland Road, across farmland, to the roundabout in Sutton Road, just west of Smither's Farm. Hitherto unknown sites of Middle Iron Age, early medieval, late medieval and post-medieval date were identified along the 1.6km route. However, no archaeological features of Roman or Saxon date were identified. Three pits and a ditch of Middle Iron Age date were recorded in the northern part of the route and residual undetermined prehistoric pottery was recovered from the south. Also in the north, was a small cluster of early medieval pits and post holes, two late medieval deposits perhaps infilling a pond or hollow and two post-medieval boundary ditches that formerly separated the northern most field from Shopland Road. Further significant deposits of late medieval date were recorded in the south of the route close to Sutton Road. Possible structural remains in the form of rubble limestone footings for a timber building lay alongside pebble and shell surfaces. Worked stone, presumably re-used from a high status building elsewhere, was also present. In the early post-medieval period the same area may have been enclosed within a rectangular enclosure. Finds from the enclosure ditches and a nearby pit were of a range and quantity to imply domestic occupation in the near vicinity. [Au]

Two sites dating to the Late Iron Age to Early Roman period were excavated during preliminary works for the construction of a large reservoir. A palaeochannel was recorded in the valley floor probably of glacial origin. A Late Iron Age settlement area was discovered, and small scale prehistoric remains consisting of two pits containing burnt flint and two pits with Middle Iron Age material in them. Late Iron Age features and finds were confined to site D [in the north area] with at least 20 pits ranged around it. Large amounts of pottery were found, no features were recorded in the interior of the enclosure, but there was evidence for ironworking taking place there. Medieval and later features included boundary ditches, gullies and pits. [Au(adp)]

Germany, M Brentwood : Essex County Council Field Archaeology Unit, Report: 1899 2008, 18pp, colour pls, figs, tabs, refs

*Work undertaken by:* Essex County Council Field Archaeology Unit

Archaeological monitoring was carried out along the line of a rising main replacement, running for 2.8km from the West Road pumping station on the western outskirts of Clacton-on-Sea to the sewage treatment works to the west of Jaywick. The work mainly consisted of monitoring of topsoil stripping over a 15m-wide easement along the pipeline route before the pipe trench was cut. The route crossed a landscape containing a high density of potential archaeological sites, recorded as cropmarks on aerial photographs and plotted onto a map base. Probable archaeological sites in the area included ring ditches for prehistoric round barrows, settlement enclosures and field boundaries of possible Iron Age, Roman, Saxon and medieval date. Monitoring found no archaeological deposits, features or finds, mainly because a subsoil layer was left in place which prevented the identification and recording of potential archaeological remains at the surface of the natural clay. Trial trenches were excavated in three locations to investigate areas where cropmarks were mapped directly on the pipeline route, but these recorded only a few undated archaeological features of low significance. Further monitoring during the cutting of the pipeline trench was abandoned as impracticable. Despite the high density of cropmarks along the pipeline route, no remains of any significance were recorded on the ground, due to the lack of visibility of archaeological remains masked by subsoil, and probably also due to plough damage where trenches were excavated over potential cropmark sites. A summary of landscape development was attempted from the evidence of the cropmarks and previous excavations in the area, especially that at Bishops Park College only 300m to the north of the pipeline. Pocock, M. Essex County Council Field Archaeological Unit : Essex County Council Field Archaeological Unit, Report: Report Number 1964 2008, A4 Blue Spine

*Work undertaken by:* Essex County Council Field Archaeological Unit

"The archaeological excavation encountered remains that included brick-walls, brick-wells, services, pits, ditches and gullies associated with properties that would once have existed along the street frontage in the medieval, post-medieval, and modern periods. However, it failed to identify further medieval or post-medieval structural remains along the old street frontage or further parts of the buildings first discovered during the previous trial trenching. Primarily, this was because the post war redevelopment of Kings Walk had efficiently cleared the area of all previous above ground remains and all but the deepest features that represented any previous phase of activity. The extent of that truncation reached c.7m OD and certainly exceeded the depth of the pre 1970's, 97-107 High Street building foundations, which did not survive. Overall, modern features dominated the site. Along the old High Street frontage, the modern walls and services of recent 1970's buildings were discovered, while the eastern half of the site contained services, wells, pits, ditches, a post-hole, and other unexcavated but obviously modern disturbance. Post-medieval activity was implied by the presence of 17th - 18th century pottery in two of the pits that were discovered. Medieval remains included a large pit located in the north-east corner of the site and an uncharacterised feature located beneath a modern concrete drain. Both were poorly dated by small quantities of mid-14th to 15th century pottery, but do appear to suggest that the former High Street/ Kings Walk Area was a focus for activity in the medieval period." **OCKENDON SCHOOL, ERIFF DRIVE, SOUTH OCKENDON*****Ockendon School, Eriff Drive, South Ockendon, Essex. Archaeological Excavation***

Ennis, T Braintree : Essex County Council Field Archaeology Unit, Report: 1766 2008, 36pp, colour pls, figs, tabs, refs

*Work undertaken by:* Essex County Council Field Archaeology Unit

Excavation was undertaken in advance of the construction of a new fitness suite and fire access track at Ockendon School. Contained within the excavation area were the remains of part of a Middle Iron Age occupation site. This comprised at least three, possibly four, inter-cutting ring gullies, representing the demolition and rebuilding of a single roundhouse over time. Two door support post holes were identified and an external three-post structure that may be the surviving remains of a granary. Intermixed with the successive round house remains were several phases of a north-east/south-west aligned boundary ditch of broadly similar date. One Roman ditch, two medieval ditches and two probable post-medieval ditches were also identified and are probably the remnants of former agricultural field systems. A subsequent evaluation undertaken in 2008, to the south-west of the excavation area, in advance of the construction of a new assembly hall, revealed a single boundary ditch of 19th century date. The results of the combined fieldwork indicate that Roman settlement remains previously excavated at Little Belhus Farm, to the north of the site, did not extend into the school grounds in any quantity and that many of the recorded cropmark ditches within the grounds were likely to be of post-medieval date. It appeared that the focus of settlement shifted north to Little Belhus Farm, in the later Iron Age or early Roman period, and that subsequent land use was of an agricultural nature until the modern development/expansion of South Ockendon. ***West Powder Magazine North Blast Wall, Tilbury Fort, Essex: Archaeological Monitoring and Recording***

Pocock, M Braintree : Essex County Council Field Archaeology Unit, Report: 1891 2008, 27pp, figs, tabs, refs

*Work undertaken by:* Essex County Council Field Archaeology Unit

Archaeological monitoring and recording was undertaken within the Scheduled Ancient Monument of Tilbury Fort, situated at the mouth of the River Thames. The investigation was undertaken to record any archaeological remains that might be disturbed during stabilisation of the north blast wall of the fort's western powder magazine. The archaeological work included the observation and recording of three boreholes, hand excavation of sixteen temporary access pits for ground anchors, and hand auguring in three of the access pits. Alluvial marshland silts and the water table were encountered at c.2.8m OD by both the boreholes and hand auguring. Overlying this were multiple soil layers relating to the construction of the fort, but more specifically to the build up of the earthen bank to the rear of the northern curtain wall and the construction of the blast wall surrounding the powder magazine. The 0.6m deep access pits encountered only a single demolition spread that contained a variety of modern domestic waste and building debris. An incomplete lower portion of a buttress located against the western side of the Master Gunner's store was also recorded within the most easterly of the access pits. The investigation established that the ground anchors and their access pits did not affect any significant archaeological remains, and their impact was minimal. [Au(abr)]

***Ashdon Hall, Ashdon: Historic Building Record and Archaeological Monitoring Report***

Ashworth, H & Hillelson Letchworth : Heritage Network, Report: 457 2008, 38pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Heritage Network

Ashdon Hall was a Grade II Listed Building with 17th century, or earlier, origins. The study concentrated on the group of barns to the south-west of the house, where a new garage was to replace one of the barns. Cartographic evidence demonstrated that the layout of the barns remained essentially unchanged since the late-19th century. The historic building record demonstrated that the earliest structure in the group was likely to have been Barn 3, the eastern range. This was tentatively dated to the mid-late-18th century. Barn 2, which formed the western range, may have been the latest in the group. This was tentatively dated to the early 19th century, and post-dated Barn 1, the southern range. The monitoring of the ground reduction following the demolition of Barn 1 revealed that the ground level had been deliberately built up to level the ground. Pottery, brick and tile fragments indicated that this occurred in the later 19th century. This work may have removed evidence for earlier features. The remains of a gravelled farmyard surface and brick path were recorded to the south of

Barn 1. No other archaeological features or deposits were observed. The bulk of the artefacts observed during the monitoring were 19th century in date. [Au(abr)]

***Archaeological Excavation and Test-pitting at St. Mary's Primary School, Great Dunmow, Essex***

Phelps, A          Norwich : NAU Archaeology, Report: 1894 2008, 54pp, colour pls, figs, tabs, refs

*Work undertaken by:* NAU Archaeology

Excavations were carried at St. Mary's Primary School, Great Dunmow. The work was conducted in two stages, the first being the excavation of four test-pits which informed the depth and presence or otherwise of archaeological deposits. The second stage entailed the excavation of the footprint of the new building. The test-pits identified archaeological remains of Roman date 0.6m beneath the surface and this discovery was expanded on in the excavation that followed, which identified a series of pits containing domestic waste material at the southern end of the excavated area. These pits appeared to have been backfilled during the 2nd century and one contained a number of disturbed cremations. In addition, a 4th century ditch was encountered at the north-western extreme of the excavation. It appeared that from the 1st century AD the excavated area comprised the rear plot of a moderate to high-status domestic building likely to have faced onto Stane Street to the south. In the post-Roman period the land reverted to agricultural use until the modern development of the school. [Au(abr)]

***Howlets, The Street, Great Hallingbury, Essex: Archaeological Monitoring***

Ennis, T          Braintree : Essex County Council Field Archaeology Unit, Report: 1920 2008, 5pp, colour pls, figs, tabs

*Work undertaken by:* Essex County Council Field Archaeology Unit

Archaeological monitoring was carried out at Howlets, during groundwork for an extension to the north side of the existing building. Howlets was a Grade II Listed Building dating to the late-16th or early 17th century situated within a possible medieval moated enclosure (HER 4428). The extension was located close to a number of large trees directly to the east of a 35m-long section of a large, dry, and partially infilled ditch. The main aim of the monitoring work was to check for the presence of medieval remains. It was likely that the existing ditch originally continued further eastwards, past the northern side of the building, to the boundary with "The Street" and as such would pass directly beneath the location of the new extension. Although not depicted on mapping, the woodland to the north of Howlets was also bounded by a large ditch and the current owner believed that at one time this continued south along the eastern edge of the property. Three test pits (A-C) were excavated. Test Pit A was located within the western half of the extension footprint. Exposed in the base of the test pit were 19th-20th century (frogged) bricks. No natural was visible and the ground was heavily root disturbed. Test Pit B was located close to the central part of the extension and contained modern brick and fragments of stone (identical to those in an adjacent patio). Test Pit C was located at the eastern end of the extension. Exposed in the base deposit were sherds of blue and white pottery, fragments of brick and pieces of flower pot. The ground had also been disturbed by modern drain pipes and roots. The test pitting confirmed the presence of modern deposits along the entire length of the extension footprint. These continued below the required depth of excavation and were likely to be modern backfill of the former ditch/moat. The cut observed at the western end of Test Pit B may represent the edge of the ditch, cutting natural clay. This being so, the likelihood of observing any medieval remains was slight and after consultation monitoring was halted. [Au(abr)]

**LAND ADJACENT TO 1 AND 2 THE COMMON, LITTLEBURY*****Land Adjacent to 1 and 2 The Common, Littlebury, Essex: Archaeological Watching Brief***

Williams, V & Brazil, R Braintree : Essex County Council Field Archaeology Unit, 2008, 20pp

*Work undertaken by:* Essex County Council Field Archaeology Unit

The proposed development was situated within the centre of the historic village of Littlebury, which had Saxon origins. The development was thought to be situated in a presumptive Saxon enclosure and as lying in close proximity to a number of Late Iron Age and Roman cremation burials. No known archaeological investigations had taken place on the development area. The watching brief was maintained on two areas. The southern area, the location for car parking bays, was stripped of vegetation but not reduced below topsoil. In the north-eastern area, adjacent to the existing buildings, foundation trenches were excavated by mechanical excavator to 1.1m. No archaeological remains were identified in either area. It seemed unlikely that any significant archaeological remains existed within the boundaries of the proposed site, therefore no future work was anticipated. [Au(abr)]

Crawley, P E Norwich : NAU Archaeology, 2008, 34pp, colour pls, figs, tabs, refs

*Work undertaken by:* NAU Archaeology

A single trench evaluation was carried out on a plot of land at the rear of 1-3 Market Hill. The work was undertaken in the historic centre of the town, close to the present market. Five relatively large pits were uncovered within the trench which dated to the post-medieval period. All of the pits were probably chalk quarry pits, perhaps used during the 16th-18th centuries. Four small probable post holes were found on the site, although they appeared to form no coherent pattern and some of them truncated the fills of the quarry pits. The lack of any medieval pottery may have indicated that the entire area had been truncated prior to the post-medieval development of the area. Following the evaluation a watching brief was undertaken during groundwork for the installation of a tower crane and the levelling of an area prior to the construction of a warehouse. A possible ditch, a probable medieval quarry pit and two undated wells were uncovered, amongst other more recent quarry pits. The wells had been capped in the 20th century. A part of the wall of the Listed building (1-3 Market Hill) was also recorded during the watching brief. [Au(abr)]

*Work undertaken by:* Archaeological Solutions

A watching brief and a building recording on a listed barn and granary was undertaken at Parsonage farm. The extant agricultural buildings were well preserved and good examples of their type. The original barn dated to the 15th century, and may have represented the remnants of a medieval moated farmstead. The adjoining granary was added in the 17th century, some repair to the barn was evident. The watching brief recorded little of interest apart from a possible earlier floor surface of lime mortar beneath the concrete floor of the barn. External monitoring revealed limited information in areas of new drainage trenches. Substantial modern disturbance at surface level likely truncated any earlier remains. Au(adp)]

Rozwadowski, M & Unger, S Hertford : Archaeological Solutions, Report: 3147 2008, 14pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

A programme of archaeological monitoring and recording was undertaken during ground works at The Cottage. Research suggested that the village of Wormley originated in the Saxon period. In the medieval period, several manorial centres existed in the area. One of these, Beaumont manor, lay adjacent to the site. During the watching brief the only remains encountered were an early modern soakaway and other drainage features. These features were likely to be contemporary with the dwelling on the site, which was originally erected in the second half of the 19th century. No features predating the 19th century house were located. Although the site had the potential for archaeological remains associated with the manor house, no such remains were present in the area monitored for the new extension. [Au(abr)]

*Work undertaken by:* Archaeological Services & Consultancy Ltd.

An historic building recording and watching brief was undertaken at the Baptist Church. The church was built in 1886, comprising brick- built structure with steep slate roofs incorporating meeting rooms, an office and a kitchen to the rear. It had been renovated in recent years to create indoor WCs and a vestry within the existing floorspace, to replace the roofs, windows, flooring on the ground floor and to update the kitchen and office. The project, which included the rebuilding of the entrance area to provide new external access, double doors into the church and a revamped lobby area, required the excavation of a single trench within the building and another to the east of the main entrance. No archaeological features were revealed during the project, which suggested that the church was built on a site that had been peripheral to the main settlement. [Au(abr)]

Rouse, C Milton Keynes : Archaeological Services & Consultancy Ltd., Report: 901 2008, 32pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Services & Consultancy Ltd.

A strip and record excavation and watching brief was carried out at Brent Pelham Hall. Thirteen post holes were uncovered, cut into a rammed chalk surface. Four of the post holes ran perpendicular to the Hall, and were thought to have been associated with a garden feature, as they were very shallow. Five other larger square post holes were also identified. These followed a different alignment to those already mentioned, and may have formed part of a lean-to on the site. Also possibly associated with the post holes and chalk surface was a shallow rectilinear gully along the same alignment. However, 20th century mapping also suggested that this feature may have been related to a former pathway. Finds from the square post holes indicated a late medieval to early post-medieval date, but the chalk surface may have predated them. [Au(abr)]

Hudson, A Letchworth : Heritage Network, Report: 491 2008, 20pp, colour pls, figs, tabs, refs

*Work undertaken by:* Heritage Network

The study area lay within an Area of Archaeological Significance, which defined the medieval core of the village in the District Local Plan. The Parish Church of St. Mary the Virgin dated from the 15th century and lay approximately 70m to the west of the study area. The monitoring programme for the proposed extension revealed a section of a linear ditch running in an east-west direction parallel to and approximately 35m from the existing road frontage. This may have represented an earlier plot boundary. Pottery discovered in the ditch indicated that it was medieval and was dated to the 12th to 14th centuries. The nature of the recovered finds from the ditch and the presence of a low fired, possibly waster vessel suggested domestic or small scale industrial activity in the vicinity. The medieval ditch and its alignment to the existing road frontage added to the understanding of the structure and nature of the village during this period. No archaeological features earlier than medieval in date were observed. [Au(abr)]

***Balls Park, Area C , Hertford, Hertfordshire. An Archaeological "Strip, Map and Sample" Excavation.***

Pozorski, Z Hertford : Archaeological Solutions, Report: 3154 2008, 51pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

An archaeological "strip, map and sample" excavation was carried out. Balls Park comprised a 17th century mansion with modern buildings set within the formal 18th century park landscape. The excavation revealed numerous features dated to the Middle Iron Age, including a sub-rectangular enclosure with internal features and possible habitation layer. Ditches, pits and post holes were also found. These Iron Age features were likely to have represented agricultural activity associated with settlement. The excavation revealed large number of features associated with the formal gardens of the Balls Park estate. Most of these early modern features represented drains and greenhouses. [Au(abr)]

*Work undertaken by:* Archaeological Solutions

Archaeological monitoring and recording was undertaken at St. Andrew & St. Nicholas Church, Hertford. The monitoring was undertaken, during groundworks associated with drainage works. During the monitoring and recording two undisturbed burial vaults were discovered. Both of them were solid masonry vaults with covering stone slabs, likely of later 19th century or later date. They were subject to minimal recording, avoiding any further disturbance, and the soakaway location moved to preserve them in situ, before the area was backfilled and reinstated by the main contractor. No structural evidence of any previous church were revealed. Only burials of probably 19th century date were identified, and preserved in situ. No other articulated burials were disturbed by the drainage works. [Au(abr)]

Semmelmann, K Milton Keynes : Archaeological Services & Consultancy Ltd., Report: 995 2008, 33pp, colour pls, figs, refs

*Work undertaken by:* Archaeological Services & Consultancy Ltd.

Milburn Barn was a 4-bay aisle less structure, predominantly built of oak with an inline midrail internal bracing and edge halved and counterbladed scarf joints, which indicated a late-16th century date. The lack of superfluous mortices suggested that it may have been built specifically for this site. The barn was used as a village hall after 1918 and the post holes discovered during the ground reduction within the barn were likely associated with its use as a hall. The remains of a wall subdividing the western most bay may have been associated with an earlier use of the barn, but the lack of dating evidence meant that this remained conjectural. More recent alterations to the building included the installation of a mezzanine floor, and the re-roofing and rebuilding of the ground floor timbers at the western end. [Au(abr)]

Hillelson, D & Winter, M Letchworth : Heritage Network, Report: 468 2008, 42pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Heritage Network

A programme of historic building recording and archaeological monitoring was carried out. Buildings 32, 34, 35 and 38 formed a contemporary group of farm buildings which dated to the mid-19th century, during a period of wide scale farm modernisation Buildings 32 and 34 had been extensively remodelled but retained king-post roof trusses with parallel queen-struts in similar style. Buildings 35 and 38 also shared a similar roof structure. Building 35 was used as stables and was likely to have been constructed as a byre. Building 38 was also used as stables but appeared to have been open fronted originally. Monitoring of footings and drainage trenches followed the contractors' timetable but the foundations for units 1, 2, 4, 5, 6 and 7 and garage blocks 4, 5, 6 and 7 were excavated and concreted before inspection could take place. Evidence for a perched water table or natural spring was observed in plots 1, 2 and 3 and a number of modern field drains and some concrete foundations were encountered. No further evidence for the Roman activity, noted in the evaluation stage of the project, was encountered. [Au(abr)]

Wilson, N Milton Keynes : Archaeological Services & Consultancy Ltd., 2008, 34pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Services & Consultancy Ltd.

During July 2008, a watching brief was undertaken at Barkway Church during groundworks associated with building work in the north aisle of the church. A new drain run went through the footings of the west wall of the aisle crossing the churchyard, terminating in a newly installed septic tank. An electricity cable followed the same trench as the drain from the church, branching off to the south. It then followed a path round the south side of the church, before turning northwards to the boiler room, located on the south side of the church. Both trenches were cut through disturbed soil but were not deep enough to disturb any burials. Whilst excavating the pit for the septic tank, four adult burials were revealed. Though the excavated burials were unmarked, other headstones in the same row were dated to the third quarter of the 19th century. It was therefore likely that the disturbed burials were of a similar date. [Au(abr)]

*Work undertaken by:* Heritage Network

The evaluation revealed no archaeological features or deposits, but topsoil stripping for a temporary haul road at the southern end of the driving range, and the stripping of the southern car park, uncovered a number of pits and ditches which demonstrated activity on the site dating to the Bronze Age/Iron Age transition. It was possible that this activity was related in some way to a precursor of the adjacent Roman road. Although no features yielded material of a Roman date, unstratified Roman pottery was recovered at the eastern limit of the study area. It was possible that this was related to the adjacent road. Fletcher, T &amp; Wadson, W.S Bar Hill : Oxford Archaeology East, Report: 1055 2008, 31pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology East

An archaeological investigation was undertaken on land at the Cokenach Estate. The investigations consisted of an open area "strip, map and record" followed by excavation of the features present. The investigation identified an undated segmented ditch, on a roughly north to south alignment. Running roughly perpendicular to this was a series of closely spaced, regular parallel ditches. These ditches, for drainage, irrigation, lazy beds or planting trenches contained sherds of abraded Iron Age pottery in the excavated ditch fills. In other excavations, similar features had been interpreted as vineyards. [Au(abr)]

Winter, M Letchworth : Heritage Network, Report: 463 2008, 14pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Heritage Network

The site lay within an Area of Archaeological Significance, as designated in the district local plan. This encompassed the centre of Royston, which was recorded in 1163 as "Crux Roys". Kneesworth Street followed the line of the Roman road, Ermine Street. It crossed the Icknield Way, an important route between East Anglia and Wessex since at least the Neolithic period. A medieval hospital and cemetery were known to be located in the vicinity of the site. In the early 17th century a number of buildings along Kneesworth Street were used as court residences and offices associated with the royal hunting lodge, known as "King James' Palace". It was noted that the chalk natural on the site occurred at an unexpectedly low level. This may have reflected the natural downward slope of the land from the west to the east. The layer of build- up material on the site was likely to have been introduced to bring the site up to a construction level in keeping with the surroundings. The layer of redeposited chalk observed in the foundation trenches may have represented an earlier floor, indicating previous occupation of the site. The brick feature observed in the drainage trench appeared to be shown on the modern Ordnance Survey plan and was likely to be a brick garden feature. The monitoring of the groundwork associated with the development revealed no archaeological features, deposits, or artefacts predating the late post-medieval period. [Au(abr)]

Letch, A Braintree : Essex County Council Field Archaeology Unit, Report: 1788 2008, 41pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Essex County Council Field Archaeology Unit

A programme of building recording and archaeological monitoring was undertaken prior to and during alterations to Roe Green House, a Grade II Listed late-16th century farmhouse. The house was constructed as a primary-braced timber-framed three-celled structure with a cross wing added in the early 17th century forming a T-shape design and creating a new 'high end'. A kitchen range was added, most likely at the same time, while a cellar/dairy was built in the 18th century along with modifications to the cross wing. The survey recorded existing historic fabric and areas newly exposed in the course of refurbishment works. However, much of the framing remained covered under modern and historic wall treatments and the survey was therefore based upon the readily accessible areas. The original three-celled house replicated the earlier hall house form, but with a first floor, and was an established type. Although much of the early range survived, the later cross wing was severely altered in the late-18th century. Primary dating features include jowled posts, lambs tongue stops, primary bracing and diamond mullion windows. Based on what was seen, the studwork was quite stout but primitive and so was the joinery. The farm to the south was also undergoing redevelopment, this featured a Grade II listed aisled barn that was likely to be contemporary with the early phases of the house but superior in build. Service and foundation trenches in the garden found no features or finds of archaeological interest. [Au(adp)]

Williams, M Hertford : Archaeological Solutions, Report: 3168 2008, 29pp, colour pls figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

Building monitoring and recording was undertaken during building works to The Old House, 27 Leyton Road, Harpenden, a Grade II Listed Building. This programme was required as a condition of planning consent for the building works and involved supervision of the insertion of a new window into a panel of the timber frame. It followed an earlier programme of building recording carried out in June 2007. This project had established that the building was of 16th century date having two ranges of this age supplemented by numerous extensions of the 17th and 19th centuries and later. The programme of building monitoring and recording involved systematic recording by notes and photography of the historic fabric which was revealed as the panel was removed from the timber frame in the stair turret located at the north end of the building. This process noted some evidence indicating there was formerly a window in this position as reveals were found on the cill and the east jamb. There were also two crude redundant mortices in the cill which would have held window bars, and a refined ogee moulding on the inside of the east jamb. However this evidence was confused by the lack of any corresponding evidence on the west jamb and the likelihood that all the timbers concerned were assembled in their present state in the course of a single build. The conclusion was reached that it was likely that this part of the timber frame was constructed in part using re-used timbers from a former window in another building but that these were utilised in the present structure to form a window here too. **OLD GORHAMBURY, BACON'S HOUSE, ST. ALBANS**  
***Old Gorhambury, Bacon's House, St. Albans, Hertfordshire, Archaeological Investigation, Recording and Analysis***

Philips, M Hertford : Albion Archaeology, Report: 2008/82 2008, 33pp, colour pls, figs, tabs, refs

*Work undertaken by:* Albion Archaeology

Old Gorhambury [Bacon's House] was within the Verulam Estate, to the west of St. Albans. The estate was owned by the Earl of Verulam who lived in Gorhambury House c.500m north-east of the ruins. Construction on Old Gorhambury began in 1563 for Sir Nicholas Bacon, Lord Keeper of the Great Seal to Elizabeth I. The house was further extended by his son Sir Francis Bacon, who developed the wider estate and water gardens around a separate banqueting house. The house passed out of the Bacon family in the mid-17th century and was repaired in the 1670's by Sir Harbottle Grimston. By 1778 it had fallen into such disrepair that it was abandoned and replaced by the present Gorhambury House. Previous archaeological works had uncovered parts of the Bacon House and remains of a late medieval/early Tudor building beneath the Elizabethan house. The 2008 archaeological works comprised the recording of structural remains in some basement areas [Areas 1 and 3] and limited archaeological excavation for construction of a new drainage sump [Area 2] and to allow visual examination of foundations [Area 4]. The excavations did not uncover evidence of the earlier buildings on the site. In Area 1 the recording of masonry in a basement room adjoining the hall basement, showed a straight join between the two sections of masonry suggesting they were built in separate construction phases. Limited excavation in Area 2 within the basement showed undisturbed geology with no archaeological deposits present. In Area 3 recent backfill and debris were removed to enable the masonry to be recorded. This area had a relatively complex development sequence. It would originally have formed part of a larger basement area with a single floor level. Subsequently, an east-west cross-wall was inserted to form the southern side of Area 3. This was probably the basement level of a wall whose main function was the subdivision of the west range on the floors above. This cross-wall was aligned at ground floor level with a possible corridor to an adjacent stair tower. Later, Area 3 was deepened to form a small cellar area. A brick crosswall was inserted to form its northern boundary and the base of the east and south walls were lined with brick. Limited

excavation in Area 4 adjacent to the base of a stair tower uncovered construction deposits within the foundation cut of this structure. [Au(abr)]

Rozwadowski, M &amp; Henry, K Hertford : Archaeological Solutions, Report: 3171 2008, 22pp, figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

A watching brief and historic building recording was carried out during groundworks. The building originated as a two-bayed timber-framed house, probably in the late-17th/early 18th century. The building was subsequently extended at the rear and in the 18th/early 19th century, in keeping with other buildings in the area, the building was refaced in red brick. Several other alterations were made to the building in the late-19th/early 20th century. Local history records that in 1835 the house was converted to a beer-house called The Royal Exchange. Some of the modifications to the building may have been attributed to this period of use, as well as its reversion for use as a domestic dwelling which probably occurred in the earlier part of the 20th century. The watching brief revealed no archaeological features in the area of works except for modern features and a layer of demolition rubble which was probably a result of the phases of alteration that were made to the building from the 18th to the beginning of the 20th century. ***Breakspeare School, Gallows Hill, Abbots Langley, Hertfordshire. Archaeological Monitoring and Recording***

Newton, A Hertford : AS, Report: AS report No. 3151 2008, A4 ring bound document

*Work undertaken by:* AS

"In August 2008 Archaeological Solutions conducted a programme of archaeological monitoring and recording on the site of a new classroom extension at Breakspeare School, Gallows Hill Lane, Abbots Langley. The works were commissioned by Kevin Hinds Practice on behalf of the Governors of Breakspeare School. The site is located south-west of the medieval core of the village, on land that slopes to the west. Much of Abbots Langley is located within a Conservation Area, as designated in the Local Plan although the site lies beyond this area. No archaeological features were located during the programme of archaeological monitoring and recording and no archaeological finds were recovered. Most of the area where the new extension was situated was disturbed by modern features, drains and electrical cables." [OASIS]

2008, 26pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Services & Consultancy Ltd.

A watching brief was carried out at The Clarendon Arms during groundworks for the extension of the building and improvement of the car parking area. Two brick lined wells were observed within the area of the existing car park. A third well shaft was also observed within the public house building. The excavation of footing trenches for a new retaining wall to the north side of the car park, and the removal of the tarmac overburden from the existing car park revealed that the level was below the subsoil horizon and lay directly on natural strata. No archaeological features predating the 19th century were observed and the archaeological impact of the development was negligible. [Au(abr)]

#### **THE STOW LONGA TO TILBROOK ANGLIA WATER PIPELINE**

#### ***Roman and Medieval Settlement Remains Along the Stow Longa to Tilbrook Anglia Water Pipeline. Evaluation and Excavation Report***

Atkins, R Bar Hill : Oxford Archaeology East, Report: 990 2009, 90pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology East

Between November 2007 and October 2008, a series of evaluations and two small excavations along a proposed Anglian Water pipeline uncovered at least two phases of Middle to Late Saxon occupation to the west and north-west of All Saints Church. The features ran in all directions and were at odds with the later, well-planned town. This implies that the town was probably re-planned at some point in the 11th century. In the area between Tilbrook and Stow Longa, previously unknown settlement remains were recorded. These comprised a 2nd-3rd century AD settlement, overlain by a 6th-9th century AD Saxon settlement. The later settlement had the most dense features, consisting of the remains of 20 post holes, probably of several different phases, and at least four pits, two of which were dated to the Early/Middle and Middle Saxon period and identified as probable rubbish pits. An excavation at Church Lane, Stow Longa found six phases of occupation/activity. The earliest remains comprised a bank running parallel to Church Lane, cut by a possible Middle Saxon roadside ditch. The next phase was a clay floor, probably of 12th-13th century date, cut by a later east to west ditch. A probable post hole and post/pad structure of c.16th century date was also recorded, and became pasture in the late-1th century which it remained ever since. The Spaldwick Road, Stow Longa site found the southern boundaries of the former cobbled medieval road and its associated roadside ditch. The ground surface was raised in the 18th

century with a dumping layer associated with the adjacent 18th century brick boundary wall of the manorial farm. [Au(abr)]

Hickling, S Norwich : NAU Archaeology, Report: 1720 2008, 76pp, colour pls. figs, tabs, refs

*Work undertaken by:* NAU Archaeology

An archaeological evaluation, excavation and watching brief found one large Roman boundary ditch and three small Roman pits, one contained a significant assemblage of late Roman pottery, together with a large amount of Roman material residual in later features. Three small Saxo-Norman ditches and three small Saxo-Norman pits were found, together with an amount of Saxo-Norman material residual in later features. A number of probably 13th-century quarry pits were found in the south-western portion of the site. These were

probably for the extraction of chalk used in the construction of the adjacent parish church. During the Roman period the site was probably adjacent to a farmstead within an enclosed field system, elements of which had survived in the modern landscape. The farmstead was probably in the area of the parish church and was of high status with masonry walls, tiled roof and hypocaust. During the Saxo-Norman period this field system continued to be utilised, although again the excavated area appears to have been in a peripheral location. During the 13th century the site was quarried and the Roman field system was replaced by a new open field system, probably in order to support an expanding population. [Au(abr)]

Smith, L Hertford : Archaeological Solutions, Report: 3136 2008, 19pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

Monitoring in 2007 revealed 42 archaeological features comprising pits, post holes and two linear features. Two pits produced Beaker pottery and deliberate deposits of burnt material.

Several undated pits and post holes yielded similar deposits and thus may have been contemporary, however, the adjacent excavation identified an increase in activity during the Iron Age and it was likely that some of the features were associated with this period. Monitoring and recording in 2008 revealed three pits, a tree hollow and a possible hearth. [Au(abr)]

*Work undertaken by:* NAU Archaeology

A watching brief was conducted in four phases on land adjacent to the River Wensum at Burgh Common. A worn post-medieval coin, a copper-alloy disc of uncertain provenance, a 16th century button, a large flint flake and several post-medieval iron objects were recovered from the spoil of the bank in the first phase of the watching brief. In the second phase a medieval iron horseshoe, a post-medieval buckle and a lead fishing-net weight were recovered from the bank material. The third phase recovered several post-medieval metal items, including a lead net weight and a fragment of struck flint. The fourth phase of the watching brief produced a lead fishing weight and a fragment of lead waste. [Au(abr)]

**SHERINGHAM SHOAL OFFSHORE WIND FARM*****An Archaeological Fieldwalking and Metal-Detector Survey Along the Route of the Sheringham Shoal Offshore Wind Farm Onshore Grid Connection***

Westall, S & Smith, M Norwich : NAU Archaeology, Report: 1808a 2008, 113pp, figs, tabs, refs

*Work undertaken by:* NAU Archaeology

A fieldwalking and metal-detector survey along the route corridor of a new underground cable between Weybourne and Salle, and at a new substation site at Salle, was undertaken. Some 16km of the cable corridor were surveyed, comprising 53 fields. Artefacts of all periods were collected and revealed a number of previously unidentified sites of prehistoric, Roman, Anglo-Saxon and medieval date. Only five fields produced five or more worked flints and none of the concentrations identified during the survey were particularly dense. Roman artefacts recovered during this survey reflected previous knowledge of Roman sites in those areas. Anglo-Saxon finds were few, with a small number of pottery sherds collected and no metal finds at all. Medieval artefacts, predominantly pottery and ceramic building materials, but also

limited numbers of coins and other metal artefacts, were recovered along much of the cable route. Post-medieval finds, predominantly pottery, CBM and metal artefacts, were present along the entire length. Undated finds included metalworking debris recovered from two fields, as well as numerous undiagnostic metal artefacts. [Au(abr)]

### **FORMER BRITISH TELECOM EXCHANGE CAR PARK, PARADISE ROAD, KING'S LYNN**

***An Archaeological Excavation at the Former British Telecom Exchange Car Park, Paradise Road, King's Lynn, Norfolk***

Crawley, P Norwich : NAU Archaeology, Report: 1795 2008, 34pp, colour pls, figs, tabs, refs

*Work undertaken by:* NAU Archaeology

A small, targeted excavation was undertaken to examine and test the results of a Ground Penetrating Radar survey. Decisions about a future piling strategy on the site would be partly based on the results of the work. Three trenches were excavated and a fourth was left unexcavated, due to the presence of a large concrete fuel tank. The excavation confirmed the continuation of the north-south wall which had been observed during evaluation in 2005. This was probably part of a later addition to the Dominican Friary [Blackfriars] and was probably part of the building known to have stood on the site in the mid-19th century. A new section of masonry, probably of a similar phase and on the same alignment, was unearthed closer to Paradise road. [Au(abr)]

Lally, M & Nicholson, K Hertford : Archaeological Solutions, Report: 2922 2008, 205pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

Five main phases of activity were identified on the site, and recorded as Phase 1 (Middle Iron Age), Phase 2 [late-2nd to 3rd century AD], Phase 3 [early to mid 3rd century AD], Phase 4 [late 3rd to 4th century AD], and Phase 5 [18th century]. Of the six phases of excavation, three Excavation Phases revealed significant Roman [late-2nd to 4th century AD] archaeology. Very limited Middle Iron Age activity was attested along with features initially interpreted as Parliamentary enclosure ditches, which, upon further investigation, turned out to be 18th century private enclosure ditches. Undated pits and several undated tree hollows, were also found. Phase 1 was attested by just three features [a ditch and two pits], two of which produced evidence for structured or ritual activity. The Phase 2 site was set out around a linear droveway, aligned parallel to the site's contours, with a perpendicular branch leading away to the south-east. A ditched rectangular enclosure was established to the north-west of the droveway. This was later enlarged and subdivided, and an aisled timber building, with an adjoining right-angled post alignment, was constructed in this enclosed space. The layout of these first Roman features implied that the site was used at this time for the sorting and holding of livestock. The discovery of deposits of tap slag suggested that smelting activity occurred locally, if not on-site, at this time. The site then changed use and became a centre for pottery production in the early to mid 3rd century AD. In addition, small-scale deposits of

tap slag suggested that the site retained its association, though to a much lesser degree, with iron smelting activity. Activity related to the pottery industry was represented by four pottery kilns, a T-shaped drying oven, a workshop with a heated room for drying, and a second related building. The driveway was also modified at this time, with the erection of a line of posts which would have restricted access to [and visibility of] the production site, and the recutting of its ditches so as to modify access to its south-easterly branch. The kilns were thought to have been abandoned at about the same time. Archaeomagnetic dating of one of them set this date as c. AD 250. Phase 4 represented the demolition of the pottery production site, which seemed to have been deliberately levelled, in the late 3rd to 4th century. Further features of this date contained significant quantities of iron smelting slag, indicating intensified industrial activity probably focused to the south and/or south-west of the pottery production site, outside of the excavated area. *Work undertaken by:* Archaeological Project Services

A watching brief was undertaken during groundworks for the construction of a single detached dwelling and associated garage at Philip Rudd Court. The development was within a zone of known Late Saxon-medieval remains associated with pottery manufacture, including a large area excavated immediately south of the current site in 1986. A single pit was identified and, although undated, it was possible that this was a recent engineering test pit. Additionally, it was likely that the deposits on the site were truncated during the construction of the surrounding housing estate during the late-1980s and early 1990s. No evidence of the

medieval pottery industry was revealed. The only artefacts recovered were a few fragments of post-medieval pottery, found as unstratified material during machining. [Au(abr)]

*Work undertaken by:* NAU Archaeology

The excavation revealed that settlement on the site began in the 11th-13th centuries. Evidence for make-up deposits, refuse pits and a probable drainage channel was discovered. Pottery sherds representing three dripping or fish dishes of 14th-15th century date were recovered. This and the dominance of domestic fowl in the faunal assemblage raised the possibility of a commercial enterprise selling prepared, cooked birds and other meat and fish. Two horn cores from probable 15th century deposits also suggested that some small scale hornworking was being undertaken at this time. [Au(adp)]

Monitoring of the excavation of five boreholes and twenty test pits was carried out at the site, situated on reclaimed marsh land known to have been utilised since the early medieval period. The majority of reclamation had taken place by means of sea bank defences since 1796. Consequently, a consistent stratigraphy of fine alluvial silts and marine deposits was encountered along the 11km cable route, with no archaeological horizons noted and no artefacts recovered. A single modern roadside ditch was observed to the south of the route. [Au(adp)]

Phelps, A Norwich : NAU Archaeology, Report: 1952 2008, 11pp, colour pls, figs, tabs, refs

*Work undertaken by:* NAU Archaeology

A watching brief was conducted during drainage works to the rear of Felbrigg Great Hall. It recorded no archaeological remains of any note in either of the two excavated areas. A few

pieces of late-19th early 20th century pottery were recovered during excavations through the flowerbeds to the rear of the property, but these were not retained. Only a small area within the courtyard appeared to be undisturbed by services, but even this was probably of 18th-century or later date. The observed height of the natural deposits suggested that, prior to construction of Gardiners Cottage, the area to the south of the current garden was terraced. This would have removed any archaeological remains. Similarly, within the courtyard modern services were found to have disturbed the surrounding deposits. [Au]

*Work undertaken by:* NAU Archaeology

A number of archaeological watching briefs were conducted at Abbey Farm, Weybourne, during the conversion of a 17th century barn which incorporated the western gable end of a monastic building. The excavation of drainage trenches adjacent to the barn was monitored. Post-medieval pottery and ceramic building material were recovered and wall foundations associated with the monastic building were exposed. The removal of concrete pads from four grain silos to the north of the barn revealed the channel of a post-medieval or early modern field drain. The excavation of a plot of ground to the south of the barn revealed one small feature cut into natural marl. This feature contained charcoal, burnt animal bone and two fragments of ceramic building material. No other features or artefacts of archaeological significance were revealed. [Au(abr)]

***An Archaeological Watching Brief on an Outfall Pipe Extension at Weybourne, North Norfolk***

Westall, S      Norwich : NAU Archaeology, Report: 1330 2008, 11pp, colour pls, figs  
*Work undertaken by:* NAU Archaeology

A watching brief was carried out on the beach at Weybourne to monitor the extension of a land drain which enabled surface and stream water to flow into the sea. The beach car park at Weybourne was at a lower level than the beach itself, which comprised a shingle bank. Without the drain, which passed through this shingle bank, the land would be liable to

flooding. A number of archaeological sites had been recorded in this area, including a Mesolithic site just a few metres to the west along the beach. In the light of these discoveries it was necessary to ensure that excavations were subjected to archaeological monitoring. The excavation revealed nothing of archaeological interest, as the only deposits through which the pipe cut were the constantly changing deposits of sand and shingle that make up the beach. It was likely that these deposits directly overlay the natural chalk, which appeared at a higher level than the beach in the low cliffs which lay to the east of the car park. Although it was likely that the chalk was higher at this point because the land rose, the fact that it appeared in the cliff face demonstrated that it had been eroded away in the area of the beach. Any silt which may once have overlain the chalk and which may have been of potential archaeological interest would, therefore, also have been eroded away in the area of the beach. [Au(abr)]

**ZIPFEL'S COURT**

***An Archaeological Watching Brief at Zipfel's Court, Norwich***

Phelps, A Norwich : NAU Archaeology, Report: 1882 2008, 15pp, colour pls, figs, tabs, refs

*Work undertaken by:* NAU Archaeology

An archaeological watching brief was conducted on the excavation of foundation trenches at Zipfel's Court, Norwich. To the south of the site the monitoring works recorded a single post medieval pit filled with peat ash and overlain by a mortar floor. Two post-medieval walls lay in close proximity to this floor, at least one of which was aligned east- west. A thick layer of dumped garden soil covered both the walls and the floor and extended across almost the whole development area. To the north, two 19th century brick cellars cut through this deposit. Both were filled with modern demolition material. It would seem that the area to the east of Zipfel's Court remained as open ground at the rear of street facing tenements until the post-medieval period, when pressure for space led to the construction of significant ancillary buildings. This development continued into the later 19th century with the construction of a recently demolished warehouse. [Au(abr)]

Smith, L & Davies, C Hertford : Archaeological Solutions, Report: 3131 2008, 22pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

A watching brief was undertaken to the north and north east of Mangreen Hall Farm. A small quantity of archaeological features consisting of seven pits, two post holes and four ditches were identified. The ditches were possibly post-medieval, but dating evidence was sparse. The pits appeared to be of prehistoric date, probably Iron Age although Bronze Age and early Roman pottery was also recovered in small quantities from these features. [Au(abr)]

*Work undertaken by:* Alison Foster

A survey was carried out at the site, whose area of primary woodland may have dated back to the pre-Roman period. Medieval banks and ditches divided the wood, and protected the managed areas, Towards the south, these formed a small enclosure that appeared on the HER as a deer park. Documentary research and field survey determined that there was very little evidence that this was the case. [Au(abr)]

*Work undertaken by:* Archaeological Project Services

The site lay close to an important Roman site of palatial proportions, The watching brief uncovered a sequence of undated, Roman, medieval and post-medieval deposits. Undated features included a post hole, pits, ditches, subsoil and a buried soil. The ditches shared a common alignment with Roman examples, and may have been of that date. Roman remains included various walls and the remnants of a hypocaust, which may have been related to the palatial building known to the north of the site. Ditches, a well and three pits were also assigned to this phase. Medieval deposits were scarce but included the backfilling of the well. The site was used as a farmyard in the post-medieval period. Pickstone, A & Mortimer, R Bar Hill : Oxford Archaeology East, Report: 1082 2008, 134pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology East

An open-area excavation was carried out. Remains dating from the Neolithic to the Middle Bronze Age were recovered. Post-medieval claying or marl ditches were extended across the whole site. Neolithic occupation evidence was present in the form of flint scatters, small pits and finds within tree boles. A small number of Beaker pits were also present. Early Bronze Age remains were more extensive and included Collared Urn pits and a barrow with three associated cremation burials [four individuals] and an inhumation. Three further isolated cremation burials including one placed in a large urn were also discovered. An extensive Middle Bronze Age field system formed of ditches and banks, typical of this area, was also noted. This was set out using topographical influences as well as earlier monuments. A subsequent settlement occupied the higher ground at the site, and included a large and deep-ditched rectangular enclosure with a small internal subdivision. To the north a small enclosure contained at least two post hole structures. A large assemblage of Deverel-Rimbury pottery and fired clay objects were recovered from three location across the site. Two large and undated round houses with Iron Age characteristics appeared to be located within the Middle Bronze Age settlement area. There was no recorded evidence of Later Bronze Age activity on the site. [Au(abr)]

#### ***The Driftway, The Street, Capel St. Mary***

Meredith, J Ipswich : Suffolk County Council Archaeological Service, Report: 2009/206  
2009, 16pp, figs, tabs, refs

*Work undertaken by:* Suffolk County Council Archaeological Service

Archaeological monitoring was carried out during construction of new dwellings at The Driftway, Capel St. Mary. Up to eight separate ditches were identified, all on a north-north-west to south-south-east alignment. One of the ditches contained Roman pottery and all were parallel to other ditches identified during the evaluation and dated to the Roman period. Considerable quantities of fired clay or burnt daub were recovered from one of these features and small amounts of fired clay were found in some of the other ditches and from a large pit of at least 1m depth, possibly indicating settlement or industrial activity in the vicinity. A small number of more recent features were probably contemporary with the Victorian cottages that previously stood on this site. [Au(abr)]

2008, 2pp, figs*Work undertaken by:* Suffolk County Council Archaeological Service

Visits were made on the 9th and 19th of June 2008. The site was located c.45m to the east of St. Mary's church and churchyard and was thus likely to be within the medieval core of the village. The excavated footing trenches were dug to a depth of c.1.5m. It was noted that the top c.1m was dark humic loam topsoil mixed with building debris and occasional pieces of quite fresh looking timber. This deposit was likely to be of fairly recent origin [19th or 20th century]. Two brick built structures were revealed, comprising a domed brick soakaway to the west of the site and a mortar-lined brick cistern or well close to the existing building to the east. Both were probably associated with the school and were thus unlikely to be any older than the 19th century. Construction of the school in the 19th century and subsequent developments within the site area have probably resulted in high levels of disturbance and a thick accumulation of garden soils mixed with construction or demolition debris. It would be unlikely for any earlier archaeology to survive unless it was cut to a substantial depth. No other features or finds of archaeological interest were noted. [Au(abr)]

2008, 11pp, colour pls, figs*Work undertaken by:* Suffolk County Council Archaeological Service

Archaeological monitoring of excavation works was undertaken. The excavations external and internal to the tower revealed a bonded flint and septaria footing that stepped out on both sides of the wall, presumably to spread the weight of the tower. Removal of the existing patterned slate floor (Victorian) in the tower revealed a secondary floor surface of compacted mortar with flints and brick/tile fragments. The subsequent removal of this floor revealed fragments of disarticulated human bone, probably from burials in the churchyard prior to the construction of the tower in the 15th century. Five half bricks set in a circle close to the centre of the tower had no obvious function. The drainage trenches and soakaway external to the tower were not deep enough to disturb intact burials and further structural remains were not uncovered. [Au(abr)]

Brooks, R Ipswich : Suffolk County Council Archaeological Service, Report: 2008/221  
2008, 40pp, colour pls figs, tabs, refs

*Work undertaken by:* Suffolk County Council Archaeological Service

An archaeological excavation in advance of the construction of a new car washing unit at RAF Mildenhall identified sequences of ditches, pits, other features and a possible occupation soil layer. These may have been later prehistoric, Roman and post-medieval features, as well as three undated cuts. Finds from these periods were also recovered. Some of the features had been truncated by modern disturbance and bioturbation, although generally the archaeological levels survived well. [Au]

Archaeological Service, 2008, 4pp, figs, tabs, refs

*Work undertaken by:* Suffolk County Council Archaeological Service

Archaeological monitoring was carried out during the construction of two small buildings, one at either end of the runway at RAF Lakenheath. The southern building lay close to an area of known Roman settlement, but whilst the soil profile was intact, no evidence of archaeological activity was found. Monitoring of the second building demonstrated that the area was probably truncated by modern disturbance. [Au]

Caruth, J Ipswich : Suffolk County Council Archaeological Service, Report: 2009/125  
2008, 59pp, figs, tabs, refs

*Work undertaken by:* Suffolk County Council Archaeological Service

An excavation was carried out in advance of the realignment of the junction of Norwich and Plymouth Roads and Exeter Crescent at RAF Lakenheath, which lay close to an area from where 267 Anglo-Saxon burials were found in 1997. The work was carried out in stages in order to minimise disruption to the traffic flow between April 2007 and August 2008. Three Anglo-Saxon burials were identified during the final stages of the work linking the existing Norwich Road into the new road, two of which were new discoveries and one of which was the second half of a burial found during pipe laying works in 2002. An Iron Age pit was also found in this area. The rest of the works revealed a series of undated ditches, which probably formed part of the wider Roman and Saxon field systems identified on previous sites. Examination of the soil profiles also identified the limits of a north-south aligned linear hollow in this area. [Au(abr)]

Caruth, J Ipswich : Suffolk County Council Archaeological Service, Report: 2008/012  
2008, 8pp, figs, refs

*Work undertaken by:* Suffolk County Council Archaeological Service

The presence of a relatively clean, well-worked topsoil, with a clear interface with the natural chalk suggested truncation of the chalk surface, indicating that this may have been a former ploughsoil and that the site was a part of the adjacent field before the construction of the standing building. Three features were identified during this work of which two were possibly archaeological. A pit had a fill distinct from the overlying topsoil, giving an indication that this predated the end of the agricultural activity, but no other dating evidence was recovered. Another possible pit was apparently filled with Topsoil/ploughsoil, which may have indicated that this was formed as a result of agricultural activity. A third Pit and its deposit probably post-dated the agricultural phase and may have related to the construction of the standing building in the 20th century. [Au]

***Erect Chain Link Fence Around MOD boundary, 11 End, RAF Mildenhall, MNL 606. A Report on the Archaeological Monitoring***

Beverton, A Ipswich : Suffolk County Council Archaeological Service, Report: 2008/194  
2008, 15pp, figs, tabs, refs

*Work undertaken by:* Suffolk County Council Archaeological Service

Three archaeological features were found across this site, all of which were linear features. One of these was the only ditch and possibly marked a boundary that ran across the east end of the site, the fill of this, produced a rim sherd of Roman pottery dating to the 2nd century and some animal bone, and therefore this was unlikely to be earlier than Roman in date. The other two features were smaller gullies that ran north-south and north-east-south-west respectively. These were very similar in morphology with animal bone being recovered from them. The archaeological integrity of one feature was questionable due to its location under a modern layer and close proximity to a previous building. Neither of these features contained datable material. The evidence recovered during this monitoring was not suggestive of settlement occupation, but may demonstrate a low level of Roman occupation on the site. The ditches and gullies and occasional finds may be indicative of field systems representing agricultural rather than domestic activity. This was in contrast to the known intense Roman settlement found on adjacent fields. The change in the character of this occupation could be due to a number of factors, but may have reflected the low-lying marginal nature of this ground, or alternatively, may simply have been the open agricultural land used to support the Roman population of the surrounding area. [Au(abr)]

**UCS ORWELL QUAY, IPSWICH (I)*****Post-excavation Assessment Report. UCS Orwell Quay, Ipswich, Suffolk***

Heard, K Ipswich : Suffolk County Council Archaeological Service, Report: 2009/087  
2008, 110pp, colour pls, figs, tabs, refs

*Work undertaken by:* Suffolk County Council Archaeological Service

The site was located within the former floodplain of the River Orwell, to the east of the Ipswich Wet Dock. Natural sands and gravels were recorded in the eastern half of the site, sloping down to the west. The natural strata was overlain by a "worked soil" horizon derived from local brown sands. It contained small amounts of medieval pottery. A large, cellared building, possibly a merchant's warehouse, was built in the eastern part of the site in the 17th or early 18th century. It was constructed of brick and stone, the latter including re-used architectural mouldings of 14th-century date. In the 18th century the building was sub-divided and converted to domestic use. Various alterations were recorded, including the laying of new floors and the installation of fireplaces, a new entrance and a sub-floor drainage system. The building was thought to be part of White's Cottages, recorded as early as 1746 and perhaps shown on Ogilby's map of 1674. The western [riverward] part of the site remained within the inter-tidal zone of the river until the early 19th century, when the Commissioners of the River Orwell reclaimed the land to create a new ballast wharf. Extensive dumped deposits relating to this period of activity were recorded. In the 1840s the site was acquired by Robert Ransome for an extension to his nearby ironworks. Extensive remains of the Orwell Works survived, including foundations, cellars, drains, flues and brick-built channels. [Au(abr)]

Suffolk County Council Archaeological Service Ipswich : Suffolk County Council Archaeological Service, 2008, 2pp, figs

*Work undertaken by:* Suffolk County Council Archaeological Service

An initial visit was made during topsoil removal. This seemed to indicate that the northern part of the site had been made up with a dark brown silty loam topsoil containing 19th century/modern ceramic building material. Much of the excavation work was carried out by a machine with a large toothless bucket, moving wet pond silts. As such, the ground works were messy and difficult to monitor as it was not possible to strip many areas cleanly. No archaeological or palaeoenvironmental deposits were encountered; the deepest deposits revealed comprised sands and gravels. It was possible that the study area has been quarried in the past; certainly quarrying was known to take place in the vicinity. [Au(adp)]

Gill, D Ipswich : Suffolk County Council Archaeological Service, Report: 2008/220 2008,  
15pp, colour pls, figs, refs

*Work undertaken by:* Suffolk County Council Archaeological Service

The remains of part of the original flint built west wall of the Guildhall and an early brick-build repair contemporary with the addition of the porch in the 15th century were recorded, during monitoring of work to replace the existing storm drains. Iron down-pipes, part of an early post-medieval drainage system, were also recorded, sealed behind the existing façade which was added during the late-18th century. A medieval ground surface and well preserved archaeological levels were identified at c. 300mm below the existing pavement level from which late medieval pottery was recovered. Previous work undertaken in 2003 at the back of the building recorded the original flint-facing on the rear wall, and examined the depth and character of the 13th century footings. These were up to 600mm deep and filled with layered gravel and rammed chalk. The footings cut a dark silt which produced late Saxon pottery. [Au(abr)]

**THE OLD VICARAGE, CLARE*****The Old Vicarage, Clare. A Report on the Archaeological Monitoring***

Everett, L Ipswich : Suffolk County Council Archaeological Service, Report: 2008/033  
2008, 11pp, figs, tabs

*Work undertaken by:* Suffolk County Council Archaeological Service

Monitoring of groundworks at The Old Vicarage, Clare, was required to investigate the archaeological potential of the site. Three incised features were recorded in the exposed sections of the footing trenches, each sealed by a layer of topsoil. A large east-west aligned ditch from which a small sherd of possible Iron Age pottery was recovered was cut by a medieval pit and a large undated pit. The latter pit may have represented an extraction pit whilst the ditch could be associated with the Clare Camp earthwork immediately north and west of the site. Whilst the evidence was only slight, the pottery from the ditch raised the possibility that the Clare Camp earthwork could have Iron Age origins. [Au(abr)]

***Fornham Hall, Fornham St. Genvieve, FSG 021. Report on the Archaeological Monitoring***

Tester, A Ipswich : Suffolk County Council Archaeological Service, Report: 2008/223  
2009, 11pp, colour pls, figs, tabs, refs

*Work undertaken by:* Suffolk County Council Archaeological Service

The monitoring of service trenches exposed evidence for the village of Fornham St. Genvieve. Surfaces of chalk, clay and soil layers with medieval pottery, likely to be the remains of buildings were found below a destruction layer from the north end of Fornham Hall. These surfaces survived between brick foundations for the hall. An undated ditch on a separate alignment to the hall was probably from the redundant village and a gravel surface may have been evidence of a road through Fornham which was later diverted when the hall was built. The reopening of an iron sewage pipe unearthed human skeletal remains within the redundant churchyard. These were reburied. [Au(abr)]

Gill, D Ipswich : Suffolk County Council Archaeological Service, Report: 2005/56 2005, 2pp, figs

*Work undertaken by:* Suffolk County Council Archaeological Service

A single visit on 21st March 2005 was made to monitor groundworks of a proposed extension at Easter Green. The county's Sites and Monuments Record lists a succession of medieval pottery concentrations (13th-14th century) alongside the road out of Ixworth and two of them were immediately either side of the development area. The site was situated on the parish boundary and there was also evidence of earlier activity in the vicinity including Roman pottery sherds. At the time of the visit all of the footing trenches were open and available for inspection. The only feature was a relatively recent pit containing brick and other household debris, which dated to the 19th/20th century. In addition to this the contractors reported finding a bottle dump whilst excavating for the swimming pool (to which the monitoring condition did not apply) in the garden to the west of the house. Plouviez, J Ipswich : Suffolk County Council Archaeological Service, 2008, 7pp, figs

*Work undertaken by:* Suffolk County Council Archaeological Service

A large group of gold staters was discovered by a metal detector user during March 2008 with the base and body sherds of a wheel-thrown pottery. Permissions and funding were sought to examine the immediate context of the find by excavation. The excavation area was positioned to include the main hoard findspot and an area to the east of this. A further area was stripped at the finder's expense to check ploughsoil on the south and west sides after an extensive illicit attack. Investigation of the ploughsoil by metal detecting produced no finds immediately below the turf. Coins were found throughout a 5m square area, particularly in the northern corner and across to the southern corner. After removal of a further spit of 100 -150mm a similarly broad distribution of coins was recovered; a total of 41 Iron Age staters were found in this layer. Two Roman coins were also found, one in the top layer and one in the lower layer of ploughsoil. No coins were found in the extension of the trench to the north-east. Only one was found in a machine strip of the area to the south-east. No coins were found below the base of the ploughsoil in any part of the excavated area. Two other metal objects were found, a lead steelyard weight, possibly of Roman date and a square-section lead strip with minimal corrosion and probably modern. Other finds from the ploughsoil included pottery sherds of Late Iron Age and Roman date, including 2nd century or later forms, fired clay, burnt flints and one fragment of Roman tile. There was a notable absence of later medieval and post-medieval finds. Two ditches and a small pit or post hole were also identified and sampled. There was insufficient evidence to characterise the site beyond stating that there was activity contemporary with and later than the hoard. It remained to be discovered whether this was domestic, presumably high status given the contemporary value of the coins, or whether it had a more ritual character. [Au(abr)]

2008, 4pp, colour pls, figs*Work undertaken by:* Suffolk County Council Archaeological Service

A watching brief was undertaken at Great Glemham, All Saints Church, during reordering works including the insertion of a new tea point and toilet cubicle in to the base of the tower and the external excavation of service trenches and the insertion of a trench arch drain. The excavation within the tower revealed a large fragment from a stone grave slab or paving slab set vertically in the ground in line with the north door splay of the tower's west doorway. To the north of the slab, against the tower north wall, the fill was unconsolidated and included fragments of coal. While the function of this feature was not positively ascertained it was thought to be relatively recent in date and in some way associated with the Victorian heating system. The drainage and service trenches external to the tower were not deep enough to disturb intact burials and further structural remains were not uncovered. [Au(abr)]

Heard, K Ipswich : Suffolk County Council Archaeological Service, Report: 2008/234 2008, 58pp, colour pls, figs, tabs, refs  
*Work undertaken by:* Suffolk County Council Archaeological Service  
The archaeological evidence comprised a number of features cutting the natural stratum and sealed by a 'worked soil' horizon. Residual sherds of late Saxon and early medieval pottery suggested activity on or close to the site during those periods. However, the earliest occupation of the site for which there was direct evidence dated to the 12th-14th centuries when a small timber building (represented by a rectangular arrangement of five large postholes) was constructed. An adjacent row of three smaller post holes may have been part of the same structure. Apart from a possible external hearth or fire pit and some shallow pits and post holes that may have been contemporary with the medieval building, there was no evidence for activity related to the use of building; internal flooring and contemporary external surfaces had not survived. The building was located immediately north of a ditch that silted up in the 13th-14th centuries. Another ditch to the north of the building was undated but might have been contemporary with it. The pottery assemblage associated with the building and adjacent ditch was small but suggested a low-status site typical of a rural community. Later occupation of the site was represented by a large pit containing 16th century pottery, building material and animal bones. Cartographic evidence suggested that the farmhouse was built in the 1880s on the site of an earlier building that had existed since at least the late-18th century. The discovery of a pit containing domestic refuse of the Tudor period suggested that the origins of Street Farm were considerably earlier. An L-shaped ditch (backfilled in the 16th-18th centuries) was likely to have been part of a rectangular enclosure. Despite its relatively late date there was no cartographic evidence for a boundary in this location on maps of the 18th-19th centuries. [Au(abr)]

Boulter, S Ipswich : Suffolk County Council Archaeological Service, Report: 2007/203  
 2008, 25pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Suffolk County Council Archaeological Service

Historical, documentary and SMR evidence suggested that within the footprint for a new building at Clays Printing Works Bungay, there was a high potential for Roman and medieval archaeological deposits to be present. These could have included a medieval defensive ditch on the north side of the town. However, the results of a trenching evaluation and subsequent monitoring of groundworks failed to identify any archaeological features. It became clear that major earthmoving and landscaping associated with the 19th century railway and its decommissioning during the 1970s, when a large borrow pit was excavated on the site, would have destroyed all but the deepest archaeological features. *Work undertaken by:* Suffolk County Council Archaeological Service

The recording of the north wall of the nave revealed three main phases of construction with the majority of the fabric characterised by well defined flint courses and dating to the 12th century. A semicircular arched doorway was probably a contemporary feature but had at the

very least been reset in its original location. Three perpendicular windows were inserted during the 15th or 16th century in conjunction with the raising of the nave walls by c. 0.5 metres. A third strip of wall fabric at the top of the wall was thought to be associated with the construction of a new roof during the 19th century. Four burials were disturbed during the subsequent groundworks, all infants or children. It was not uncommon for the graves of infants and children to be grouped together close to the church in this way. [Au(abr)]

Building recording and archaeological monitoring was carried out at the site, in advance of conversion. One small post hole was recorded during the watching brief and was assigned to the later post- medieval period. This may have been associated with construction of outbuildings in the early 19th century. [Au(adp)]

*Work undertaken by:* Suffolk County Council Archaeological Service

Monitoring of groundwork on land at Little Priory, Church Street, Wangford with Henham, was carried out as a condition of the planning consent. Despite the site's location immediately adjacent to Wangford Church and within the defined site of Wangford Priory, no medieval features were revealed. A number of disarticulated human bones were recovered from modern pits, the likely remains of disturbed medieval or post-medieval burials from an unknown location. [Au]

Good, C Ipswich : Suffolk County Council Archaeological Service, Report: 2008/232  
2008, 8pp, figs, refs

*Work undertaken by:* Suffolk County Council Archaeological Service

An evaluation was undertaken at land at Ellough Road, in order to characterise the nature of any surviving archaeological deposits. The archaeological condition was enforced without a Brief and Specification due to a planning error, meaning only a small sample of the site was available for inspection. The site lay some 1km south east of the medieval town of Beccles (BCC 018) and close to a number of find spots including Roman and Bronze Age pottery (BCC 008) recorded in the county Historic Environment Record. Four trenches were excavated over the site, but all were dug through layers of modern and extensive contamination and disturbance. No archaeological evidence was revealed, and it was likely much of the site was disturbed by this contamination. Subsequent monitoring concluded the contamination was widespread, and no archaeology was revealed. [Au(abr)]

Pocock, M Chelmsford : Essex County Council, Report: 19 2008, 1p

*Work undertaken by:* Essex County Council Field Archaeology Unit

The excavation encountered remains including brick walls, brick wells, services, pits ditches and gulleys associated with properties that once existed along the street front of the medieval, post-medieval and modern periods. Overall modern features dominated the site. Along the old high street frontage modern walls and services of 1970s buildings were discovered, the eastern half of the site contained services, wells ditches and pits and a post hole, and other unexcavated but obviously modern features. The results were of interest as they broadly supported the assertion that the high street was a focus of settlement in the medieval period undergoing an expansion in the late-17th-18th century. Hollowy, B Colchester : Colchester Archaeological Trust, Report: 492 2008, 4pp, figs, tabs, refs

*Work undertaken by:* Colchester Archaeological Trust

The monitoring work involved the stripping of an area for the foundation base of a proposed stable block and an access and service road. Natural geological levels were not encountered across the majority of the site, although glacial sands and gravels were noted as patchy deposits across the stripped area. No archaeological features were observed in the stripping of the area or of the access and service road. Plough scars were apparent across the site, and, as a result of some discussion with the landowner, it became apparent that the field in which the site is located had been ploughed in the recent past. No significant finds were discovered, although modern pottery and modern agricultural ironwork was recovered from the topsoil. [Au(abr)]

*Work undertaken by:* AOC Archaeology Group

A watching brief was carried out, and covered the machine excavation of strip foundation trenches, service runs and ground reduction. Three features were identified truncating the brickearth, consisting of two pits and a linear ditch. The ditch did not produce any dateable finds, and the dating evidence recovered from the pits was ambiguous, although it did indicate that a low intensity of activity was taking place on site during the late Bronze Age to early Iron Age and the Roman periods. Sealing the features and across the remainder of the site was a layer of subsoil followed by a layer of either topsoil or made ground. [Au(abr)]

Pozorski, Z Hertford : Archaeological Solutions, Report: 3199 2008, 35pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

A programme of archaeological monitoring and recording at Marks Warren Quarry, Whalebone Lane North, Romford was undertaken. Previous archaeological investigation in the area had identified prehistoric activity, including an Iron Age ditched enclosure, a Roman enclosure, the flint foundations of a Roman building and a Late Iron Age/Roman field system, late Bronze Age/early Iron Age pits, post holes and a Bronze Age barrow, Late Iron Age cremations and pits, Saxon cremations and a ditch, post-medieval drainage ditches, post holes and 20th century activity. The 2008 archaeological investigation identified four phases of activity. Phase 1 comprised Late Bronze Age/Early Iron Age ditches, possibly part of an enclosure, pits and post holes. Phase 2 was Roman and comprised a cremation, pits and possibly a ditch which formed part of an enclosure. Phase 3 evidence consisted of a single medieval post hole. Post-medieval and modern activity was assigned to Phase 4 and included ditches, pit, field drains and a plough damage layer. Several undated features were identified across the site. [Au(abr)]

Humphrey, R Brockley : Pre-Construct Archaeology Ltd., Report: ECO08 2008, 7pp, figs

*Work undertaken by:* Pre-Construct Archaeology Ltd.

Excavations at Embassy Court revealed a sequence of archaeological remains related to settlement on the Roman road of Watling Street. To the west of the site, an arrangement of

post holes and beam slots was interpreted as representing the remains of a roadside building, the full size of which was not revealed as it extended beyond the western limits of the trench. In the east of the trench, up to six cremation burials were observed cut into the natural stratigraphy. It was suggested that additional burials may have been found beyond the eastern extent of the trench. Separating the proposed structure in the west and the cremations in the east was a large, north to south ditch cut. An east to west ditch was also noted, but was not thought to be a roadside ditch. Guarino, P Twickenham : AOC Archaeology Group, 2008, 14pp, figs, tabs, refs  
*Work undertaken by:* AOC Archaeology Group

A watching brief was undertaken in 2008 on an area to the west of the new Wembley Stadium, London. The project was undertaken in association with a programme of geo-technical investigations. The investigations involved the observation and recording of five window samples and two machine excavated geo-technical test pits. All five window samples presented a sequence comprising a layer of rubble-rich made ground overlying redeposited London Clay and naturally deposited London Clay. The two test pits had made ground; only in one of them naturally deposited London Clay was uncovered. It was thought that horizontal truncation took place prior to the deposition of the made ground, removing any previously existing subsoil deposits. The horizontal truncation of deposits was thought to have occurred during the development of the site in the early 20th century. The disturbed nature of all the deposits indicated that the potential for archaeological horizons to survive in these areas was very poor. No significant archaeological remains or finds were identified during the watching brief. [Au(abr)]

Buu, R & Bystron, A London : Museum of London Archaeology Service, 2008, 20pp, figs, refs

*Work undertaken by:* Museum of London Archaeology Service

Archaeological monitoring was carried out on the excavation of nine construction pits supporting the basement wall retaining props. Only one archaeological deposit was recorded in section in one trench. This was interpreted as late post-medieval cess pit fill. Natural terrace gravels were observed at 18.8m OD, truncated by the basement slab of Chichester House. The results indicated a very low [negligible] potential for survival of pre-modern remains, wholly removed by modern development. [Au(abr)]

Cummings, R London : Compass Archaeology, 2008, 22pp, colour pls, figs, tabs, refs

*Work undertaken by:* Compass Archaeology

A watching brief was undertaken during groundwork at the site. Eight test-pits were observed inside the existing basement and in the adjacent courtyard area. A part collapsed brick-built arched drain was observed in one of the external test pits. The drain was considered to be of early 19th century date and was presumably related to the buildings that stood on the site

until the existing apartments were constructed in 1871. The drain was partly truncated by the associated wall foundations. No further archaeological finds or features were observed, the other external pit revealing only recent made ground. Elsewhere natural deposits were truncated by 19th century ground reduction for the present basement, and it was clear that any potential archaeological horizon had been destroyed by these works. *Work undertaken by:* Museum of London Archaeology Service

A watching brief revealed late post-medieval archaeological deposits and masonry in sections of the three trenches. It appeared that the construction of the PLA building in the early 20th century and the previous buildings on the site had a significant impact on archaeological deposits. Nevertheless, pockets of archaeological material could have survived beneath the existing and earlier basements. Further evaluation at a later stage may have helped to confirm the extent and significance of deposits and would inform the archaeological mitigation strategy. [Au(abr)]

**2 COPTHALL AVENUE, CITY OF LONDON*****An Assessment of an Archaeological Excavation and Watching Brief at 2 Cophall Avenue, City of London, London EC2***

Humphrey, R Brockley : Pre-Construct Archaeology Ltd., 2009, 153pp, colour pls, figs, tabs, refs

*Work undertaken by:* Pre-Construct Archaeology Ltd.

The investigation comprised a limited field evaluation followed by a watching brief of concrete slab removal, power-auguring of proposed pile locations and excavation of a lift shaft pit area to naturally occurring geological deposits. The significance of an east-east running palaeochannel observed in the area could not be understated [sic]. It gave a unique insight into the environmental conditions that existed in this part of London prior to the settlement of the area by prehistoric and Roman communities. The backfilling of this course appeared to have begun before human occupation began in the locality. Overlaying this was a layer of silt and domestic waste, with timber posts driven through. These were interpreted as structural in nature, or perhaps the revetment of a drainage ditch. Another arrangement of timbers may have suggested further structural remains. Several dumped layers of Roman domestic debris completed the sequence. [Au(adp)]

*Work undertaken by:* Enfield Archaeological Society

The investigation found a later plough disturbed soil incorporating much Roman pottery, and a single pit below a possible medieval to 19th century cultivation soil, with major modern intrusions. The area appeared to have been used as a rubbish dump in the 2nd, and to a lesser extent, 3rd and 4th centuries. [Au(adp)]

Pozorski, Z &amp; Newton, A S Hertford : Archaeological Solutions, Report: 3246 2008, 21pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

A programme of archaeological monitoring and recording was conducted during conversion works to barn and oast buildings and works to the farmhouse. The farmhouse was Grade II Listed, dating to the early 17th century, with later alterations. The barn is also Grade II Listed, probable later 17th century with various additions. The monitoring revealed no significant archaeological features or finds associated with earlier occupation of the farmstead. The recording revealed that the dwarf wall of the barn structure had undergone repeated phases of repair and repointing. [Au(abr)]

Cummings, R London : Compass Archaeology, 2008, 19pp, colour pls, figs, tabs, refs

*Work undertaken by:* Compass Archaeology

A watching brief was undertaken during groundworks on King George's Field. No archaeological finds or features were observed during the course of the watching brief. Exposed deposits consisted of topsoil containing occasional 19th-20th century pottery, overlying truncated subsoil and natural deposits. Various modern intrusions were observed, including services and an unidentified section of recent brickwork which probably represented a foundation for a small, insignificant structure of war-time or later date. #### ***The Teardrop Site, Warren Lane, Woolwich. Archaeological Summary Statement***

Oxford Archaeology Oxford : Oxford Archaeology, 2008, 17pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology

The report presented a summary of archaeological work carried out at the site in advance of an anticipated future development. A large Iron Age oppidum ditch was found in the north of the site, together with two smaller associated ditches in the north-west of the site. The main ditch was dated by optically stimulated luminescence [OSL] to c.500-100 BC, and showed a gradual silting up that meant that it would still have been visible in the medieval period. Two 14th century London Ware kilns were excavated in the south-east of the site, one of which was exceptionally well preserved and displayed progressive development from an original double flue layout to a single flue design. Large quantities of pottery wasters were also recorded. In the northern part of the site, the oppidum ditch had been truncated by medieval and post-medieval building along the frontage of Warren Lane. In the area behind the houses on Warren Lane, two Tudor period kilns and an early medieval kiln were excavated together with numerous associated pits and post holes. Elsewhere there was little or no survival of the 16th century Rope Yard buildings remaining, although occasional remnants of 18th-19th century buildings were found. These had been largely truncated by the later 20th century redevelopment of the site. [Au(adp)]

*Work undertaken by:* Pre-Construct Archaeology Ltd.

The watching brief revealed the presence of a ditch, interpreted as the northern boundary ditch surrounding the medieval priory of St. John the Baptist. Overlaying this ditch was a series of layers, possibly relating to the agricultural use of the land, A robber cut, dated by pottery to the 17th/18th century, was also exposed. This was overlain by a series of 19th century dump layers and walls, in turn overlain by 20th century concrete. [Au(adp)]

Humphrey, R Brockley : Pre-Construct Archaeology Ltd., 2008, 18pp, colour pls, figs, tabs, refs

*Work undertaken by:* Pre-Construct Archaeology Ltd.

Archaeological work comprised the monitoring of the exposure of foundations of the existing buildings on the site, in order to ascertain whether they had been built within construction cuts made through natural stratigraphy or made ground. Evidence of a ground-raising episode was evident in all trenches excavated. However, not all residential footings impacted on natural stratigraphy. Log data from window samples suggested a maximum depth of 1m of made ground across the development area. This suggested that non-piled foundations may have had a minimal impact on any surviving archaeological remains in these areas. [Au(adp)]

*Work undertaken by:* Archaeological Solutions

Two phases of archaeological excavation were carried out on land at Spring Farm. Phase I was undertaken during 2007 and Phase II during 2008. Dateable material fell into five chronological phases. Late Bronze Age-Early Iron Age activity was attested by one pit, one post hole and two cremations. Medieval activity was concentrated at the centre of the site and included an enclosure and several ditches. Post-medieval activity was present in the form of boundary ditches and two pits. The majority of dateable features on the site were modern. These included thirteen ditches, two pits and a surface layer. [Au(abr)]

Ennis, T Braintree : Essex County Council Field Archaeology Unit, Report: 1802 2008, 21pp, colour pls, figs, tabs, refs

*Work undertaken by:* Essex County Council Field Archaeology Unit

A watching brief was undertaken on groundwork for the construction of apartments at 59 Main Road, Romford between August 2007 and May 2008. Prior to the commencement of groundwork an existing building "Highlands" on the site had been demolished. Three small pits and a short length of ditch were identified and recorded. However, no dating evidence was recovered. One of the pits was of probable recent date whilst the other features may have been post-medieval or earlier. The ditch and one of the pits clearly predated the construction of the former building in the first half of the 20th century. No evidence for the London to Colchester Roman road or any contemporary landscape or settlement was found. This supported negative evidence from previous archaeological investigations at 63, 63a and 69 Main Road and suggested that there was no Roman settlement on the north side of Main Road between Gidea was still unknown. It may have lay directly beneath the present day road or perhaps slightly to its south, given that there was a noticeable northwards kink in the route of Main Road in the immediate vicinity of the site. Moller, J Twickenham : AOC Archaeology Group, Report: 30340 2008, 23pp, figs,  
tabs, refs

*Work undertaken by:* AOC Archaeology Group

Four geotechnical pits were excavated to determine the character of foundations associated with a toilet block in advance of construction of a new facility. These had the potential to be part of the historic dairy, however, on examination, most of the foundations were seen to be based on concrete footings, indicating a late-19th or 20th century date. One wall, recorded in Test Pit 3, seemed to be associated with one of the 19th century buildings demolished in 1959 for the construction of a café and a playground. [Au]

*Work undertaken by:* AOC Archaeology Group

The archaeological investigation revealed at least five phases of occupation of the area. All deposits and features encountered were dated to the post-medieval period, mainly between the 18th and 19th century. This included at least four phases of construction that sealed a series of 17th century cut features, probably associated with gravel quarrying activities. The material culture represented by the finds showed evidence of domestic activities and possibly some small scale business activities that could be associated with the presence of a chemist shop in the area. Brogan, G &amp; Greene, R Hertford : Archaeological Solutions, Report: 3024 2008, 20pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

An archaeological trial trench was excavated within the courtyard associated with the existing late-19th century and early 20th century buildings that lay immediately west of the Channelsea River. The evaluation trench encountered a substantial deposit of gritty sand under a very compact layer of gravel, possibly a metalled surface. This was cut by the construction trench for the east brick wall of an 18th century structure. The discovery of the brick wall and associated tile floor within the trial trench required additional study through a partial excavation of any intact structural remains. The excavation revealed the remains of an 18th century structure. The latter comprised a brick and mortar wall located on the east side of the structure that was intact to a height of 0.80 m, and the floors of three rooms. It also revealed the remains of two fireplaces, a second wall for the west side of the structure, a partition wall oriented that divided the structure in half, and a pathway that extended westward away from the south-west corner. A pit that contained a dark fill, and a pit that contained animal bone were also revealed within two of the rooms. Following the abandonment of the structure the site was raised by substantial tips of ballast before a late-19th century granite set courtyard was constructed. [Au(abr)]

A watching brief was undertaken during the excavation of Thames Water trial trenches on the Broadway, Stratford, in the proposed location of a construction shaft. Excavations did not extend beyond 1.5m depth below the existing ground surface. Modern made-ground and services were exposed for the full depth, and the extent of modern ground deposits could not be established. Consequently, the presence and relative survival of archaeological material could not be ascertained. It was concluded that further work was necessary in order to determine the existence and nature of archaeological remains. It was anticipated that this would take place during the main shaft-construction works. [Au(abr)]

Croxson, N & Cook, S Oxford : Oxford Archaeology, Report: 3560 2008, 92pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology

Valentines Park had undergone a wide programme of restoration and regeneration. The work was undertaken in 2007-8, and concentrated principally on areas in the historic 18th century core of the site. Recording of the standing historic structures, included the walls of the Kitchen and Parterre Gardens, the Dovecote, the Alcove Seat, the Grotto, the Cottage, the Granary and Jacobs Well. In addition a watching brief was maintained during various elements of the regeneration work that caused ground disturbance in the historic gardens. As well as creating a record of the structures prior to restoration the work increased the understanding of the park and its individual features. The work has shown that the upper level of the Dovecote was probably only added in the 1860s, as a conversion of an existing garden building, and that the uppermost level of some of the walls in the walled gardens were secondary additions. The work also revealed possible evidence of a heated wall in the Kitchen Garden and confirmed that the south-west wall of the 19th century cottage incorporated the earlier, 18th-century wall from the Kitchen Garden. The below-ground watching brief identified a number of features from the park including culverts, walls from probable former paddock buildings and evidence of a possible blacksmiths. [Au(abr)]

"An archaeological watching brief was conducted on a ground reduction scheme for foundations and services at The Royal Ballet School, White Lodge, Richmond Park. The development is situated within the grounds of White Lodge and the development plan is divided into three phases and includes construction of a new boarding house, head's house, dining hall, studios and swimming pool and an extension to the Pavlova studio. No archaeological features were revealed during the watching brief. The sequence of topsoil and undated subsoil overlay the natural drift and solid geology. With the exception of post-medieval brick fragments and a sherd of ceramic no artefacts were recovered from the site." [OASIS]

Hogg, M & Melikian, M Twickenham : AOC Archaeology Group, Report: 7241 2008, 25pp, colour pls, figs, tabs, refs

*Work undertaken by:* AOC Archaeology Group

An archaeological watching brief was conducted on a ground reduction scheme for foundations at The Royal Ballet School, White Lodge, Richmond Park, London. The development area was situated within the grounds of White Lodge. The development plan was divided into three phases. Phase I involved the excavation of the footprint area for a new boarding house, the head's new house and an extension to the Pavlova Studio. Phase II consisted of monitoring new foundations for a new Dining Hall. Phase III involved the excavation of the footprint area for a new swimming pool and new studios. This report comprised sections on all phases of the watching brief, to present a complete report on the archaeological observations. Despite repeated attendance as a watching brief during groundwork, no archaeological features were revealed. A sequence of topsoil and undated subsoil overlay the natural drift and solid geology. This sequence was truncated in the southern part of the site by made ground associated with the construction a tennis court and bungalow in the mid-20th century. [Au(abr)]

**30 OLD PALACE LANE*****30 Old Palace Lane, Richmond, London Borough of Richmond. An Archaeological Watching Brief Report***

Pole, C Twickenham : AOC Archaeology Group, Report: 7974 2008, 25pp, colour pls, figs, tabs, refs

*Work undertaken by:* AOC Archaeology Group

A watching brief was undertaken on ground works at the back garden of 30 Old Palace Lane. The watching brief revealed several layers of post-medieval infill containing demolition material but little domestic waste. The dating was undiagnostic, but the building material of the earliest layer was probably post-Tudor, while a later layer had a small quantity of clay tobacco pipe stem and flower pot, and could be ascribed a post-Tudor date with more confidence. The combined thickness of the layers containing cultural material suggested something other than house building, and it was possible that the deeper parts of the investigation were within the moat that surrounded Richmond Palace. This was recorded as having been backfilled during the extension of the Palace by Henry VII [1485-1509]. While this would not fit with the post-Tudor probable date of the cultural material in the layers, the moat may not have been completely backfilled at that time. There was no direct evidence for the cut of the moat, but this was expected in such a small investigation. Alternatively the remains could represent a number of episodes of development of the site for housing, until the present house was built. The Palace was demolished in the Commonwealth period, and following an unsuccessful attempt to rebuild the Palace by Charles II the ruins were sub-

divided and sold. If this was the case, the reason the ground was disturbed to such a depth was not known [Au(abr)]

**4, MAIDS OF HONOUR ROW, THE GREEN, RICHMOND**  
***4, Maids of Honour Row, The Green, Richmond, London Borough of Richmond-upon-Thames. A Report following an Archaeological Watching Brief and Historic Building Record***

Capon, L Twickenham : AOC Archaeology Group, 2008, 31pp, colour pls, figs, tabs, refs

*Work undertaken by:* AOC Archaeology Group

The fabric of the basement of the early 18th century property, 4, Maids of Honour Row, was examined during stripping for refurbishment. The building appeared to be of a single phase, with no evidence of earlier buildings on the site being incorporated into its structure. Additional to the internal works were limited landscaping and excavations associated with creating and improving access to the basement in the front and rear gardens. A watching brief was carried out during these works. One aim of the investigation was to determine whether any parts of Richmond Palace survived beneath, or were incorporated into, Maids of Honour Row. At no point were any structures or deposits of proven Tudor /medieval date encountered. Post-medieval features were present: one drain predating Maids of Honour Row was revealed and structural elements of the basement were examined, indicating layout and function. [Au(abr)]

*Work undertaken by:* Pre-Construct Archaeology Ltd.

The investigation revealed the partially demolished remains of brick-built foundation walls for an 18th century outbuilding, along with a brick-lined well shaft that had been incorporated into the wall. These were thought to have been contemporary with the main building, while the top of the well had been capped at a later date by a brick-built dome, constructed in the early 19th century. No archaeological features predating the early-mid-18th century were encountered. [Au(adp)]

***Hampton Court Palace, East Front Drainage, Archaeological Watching Brief Report, Final Report (1)***

Cook, I Oxford : Oxford Archaeology, 2008, 14pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology

A watching brief was carried out at Hampton Court Palace. A single trench was excavated along part of the eastern front of Hampton Court Palace. The work was undertaken in advance of the installation of a new French drain. The watching brief revealed a layer of demolition rubble as well as wall foundations and brick built drains. The demolition was probably the result of the demolition of part of the Tudor palace prior to the construction of the new 17th century palace by William and Mary. The wall foundations could be the remains of the Tudor palace. The brick built drains could have been constructed at the same time as the Baroque palace, utilising Tudor brick. [Au(abr)]

Bystron, A London : Museum of London Archaeology Service, 2008, 16pp, colour pls, figs, tabs, refs

*Work undertaken by:* Museum of London Archaeology Service

A watching brief was carried out as part of works for the wider Thameslink programme. The remains of two phases of post-medieval brick cellars were identified, consisting of walls and a floor. The second phase of cellaring may well have dated to the mid-15th to early 16th centuries on the evidence of building materials, with the first phase likely to have been of a similar date range. Other deposits related to the demolition of the cellars and their backfilling, likely to be of mid-19th century date, and the construction of the viaduct. The remains were only of local significance and no further work was deemed necessary. [Au(abr)]

An excavation was carried out as part of the redevelopment of the site. An east to west prehistoric ditch truncated the natural sandy brickearth, with a possible prehistoric curvilinear feature adjacent to this. A peat layer sealed the prehistoric cut features, and contained a single cattle bone and a few burnt flints. This layer indicated that the area was marshy, marginal land, probably during the Saxon and medieval periods. Two post-medieval post holes were recorded, sealed by homogeneous clay layers that indicated the site had been flooded and abandoned during the post-medieval period until the beginning of groundworks associated with the construction of the Georgian terrace house and of a north-south sewer that truncated the western half of the study site. The excavation recorded a stream channel, formed during two separate periods. The earlier phase of the channel was associated with Late Iron Age artefacts to the south, and the later phase with Roman artefacts to the north. A fairly shallow bank of natural sand separated these two streams. 17th century pitting and 18th century walls were observed on the site, as well as a post-medieval well/soakaway and a number of other pits, wells and soakaways. 20th century demolition rubble associated with the destruction and subsequent clearance of the site after the Second World War overlay the post-medieval occupation layers, and was in turn sealed by reinforced concrete. Orr, K London : Wessex Archaeology, Report: 68360.04 2008, 31pp, colour pls, figs, tabs, refs

*Work undertaken by:* Wessex Archaeology

The excavation of two drainage trenches with associated manholes was carried out in the basement/former crypt, along with a watching brief of a stretch of service trench. Roman dump layers, rapidly deposited, sealed early Roman features cut in the first two centuries AD. A second phase of Roman activity was represented by a series of cut features dug through the dump layers. These included structural remains in the form of two post holes, several pits and a probable boundary ditch. The results indicated a peripheral area liable to flooding in the Roman period. No late Roman or Saxon deposits were revealed, but one surviving wall likely to relate to the 13th century St. Thomas' Church showed evidence of 17th or 18th century robbing. This was likely to have been carried out on 1702 during the rebuilding of the church. The watching brief did not reveal any evidence for features other than the foundation trench for the church tower. These cut through a series of post-medieval dumps and levelling layers containing residual Roman pottery derived from the upcast thrown up during construction of the church crypt. [Au(abr)]

The watching brief found a layer of alluvium sealing natural terrace gravel. Colluvium overlay this, and was dated by finds to the early post-medieval period. This was located below post-medieval to modern demolition layers and made ground. Additionally, foundation structures and a basement or cellar, likely to form part of or relate to the 19th century brewery house, were uncovered along with a portion of a structure of unknown function that may have predated this. A post-medieval well or cesspit was located towards the northern perimeter of

the site, and towards the south a substantial layer of brickearth was observed between a layer of agricultural soil and alluvial deposits. One of the borehole investigations also revealed what appeared to be a fill, or a series of fills, contained within a deep cut truncating the natural gravels. [Au(adp)]

An evaluation took place and found four post holes and five linear features. The subsequent exploratory excavation revealed six linear features, ten post holes and a complex of intercutting pits. The final phase, a full excavation, was carried out with the objective of focussing on the investigation of the features revealed during the previous phases. A mid-Saxon pottery assemblage was recovered, along with numerous features of archaeological interest. The exact dating and definition of these features was hampered by the extensive disturbance that the site had suffered as a result of bioturbation, rooting, tree growth and horticultural activity. *Work undertaken by:* Museum of London Archaeology Service

A watching brief was carried out on ground reduction of those areas of the site that were unbasemented. Post-medieval wells and cess pits were recorded, with finds including the backfill of an 18th century cess pit. The pottery and clay pipe material indicated a date of deposition from c.1720-60. Evans, G London : Wessex Archaeology, Report: 65942.03 2008, 25pp, colour pls, figs, tabs, refs

*Work undertaken by:* Wessex Archaeology

An evaluation and watching brief was undertaken at the site, which lay within the Tyburn river valley 200m to the north of the Roman road which ran along the line of present day Oxford Street, and some 50m to the west of the historical course of the River Tyburn. Given the site's position it was presumed that significant archaeological deposits relating to the Tyburn, the Roman road and the early medieval Tyburn village may have been located. However, all of the deposits observed during the evaluation and watching brief contained exclusively 19th century or later material and no structural remains were uncovered dating from these periods. The results of the evaluation demonstrated that the proposed development would not have an impact on significant archaeological deposits. [Au(abr)]

***The Sanctuary, Westminster Abbey, City of Westminster. An Archaeological Watching Brief During Drainage Repair Works***

Jorgensen, P Brockley : Pre-Construct Archaeology Ltd., 2008, 36pp, colour pls, figs, tabs, refs

*Work undertaken by:* Pre-Construct Archaeology Ltd.

A watching brief was carried out during works to repair a collapsed sewer. Medieval walls, presumably associated with the Chapter Clerks dwelling and the Bishop of London's dwelling, were recorded. Additional archaeological features including several pits dating to the medieval period, and a construction cut likely associated with the abbey precinct wall were also identified. Several post-medieval gravel road surfaces and a medieval palaeochannel were recorded in a separate trench. [Au(abr)]

Spall, C York : Field Archaeology Specialists Ltd., 2008, 23pp, colour pls, figs, refs

*Work undertaken by:* Field Archaeology Specialists Ltd.

The installation of a sprinkler main involved the excavation of a single trench. The trench encountered a buried soil horizon into which a stone-built cellar had been constructed. The

cellar was represented by a stone built wall flanked by pine plank shuttering and had been backfilled and levelled with demolition material . Cartographic evidence suggested that these structural remains belonged to a building constructed between 1754 and 1861 and demolished during the mid-20th century. [Au(abr)]

**WAYGOOD GALLERY, 31-37 HIGH BRIDGE**

***Archaeological Watching Brief Report on Works Associated with the Waygood Gallery, 31-37 High Street High Bridge, Newcastle-upon-Tyne, Tyne and Wear***

Peters, C & Wood, F Alston : North Pennines Archaeology Ltd., Report: CP/643/08 2008, 35pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

An archaeological watching brief was undertaken on groundwork relating to the redevelopment of the Waygood Gallery, Nos. 31-37 High Bridge Parade, Newcastle upon Tyne. The site was located in an area of high archaeological potential highlighted during a desk-based assessment and subsequent building recording of the site. Cellaring was known to have occurred across much of the area, relating to Victorian buildings on the site. The watching brief occurred in two phases, firstly, in May 2008, when a foundation pit was excavated for a tower crane in the courtyard behind Nos. 25-29 High Bridge, and secondly, between August and November 2008, within the courtyard of the building itself. During Phase 1, features thought to be the remains of an external warehouse wall were recorded, with a later abutting wall, and an original cellar floor relating to the inside of the warehouse. No earlier archaeological deposits were located, and the area was shown to have been disturbed by several pipes and services. During Phase 2, a feature believed to be the remains of a post-medieval brick built well was recorded, located in the southern end of the courtyard within the Waygood Gallery. Two orange and red silty sandy industrial spreads were uncovered, both containing animal bone. No other features were observed and it is thought that the area within the courtyard had already been subject to modern disturbance when the cellars for the building were constructed. As the redevelopment of the buildings required no further groundwork, further monitoring was not required during this work. This watching brief provided a rare opportunity to test the subsurface medieval survival of the area. The area truncated by the groundwork has proved to be within the known area of Victorian cellaring although earlier deposits may yet survive below the level reached by these works. In addition, there remains the potential for pockets of archaeology to survive in areas not impacted upon by the cellaring, and as a result, due to the high archaeological potential of the area, it is likely that similar works in the vicinity will require a similar scheme of archaeological mitigation. *Work undertaken by:* Bamburgh Research Project

The excavation of the floor foundation area for the new extension exposed a yellow-brown sandy clay subsoil, in other areas a buried topsoil sealed beneath the existing yard surface was not bottomed. Excavation of the construction trenches was undertaken following the laying of the aggregate for the new floor surface. Excavation reached a depth of 1.1m below ground level and exposed a clean yellow-brown subsoil. The excavation associated with the extension of the yard area revealed a buried a topsoil that extended beneath a redeposited yellow brown clay subsoil that was not bottomed at the depth of excavation. The absence of any features of archaeological interest in the area of the extension and the presence of an area of redeposited subsoil in the area of the yard extension precluded the recording of any further archaeological remains. Horn, R Alston : North Pennines Archaeology Ltd., Report: CP/766/08 2008, 24pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

A programme of archaeological works on land beside St. Paul's Monastery, Jarrow, Tyne and Wear was undertaken. The site was located within an area of high archaeological potential, within the boundary of the designated Scheduled Ancient Monument of St. Paul's Monastery. As a result, all works associated with the insertion of six new interpretation panels in the environs of the monastery required a programme of archaeological work to be undertaken, in the form of a watching brief, undertaken on all groundworks associated with the development. The works involved the excavation of two circular pits for each interpretation panel. Modern glass, pottery and ceramic building material were recovered from the foundations of Interpretation Panels 3, 5 and 6. A possible cobbled surface was discovered at the base of the foundations for Interpretation Panel 6. The archaeological material encountered was consistent with material that was to be expected in view of the past habitation in the vicinity. The discovery of a possible path or floor surface was unsurprising given the location of the site within the monastery. It was recommended that due to the continuing high archaeological potential of the area, and the status of the site as a Scheduled Ancient Monument, any further development in the area should be subjected to archaeological investigation. **THE FORMER NEWPORT IRON WORKS, NORTH MIDDLESBROUGH ACCESSIBILITY SCHEME*****Archaeological Watching Brief on Land at the Site of the Former Newport Iron Works, North Middlesbrough Accessibility Scheme, Teesside***

Jackson, D Alston : North Pennines Archaeology Ltd., Report: CP/779/08 2008, 27pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

The watching brief was initiated following the discovery of significant archaeological remains during development associated with the North Middlesbrough Accessibility Scheme. The works were conducted within an area of high archaeological potential related to the Newport Iron Works [HER 1822], which was classed as significant due to the large amounts of iron ore smelted in large blast furnaces, the remains of which are still partially extant. The works involved the excavation and removal of large amounts of topsoil and industrial debris, both at the northern and southern extents of the site. The watching brief revealed the presence of archaeological features and horizons in both areas associated with the 19th/20th century Newport Iron Works. The archaeological features at the northern end of the site were particularly well preserved. Features included a large flue, several vents and the base of a chimney, which probably related to the former water-cooling plant for the iron works. However, the archaeology at the southern end of the site was poorly preserved, largely being made up of demolition material and industrial debris with only one discernable feature noted. This feature probably represented the remains of a flue structure associated with one of several blast furnaces within that area. Based on the archaeological investigations conducted, the survival of significant archaeological remains associated with the Newport Iron Works were expected throughout the proposed area of development. Therefore, it was recommended that any further ground reduction within the area be subject to a programme of archaeological observation and investigation. [Au(abr)]

*Work undertaken by:*

An archaeological monitoring and recording exercise was undertaken in the village of Elsdon. The investigations were carried out during December 2007 and January 2008. The village of Elsdon was of medieval origin and contained the site of Mote Hills motte and bailey castle, which had Scheduled Monument status. The scheme was considered to have most potential for disturbing archaeological remains where poles carrying overhead power lines were being replaced in close proximity to the Scheduled area in the north-eastern part of the village. Intrusive groundworks associated with the replacement of poles in the vicinity of the Scheduled Monument were to be monitored and any remains of note recorded. Replacement of other poles in the scheme were monitored as appropriate. Natural geological material was recorded in each of the foundation pits. This was overlain by topsoil or made ground at all but one location. In Pit 2, located on ground directly east of Elsdon Burn, a spread of stones, possibly from a collapsed wall or surface of uncertain period of origin was recorded. No

archaeological deposits or features of note were recorded in any other foundation pit. [Au(abr)]

Young, G      Bamburgh : Bamburgh Research Project, Report: BRP 08/09 2008, 14pp, colour pls, figs, tabs, refs

*Work undertaken by:* Babburgh Research Project

Archaeological monitoring was undertaken during the groundworks associated with the construction of an extension to Manor Cottage. Excavation of the western foundation trench for the extension commenced on the 23rd of September and was suspended on the 24th of September 2008. The trench was excavated c. 0.7m wide and was dug down in a series of spits using a mini-digger. A series of layers of made ground of recent date were encountered, comprising topsoil to a depth over layers of rubble and stone fragments. Modern china, plastic and polythene indicated a 20th century date for the deposit sequence. Excavation continued to a depth of 1.7m when the reach of the machine arm became a limiting factor. A consultation between the contractor and the building inspector resulted in a decision being taken to alter the foundations to take into account the great depth of made-up material. The building foundations would be completed as a concrete raft at a depth of 0.5m below ground level and the excavated trench filled to this depth with building stone. The watching brief was therefore suspended following consultation. The house at Manor Cottage lay at the western extent of the village and on a part of the road that rose up towards the east with a noticeable gradient. The level platform for the house construction was likely to be the result of terracing into the natural gradient. The ground on the western downhill side, being made up more than 1.7m. The excavation of the trench therefore revealed no features of archaeological interest, but equally must have been seen as indicative of a much localised situation with regard to the preservation of archaeological features and the depth at which they may have been encountered. *Work undertaken by:* Headland Archaeology Ltd.

The watching brief provided additional information concerning the medieval settlement, remains of the abandoned medieval village of Bondington to the west of Cheviot House and potentially identified the limits of the medieval cemetery associated with the church of St. Lawrence. Although monitoring conditions were not ideal, the watching brief in Area 2 reinforced the results of previous work regarding the reduction in activity in the north of the site as distance from the medieval settlement core increased. The possibility of a prehistoric presence on the site remained inconclusive. [Au(abr)]

Parker, J      South Shields : Tyne & Wears Museum Archaeology Department, 2008, 48pp, colour pls, figs, tabs, refs  
*Work undertaken by:* Tyne & Wears Museum Archaeology Department

The excavation was carried out between 2007 and 2008, and comprised a strip and record exercise with subsequent excavation work. A watercourse was found to run south-west to north-east across the site. On the northern edge of the watercourse were a number of shallow pits of uncertain function. Also present on the south side of the watercourse was an area of scorched clay, suggesting a burning event. To the north of the watercourse was a roundhouse whose eavesdrop gully had an internal diameter of 10.58m. This activity demonstrated Iron Age activity within the area, although with only one roundhouse and few other determinable features, the nature, extent and purpose of settlement was unclear. There was no trace of an enclosure ditch and it seemed likely that the roundhouse belonged to an unenclosed Iron Age settlement. While it was possible that it may have represented the only surviving example of a larger collection of buildings, it was more probable that it was an outlying structure belonging to a settlement whose focus was beyond the limits of Areas 1 and 2. **IRON SIGN FARM*****Archaeological Watching Brief at Iron Sign Farm, Northumberland***

Amat, D Bakewell : Archaeological Research Services, Report: ARS 35 2008, 14pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Research Services

The watching brief was carried out to monitor the groundwork on a public road close to Iron Sign farm. The groundwork involved excavating to the level at which a telecommunications duct had been previously placed to assess whether archaeology existed or had been disturbed in the area. The route of the ducting crossed the Scheduled Ancient Monument of Hadrian's Wall, the Hadrian's Wall Vallum and the line of the Roman Military Way at approximate right-angles. Previous work along the route of the B6318 had revealed the presence of archaeological remains associated with Hadrian's Wall. Earthworks associated with the vallum were also visible in fields to the east and west of the proposed development. The purpose of the evaluation was to determine whether any remains survived, at what depth and in what condition. Neither the fabric of Hadrian's Wall nor the vallum was identified during the watching brief and there were no signs of features lying below the road surface. The original natural surface had been heavily truncated during the construction of the road and it was likely that this process would have destroyed any surviving archaeology. No features of archaeological significance or buried land surfaces were revealed. [Au(abr)]

***St. Andrew's Church, Heddon on the Wall. Report of Archaeological Monitoring***

Young, G Sheffield : Bamburgh Research Project, Report: BRP 08/08 2008, 14pp, tabs, refs

*Work undertaken by:* Bamburgh Research Project

Archaeological monitoring was undertaken during groundwork associated with the installation of a new WC at St. Andrew's Church, Heddon on the Wall. Excavation of the trench for the waste pipe commenced on the 5th August 2008 and was completed the following day. The trench was between 0.3m and 0.4m wide and was excavated to a maximum depth of 0.5m

below ground level. The area of the new trench had been highly disturbed by the installation of previous services and as a result no in situ layers of archaeological interest were encountered. Within the porch of the church adjacent to the new WC a human skull was seen in section but was not further disturbed. The excavation of the trench, with the exception of the human skull, revealed no features of archaeological interest. The lack of such material was certainly due to the previous disturbance of the area by the installation of the pre-existing services and cannot reflect the conditions that would be expected within the wider area of the churchyard. The exposure of the human skull was clearly an indication that burials and chanel deposits were likely to be present elsewhere, both in the churchyard and also in the vicinity of the church itself. *Work undertaken by:* Bamburgh Research Project

Archaeological monitoring was undertaken during groundwork associated with the construction of a new dwelling. No features of archaeological interest were identified and no finds were present. Stripping of the topsoil had occurred prior to the commencement of the watching brief, this limited the amount of evidence available to interpret the site, however, the absence of any finds from the monitoring of a considerable excavated volume suggested that the site was located in an area of the settlement with little or no archaeological activity. Peters, C Alston : North Pennines Archaeology Ltd., 2008, 28pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

Despite the high archaeological potential of the area and the large number of test pits excavated at the site, very little of archaeological interest was encountered during the watching brief. This was largely explained by the situation of the test pits on pre-existing service trenches, that had already disturbed the site. The surviving remains of a drain/culvert and a section of walling at Station Road, possibly associated with the former hospital buildings, lay immediately east of the works. Another narrow small wall was revealed adjacent to Bridge End Cottages, possibly forming a revetting wall in an attempt to contain river erosion. A post-medieval drain or culvert was uncovered on Princes Street, and contained a number of 20th century pottery sherds in its backfill. [Au(adp)]

*Work undertaken by:* North Pennines Archaeology Ltd.

A desk-based assessment and watching brief were carried out in relation to the construction of a new dwelling and garage on the site. The assessment revealed that the proposed development site lay adjacent to the church of St. Peter's, however, an earlier Anglo-Saxon chapel was known to have existed. This led to potential for related features, perhaps as early as the 8th or 9th century, to be located within the development area. However, no archaeological remains were recorded during the subsequent watching brief, with the exception of later ridge and furrow. [Au(adp)]

*Work undertaken by:* TWM Archaeology

"An archaeological watching brief was commissioned by Northumbrian Water in advance of water mains improvements in Haltwhistle town centre, between Gilsland and Greenhead, and on the Military Road, B6318. The mains improvements project comprised the excavation of several hundred pits, as well as lengths of open cut trench. Scheduled Monument Consent was required in areas where the works encroached on the Scheduled area associated with two Roman marching camps. In these Scheduled areas and in other areas of high archaeological sensitivity (within 50m of the line of Hadrian's Wall and in the centre of Haltwhistle) a continuous archaeological presence was required, whilst intermittent assessment of the works was undertaken in other areas. Where the pipeline crossed the defences of two marching camps (Markham Cottage Roman Camp and Milestone House Roman Camp) archaeological trenches were excavated in advance of the pipelaying to ensure the preservation by record of any significant archaeological deposits. A similar

archaeological excavation strategy was adopted where the pipeline crossed the line of the Stanegate Roman road to the east of the Milestone House Roman Camp." [OASIS]

***Archaeological Watching Brief at the Best Western Beaumont Hotel, Hexham, Northumberland***

Liddell, T Alston : North Pennines Archaeology Ltd., Report: CP/743/08 2008, 22pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

A watching brief was maintained at the Best Western Beaumont Hotel. The hotel was located within the historic core of Hexham, at a location which was once within the grounds of Hexham Abbey. The potential therefore existed for archaeological remains to be revealed by the proposed groundwork at the site. The watching brief was undertaken during the

excavation of the foundation trenches as well as the deep piling. This clearly indicated that in the southern half of the site the modern surface lay on the natural sand substrate (which was excavated to a depth of 2m without change) while the northern extent of the site revealed modern overburden and makeup at least 1.4m in depth with no sign of the natural substrate. Due to the lack of archaeological presence within the area excavated, it was considered that no further archaeological monitoring was required within the scheme of works, unless excavation to a greater depth than had already been tested was required. Liddell, T. Nenthead : North Pennines Archaeology Limited, Report: CP 743/08 2008, .pdf document and A4 bound report

*Work undertaken by:* North Pennines Archaeology Limited

"In October 2008 carried out an archaeological watching brief at The Best Western Beaumont Hotel, Hexham, Northumberland (NY935639). The work followed a planning application for the construction of a new extension to the Beaumont Hotel, which affected an area considered to have a high archaeological potential. The hotel is located within the historic core of Hexham, at a location which was once within the grounds of Hexham Abbey. The potential therefore existed for sensitive archaeological remains to be revealed by the proposed groundworks at the site. The watching brief was undertaken during the excavation of the foundation trenches as well as the deep piling. This clearly indicated that in the southern half of the site the modern surface lay on the natural sand substrate (which was excavated to a depth of 2m without change) while the northern extent of the site revealed modern overburden and makeup at least 1.4m in depth with no sign of the natural substrate. Due to the lack of archaeological presence within the area excavated so far, it is considered that no further archaeological monitoring is required within the current scheme of works, unless excavation to a greater depth than has already been tested is required." Carlton, R J Newcastle upon Tyne : The Archaeological Practice Ltd., Report: AP07/68  
2008, 22pp, colour pls, figs, tabs, refs

*Work undertaken by:* The Archaeological Practice Ltd.

The process of recording during development works was conducted at the site, a Listed Building and Scheduled Ancient Monument. The excavation in the position of a new sun room revealed an east-west oriented feature made of irregular slabs, perhaps the footings of a removed wall, or possibly a paved pathway. In the south-eastern angle of the trench was an area of consolidated stonework with a clear face standing two courses high on the west. A section of the timber floor of the attic was removed, and shown to have been of 17th century origin. Other observations relating to the fabric and structure of the vicarage were noted. [Au(adp)]

Stephenson, H & Carter, G. South Shields : TWM Archaeology, Report: Project number  
796 2008, A4 plastic comb-bound report

*Work undertaken by:* TWM Archaeology

"A watching brief was carried out by was carried out by TWM Archaeology on behalf of Northumbrian Water, on a scheme to refurbish water mains in the Ovingham and Wylam area. An archaeological assessment by TWM archaeology in 2007, recommended archaeological mitigation in the form of a watching brief should be carried out in nine of the twenty areas affected. A total of fifty four trenches were observed and recorded by TWM Archaeology staff between November 2007 and February 2008. With the exception of Trenches in Engine Dene Wylam, no archaeological deposits were observed in any of the trenches, and none appear to have been disturbed by these works. Engine Dene in Wylam is known to be the site of a old clay pit associated Post-Medieval brick manufacturing, prior to 1864. Deposits visible in section in trench ED3 may indicate industrial activity, probably brick making, in the south-west of the area." [OASIS]

Fletcher, M Manchester : Matrix Archaeology, Report: 2008-09 2008, 16pp, colour pls, figs, refs

*Work undertaken by:* Matrix Archaeology

A watching brief was undertaken within a site where previous fieldwork demonstrated late prehistoric, Roman, medieval and early post-medieval activity. Within the French drain excavations, none of the man-made deposits appeared to be continuous for any distance, and there was a considerable amount of relatively recent disturbance across the area. The dump of angular sandstone boulders was assumed to be related to the construction of the Museum in the 1970s, either as a soakaway or as surplus construction material. The only in situ find was an Iron Age VCP sherd. [Au(adp)]

***Kinderton Hall Farm, Middlewich, Cheshire. An Archaeological Watching Brief on the Site of the Scheduled Ancient Monument***

Wilson, P Manchester : University of Manchester Archaeological Unit, Report: 2008 (52) 2008, 35pp, colour pls, figs, refs

*Work undertaken by:* University of Manchester Archaeological Unit

Observations made during the watching brief yielded little in the way of archaeological deposits of finds. Excavations of nine service trenches and a series of post holes predominantly exposed in glacial deposits an area which had been modified through the introduction of demolition material used to level the ground surface. Archaeological material discovered included two cut features positioned in the western part of the study area, one of which was possibly a modern foundation trench. Two timber posts were also discovered, one of which underpinned the foundations of the eastern elevation of Building 1. [Au(abr)]

Murray, E Lancaster : Oxford Archaeology North, Report: 2008-9/884 2008, 30pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology North

The watching brief was carried out in two stages, the first in May 2007 and the second in June and July 2008. Observations of the first phase were limited. Stripping revealed extensive deposits of modern made ground, sealed beneath were a number of archaeological features cutting the natural alluvium. Chief among these was the second century AD Roman road. A single pit with a small assemblage of Roman pottery was recorded. The road appeared to have fallen out of use prior to the fourth century. The watching brief identified a resumption of activity in the post-medieval period, with a number of structural, drainage, boundary and pit features likely to be associated with Kingsley Cottage. Ahmad, C & Adams, M Liverpool : Liverpool Museum Field Archaeology Unit, 2008, 15pp, colour pls, figs, tabs, refs  
 Work undertaken by: Liverpool Museum Field archaeology Unit  
 The area towards the eastern side of the site was monitored during the removal of a modern concrete slab where the former engine house and possible wheel pit may have been situated. This revealed a group of foundations which may have related to Knight's Mill, However, it was apparent that the engine house had been totally destroyed by the construction of Jack Lee Mill in the 1950s. No remains relating to water power were located. [Au(abr)]

Railton, M Alston : North Pennines Archaeology Ltd., Report: CP698 2008, 21pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

The most extensive feature recorded during the watching brief was a well-constructed cobbled track, of possible medieval or post-medieval date, which originally ran along the southern edge of the northernmost terrace. The watching brief also revealed evidence for a crude cobbled surface, which may have been associated with the medieval longhouse. The cobbled surface appeared to have been laid down to facilitate access to the area of the longhouse from the track. A possible timber building, of unknown date, was identified during an previous evaluation. Of the artefacts recovered, the most important was a fragment of medieval pottery from beneath the cobbled track. [Au(abr)]

***Archaeological Investigation of the Remains of a Medieval Vaccary at Gatesgarth Farm, Buttermere***

Railton, M Kendal : North Pennines Archaeology Ltd., 2008, 10pp, figs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

Archaeological investigations at the site had revealed a number of features believed to be associated with a medieval vaccary [cattle farm]. Excavation revealed a longhouse dwelling, an associated trackway, timber structures and an earthwork platform, as well as a small assemblage of medieval pottery dating back to the 13th or 4th century. It was thought to have the potential to provide insight into the nature and scale of medieval farming practices in the Lake District. [Sec(abr)]

North Pennines Archaeology Ltd. Alston : North Pennines Archaeology Ltd., 2008, 100pp, colour pls, figs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

The works entailed the construction of a new house extension on the south facing gable end of the property, which involved the excavation of three small trenches to upgrade and replace existing utilities. However, the trenches revealed no clear evidence of Roman archaeology despite the close proximity of the fort to Craiginvar, this was probably due in part to the area being heavily disturbed by the building of the house and or the subsequent construction of a garage. It was likely that the majority of archaeological features in this immediate area had either been severely truncated or were located away from the immediate development site. [Au(abr)]

Suddaby, I Musselburgh : CFA Archaeology Ltd., Report: 1560 2008, 12pp, colour pls, figs, tabs, refs

*Work undertaken by:* CFA Archaeology Ltd.

An archaeological watching brief was undertaken as part of a programme of work aiming to improve the recreation and wildlife of the village. The pond was excavated some 10m to the south of the assumed alignment through Burgh-by-Sands of Hadrian's Wall Vallum, but was not within the Scheduled Area covering the Vallum itself. The pond was excavated in a low lying and often waterlogged area. The work revealed that under modern topsoil, a spread of 19th century made ground overlay wet peaty silt, with natural gravely sand below. No Roman finds or features were recorded. [Au(abr)]

Liddell, T Alston : North Pennines Archaeology Ltd., Report: CP/660/08 2008, 40pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

The watching brief in the farm courtyards indicated that anything of archaeological interest had been destroyed in these areas during renovation and building work in the 19th and 20th centuries, with evidence of modern and late post-medieval cuts and features (such as drains and concrete) evident throughout the groundworks watched. The watching brief in the Garth area indicated that significant late medieval or early post-medieval buildings could survive in close proximity to the farm along the southern edge of the Scheduled area. The work also established the remains of a stone tomb, and a building, both had been cut by the farm buildings, giving them a date of 17th century or earlier. Two power cables were uncovered running north-east to south-west roughly in line with the northern wall of the farm, both of these cables cut through the Scheduled area. The evaluation presented evidence of post-medieval cobbled surfaces as well as building rubble of unknown date directly to the north of the farm wall. The potential for medieval and post-medieval archaeology remained very high north of the farm within the Garth area of the Scheduled Monument. The potential for any significant medieval or post-medieval archaeological features remained very low within the confines of Abbey Farm. [Au(abr)]

**PENRITH CASTLE, PENRITH*****Archaeological Watching Brief At Penrith Castle, Penrith, Cumbria***

Horn, R Alston : North Pennines Archaeology Ltd., 2008, 15pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

A programme of archaeological works on land beside Penrith Castle, Cumbria was undertaken. The site was located within an area of high archaeological potential, within the boundary of the designated Scheduled Ancient Monument of Penrith Castle. As a result, all

works associated with the insertion of a new interpretation panel in the environs of the castle required a programme of archaeological work to be undertaken, in the form of a watching brief. The works involved the excavation of four square pits to hold the supports for two interpretation panels. Medieval and post-medieval pottery was recovered from one pit associated with Interpretation Panel 2. However, no archaeological features were encountered during the excavation. The archaeological material encountered, which consisted of pottery with clean breaks, was consistent with material that was expected in view of the past habitation in the vicinity. The discovery of pottery was unsurprising given the location of the site within the castle courtyard. Due to the continuing high archaeological potential of the area, and the status of the site as a Scheduled Ancient Monument, any further development in the area should be subjected to archaeological investigation. Martin, G Carlisle : Gerry Martin Associates Ltd., Report: 44 2008, 16pp, colour pls, figs, refs

*Work undertaken by:* Gerry Martin Associates Ltd.

An archaeological condition was placed upon the removal of the existing brick wall and its replacement with new footings and fabric in an area of the projected course of Hadrian's Wall. The full width of the wall was not observed, due to the overlying Roman metalled surface and the oblique angle of the study area. It appeared highly probable that this footing was the northern edge of the foundation of Hadrian's Wall. This assertion was strengthened by the location of an unexcavated ditch that lay in front of the wall. [Au(abr)]

The watching brief did not encounter any evidence indicating that the alignment of Hadrian's Wall crossed the site. The alignment of the Port Carlisle Navigation Canal was observed, along with possibly contemporary industrial structures. The canal had been backfilled and the structures truncated prior to the construction of railway sidings on the site in the mid-19th century. The site was overlain by substantial depths of made ground associated with the establishment of the railway sidings. [Au]

*Archaeological Watching Brief Report On Land At Doves Yard St. Nicholas Bridge, Carlisle, Cumbria*

Sowerby, M & Town, M Alston : North Pennines Archaeology Ltd., Report: CP642/08 2008, 26pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

A watching brief was undertaken at Dove's Yard. An earlier archaeological evaluation on the site, had identified the remains of two timber structures and a buried soil horizon of possible medieval date. The subsequent ground works involved the excavation of a foundation trench. A substantial east -west aligned medieval ditch was exposed at the western portion of site, which probably formed part of a complex of medieval features revealed during the initial evaluation. The eastern section of the site revealed no further evidence of archaeological features or deposits, this was probably due in part to the area being heavily disturbed by the building of the railway and associated engine sheds on the site. It was highly likely that the majority of archaeological features in this immediate area had been severely truncated by post-medieval activities. [Au(abr)]

**WALBY GRANGE, WALBY, CROSBY ON EDEN, CARLISLE****Archaeological Evaluation and Watching Brief at Walby Grange, Walby, Crosby on Eden, Carlisle, Cumbria**

Murray, R Crosby on Eden : Headland Archaeology Ltd., 2008, 17pp, figs, tabs, refs

*Work undertaken by:* Headland Archaeology Ltd.

An evaluation at Walby Grange, across the plotted line of Hadrian's Wall and some associated monitoring works, was carried out. A total of three evaluation trenches were excavated. A large negative feature, oriented south-west to north-east, was present in all the evaluation trenches and was interpreted as the ditch on the north side of Hadrian's Wall. An area of sandstone slabs to the south of the ditch was present in one of the trenches and may have been the remains of the wall itself. A shallow linear feature and two post holes found close to the ditch may also relate to Hadrian's Wall. The watching brief uncovered no features of archaeological interest, however, it did recover a largely undiagnostic piece of ceramic building material that could have been a fragment of Roman roof tile or alternatively a post-medieval window box. Fell, D Kendal : David Fell, 2009, 15pp, figs, refs

*Work undertaken by:* David Fell

The survey suggested that the earthworks, comprising a double bank and ditch enclosure with west-facing entrance, probably represented the remains of an Iron Age hillfort which may have been constructed concentrically to a Bronze Age barrow. Though the survival of the hillfort was remarkable, the earthworks had been damaged by tracks, and by post-medieval ridge and furrow ploughing. The hillfort may have dominated a possible "territory" defined by the minor tributaries of the River Eden. [Sec(abr)]

Mounsey, K Alston : North Pennines Archaeology Ltd., Report: CP/632/08 2008, 25pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

A programme of archaeological work was undertaken on land associated with Haig Colliery. Notable historical monuments and features within the environs were Saltom Pit, remains of the Wellington Pit, the Howgill Incline and Jonathan Swift's House. Three main locations were subject to watching brief conditions. Area A, path works on the Howgill Incline and in the vicinity of the former Howgill Incline brake house. Area B, path construction in the vicinity of the former Wellington Colliery and Area C, change of use of a small pond feature associated with the Wellington Colliery. No archaeological features were found in areas A. and B. In Area C, post -medieval archaeological features in the form of stone walls and cobbled floor surfaces were uncovered. It was thought probable that these belonged to part of the Wellington Colliery complex. Post-medieval pottery and ironwork along with some fragments of clay pipe were recovered. This was consistent with material associated with late-19th century, early 20th century coal mine workings. No further work was deemed necessary.

However, due to the continuing high archaeological potential of the area, and the fact that it contained a Scheduled Monument, any further development in the area should be subjected to a programme of archaeological investigation. [Au(abr)]

***Archaeological Watching Brief at Saltom Pit, Near Whitehaven, Cumbria***

Jackson, D Alston : North Pennines Archaeology Ltd., Report: CP/775/08 2008, 25pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

An archaeological watching brief was carried out at Saltom Pit, during consolidation and remediation works at the site. The works were conducted within an area of high archaeological potential related to Saltom Pit, England's first undersea coal mine. The works involved the excavation and removal of large amounts of encroaching material left by decades of cliff erosion. The watching brief revealed the presence of archaeological features and horizons associated with the 18th/19th century coal mine. This type of archaeological activity was not surprising given the relatively well-preserved nature of several mine buildings above ground. As the watching brief was conducted as part of a recommendation to observe groundworks in advance of repairs to the north end of the sea wall and with the installation of fencing and ground reduction east of the sea wall, no further work was deemed necessary. However, given the high archaeological potential of the area and the site's status as a Scheduled Ancient Monument, it was recommended that any future work be subject to a programme of archaeological investigation. Whitehead, S Ulverston : Greenlane Archaeology Ltd, 2008, 26pp, colour pls, figs, tabs, refs

*Work undertaken by:* Greenlane Archaeology Ltd

A watching brief on groundwork relating to the relaying of paths and the installation of a new water pipe was undertaken in addition to the recording of the flag stones in the vestibule. The site work was carried during January and February 2008. The earliest surviving fabric of St. Andrew's Church was the west tower which was thought to be 14th century, although the church was largely rebuilt in 1720-1722. Origins of a much earlier church were indicated by the presence of three cross shafts thought to be of Norse origin and dating from the 10th century and four "hog backed" tombstones which were associated with two of the crosses. During the watching brief no archaeological features were encountered although some 18th to 20th century pottery and disarticulated human remains were found within the topsoil and subsoil. [Au(abr)]

**ALLANDALE, SHAP*****An Archaeological Watching Brief at Allandale, Shap, Cumbria***

Railston, M & Shaw, P Alston : North Pennines Archaeology Ltd., 2008, 200pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

A watching brief was undertaken in the garden of a private dwelling known as Allandale. Human remains had previously been discovered at the site during the excavation of trenches

for a garage extension to the rear of the property. Allandale was the site of the Shap Quaker Meeting House between 1704 and 1778, and the human remains discovered at the site were believed to be from an associated Quaker burial ground. The property was sold in 1803, and was eventually converted into a private residence. The full extent of the burial ground was not known, but it was considered likely that further burials could be revealed by the excavation. The watching brief was undertaken at the rear of Allandale, during the excavation of foundation trenches for the extension to the existing garage. This was situated in the back garden, immediately to the north of the house. Human remains relating to at least three burials had been revealed at the site prior to the start of the watching brief. In addition to these, two near complete skeletons and parts of a further three burials were revealed during the course of the monitoring, making eight skeletons in total. No unexpected features were exposed during the monitoring, the burials being consistent with the beliefs and practices of the non-conformist Quaker community. The graves were unmarked, and the shrouded bodies were placed in simple graves, aligned approximately east-west, apparently without coffins. An example of a simple charnel pit was also revealed. These were not uncommon, as space within Quaker burial grounds was often very limited. The assemblage of eight skeletons comprised six males, who were between 33 and 51 years old, one female between 25 and 35 years of age, and one individual who could not be assigned a gender or age. Dental disease seemed to be the most prevalent pathology amongst these individuals, with dental calculus present on nearly every tooth. Joint disease seems to be second to this, as would be expected from a collection that contained older individuals. The human remains were reburied within the boundary of the original burial ground. Given the evidence for human remains at the site, it was recommended that any future excavation work at the site should be subject to archaeological monitoring by an experienced archaeological osteologist. Turnbull, P & Walsh, D Barnard Castle : Brigantia Archaeological Practice, 2008, 13pp, colour pls, figs, refs

*Work undertaken by:* Brigantia Archaeological Practice

Observation of trenches and other excavations revealed nothing of archaeological significance other than a small amount of charnel, all of which was replaced as close as possible to where it had been found. It was established that almost all of the excavated trenches followed the line of an earlier set of drains and caused little disturbance of intact deposits. In the course of removing the vestry floor, a heavy grave slab of exotic black stone was discovered. It had the traces of an inscription and of heraldic devices of brass or latten which had been leaded onto its surface. A late medieval date was suggested. [Au(abr)]

**FRIENDS' MEETING HOUSE, MEETING HOUSE LANE, PENRITH**  
***Archaeological Desk-Based Assessment and Watching Brief at Friends' Meeting House, Meeting House Lane, Penrith, Cumbria***

Strickland, J Alston : North Pennines Archaeology Ltd., Report: CP735 2008, 37pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

A desk-based assessment and a watching brief was undertaken at Friends' Meeting House established in the late-17th century. This was the first dissenting place of worship in Penrith. The current building present on site was built in the late-18th century and was Grade II Listed. It was known to have a burial ground to the east of the building. Due to the proximity of the burial ground to the development site, there was potential that human remains might be disturbed. Research had shown that the Friends' Meeting House was located within the medieval town of Penrith. Alterations made to the meeting house in 1803 left the meeting house in the present form. Further alterations were made in 1992 for an extension at the north end of the building. Documentary evidence suggested that the town was formerly defended with walls, and that a section of the town walls may have been in the Sandgate area, although there was some doubt as to whether these walls were ever completed. The archaeological watching brief took place over four days and monitored the excavation of foundation trenches and service-runs at the site. A stone built culvert of an uncertain date was uncovered in close proximity to the south-west end of the building. Otherwise, no significant archaeological remains were uncovered. [Au(abr)]

The watching brief revealed a remarkably deep sequence of deposits, primarily the result of the demolition of the school and earlier phases of tipping or demolition, perhaps intended to level the ground or raise it above the flood plain of the nearby river. Beneath these layers were preserved medieval soil horizons containing a large collection of pottery, principally of late-12th to 14th century date. Cut into this deposit and the natural clay beneath were a cluster of linear features and pits, probably of 17th or 18th century origin but of uncertain purpose. They appeared to be on the same alignment as the current properties. [Au(abr)]

A desk-based assessment revealed that a single building stood on the site from 1770 to 1787. The watching brief revealed a thick and largely sterile later of subsoil. Evidence of their demolition was also represented by a thin later above the cu, with; the only other cut features for 20th century drains. Flagstones present in both the east and west sections appeared to have related to yard surfaces that post-dated the early buildings A small deposit of brickearth-like sediment was noted in the south-west corner of the site which produced a sherd of medieval pottery. Other medieval pottery was also recovered from the subsoil but was residual. [Au(abr)]

Clark, S & Elsworth, D Ulverston : Greenlane Archaeology Ltd, 2008, 27pp, colour pls, figs, tabs, refs

*Work undertaken by:* Greenlane Archaeology Ltd

As part of a series of alterations to Ulverston Parish Church a programme of archaeological work was carried out. This comprised a watching brief of ground works relating to the removal of an outbuilding and construction of a new toilet facility, and the recording of the walls during maintenance work inside the church tower. The earliest surviving fabric in the church is the Norman doorway which is probably 12th century and all that remains of the original building, said to have been built in 1111. It is recorded that the present church replaced an earlier one, which collapsed in a storm in 1540, and was rebuilt using material taken from several local monastic sites, although this too has seen several phases of later repair and extension during the 19th century. The watching brief was only carried out once the former outbuilding had been demolished and the foundation trench excavated, rather than actually during excavation. No definite archaeological features were encountered although some disarticulated human remains were found within the topsoil. A V-shaped cut feature was, however, observed beneath the tower, but this was considered most likely to have been excavated to provide access for a pipe between the boiler room and the earlier outbuilding. **WALLEND FARM, GREENHEAD*****Archaeological Watching Brief at Wallend Farm, Greenhead, Cumbria***

Horn, R Alston : North Pennines Archaeology Ltd., Report: CP/785/08 2008, 18pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

In September 2008 an archaeological watching brief at Wallend Farm was undertaken. The site lay in a zone of archaeological sensitivity, between Hadrian's Wall and the Hadrian's Wall Vallum, within the Hadrian's Wall World Heritage Site. The work was requested following a planning application for the construction of an extension at the site. The works involved the excavation of five foundation pits 1.10m in width, 1.80m in length and 1.20m in depth, to hold the supports for an extension to one of the farm buildings. No archaeology was observed within any of the foundation pits and no archaeological finds were recovered. This was

consistent with previous works carried out on the site. Due to the continuing high archaeological potential of the area, and the status of the site as part of Hadrian's Wall World Heritage site, any further development in the area should be subject to a programme of archaeological investigation. *Work undertaken by:* Oxford Archaeology North

An archaeological evaluation was carried out in February 2008. This comprised the removal of modern surfacing over the maximum feasible area of the site. Results confirmed well preserved buried remains of archaeological interest survived in-situ, namely the remains of early 19th century workers' dwellings. Detailed excavation was carried out in March 2008, and exposed further archaeological remains of high local, or even regional significance. In particular, the remains of early 19th century back-to-back dwellings, together with evidence for their subsequent remodelling, possibly undertaken under local authority control in an attempt to improve the sanitation and living conditions of the urban poor. The investigation provided a detailed mitigation record of the buried remains of archaeological significance across the site in advance of their potential destruction. [Au(abr)]

*Work undertaken by:* University of Manchester Archaeological Unit

The watching brief observed the construction of a cycle path and handrail on the northern side of the ditch, the construction of a footbridge across the ditch and the clearing of modern detritus from within the ditch. The archaeological monitoring did not identify any significant archaeological remains during groundworks and indicated that no significant disturbance was made to archaeological deposits forming part of the earthwork. The profile of Nico Ditch was also retained and was not altered during the clearing of modern detritus from within the ditch. [Au]

The detailed excavation of the iron and brass foundries was completed in December 2007, although an archaeological watching brief was maintained until August 2008 during earth-moving works associated with the development. The excavation allowed a detailed record to be compiled of an industrial complex that represents the evolution of Rochdale as an industrial town, which during the early 19th century developed an engineering industry of national importance. In particular, the buildings can be linked to the Petrie family, who earned repute as manufacturers of textile machinery. It was recommended that the results obtained from the archaeological investigation were disseminated to the wider public, including the installation on site of a permanent information board. Middleton, P Lartington : Archaeo-Environment Ltd, 2008, 151pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeo-Environment Ltd

In April 2008 an intermittent watching brief was undertaken during a programme of geotechnical test pitting across the area of the planned Phase I development. A total of ten trial pits and twenty four contamination trial pits were dug across the site. Of the latter, seven were at basement level and seventeen were at podium level, the height of the former station platform. The test pits and podium level trial pits provided some indication of the construction and form of the former station but it was the seven basement level pits which were important with regards the potential survival of archaeological remains. The depth of archaeological

deposits across the site was found to be less than 1.00m in most cases. These deposits were primarily mixed demolition debris and rubble with indication of structural remains found in only one trench. This would suggest that the site was levelled and graded prior to construction of the station. However, deeper foundations and wall footings may be preserved, especially on the east side of Greengate. It was proposed that a phase of archaeological evaluation of 28 trenches should be undertaken covering all three phases of the proposed development. Additional trenches may need to be considered for the western end of Phase 3. In addition, a programme of archaeological building recording was recommended for the standing structures due for demolition. These included the buildings on the east side of Greengate and the structures associated with the former Exchange Station. [Au(abr)]

### **STOCKPORT MARKET PLACE, PHASE 1 AND 2**

#### ***Stockport Market Place, Phase 1 and 2 : An Archaeological Watching Brief and Excavation***

Gregory, R & Arrowsmith, P Manchester : University of Manchester Archaeological Unit, 2008, 61pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Manchester Archaeological Unit

An archaeological watching brief was undertaken at the site of Stockport Market Place as a prerequisite to the Phase 1 and Phase 2 refurbishment of the Covered Market. The watching brief identified a 19th century levelling layer, an area of cobbling forming part of the surface of the Market Place prior to the construction of the Covered Market, a possible old ground surface predating the construction of the Covered Market and a hollow area which may mark the site of the late-17th century early 18th century meal and cheese house. During the watching brief the remains of a small rectilinear structure was also discovered which, was subject to a further stage of excavation. The excavation indicated that the structure was defined by a sandstone wall, had a clay floor and was constructed during, or after, the early to mid-18th century. Artefacts recovered from its interior implied that the structure had been demolished and backfilled during the 19th century. Based on the available dating evidence and the known history of the site it is most probable that the rectilinear structure formed an 18th century addition to the pre-1680 colonnaded Market House which stood in the western end of the Market Place until its demolition during the early 19th century. The overall arrangement suggested that it formed the remains of a room which was used for cold storage, and in the context of the Market Place the most likely commodity stored in this room was cheese. ### **BRAMHALL HALL PARK, BRAMHALL, STOCKPORT**

#### ***Bramhall Hall Park, Bramhall, Stockport: An Archaeological Evaluation and Watching Brief***

Wilson, P, Garratt, R & Grimsditch, B Manchester : University of Manchester Archaeological Unit, 2008, 70pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Manchester Archaeological Unit

An archaeological evaluation and watching brief was carried out at Bramall Hall Park. It was recognised that the evaluation area had been modified in the relatively recent past by the introduction of drainage features and a series of square-cut posts. However, ceramics were discovered dating possibly to the 13th century and up to the 18th century. Brick material dating from the 16th and 17th centuries was also located. The ceramic evidence may point to an occupation predating the earliest surviving, late medieval, remains of the hall, whilst the bricks may derive from the demolition of the west wing of this building during the late-18th century. The bricks derived from two distinct chronological phases possibly hinting the west wing had undergone repairs later in its life. Features truncating deposits of sand and gravel positioned in the western area may suggest the location of possible beam slots, and thus the position of early structures close to the hall. Observations made during the watching brief through Carr Wood and along Hall Road yielded a complete dearth of archaeological evidence. Findings revealed geological deposits only rather than any evidence of a medieval park pale or structures associated with the hall. Earlier results from a geophysical survey augmented these findings. *Work undertaken by:* Oxford Archaeology North

The application site was of historical and archaeological interest. In particular, it was known to have been occupied by a corn mill from at least the late-12th century, and was converted for use as a textile bleaching works in 1874. Rapid development then ensued, the bleach works closed during the early 1930s, and the site was acquired by the Standard Chemical Co. The site was derelict since 1996, and the buildings deteriorated considerably. A programme of archaeological investigation was carried out in November 2007. A building survey concluded that the majority of the buildings occupying the site had been remodelled to varying degrees during the 20th century, some fabric survived in the buildings that were to be retained as part of the development. The survey was followed by excavation of several targeted trenches. Initial results demonstrated that buried archaeological remains survived in situ across the southern part of the site. The extent and location of trenches placed in the northern part of the site was restricted by stockpiled demolition material, although the excavation of two short trenches revealed archaeologically sterile deposits; the north-western part of the site, however, awaits evaluation. Significant remains of the former corn mill and the bleach works, including the well preserved remains of two 19th century waterwheels, were exposed during the course of the further investigation. This led to a temporary suspension of the archaeological fieldwork whilst the options for the consolidation and long-term management of the waterwheels were considered. [Au(abr)]

*Work undertaken by:* York Archaeological Trust

A watching brief observed no activity earlier than the 16th century hall. Previous work had identified potential Iron Age settlement. Several buildings predating the standing hall were identified of probable late medieval/post-medieval date were found in the evaluation. The watching brief observed three possible internal divisions. A very degraded timber was found running from the western corner of the chimney breast and fireplace set in the south wall. A building survey, which could not directly examine the upper story, found that Phase II of the timber framed house of c.1556 was clad in coursed, slabbed rubble in Phase IV. [Au(adp)]

***Archaeological Recording***

Frost, P Pontesbury : Castlering Archaeology, Report: 295 2008, 32pp, colour pls, figs, tabs, refs

*Work undertaken by:* Castlering Archaeology

Archaeological recording was carried out on site of the former Crosse Hall Mill Farm, Chorley. Once part of the Crosse Hall Estate established by Richard Crosse in the early 15th century, it now lay within the residential development known as "Rivington View". A desk-based assessment of the site in 2005 confirmed that the ground plan of the mill/farm complex survived on the site almost in its entirety as recorded on the 1839 Tithe and subsequent OS maps. The first edition OS map of 1844-7, recorded Cross Hall Mill as the site of a madder mill, processing madder for dyestuffs. Cotton manufacture arrived in the town of Chorley by the mid-18th century and associated water-powered industries were soon established. By 1894 however, the mill had returned to farm use. Although the site of the farm/mill had been subjected to stone robbing over a period of over 50 years, substantial structural remains survived. The recording showed that the ground plan of the main buildings on the mill/farm complex survived. The structural remains suggested that they represented the "messuage, watercornmill or grist mill called Crosse Hall Mill" leased from Richard Crosse in 1788. No evidence of occupation of the site prior to this date was revealed. The foundations appeared to represent the "house, outhouses, edifices, buildings, barns, stables, watercourses and sluice" mentioned in the 1788 lease. Rebuilding work on the site took place after milling ceased. The mill wheel was removed and the water presumably diverted back to the Black Brook. The millrace was allowed to silt up and the stone culvert adapted to contain the flow of water that would have seeped in from the former reservoirs. The final building phase appeared to have been the conversion of the former mill to the shippon. Following the excavation and archaeological recording work, minor structural remains such as the concrete base and the east wall of the shippon were taken down to the agreed site level. Elsewhere structural remains were preserved in situ. The site was to be covered in topsoil and mounded over before seeding in order to form a "green area" within the housing development. [Au(abr)]

**THE POTHOUSE, LUNESIDE EAST*****Archaeological Watching Brief at the Pothouse, Luneside East, Lancaster***

Jackson, D Alston : North Pennines Archaeology Ltd., Report: CP/758/08 2008, 26pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

An archaeological watching brief was undertaken on the site of The Pothouse, within the former St. George's Works complex on St. George's Quay, Luneside East. The work followed a detailed excavation of the main pottery complex including the central kiln in the autumn of 2007. The remains of the Pothouse, and associated pottery assemblage, were of regional, if not national, importance. The work constituted the excavation of four trenches and five test pits both by machine and by hand, which were specifically targeted in order to gain the maximum amount of information within the restraints of the work timetable. The work also included a limited investigation of the kiln working area and the retrieval of c.290 litres of pottery from the shadruck deposits. Most of the results obtained during the watching brief served to support the conclusions drawn from the excavation conducted in 2007. However, a further shadruck deposit, separate to those located during 2007 was identified and investigated. More importantly, this newly exposed pottery dump not only contained examples never before attributed to Lancaster, but also contained styles which may have been unique to that factory. The Lancaster Pottery provided the rare opportunity to investigate a delftware site which has been largely undisturbed for over 200 years. However, there was still much to be learned from this important site. Therefore, it was recommended that further investigation and research be strongly considered. [Au(abr)]

*Work undertaken by:* Lancashire County Council Archaeology Service

The church was located at the south end of the village of Slaidburn. It was a Grade I Listed Building, and was described as of early and late-15th century date, with early 17th century alterations. It seemed probable that there was a Norman establishment here, and just possibly a pre-conquest site. On arriving at the site, it was clear that extensive works had already been undertaken, it was apparent that there had been no archaeological supervision or even presence. Inside the church two box pews, formerly located in the two western corners of the church, had been mainly removed, only leaving the side panelling attached to the church walls in position. Both of these pews appeared to have been significantly raised above the level of the pews in front of them. The pews and floors in front of the removed box pews had started being altered, before work was halted. A detailed survey was not undertaken only an outline Level 1 record. Upon arrival it was clear that the external drainage works were almost complete, with a new drain having been inserted under the path around the west end of the church and continuing under the path through the graveyard south of the church and into the churchyard extension to the east of the church. The exterior trench for the drain link through the south wall had been also been completed, running between two marked graves. The trench and pipe work for the link through the west wall was undertaken [without supervision] whilst the interior works were being inspected just north of the listed cross shaft. Considerable amounts of bone and several human teeth were in plain evidence across the churchyard, both in the extant spoil heaps in the material of the pathway, and even a few scraps loose on the grass. These may have been the result of spillage/tracking. [Au(abr)]

Trippier, J M Bolton : J. M. Trippier, 2008, 34pp, colour pls, figs., tabs, refs

*Work undertaken by:* J. M. Trippier

An archaeological watching brief was undertaken at Little Broad Oak Farm, Penwortham. Little Broad Oak Farm was a former farmhouse with possible 16th or 17th century origins. The remnants of some brick footings, which formed a westerly extension to the north wall of the farmhouse, were noted. It was apparent from the cartographic evidence that this extension was present in 1948 but demolished before 1891. The brick sizes suggested a late-17th or 18th century date for its construction. A ditch with a modern drain and a silage pit were also noted in the orchard area to the north of the house. [Au(abr)]

*Work undertaken by:* Oxford Archaeology North

The excavation revealed details of both of the known major monuments of the sea walls and docks. The excavations revealed a fragment of sea wall and also phases of surfacing and warehousing which appeared top have had a relatively short period in use before modification. The dock walls, for the most part, survived in almost perfect condition, and to their full height, indicated by the presence of granite coping stones with Hartley locking stone pattern. The full depth of the walls was never revealed. The majority of infill used in reclamation was a mix of quarry waste and material purpose dredged from the river bed.

Limited numbers of ceramic and clay pipe fragments did find their way into this material.

***Liverpool Canal Link, LC1-3, Mann Island, Liverpool. Post-excavation Analysis Project Design***

Raynor, C Lancaster : Oxford Archaeology North, 2008, 46pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology North

The excavations revealed details of both the known major monuments, and additional structures which did not feature on maps and had not been documented previously. The excavations revealed a series of sea walls, and also temporary reclamation walls, which provided long and short term sea defences, at various stages in reclamation. The walls appeared to have survived in near perfect condition and almost to their full height of c.5m. The dock and sea walls carried in style, with the sea walls constructed from yellow sandstone and the docks from less brittle pink variety. A number of alterations and additions to the dock walling were apparent. Manchester Dock, and its associated warehouses, survived in excellent condition, less than 1m below the modern ground surface. ***Mann Island, Liverpool, Merseyside. Archaeological Post-Excavation Assessment Report***

Quartermine, J Lancaster : Oxford Archaeology North, Report: 2008-9/898 2008, 65pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology North

The excavation took three forms, a watching brief on trenches excavated by the construction engineers to assess ground conditions, mechanically assisted excavation of areas of complex building remains and bulk excavation by machine of infilled ground areas of complex building remains, and the bulk excavation by machine of infilled ground behind sea walls and within redundant docks. Details of the construction of each of the major features was revealed. In most instances, the dock and sea walls were all remarkably well-preserved, to almost their full original profile. Walling of the Dry Dock, George's Dock Passage, Manchester Dock and three successive sea walls was located, showing developments and variations in construction technique and material over a period of less than 50 years. **GIN PIT, TYLDESLEY*****Gin Pit, Tyldesley, Greater Manchester: Building Investigation and Excavation Draft Report***

Plummer, A Lancaster : Oxford Archaeology North, 2008, 104pp, colour pls., figs, tabs, refs

*Work undertaken by:* Oxford Archaeology North

The study area comprised the former site of the Gin Pit Colliery, which was part of an important landscape comprising evidence of medieval and subsequent mineral extraction. The 19th century pit bank or 'heapstead' structure was possibly a unique survival of its type in the North West, and a desk-based assessment demonstrated that the pit's history was well documented from the mid-19th century onwards. Tithe maps show the railway connecting the pit to the nearby Bridgewater canal alongside early buildings, and map coverage from 1894 until 1952 clearly demonstrated the subsequent development of the colliery. Moreover, the name Gin Pit suggested that it originally had horse-powered winding gear, which implied that the colliery was older than the 1840s date indicated by the documentary evidence. The amount of documentary evidence, the potential antiquity of the pit, the level of survival of the colliery buildings, and the presence of the buried remains of the entire pithead [at pit brow level], greatly enhanced the importance of the site. As many of the nearby collieries had now been demolished, the colliery remains at Gin Pit represented a rare survival of part of the historic industrial landscape of Greater Manchester, and the site thus assumed greater local and regional significance. Adcock, J Thornton : GSB Prospection, Report: 08/57 2008, 12pp, colour pls, figs, tabs, refs

*Work undertaken by:* GSB Prospection

The up-stream section of the leat and part of the mill lay beneath unsurveyable vegetation, but even in the accessible areas it was not possible to identify in-situ structural remains or clearly define the footprint of Sutton Mill. The lack of coherent responses was thought to be a combination of the construction materials used within the fabric of the mill and site clearance and/or redistribution of structural material as part of the post-demolition landscaping. The leat also proved elusive, being unidentifiable around the mill structure itself and only faint indications of possible culvert structures apparent beneath Coppull Lane. [Au(abr)]

Gregory, R Manchester : University of Manchester Archaeological Unit, 2008, 52pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Manchester Archaeological Unit

An evaluation and subsequent open-area excavation was undertaken at the site of Dicconson Mill. The most significant remains uncovered were confined to the southern portion of the site and formed part of a spinning mill, which was located on the northern side of the River Borsdane. These remains included the boiler house and engine house of the mill and a privy tower. The excavation also uncovered a number of ancillary structures located to the north of this mill. These included four unusual stone vaults, the walls of a weft house and the partial remains of an engine house. Which powered the looms in an early 19th century weaving shed. [Au(abr)]

**8 BLACK LION STREET, BRIGHTON*****A Geoarchaeological Watching Brief at 8 Black Lion Street, Brighton, East Sussex***

Pope, M Portslade : Archaeology South-East, Report: 2008052 2008, 42pp, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

In February 2008 contractors began work on removing a concrete raft from the basement of No. 8 Black Lion Street, monitoring took place during this work. The recorded sequence was identical across the whole extent of the basement and simply comprised decalcified Head Gravel. The rounded nature of these gravels suggested the possibility of some fluvial reworking of the gravels at this location. It was noted that a small percentage of the gravels were heavily rolled but not to the extent that would suggest inclusion in a beach gravel. The conclusion was reached that a component of the gravels within the Head Deposits were introduced through high-energy flow, perhaps as part of the bedload of braided channels forming on the flanks of the Steyne valley during the quaternary. These fluvial deposits were then reworked through solifluction to cover the coastal plain in this locale. No sampling was undertaken given the shallow, decalcified and high-energy nature of the exposed deposits. On the basis of conversations with ground workers at the site it was established that decalcified gravels existed at a depth of 2m OD below the basement surface. These were encountered during the excavation of a drainage sump during an earlier stage of the work. [Au(abr)]

**FALMER INFRASTRUCTURE WORKS*****A Geoarchaeological Watching Brief for SEEDA Funded Falmer Infrastructure Works, East Sussex Watching Brief on Geotechnical Investigations***

Pope, M &amp; Peyre, L Portslade : Archaeology South-East, Report: 2008171 2008, 23pp, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

A geoarchaeological watching brief was carried out as a first stage in the evaluation of the area of proposed infrastructure works for the Community Stadium project at Falmer. A series of 27 geotechnical test pits were monitored close to the line of the A27 trunk road and within part of the north eastern portion of Stanmer Park. The investigation revealed an unpromising

sequence of made ground and re-deposited head deposits disturbed or emplaced during the building of the A27 dual-carriage way. However the line of the proposed works located within Stanmer Park revealed a partially disturbed dry valley sequence offering archaeological and palaeoenvironmental potential. This sequence was expected, at least in part, to correlate with multi-phase solifluction and fluvial deposits more recently investigated at Woollards Field, 1km to the south of the site. Pleistocene sediments recorded here offered modest potential for Palaeolithic archaeology, preserved Holocene colluvium and land surfaces but poor preservation of palaeoenvironmental indicators. Brighton & Hove Archaeological Society Field Unit Brighton : Brighton & Hove Archaeological Society Field Unit, 2008, 51pp, colour pls, figs, tabs, refs

*Work undertaken by:* Brighton & Hove Archaeological Society Field Unit

Other than an area of burning and large volumes of fire cracked and burnt flint together with large quantities of cooking pot sherds, no evidence to confirm a detached kitchen were found. The burnt area did not represent the remains of a hearth as it was situated within an east-west ditch, dated from pottery found therein to have been extant from c. 1200-1350. An in-situ cooking pot found close by the burnt area was similarly dated. Whilst the evidence suggested a fire on the site [French raids along the coast were known at this time, particularly in neighbouring Rottingdean and Brighton], further archaeological investigation was necessary to confirm this. As no remains for a hearth, or hearths were found, it was evident that excavations to date had been outside, rather than inside, buildings. However, as the natural geology [and the apparent man-made platform on which the site appeared to be sited] was of chalk, geophysical survey results were inconclusive, other than in the area known to be a house. No sign of a hearth was apparent from geophysical survey. [Au(abr)]

**OVINGDEAN**

***Ovingdean Excavations 2008***

White, C Brighton : Brighton & Hove Archaeological Society Field Unit, 2008, 1p

*Work undertaken by:* Brighton & Hove Archaeological Society Field Unit

Excavations were undertaken in Ovingdean on a known medieval manorial complex which appeared to be enclosed by earthworks within a field known as Hog Croft to the immediate north of St. Wulfran's Church. Excavations undertaken in 2002 and 2006 had located a manorial dwelling house dating to the 13th century, several tumbled walls sited at a distance from the house and a well. Towards the end of the 2006 season an area which produced copious amounts of animal bone and cooking pot sherds was provisionally interpreted as a detached kitchen. The purpose of the 2008 excavation was to further investigate this possible kitchen area. Other than an area of burning and large volumes of fire cracked and burnt flint together with large quantities of cooking pot sherds, no evidence to confirm a detached kitchen were found. The burnt area was unlikely to be the remains of a hearth, it was situated within an east-west ditch, dated from pottery found to have been extant from c.1200-1400. An

in-situ cooking pot found close by the burnt area was similarly dated. Whilst the evidence indicated the possibility of fire on the site (French raids along the coast are known at this time, particularly Rottingdean and Brighton which are nearby), confirmation would require further archaeological investigation. A series of three rectangular post holes were identified, the second of which displayed evidence of a post pipe. These appeared to run roughly north-south. A fourth post hole, of similar dimension to the first three, was located approximately six metres to the east. A beam slot to accommodate an angled timber was located in close proximity to the series of three post holes. This evidence may indicate an earlier phase of occupation on the site. However, when the building was removed in antiquity, the voids were backfilled almost immediately as indicated by a lack of stratigraphic layers and there were very few finds therein. The east-west ditch cut this earlier building and was therefore a later phase of occupation. [Au(abr)]

Funnell, J Brighton : Brighton & Hove Archaeological Society Field Unit, 2008, 1pp  
*Work undertaken by:* Brighton & Hove Archaeological Society Field Unit

A visit was made to the site on Saturday 19th April 2008. The trenches for the footings had already been dug. The trenches adjacent to the house were down to chalk level and no incursions or archaeological features were noted cutting into the natural bedrock. Other trenches relating to an extension to the existing patio did not reach chalk. An examination of the sides of the footing trenches found only cuts made previously for utility purposes. The up-cast from the digging was examined, but produced only a single white patinated hard hammer struck flint flake, possibly of Late Neolithic date. [Au(abr)]

*Work undertaken by:* Archaeological Research Services

A watching brief was undertaken at St. Michael's Church, Steeple Claydon during groundwork for the construction of the new parish room. A large quantity of disarticulated human bone fragments were recovered during ground reduction and the excavation of foundation trenches. These were retained at the church for reburial. Two partial skeletons were uncovered during excavation of a new septic tank. These were of probable 18th or 19th century date, and the only obvious sign of pathology was some tooth decay to one of the skeletons. They were removed under faculty and retained at the church for reburial. No archaeologically significant finds were observed during this watching brief, but five 19th century tombstones that had been reused as a footpath outside the vestry were noted, and fragments of 19th and 20th century pottery, glass and ceramic grave markers were also observed. ***Watching Brief. The Homestead, Eyethrope Park, Waddeson***

Richards, J Milton Keynes : Archaeological Services & Consultancy Ltd., Report: 1089  
2008, 33pp, colour pls, figs, tabs, refs  
*Work undertaken by:* Archaeological Services & Consultancy Ltd.

The remains of a typical late-19th to early 20th century formal garden were recorded to the north of The Homestead, as well as a sunken garden to the south of the house. The pond embankment was found to have been constructed of redeposited natural clay, with the pond itself being lined with clay. No archaeological finds or features predating the 19th century were recorded during the watching brief. [Au(abr)]

*Work undertaken by:* Archaeology South-East

A watching brief was undertaken during the insertion of flood defences in Hastings. The work included the excavation of pipe trenches of an average width of 1.2 metres to a depth of up to 3 metres in addition to topsoil stripping of the area for the location of the compound. The sections of excavation work undertaken along the route of road and pathways revealed no archaeological deposits. A void space uncovered in front of the Angel pub was found to have originated from settled backfill of an earlier sewerage pipe trench. In the grassed area at the north of the compound site a deposit of degraded concrete suggested that a structure may have stood on the site in post medieval or modern times. This possible foundation was not investigated further as no further impact by the works was anticipated. [Au(abr)]

#### **BEDDINGHAM**

***Finds from Beddingham***

Funnell, J Brighton : Brighton & Hove Archaeological Society Field Unit, 2008, 1p  
*Work undertaken by:* Brighton & Hove Archaeological Society Field Unit  
 Fieldwalking uncovered considerable quantities of fire-cracked flint in a field located west of Preston Court Farm. The flint appeared extremely concentrated on the southern, upper reaches of the field where it created almost a pathway. This may possibly have been the location of a ploughed out flint cairn. A further visit to the field on again noted numerous pieces of fire-cracked flint. The concentration of flint appeared to be focused in a shallow depression on the side of the hill. The field was known to contain a small Roman building, possibly associated with the large villa complex excavated at Beddingham during the 1990s. The finds recovered also lay close to a known Saxon cemetery. Finds recovered included a Neolithic white patinated [oyster shaped] scraper. Fire-cracked flint, and 19 sherds of pottery. Three sherds of pottery were dated as Iron Age. Roman pottery discovered was a mixture of 3 fabrics, the predominant type was East Sussex Ware. The pottery, flint work and fire-cracked flint were supportive evidence for the archaeological remains and features known from this field. It would require further organised field walking and geophysical surveys to determine the exact nature and location of these features, and determine the accurate location of the "pathway" of fire-cracked flint. ***East Sussex County Council Archaeology Team Watching Briefs. Menival, 52 East End Lane, Ditchling***

Chuter, G Lewes : East Sussex County Council, 2008, 6pp, figs, colour pls, figs, tabs, refs

*Work undertaken by:* East Sussex County Council

The site lay in a designated archaeologically sensitive area defined because it lies within the historic core of the medieval and post-medieval village of Ditchling, as well as an area of prehistoric activity. Information by the architect managing this development was that only cutting of foundation trenches was taking place on the day monitoring had been arranged for. It was therefore surprising when on arrival at the site it was found that that the house had been demolished and substantial ground disturbance had taken place, comprising a series of rubble filled trenches and areas of ground reduction, along with two large spoil heaps. Examination of the trench section at the eastern side of the site recorded three horizons within the Folkestone Beds Sand geology. The top horizon contained fragments of chalk, flint and a number of archaeological artefacts. These artefacts included ceramic building material, and medieval pottery. The middle horizon comprised a number of pieces of prehistoric flintwork, including a Mesolithic/ Neolithic scraper and a Neolithic blade. The lower horizon contained a small quantity of prehistoric flintwork. Examination of an area at the southern end of the site recorded a number of pieces of prehistoric flintwork. It was likely that further reduction of this area would produce more artefacts and possibly associated features. Examination of both spoil heaps recovered further pieces of prehistoric flintwork and ceramic building material. The site had clearly been the focus for activity in the late Mesolithic/early Neolithic period and this activity based on evidence from the wider landscape was likely to be in the form of a seasonal hunting camp. Later activity relating to the medieval village of Ditchling was attested by the recovery of medieval pottery and ceramic building material. [Au(abr)]

**FIRLE RESERVOIR AND POVERTY BOTTOM [NORTON PUMPING STATION]**

***Archaeological Interim Report: An Archaeological Evaluation and Watching Brief: Pipeline Between the Firle Reservoir and Poverty Bottom [Norton Pumping Station], East Sussex  
Lewes District***

Grant, K & Russell, C Portslade : Archaeology South-East, 2008, 9pp, figs, refs

*Work undertaken by:* Archaeology South-East

Although the topsoil strip uncovered a few residual finds ( a few worked flints, some potsherds and some ceramic building material) which were collected for analysis and dating, no archaeological cut features were observed during the works around the new compound area. The easement topsoil strip began in Area A [ Poverty Bottom compound] and was

continuously monitored through to Area I [ Firle Reservoir]. Several finds, including some CBM fragments, potsherds and worked flints, were collected from the topsoil deposits in each area. Although Areas A and F revealed no potential archaeological features, Areas B, C, D, E, G, H and I revealed possible archaeological features (including several wide linear features which seemed to correspond with recorded cropmarks and a few small pits containing prehistoric finds). Abundant plough scarring was visible down to the chalk bedrock to varying degrees in all of the areas. This is likely to have caused heavy plough damage and would have affected the survival of archaeological remains. [Au(adp)]

**POVERTY BOTTOM TO FIRLE WATER MAIN*****Poverty Bottom to Firle Water Main. Archaeological Field Walking Survey***

Ralph, S Buckingham : Network Archaeology, Report: 403 2008, 56pp, figs, tabs, refs  
*Work undertaken by:* Network Archaeology

A field walking survey was undertaken of a proposed pipeline route. The survey aimed to provide dating evidence for a field system seen on aerial photographs, as well as to identify any previously unknown sites. Field walking covered 1.6km of the Proposed Route and 745m of a Route Option designed to avoid a badger set. A total of 74 finds were recovered including ceramic building material, post-medieval pottery, a sherd of unidentified pottery, six iron objects, two copper-alloy cartridge cases, glass, burnt flints and two pieces of ironstone. The field walking survey produced no additional sites to those already identified in an earlier desk-based assessment. Dating evidence for the field system was not found, though a single sherd of Roman or medieval pottery was recovered from the same plot. From the twenty-one sites identified in the desk-based assessment, the proposed route directly impacted upon one regionally important site [an Iron Age or Roman field system at Gardener's Hill], and seven locally important sites. The Route Option directly impacted upon one regionally important site [an Iron Age or Roman field system at Gardener's Hill]. Recommendations were made for the consideration of trench evaluation in advance of construction, and also for a watching brief during construction. [Au(adp)]

**10 HIGH STREET, NEWHAVEN**

***East Sussex County Council Archaeology Team Watching Briefs. 10 High Street, Newhaven***

Chuter, G Lewes : East Sussex County Council, 2008, 4pp, colour pls, figs

*Work undertaken by:* East Sussex County Council

The site was located within the medieval and post-medieval town of Newhaven [formerly Meeching]. The area had produced evidence of occupation during the Palaeolithic and Romano-British periods. Initial site clearance/groundwork exposed a brick built chamber or tank with an arched roof, of probable 19th/20th century date. Evidence was also seen, in the form of residual/disturbed flint gravel, that the underlying geology at this location was either clay with flints or river terrace gravel. This was important given the discoveries of in situ Palaeolithic material in a similar deposit recorded during archaeological excavation 100m to the south. As the proposed extension was to be built on a raft foundation and no further ground reduction was required, further monitoring was not carried out. [Au(abr)]

**PEACEHAVEN**

***Excavations at Peacehaven***

Birks, S Brighton : BHAS, 2008, 1pp, figs

*Work undertaken by:* BHAS and MSFAT Field Units

Phase 2 excavation of a barrow on Peacehaven Heights took place in 2008. The barrow was located very close to the cliff edge and would shortly be lost to cliff erosion. The north-west quadrant of the mound was the focus of the excavations. Earlier excavations of this same quadrant in 2007 revealed that the mound had been used during World War II for military purposes. Two slit trenches had been dug by soldiers into the centre effectively removing large quantities of the interior of the earthworks. The trenches were part of the coastal defences used to protect the radar station that once stood adjacent to the mound. The excavations revealed that the large mound (evident in 2008) covered a smaller mound with an approximate 8m radius. This comprised layers of local sandy/clay deposits as well as flint [both worked and unworked], pebbles and pieces of sandstone. Around three thousand pieces of worked flint and waste flint flakes were collected for analysis. The flint work was of mixed period, Mesolithic, Neolithic and Bronze Age, and included scrapers, piercers, blades, cores, an axe rough-out and a possible Neolithic arrowhead. Some 40 sherds of pottery were also recovered, most of which were prehistoric. Some were of typical Bronze Age fabric with some possibly being Beaker. Other sherds were probably Iron Age and Roman. The excavation failed to produce any evidence for a central burial, but a sherd of green glazed pottery deep in the centre along with two pieces of clay pipe in the layers above it suggested the centre of the barrow has been disturbed, probably by Antiquarian robbers from the 1700-1800s. The robber trench probably corresponded with one of the craters in the mound just beyond the excavated area. Beyond this intrusion and below the flint layers a number of small pits were found containing burnt stone, charcoal and pot sherds. Although no cremated bone appeared to have survived, these were probable cremation pits. Pottery and charcoal was taken from these features for dating. A number of stake and post holes were also revealed adjacent to and around the pits, which possibly indicated grave markers or some other funerary or earlier structure. To date only one quadrant had been excavated, so further excavation would be needed to have the full plan of these features. Several soil samples were removed for further investigation along with several, small charcoal samples. No ring ditch was evident but shallow scoops had been removed from the clay in an area where the ditch might be expected. The clay was difficult to excavate with modern metal tools and it may have proved too difficult for the barrow builders to dig a ring ditch. The evidence suggested that they brought in soil from the surrounding area instead and they made a mound from that. Initial analysis suggested the finds would confirm this to be a Bronze Age funerary monument. [Au(adp)]

### **HORSESHOE PLANTATION**

#### ***Flint and Other Finds From Horseshoe Plantation***

Funnell, J Brighton : Brighton & Hove Archaeological Society Field Unit, 2008, 2pp

*Work undertaken by:* Brighton & Hove Archaeological Society Field Unit

Horseshoe Plantation contained what appeared to be some form of prehistoric enclosure. The circular ditch enclosed a proliferation of flint-work and fire cracked flint. The lack of earthworks associated with the ditch was deemed odd. The lack of a central mound suggested that it was not a burial mound, and a lack of any depression indicated that the interior had not been investigated in the past. The absence of any earthworks for a surrounding bank raised the question about where the earth from the ditch creation was re-deposited. The earthwork lay immediately adjacent to an ancient parish boundary and a dip in the straight line of this boundary towards the feature suggested that it was used as an ancient marker. A total of 33 flint flakes were discovered. [Au(abr)]

*Work undertaken by:* East Sussex County Council

The site was situated within an extensive multi period landscape comprising settlements and burial areas dating from the Neolithic, Bronze Age, Iron Age, Roman and Early Saxon periods. The foundation trenches were hand dug through an existing paved area. The trench section recorded a debris/hardcore layer below the former paved area. No archaeological features or deposits were observed and no archaeological artefacts recovered [although the spoil was not examined]. The watching brief was useful in recording elements of the former ground surface that existed prior to the construction of the Rookery Hill estate. This highlighted the potential for archaeological features to survive in situ on Rookery Hill. [Au(abr)]

An archaeological planning condition was put in place due to this area of Norwich Beds sand geology being rich in finds of prehistoric and Roman artefacts, relating to permanent and semi permanent occupation. Archaeological monitoring was carried out on the foundation trench,

no archaeological features were recorded. Finds included a single piece of fire fractured flint, modern flower pot and ceramic building material. Although no archaeological features were identified, the fire fractured flint did indicate prehistoric activity in the immediate vicinity. The monitoring was also useful in recording in situ areas of the Norwich Beds that had survived unimpacted by modern development. [Au(abr)]

On arrival to the site the excavation of the trenches had been completed. There was an area of previous ground work disturbance for septic drainage arrangements. The property was in parts a converted Victorian stable block with flint and mortar walls. There were minimal artefacts relating to the date of the building with just a few fragments of pottery and building material. There was no evidence of medieval artefacts which was surprising considering the very close proximity of a moated site [at the bottom edge of the property's garden]. This led to the consideration of whether the area of the Victorian development was cleared of the surrounding topsoil prior to undertaking the building work. [Au(abr)]

***An Archaeological Excavation at Bodiam Castle, Robertsbridge, East Sussex***

Fallon, D Portslade : Archaeology South-East, Report: 2008022 2008, 37pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

An excavation was carried out at Bodiam Castle. A photographic survey of the entire revetment wall and the bridge abutment was carried out as an initial stage of this work. The excavation took place in advance of necessary preservation and repair works. Tree growth had caused extensive damage to the northern end of the revetment wall in the north-west corner of the moat. An excavation was required to establish the extent of this damage and the state of preservation of the remains of the wall. Accordingly, a single trench was excavated by hand. Initially, a deposit of topsoil was removed revealing a slump of the moat bank. This exposed a fragment of the revetment wall that, although damaged and unstable in places, was well preserved. As well as facing blocks, original layers of mortar and evidence for coursing within the rubble core had survived. The facing blocks to the north of the trench had chisel marks on their outward surface and on one of these blocks a mason's mark was recorded, in the form of an arrow pointing to the left, similar to those found in the gatehouse of the castle. **LODGE FIELD, BRIGHTLING*****Lodge Field, Brightling A Geoarchaeological Appraisal And Excavation of a Mesolithic and Multi Period Prehistoric Site, and an Assessment of the Results [MA Sussex University]***

Haken, B Brighton : University of Sussex, 2008, 53pp, colour pls, figs, tabs, refs, index

*Work undertaken by:* Bertie Haken

The topographical, geoarchaeological, and excavation strategy produced significant results in understanding the human activity and taphonomic processes that occurred in Lodge Field. The augering and profile transect supported the topographical evaluation, providing evidence for the location of buried soil under a lynchet in Lodge Field. The sandstone benches located on the north facing slope created a natural topographical feature where colluvium accumulated forming a plateau edge deposit, itself becoming a natural boundary allowing colonisation by plants and trees and later becoming a field boundary. The sandstone benches were also traced along Long Reach towards Brightling village. During the earlier and middle Mesolithic hunter gatherers utilising either the ridge ways or navigable river ways to exploit this landscape. The activities associated with the manufacture and repair of hunting equipment, suggested longer term activity processing of food and hides. Stake holes found also suggested processing being undertaken. The upper horizon of the Mesolithic soil was truncated presumably by vegetation and woodland clearance, or possible cultivation resulting in a colluvial plateau edge skirt along the edge of the sandstone bench. The early Neolithic flintwork in the colluvium above the buried soil suggested a transition to an intensification in farming activities from overpopulated areas on the Downs into areas utilised in the past creating Britain's first large agricultural landscape. The excavation of T1 and T2 provided detailed pedological and sediment description through the plateau edge deposits. TP1 indicated only a shallow ploughsoil at the top of the hill. TP2 and TP4 indicated a shallow ploughsoil over a weathered parent material. TP3 in the head of the minor dry valley produced a shallow colluvial brown earth deposit. Surface and excavated artefacts suggested that the likely activity areas were on the north edge of Lodge Field, probably further up slope and now eroded and displaced towards the lynchet, where the colluviation covered and sealed the preserved palaeosol. The flintwork distribution in the excavation supported this suggestion. This evaluation supported a model for the geoarchaeological investigation of archaeological sites with artefact scatters in the surrounding area. [Au(abr)]

*Work undertaken by:* JE Jacobs

A watching brief was undertaken on a series of test pits along with a review of borehole data, that formed part of the site investigation. The work was originally due to take place on the existing Waste Recycling Transfer Station (WRTS) site and a proposed Household Waste Recycling Site (HWRS). Only test pits in the existing WRTS were observed as it was not possible to access the proposed development area at the time of the watching brief. An examination was made of the proposed development area to establish the topography of the site and the presence of any upstanding archaeological remains. The results of the work did not identify any archaeological remains or artefacts. Both the WRTS site and the proposed development sit within the area of the removed hill face and any archaeological remains in this area, including possible palaeoenvironmental remains will have been destroyed. No further archaeological work was proposed in the area of the recycling centres. [Au(abr)]

Garland, N, Doherty, A., Clifford, T &amp; Allott, L Portslade : Archaeology South-East, Report: 2008048 2008, 25pp, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

Trenching initially followed the line of power cables across two fields. However, during initial excavation, a pit containing a high quantity of slag material, a possible Romano-British wall and an associated layer of burning was encountered. It was decided that these remains would be preserved in situ due to their significance to the area. The cable trenching was directed along a new route around the edges of the two fields. From this excavation three features were discovered. Two possible drainage channels discovered in trenching to the far south-eastern corner of the fields and a possible trampled trackway leading to the large slag bank, found in the far south-western corner of the fields. **GARDEN COTTAGE, ALCISTON*****East Sussex County Council Archaeology Team. Watching Briefs, Garden Cottage, Alciston***

Chuter, G Lewes : East Sussex County Council, 2008, 6pp, colour pls, figs, tabs, refs

*Work undertaken by:* East Sussex County Council

A watching brief was undertaken on a small rear extension to Garden Cottage. The area was a designated Archaeological Sensitive Area as it formed the historic core of the Saxon, medieval and post- medieval village of Alciston. During the medieval period the manor and village was held by Battle Abbey and was used as an agricultural grange. Remnants of this use survive at Alciston Court to the south of the church, where there was a medieval tithe barn

and dovecote. The post-medieval village [and possibly the medieval village] was a typical ribbon settlement, lining an important droveway linking the South Downs with the low Weald. The "village street" section of this droveway would have been fronted by a series of property plots, each containing a domestic building and ancillary agricultural/industrial structures. Elements of these buildings and property plots still survived in the village, such as the Old Clergy House adjacent to Garden Cottage. The extant building on the site had its origins in the 1920s. The foundation trenches revealed a garden soil varying in depth, being generally deeper further away from the present building. This increase in depth suggested that the garden soil partly comprised made ground, redeposited during the original construction of Garden Cottage. There was no obvious sign of the former land surface within this layer. A number of artefacts were recovered comprising mainly post-medieval ceramic building material, an undatable lead weight, a post-medieval livery button, and a single sherd of mid-late Saxon pottery. Below the garden soil lay the natural geology. No cut features were observed within this context. Use of a metal detector recovered a medieval copper alloy ring brooch from the garden of the house. The watching brief was useful in recovering a number of artefacts relating to Alciston's history. The mid-late Saxon sherd confirmed the occupation of the village during this period, a hypothesis that had previously only been supported by the style and date of the place name and its mention in the Domesday Book. It was surprising given the proximity of known medieval/post-medieval houses that artefacts of this period were not recovered from the foundation trenches. This lack of material [other than the medieval brooch] raised the possibility that either this was an empty plot during these periods or the occupation area lay closer to the road. [Au(abr)]

***An Archaeological Watching Brief of the Friston Forest Water Pipeline, Friston, East Sussex***

Butler, C Polegate : Chris Butler Archaeological Services, 2008, 29pp, colour pls, figs, tabs, refs

*Work undertaken by:* Chris Butler Archaeological Services

A pipeline was installed across part of Friston Forest and Lullington Heath National Nature Reserve in early 2008 as part of the Friston Forest Grazing Project. The pipeline passed along the edge of the Archaeologically Sensitive Area in Lullington Heath, and across a number of prehistoric field lynchets. A watching brief was undertaken during the work, with large quantities of prehistoric flintwork being recovered from along the entire route of the pipeline. Sections were also recorded through a number of the field lynchets. The dating evidence suggested that these field lynchets may have originated during the Bronze Age, although there was also evidence for earlier activity in the Neolithic period. Evidence was also recovered confirming the use of this area for training during the Second World War. [Au(abr)]

Chuter, G Lewes : East Sussex County Council, 2008, 5pp, colour pls, figs

*Work undertaken by:* East Sussex County Council

Detection of archaeological features during the watching brief was difficult due to the narrow width of the trench. No features were identified either in the trench section or by artefact rich spoil removed. A number of archaeological finds were recovered from the spoil, comprising a possible prehistoric flint core and a quantity of post-medieval ceramic building material. Prehistoric flintwork was not uncommon in this area and represented hunter/gather activity from the Mesolithic, Neolithic and Bronze Age periods. The ceramic building material was most likely to have been deposited during manuring of fields, suggesting they had been cultivated at some point in the past. [Au(abr)]

Greatorex, C Polegate : C.G. Archaeology, 2008, 45pp, figs, tabs, refs

*Work undertaken by:* C.G. Archaeology

A watching brief was maintained on groundworks associated with the construction of two new buttresses against the southern perimeter wall of Long Man Car Park. The walls of the village car park once formed part of a large barn. A significant quantity of late-18th to 19th century roof tile, probably associated with this barn (or at least a nearby building) was recovered from the excavated topsoil. Two sheep burials were found, both contained late-18th-19th century tile of a type identical to that found within the topsoil. Although the monitored groundworks did expose the flint base of the barn/car park wall, no evidence for a foundation trench or any other structural features was discovered. Cartographic sources confirmed that the perimeter walls of the barn/car park dated from at least 1725. No evidence was found to support a theory that the original barn was of late medieval origin. However, it was believed that a number of worked green sand and chalk blocks incorporated into the barn/car park walls were first used in the construction of the nearby Wilmington Priory complex. Greatorex, C Polegate : C.G. Archaeology, Report: 08/02 2008, 48pp, colour pls, figs, tabs, refs

*Work undertaken by:* C.G. Archaeology

A watching brief was maintained on works associated with the reordering of the west end of St. Dunstan's Church. It was believed that a previously unrecorded sandstone column base and associated plaster floor revealed during the project were remnants of the Norman church largely destroyed by fire in 1389. The fieldwork confirmed that two successive areas of tile flooring located at the north-western end of the church had been laid down in the later 18th-early 19th century. The cutting of a drainage trench across the churchyard exposed a single probable in situ inhumation [no excavation of the observed remains was required]. A small assemblage of disarticulated human bone was also gleaned from the removed topsoil. [Au(abr)]

Whittaker, D & Grant, K Portslade : Archaeology South-East, Report: 2008007 2008, 61pp, colour pls figs, tabs, refs

*Work undertaken by:* Archaeology South-East

An evaluation and watching brief was undertaken ahead of works on the Windmill Hill to Hazards Green Water Treatment Works. The watching brief focused on where the pipeline cut three roads with possible Roman/medieval origins. The evaluation revealed possible industrial activity of uncertain date in Trench 1, possible cart-ruts or industrial linear features of uncertain date in Trench 2 and evidence of a possible 19th century quarrying pit in Trench 3. The watching brief uncovered deposits associated with an ancient marine inlet together with posts associated with a possible Roman jetty. Finds dating from the 12th century to 19th century were recovered from the length of the pipeline. [Au(abr)]

**LITTLE MANOR, SELMESTON**

***East Sussex County Council Archaeology Team Watching Briefs. Little Manor, Selmeston***

Chuter, G Lewes : East Sussex County Council, 2008, 4pp, colour pls, figs

*Work undertaken by:* East Sussex County Council

The site lay within the historic core of the medieval and post-medieval village of Selmeston and was also in close proximity to a 5th-6th century AD inhumation cemetery. Groundworks comprised removing an old concrete base, reducing the ground level on the southern side and the digging of foundation trenches. In the area of the ground reduction, the ground appeared was disturbed or redeposited and contained a small assemblage of 19th/20th century tile and animal bone. The area of the removed concrete slab revealed a partially disturbed sandy clay mixed with beach pebble, the pebble was hardcore below the former slab. The foundation trenches within the slab area was above a subsoil or natural geology. No archaeological features or deposits were recorded within the development area. The builders recovered a single late medieval pot sherd from the base of a test pit dug in the ground reduction area. Two 20th century earthenware pot sherds were recovered from the spoil heap. It was likely that the ground surface on the site of the garage and the adjacent area had been raised at some point, most likely with spoil extracted during the construction of Little

Manor, which appeared to sit on a levelled terrace. It was therefore likely that if archaeological remains did or do exist in this area they were at a depth well below the impact of small scale development. [Au(abr)]b

***An Archaeological Watching Brief at Warbleton Priory, Rushlake Green, East Sussex [Cart Lodge]***

Butler, C Polegate : Chris Butler Archaeological Services, 2008, 20pp, figs, tabs, refs  
*Work undertaken by:* Chris Butler Archaeological Services

A watching brief was carried out during groundwork associated with the lowering of the ground level in the Cart Lodge and a new driveway at Warbleton Priory. The watching brief resulted in the discovery of a number of lime kilns, which although undated were probably associated with later modifications and building work at The Priory rather than the original monastic complex. A number of other post-medieval features were recorded, and post-medieval artefacts were recovered. [Au(abr)]

*Work undertaken by:* Chris Butler Archaeological Services

A watching brief was carried out during the groundwork associated with the construction of a Manège at Warbleton Priory. This involved the levelling of the area where the Manège was to be constructed and a slight grading of the ground level in the area to the west between the Manège and the existing stable block. No archaeological features were discovered and only a small number of post-medieval artefacts were recovered. [Au(abr)]

***An Archaeological Watching Brief on Land at 2, Spring Cottages, Peelings Lane, Westham, Pevensey, East Sussex***

Grant, K Portslade : Archaeology South-East, 2008, 23pp, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

A watching brief was maintained during building alterations. Within the trench three pit/post hole features were revealed, cutting into the natural deposits. One post hole contained 20th

century material and the other contained a single sherd of Roman date. The final feature was probably a rubbish pit which contained a mix of 19th century pottery and porcelain sherds, many small animal bones with signs of butchery and a 19th/20th century fragment of bottle glass. Whilst providing evidence of activity from the Roman, post-medieval and modern periods, the results of the watching brief did not indicate the archaeological potential suggested by previous works carried out within a close vicinity. Riccoboni, P Portslade : Archaeology South-East, Report: 2008020 2008, 26pp, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

A watching brief was carried out on land at 24 Rattle Road. The site lay c. 800m east of Pevensey Castle, a Scheduled Ancient Monument. A previous evaluation had been conducted at the site, which discovered the remains of a gully containing Roman and medieval pottery. The watching brief recorded the remains of a further six archaeological features. Two pits, two post holes and two linear features were recorded across the site mostly within the newly excavated wall footing trenches. Two features were of probable Romano-British date and may have been associated with a Roman settlement known to have existed in the area. Artefacts recovered from the topsoil and subsoil across the site indicated some, albeit limited, activity on the site from the Roman through to the post-medieval periods. [Au(abr)]

Vaughn, T & Sworn, S Worcester : Historic Environment and Archaeology Service, Worcestershire County Council., Report: 1599 2008, 50pp, colour pls, figs, tabs, refs  
*Work undertaken by:* Stratascan, Worcestershire County Council Historic Environment & Archaeology Service

A geophysical survey and an archaeological watching brief was undertaken between Bramley and Basingstoke. The survey identified a scatter of anomalies, interpreted as possible pits and a series of linears within the fields south of the substation. However the results of the subsequent watching brief did not tally with these findings. Three prehistoric features were recorded adjacent to the substation. These comprised an early/middle Iron Age pit containing the dumped remains of a kiln superstructure, and two small pits/post holes with extensive inclusions of fire-cracked stone. A medieval ditch, probably a field boundary, and a single undated pit/posthole were observed north of Tudor Farm, along with a late post-medieval/modern furrow or headland south of The Mill House. Three residual worked flints were recovered from the sub soils. A small quantity of residual pottery was recovered, including three Roman pottery sherds, along with post-medieval and modern pottery, all of which were considered to be the result of manuring or casual loss. Wright, J, Powell, A &amp; Barclay, A Salisbury : Wessex Archaeology, 2008, 60pp, figs, refs

*Work undertaken by:* Wessex Archaeology

In contrast to many other Roman sites in the area, Area D provided clear evidence for settlement in the form of roundhouses, as well as a range of additional features not found in Area A, such as cremation burials, a corn drier, and evidence of smithing. Evidence of iron working and possible production included large quantities of charcoal, iron slag and hammer scale, recovered from the 3rd century settlement enclosure at Daneshill, c. 2 km to the east, which like the Area D settlement was sited on the Reading Beds. The presence at Areas A and D of features associated with animal husbandry and structures for the storage of grain, pointed to the mixed agricultural regime practiced by the local population. Analysis of animal bones showed that cattle and sheep/goat were probably kept in equal numbers supplemented by a fair proportion of pigs, a few horses and dogs. The disarticulated nature of the horse remains indicated that they were also eaten, the presence of juvenile domestic fowl indicating poultry keeping. [Au(adp)]

The evaluation uncovered part of a large ditch, running parallel and 30m to the south of the projected line of the Winchester to London Roman road. This was the continuation of a property boundary ditch uncovered in the Stage 1 evaluation. The upper fill of this feature contained significant quantities of late Roman settlement activity, including coins, a bone pin, pottery, animal bone, ceramic building material and environmental material that indicated the storage or use of large quantities of grain. Elsewhere on the site, little of archaeological significance was recorded, apart from two residual later prehistoric pot sherds. [Au(adp)]

*Work undertaken by:* Liss Archaeological Group

Three seasons of excavations of an archaeological site near to the village of Liss uncovered the remains of a late 4th century Roman villa. The villa appeared to have grown in three main phases from a single aisled building, to at least two complexes of buildings with attached baths, around a central courtyard. Only approximately the eastern hall of the villa as a whole was excavated and further work may help to clarify its overall appearance and nature. Limited evidence was also found or dated to the 1st century AD and Iron Age occupation of the site. [Au(abr)]

*Work undertaken by:* Oxford Archaeology

An archaeological watching brief on the construction of a gas pipeline was undertaken. The pipeline ran between an existing compressor station at Lockerley in the borough of Test Valley, and Marchwood Industrial Park, Southampton. Two Iron Age pits were revealed in Field 0.2 at the northern end of the pipeline, near Lockerley. Two Roman ditches were revealed in Field 6.20 and medieval or post-medieval field boundary ditches in Fields 6.8 and 6.9, near the village of Wellow. A pit was revealed in Field 11.12 and a pit and gully revealed in Field 12.7 at the southern end of the pipeline. Post-medieval pottery was recovered from twenty of the fields along the route of the pipeline, and was probably deposited during manuring. In the post-medieval period it was likely that much of the route comprised pastoral and arable land. [Au(abr)]

Mason, C Wincanton : Context One Archaeological Services, 2009, 13pp, pls, figs, refs

*Work undertaken by:* Context One Archaeological Services

The investigation recovered modest archaeological evidence on the site in the form of a shallow medieval pit. A similar pit was observed to the south of the site during a watching brief at Kent's almshouse. Combined, these discoveries confirmed medieval occupation along Middlebridge Street, possibly as early as the 12th or 13th century, but it was considered to be peripheral activity and added little knowledge to the nature of trade and industry taking place on the site, or the status of this suburb. Russell, A Southampton : Southampton City Council Archaeology Unit, Report: 661 2008, 72pp, colour pls, figs refs

*Work undertaken by:* Southampton City Council Archaeology Unit

Road improvements to the north side of Romsey Abbey disturbed human remains. The deep excavations were then subject to an archaeological watching brief. This led to the recovery of the remains of at least 32 adult skeletons and five juveniles within adults/sub-adults and one juvenile being an articulated skeleton. Two of the earlier graves gave radiocarbon date spanning the 13th centuries with later graves giving dates in the 13th to 16th centuries. A layer of charcoal may have been associated with a burial in the Late Saxon period. The mix of males, females and juveniles suggested that the area was used for the burial of the people of Romsey throughout the medieval period, rather than being a place of burial for the nuns. A number of mid-19th century Minton floor tiles were recovered testimony to a restoration by the Rev. Noel, later expunged by the Rev. Berthon's more extensive and less colourful restoration in the late-19th century. [Au(abr)]

Wessex Archaeology Salisbury : Wessex Archaeology, Report: 64323.01 2008, 22pp, colour pls, figs, tabs, refs

*Work undertaken by:* Wessex Archaeology

An archaeological excavation and watching brief was carried out between 2007 and 2008, during demolition of buildings and site clearance. The programme recorded a small number of domestic refuse pits, a well and a post hole dating to the medieval and post-medieval periods. No firm evidence was found for any earlier activity, however, there was thought to be the potential for the survival of archaeological remains in the wider site area. [Au(adp)]

Smith, M Bedford : Albion Archaeology, Report: 2008/27 2008, 19pp, colour pls, figs, tabs, refs

*Work undertaken by:* Albion Archaeology

An archaeological watching brief was carried out on preliminary earthworks being undertaken in advance of the construction of a noise reduction bund at Thruxton Airport, Andover. The work was necessary because of the site's proximity to a parish boundary and its setting within a significant, wider archaeological landscape. Six trenches, up to 16.5m in length, were opened across the area of the proposed bund and excavated down to 0.3m or undisturbed geological deposits. The trenching identified the shallow nature of the overburden within the area and revealed the underlying chalk geology of the ridge. No archaeological deposits were identified at any level within the trenches. The trenching did reveal areas of disturbed ground

associated with the airfield. The parish boundary was not present in the form of a cut archaeological feature in the area observed. [Au(abr)]

*Work undertaken by:* Context One Archaeological Services

The archaeological investigation revealed only one feature, the remains of a large medieval pit. The area examined represented a very small part of the overall development and as such it was difficult to assess the significance of this in relation to the nature of medieval and post-medieval suburban activity in the area. The backfill of the pit contained a moderate amount of animal bone, roof tile and pottery that could be dated to the 13th and 14th century. The nature of the material recovered was indicative of domestic activity. [Au(abr)]

*Work undertaken by:* ARCA, University of Winchester

A watching brief was carried out during the excavation of a Ha-Ha ditch, sunken fence circuit, rainwater collection tank and swimming pool in the ground of Old Alresford House. Works revealed parts of older features, which probably represented remains of an earlier 18th century ha-ha ditch, whose alignment appeared as an annotation on Richard Woods' landscape plan. During the watching brief, topsoil removal exposed part of this feature. Subsequent geophysical survey along its marked route confirmed the existence of an earlier ha-ha. In addition, several scatters of flint artefacts and flint working debris were found on the slopes. [Au(abr)]

*Work undertaken by:* Canterbury Archaeological Trust

An archaeological evaluation in 2007 identified Romano-British, medieval and late-18th century activity. The Romano-British activity was limited to the presence of a large pit and a linear ditch. A single ditch was dated to the medieval period. Late 18th century brick walls and deposits, interpreted as clay floors, were found beneath the demolition debris of the modern garages. The remains indicated that a substantial amount of the Napoleonic Barrack building still existed. The depth of the 2008 excavation was restricted to the depth of the proposed building works, and this was not deep enough to expose prehistoric or Roman levels. The remains of the Napoleonic barracks were prominent at quite a high level and took the form of three main load-bearing walls, an internal brick structure and some remaining floor surfaces. Concrete was discovered predominantly in the south-eastern area of the site, which may have related to later uses of the military building. [Au(abr)]

Clarke, C Twickenham : AOC Archaeology Group, Report: 30134 2008, 21pp, figs, tabs, refs

*Work undertaken by:* AOC Archaeology Group

A watching brief was carried out at Barty House Nursing Home. This involved landscaping to the rear of the Grade II Listed Building. Numerous features were identified during the watching brief, comprising two phases of activity. The first phase of activity was dated to the 19th or early 20th century, representing the subdivision of the land to the rear of the house, and the planting of trees or shrubs as part of decorative gardening. The second phase of activity represented more functional use of the garden during the first half of the 20th century, associated with the presence of rubbish pits and the backfilled construction cut for a suspected World War II air raid shelter. ***Maidstone Museum & Bently Art Gallery, East Wing Development, St. Faith's Street Maidstone, Kent. An Archaeological Watching Brief***

King, G London : Compass Archaeology, 2008, 34pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Compass Archaeology

A watching brief took place on the site of the proposed East Wing development of Maidstone Museum and Bently Art Gallery. Archaeological monitoring was undertaken on geotechnical groundworks in the form of five small test pits located across the redevelopment area. The site lay within an area of known archaeological importance and had the potential to contain archaeological deposits dating from the Roman period. It was also possible that previously unrecorded finds and features relating to the medieval manor house of Chillingdon Manor that had stood on the site since the 14th century, may have survived. All exposed deposits and strata were recorded and photographed, but no archaeological finds or deposits were encountered in the small areas monitored. It remained possible that archaeological deposits and finds may have survived across the rest of the redevelopment area. [Au(abr)]

**LYMINGE*****Uncovering an Anglo-Saxon Monastery in Kent. Interim Report on University of Reading Excavations at Lyminge***

Gabor, T Reading : University of Reading, 2008, 16pp, colour pls, figs, tabs, refs  
*Work undertaken by:* University of Reading

The results in Trench 1 confirmed the impression that the archaeology in the area was predominantly of a single, middle Saxon period [broadly 7th-9th centuries]. Later features

were restricted to two field boundaries of post-medieval date and a more substantial ditch which bisected the site and in its final form was late medieval. Middle Saxon features were concentrated in what seemed to be two distinct zones, the most extensive being confined to the south side of the central boundary ditch. As the boundary coincided with a distinct break in the distribution of Middle Saxon features, it may suggest that it perpetuated a much earlier boundary. The southern concentration was dominated by an imposing post-built timber structure. It was constructed of eight pairs of outer wall posts set into pits up to 0.80m deep, several of which preserved their original post impressions. A distinctive feature which sets the Lyminge structure apart from the mainstream tradition of Anglo-Saxon timber construction was a longitudinal alignment of posts creating two aisles, these were out of alignment with the outer wall posts raising the possibility that this feature was a later structural modification, although it could be regarded as primary, especially if an upper storey is envisaged. This building was stratigraphically contemporary with an exterior yard surface, which comprised a metalling of crushed flint compressed into prepared chalk. Fragments of animal bone and iron slag were incorporated into the metalling, whilst an adjacent pit was found to contain a mass of flint nodules. Hollowed areas within the surface were filled by occupation deposits yielding domestic material including middle Saxon imported pottery, ironwork and animal bone. Whilst the metalling was cut by several pits of middle Saxon date, no earlier features were discovered beneath portions lifted for sampling. Bearing in mind its connection with a building with barn-like affinities, it was not unreasonable to suggest that this metalled surface could have served the function of a threshing floor. Two further structural elements were found in close proximity to the two-aisled building. The first was a small sunken featured building with a classic gable post pairing along the longitudinal axis of the pit. Cutting across the floor plan of the two-aisled building was a long section of wall-trench. Its progress was interrupted by several intercutting pits, some stratigraphically earlier and others later. It was impossible to know whether this was an isolated feature, perhaps the portion of a timber palisade, or part of a more complex structure severely attenuated by plough truncation. The remaining features in Trench 1 comprised some 35 pits of both sub-circular and sub-rectangular form, the most impressive of which had neatly cut cylindrical profiles extending to a depth of nearly 2m. Preliminary impressions indicated that the range embraced the storage of foodstuffs, cess and rubbish disposal. Whilst middle Saxon occupation in the form of pits and ditches extended across the area, the archaeology in Trench 2 was distinct for its lack of structural evidence. The most substantial ditch was found to be of two distinct phases, the later representing a continuation of one of the minor, post-medieval, field boundaries traced in the corner of Trench 1; the earlier phase, dated to the Middle Saxon period. The 34 pits discovered in Trench 2 were arranged in distinct clusters separated by sterile areas of chalk. Their morphological range was similar to that encountered in Trench 1. Another divergence was the presence of pits with short adjoining gulleys which hinted at a more specialised usage potentially connected with agricultural processing or light industrial activity. The large and varied collection of artefacts recovered from the 2008 excavations must represent one of the most important of Middle Saxon assemblages from Kent. [Au(abr)]

During excavation of an evaluation trench, evidence of early medieval occupation south of Church Road was encountered in the form of three individual features. Subsequent use of the site for agricultural purposes towards the later 13th century was apparent in the form of an

extensive soil horizon. A re-establishment of occupation during the late 13th/early 14th century appeared towards the north-east end of the trench in the form of a shallow masonry wall foundation, which was sealed by the tail-end of a compact gravel surface. A subsequent watching brief revealed the further extent of these deposits. [Au(abr)]

Trevarthen, M Salisbury : Wessex Archaeology, Report: 66153.01 2008, 32pp, colour pls, figs, tabs, refs

*Work undertaken by:* Wessex Archaeology

The broad findings of the evaluation were corroborated by the excavation and watching brief. The watching brief on the central and northern parts of the Link road were archaeologically blank, whilst truncated late prehistoric agricultural boundary and enclosure ditches, overlain by a Romano-British rectilinear field system, were recorded within a zone extending to c. 0.15km north of Stirling Way. Dating from these features was generally sparse, although a small dump of Middle-Late Bronze Age pottery in the terminal of one may have represented a ceremonial act. In addition to the Late prehistoric and Romano-British field system related remains, a single feature of possible late Neolithic/early Bronze Age date was identified and one truncated hollow was investigated which contained small quantities of medieval material. A watching brief was carried out on forty-two square postholes excavated for the erection of a new fence line bordering the churchyard site, east of the existing wall which was being restored and renovated. Additionally, six small linear slots, were excavated through the concrete path to house steel rods designed to reinforce stability. No archaeological cut features were observed on the site, although datable finds (including potsherds, ceramic building material, bone and glass) were recovered from the topsoil deposit in some of the post holes. All of the recovered material was post-medieval and the earliest piece of pottery was dated to the late-18th to early 19th century. [Au(abr)]

**MOAT BANK AT SCOTNEY CASTLE*****An Archaeological Watching Brief on the Moat Bank at Scotney Castle Estate, Kent***

Archaeology South-EastPortslade : Archaeology South-East, 2008, 1p

*Work undertaken by:* Archaeology South-East

In February 2008, ground works were undertaken across the Old Scotney Castle moat bank in an attempt to locate the source of a leak which was draining water from the moat into the adjacent River Bewl. Two small areas of mechanical excavation were completed, and the source of the problem identified. The necessary remedial measures were then carried out. During the course of this work, archaeological monitoring recorded two discrete deposits comprising the upstanding bank at this location. In section the upper deposit was clearly seen to be eroding down slope towards the river, whilst the lower deposit had become consolidated and stabilised. No datable artefacts were recovered, but it was thought likely that the height of the bank may have been significantly reduced since its last episode of constructional landscaping. [Au]

*Work undertaken by:* Archaeology South-East

A watching brief was undertaken at the old Stable Block, Scotney Castle, Lamberhurst, during renovation. The watching brief was maintained intermittently between April and June 2008. The groundworks involved the removal of the stable block floors, which were mostly mid-19th century in date and laid in a herringbone style. These floors were recorded before their removal and all works were monitored during their destruction. In four of the rooms, earlier floors were discovered surviving beneath the herringbone styled floors. These were the original stable block floors, constructed of red bricks or mini bricks, which were specifically designed for use in a stable block. [Au(abr)]

Semmelmann, K Milton Keynes : Archaeological Services & Consultancy Ltd., Report: 1033 2008, 21pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Services & Consultancy Ltd.

The property was a stone built, two storey structure under a pitched tiled roof, and lay at the eastern end of a short terrace of three similar properties. Building analysis focusing primarily on the roof trusses in the adjoining properties in 1999 led to the hypothesis that the terrace may have dated from the 15th century and could have incorporated a possible 14th century building at the western end. During the watching brief, which was limited to the removal of part of the east wall to create a new door, a small soot filled cavity, another smaller recess containing the remains of a purlin and the cut line for the roof of the former extension were revealed. There was no evidence of earlier roof timbers as only modern rafters were revealed, but the presence of a bonding timber suggested an 18th century date for this part of the building. [Au(abr)]

Zeepvat, B Milton Keynes : Archaeological Services & Consultancy Ltd., Report: ASC: 976/MKV/2 2008, 36pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Services & Consultancy Ltd.

A watching brief was undertaken at 12 Walton Road. It was intended that the watching brief was to be preceded by historic building recording of the cottage and barn that stood on the site. Unfortunately these were demolished before the recording took place, so a record of the building was compiled from drawings and photographs provided by the architect. The cottage and barn were constructed in the mid to late-19th century, before 1881. Both buildings were brick-built, under slate roofs. As constructed, the cottage was of "two up, two down" plan, with kitchen and parlour on the ground floor, and central stairs and landing leading to two bedrooms above. The cottage was extended to the west in the 1950s or 1960s, with a single storey extension housing a bathroom and kitchen. The watching brief revealed a probable north-south ditch running across the site, cut into the underlying gravel. Adjacent to this was a smaller feature, either a parallel ditch or a pit. Neither feature contained any dateable artefacts, and none were noted in the remaining topsoil, or the excavated material from the footing trenches. Based on the available archaeological and historical evidence it seemed unlikely that the site was occupied prior to the construction of the 19th century cottage. It was unfortunate that circumstances permitted such a limited examination of the site. [Au(abr)]

Wilson, N Milton Keynes : Archaeological Services & Consultancy Ltd., Report: 1108 2008, 33pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Services & Consultancy Ltd.

A watching brief was undertaken to the rear 110 High Street. The work was required to monitor any archaeology disturbed during building works. Several limestone footings for demolished walls were observed in the foundation trenches. Other than a few fragments of red peg tile no finds to date either the levelling layer or the walls were observed. It seemed likely that the walls were associated with the former Horseshoe Inn, which was demolished during the late-18th or early 19th century. The two wings extending from the school may also originally have been part of the inn. The only other feature recorded was part of a large truncated pit which predated the walls. A single sherd of late medieval reduced ware pottery and a deer antler were recovered from the fill of this pit. During the 19th century the site was within the grounds of St. Paul's School, and was on the line of a demolished wing extending westwards from the school. Elements of a second wing survived to the north of the demolished wing and seemed to stylistically predate both the school and 110 High Street early 19th century build date. [Au(abr)]

Meckseper, C Bedford : Albion Archaeology, Report: 2008/92 2009, 101pp, colour pls, figs, refs

*Work undertaken by:* Albion Archaeology

Investigations at the Royal Train Shed revealed railway tracks, inspection pits and track foundations relating to the present building and an earlier carriage shed on the same locations. No traces of the first Wolverton Station were found. The watching brief at the Triangular building concentrated on observations during the removal of the modern concrete floor and the piling operations in the area of a preceding wharf structure by the canal side, the location of which was known from historical maps. Observations were also carried out during ground reduction along the foundations of the outer walls and around a group of pile caps in the south-eastern corner of the building. The main structures observed and recorded within the Triangular Building represented the foundation for the multitude of rail tracks that were laid throughout the building after its conversion from a locomotive erecting shop to a carriage paint shop after 1863. No archaeological deposits in general nor structural remains from the Priory were uncovered or disturbed by the groundwork. Archaeological artefacts recovered were limited to a single sherd of medieval pottery. Although limestone rubble was observed on site, this seemed to have been laid down after the dissolution of the priory, and probably related to localized ground raising and stabilization in one of the marshier parts of the town, which presumably would have taken place frequently during the early post-medieval period. King, D Swindon : Foundations Archaeology, Report: 610 2008, 36pp, figs, tabs, refs

*Work undertaken by:* Foundations Archaeology

The excavations indicated that the site lay within an area associated with Roman settlement. Due to the interleaving nature of the alluvial layers into which the archaeological features were cut, it was not possible to say where the centre of the settlement might have been, as many of the features could only be partly seen. It was agreed by all parties during a site visit that the depth of excavation required in this area would not be sufficient to expose all areas of archaeology in the caravan park, or all archaeological features within the defined excavation area. No further excavation was, therefore, undertaken. The excavation revealed activity associated with a long-lived settlement spanning the Iron Age/Early Roman period to the 4th century AD, with a possible break in occupation between the mid-2nd and mid 3rd centuries. Features, such as a possible enclosure, pits and areas of burning, attested to the presence of a Roman settlement. The low density of the features and the finds assemblage suggested a non-intensive, low-status, rural settlement. [Au(abr)]

*Work undertaken by:* John Moore Heritage Services

The investigation revealed three phases of medieval activity, dating from the late-11th century through to the 14th century. The earliest phase comprised an enclosure and several pits, the second phase the corner of a building probably associated with the Templar preceptory and the third phase a field or paddock dating to after the establishment of the new preceptory in Sandford. No evidence of activity was found thereafter until the late post-medieval period. [Au(abr)]

***The Queen's College Oxford, Kitchen Extension, Archaeological Investigation Report***

Hiller, J Oxford : Oxford Archaeology, Report: 3983 2008, 38pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology

In March 2008 an archaeological investigation was carried out at the Queen's College, Oxford. The work took place in advance of proposals to construct a new below-ground basement north of the existing kitchen building, specifically, to determine whether piled foundations would encounter below-ground structural remains associated with the medieval

college. The work revealed layers of construction/demolition debris cut by the foundation trench and wall forming the north-east corner of the medieval West Range depicted on historic views. The northern end of West Range was equipped with a hearth, and later a possible doorway inserted within the wall leading to the yard outside. A narrow garden wall and a path were identified leading to the building, and these were probably of later medieval/early post-medieval date. The northern line of the medieval North Range, identified in a previous excavation, was confirmed in service trenches and trial pits by its robber trench. Demolition debris above the structures and the robber trench dated to c.1719, when the present North Quadrangle circuit was completed with a new North Range. [Au(abr)]

*Work undertaken by:* Oxford Archaeology

An archaeological excavation and watching brief was carried out at Magdalen College School, Oxford. Residual early middle Saxon pottery was revealed and may be indicative of Anglo-Saxon activity on the banks of the Cherwell, possibly relating to a river crossing on the site of Magdalen Bridge. Three 19th and 20th century ditches were revealed on the western side of the excavation, which may have represented a re-establishment of a medieval field boundary. A large 19th century gravel quarry respected the limits of the ditches, and may have been dug to provide material for local development. There was no evidence for any activity associated with the 17th century Civil War defences lying c.100 m to the north. [Au(abr)]

Mundin, A      Reading : Thames Valley Archaeological Services, Report: 08/67 2008, 13pp, colour pls, figs, tabs, refs

*Work undertaken by:* Thames Valley Archaeological Services

One pit of possibly medieval date was uncovered close to the existing house. Though the footings varied in depth, natural geology was uncovered in all the bases, though an area of soil, thought to be a depression from a tree hole was noted in the southern corner. One sherd of pottery seems to date this feature to the 17th century [or later] and thus this tree clearance could be contemporary with the original pub. The terrace for the house only seemed to be from landscaping of topsoil, and was not medieval in date. The finds from pit 2 were of importance to the village as no previous medieval archaeological evidence, apart from features in the local church, was known. [Au(abr)]

*Pippins, 5 Orchard Haven, Dorchester-on-Thames, Oxfordshire. An Archaeological Watching Brief*

Mundin, A Reading : Thames Valley Archaeological Services, Report: 08/95 2008, 21pp, colour pls, figs, tabs, refs

*Work undertaken by:* Thames Valley Archaeological Services

The watching brief uncovered a wealth of archaeological deposits. The discovery of a grave raised the number of burials in the immediate vicinity of Orchard Haven to at least six, lending weight to the suggestion that one of the town's cemeteries is located in this area. However, whilst it was probable that the burial here was of Roman date, the chronology was not secure, with only a broad terminus post quem of 2nd century AD being provided by pottery, the burial could be of later Roman or Saxon date. The high density of other features recorded on the site points to the presence of occupation in this location that seems to have ended in very early Roman times. It did seem clear that this area close to, but beyond, the formally defined area of the Roman town was a significant component of the occupied area of historic Dorchester. [Au(adp)]

*Rycote Chapel, Coffins in the Crypt: Archaeological Watching Brief Report*

Boston, C      Oxford : Oxford Archaeology, Report: 3777 2008, 90pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology

In March 2004 archaeological recording action was carried out in the crypt of Rycote Chapel. The work included the recording of 24 coffins of the Bertie Family, the Earls of Abingdon and Barons Norreys of Rycote. The coffins dated from 1649 to 1884, and were remarkable for their ornate upholstery and coffin fittings. One anthropoid lead coffin of the infant brother of the first Earl (1649) was very unusual. The identities of members of the family interred within each coffin were known in all but four cases. From incomplete inscriptions and historical records, three out of these four were tentatively identified, leaving only one unknown. The burials included six generations of the Bertie family, the last interment being Montague the 6th Earl in 1884. [Au(abr)]

Mundin, A Reading : Thames Valley Archaeological Services, Report: 01/53c 2008, 19pp, colour pls, figs, tabs, refs

*Work undertaken by:* Thames Valley Archaeological Services

The deep trenching (over 1m) revealed several layers of archaeological deposits and the remains of what appeared to be a single wall. The two lower deposits appeared to date from the medieval period. Pottery from these fills suggested both were of pre-14th century date, probably 11th century. There was no indication, as these layers were only investigated in relatively small sections, that these were from larger agricultural features; it seemed that these were early medieval occupation levels, contemporary with the origins of the Castle. As there were no cut features, it seemed that intensive settlement was probably not directly on this site. The presence of the wall, seems to be a boundary division between two plots, probably facing the High Street, but further evidence of individual structures was not evident. This was quite a long way back from the high street, and on the line of a boundary marked in 1850 tithe map. While it could still be the line of a medieval boundary, it was not impossible the wall was later. [Au(abr)]

Roberts, C. Oxford : JMHS, 2008, A4 report  
*Work undertaken by:* JMHS

"A watching brief was carried out by John Moore Heritage Services at Church Farmhouse, Northmoor, Oxfordshire during the excavation of footings for a workshop and garages. In part topsoil overlying disturbed ground, with elsewhere made ground was observed within the yard area; outside this area the topsoil overlay subsoil. A short length of limestone wall of unknown date was uncovered in the north eastern side of site. It ran southeast-east to northwest-west, and could either be part of old farmyard buildings associated with Church Farmhouse, or part of an even earlier structure or boundary wall." [OASIS]

Cook, I Oxford : Oxford Archaeology, 2008, 11pp

*Work undertaken by:* Oxford Archaeology

An archaeological watching brief was carried out at Advance Gate, Castle Hill, Windsor Castle. The work was commissioned by The Royal Household in advance of the construction of a new police box and pedestrian turnstile. The watching brief revealed two brick foundation walls and two brick manholes that were probably associated with buildings situated along Castle Hill prior to their demolition during the early part of the 19th Century. A demolition layer was also observed and was most likely associated with the demolition of the buildings. [Au(abr)]

Smith, M P Southampton : Southampton City Council Archaeology Unit, Report: 908 2008, 35pp, colour pls, figs, tabs, refs

*Work undertaken by:* Southampton City Council Archaeology Unit

A Grade II Listed timber-framed house stood at the north end of the street frontage. It was probably of 17th century date and may originally have been the south end of a lobby entrance house. In the 18th century, a brick-built cottage was built against the south end of the earlier house. At some stage, probably by 1785, the two were formed into a single property. In the later 19th century the north end of the original timber-framed house was demolished. An archaeological watching brief on groundwork to the south and west of the surviving buildings produced no evidence for activity that predated the houses. [Au(abr)]

Beachus, K & Brossier, A Reading : JE Jacobs, 2008, 29pp, colour pls figs, tabs, refs

*Work undertaken by:* JE Jacobs

A watching brief was carried out on works at HMP Reading. The work was undertaken in two phases. The first phase, to the south of A Wing, in April 2007 was the excavation of a trench for a new water main. The second phase, in April 2008, was the excavation of a pipe trench in the area adjacent to the modern gatehouse. The first phase of work identified brickwork foundations relating to the first brick phase of the prison, between 1885 and 1954. The work on the second phase was abandoned due to the presence of a concrete wall in the pipe

trench. No evidence of the Abbey was identified, however, two elements of the early prison were noted in the trenches. [Au(abr)]

***New Boundary Wall, St. James Church, Reading, Berkshire: An Archaeological Watching Brief***

Milbank, D Reading : Thames Valley Archaeological Services, Report: 08/107 2008, 9pp, figs, refs

*Work undertaken by:* Thames Valley Archaeological Services

The observations made during the watching brief demonstrated that although the above-ground portion of the flint wall was unstable, the part of the wall below the tarmac level was solid and substantial, and provided a stable footing on which the new brick wall could be built. The depth of the excavated trench, even at its deepest point, was not sufficient to expose any underlying deposits, and it was not possible to determine the depth of the flint wall footings. Overall, the results of the watching brief indicated that archaeological remains of any period (other than the wall footing itself), and specifically those relating to the Abbey and its Church, were not present at the level of the base of the trench. Potential still exists for deposits to have survived below the rebuilt wall, and the construction of the new brick wall would not affect any archaeological levels below the extant footings. Davis, R Salisbury : WA Heritage, Report: 67581.02 2008, 30pp, colour pls, figs, tabs, refs

*Work undertaken by:* WA Heritage

Historic building recording carried out at the site demonstrated that parts of Chatley farmhouse, a Grade II Listed Building, dated to the late-16th or early 17th century. A two bay timber framed structure with a brick chimney stack at its north end remained fossilized within the later structure. The small proportions suggested a modest beginning for the farmhouse, with extensions to the north and south sometime in the late-17th or early 18th century, probably as a result of new, wealthy owners. No significant archaeological remains were encountered during the monitoring of the groundwork associated with the development. [Au(adp)]

Compass Archaeology London : Compass Archaeology, 2008, 18pp, colour pls, figs, tabs, refs

*Work undertaken by:* Compass Archaeology

No remains of significant archaeological importance were observed during the course of the archaeological watching brief. A number of 19th and 20th century wall bases of former garden glasshouses were recorded, and could be seen on 1870 and 1935 OS maps. These had been demolished in the 20th century, and the wall bases had suffered quite damaging truncation. Metal and pottery finds all supported the use of the area as a garden and orchard since the construction of the Silvermere property in the 1830s. Once the glasshouses were recorded and removed, no further archaeological deposits were observed, and only natural sands encountered. No archaeological finds, features or deposits relating to the Bronze Age were observed despite the proximity to a recorded Bronze Age barrow revealed in the construction of the Silvermere house in the 19th century. **HATCH FURLONG, EWELL*****Excavation at Hatch Furlong, Ewell***

National Trust Swindon : National Trust, 2008, 2pp

*Work undertaken by:* National Trust

The aim of the third season was to investigate areas adjacent to those previously examined at the southern end of the site, and to define the areas dug in the 1970s and glimpsed in Trenches 2 and 5 in 2006; to explore the post holes revealed in Trench 9 in 2007; and to complete the examination of the deeper of two chalk-cut shafts in Trench 6. Accordingly five new trenches were opened. The 2008 work allowed more sense to be made of the Roman site in terms of its overall plan. It seemed that various activities were accommodated within areas defined by shallow ditches laid out across the chalk spur. It was possible that these

ditched areas were accessed from a cambered metalled surface that ran parallel to the line of the medieval and modern Cheam Road. The four chalk-cut shafts, three of whose fills were dated to the 2nd century, were best seen as two separate pairs. While each would have produced quantities of chalk rubble suitable for building or other purposes, the process of backfilling seemed to have involved repetitive acts entailing the manipulation of whole and incomplete carcasses of various animals such as young dogs, piglets, deer, horse and cattle. The excavation of the basal fills of shaft [1005] in particular recovered a wealth of environmental data. Similar material also appeared to have been recovered from the fill of at least one of the shafts excavated in the mid-19th century. The activities carried out on the site in the later Roman period appeared to have encompassed low-level exploitation of the North Downs chalk through the digging of a number of shallow scoops or quarries. The quarries seemed to have been backfilled with domestic refuse. [Sec(adp)]

*Work undertaken by:* Archaeology South-East

Three areas were excavated. Natural was not reached in Area 1, whilst in the northern parts of Areas 2 and 3, all archaeological horizons and deposits (aside from modern features) had been removed by the construction of the original house and tennis court. Significant made-ground layers were recorded on the southern sides of Areas 2 and 3, however, this did yield archaeological features and artefacts of late Iron Age/early Roman date. These features comprised a ditch and pits, and a number of irregular features of natural origin were recorded. Cultural material retrieved from these features dated the site to c.10-70AD. [Au(abr)]

***Bridge Wharf, Chertsey, Surrey. County of Surrey. An Archaeological Watching Brief Report***

Knight, H London : Museum of London Archaeology, 2009, 23pp, colour pls, figs, refs

*Work undertaken by:* Museum of London Archaeology

No prehistoric, Roman, Saxon or medieval remains were seen during the watching brief. A redeposited gravel contained chalk, bone and pottery fragments which suggested a date of 16th to 17th century for a bridge repair or wharf construction. A channel riveted by stakes, which may have dated from the late-16th to 17th century was recorded in the east facing section. The channel, which would have emptied into the river, had ceased to be functional by the later 17th or 18th century. At the southern end of the watching brief, a 19th century refuse pit and brick lined drain was encountered. [Au(abr)]

***No. 16 Abbey Gardens, Chertsey, Surrey, KT16 8RQ, Runnymede Borough Council. An Archaeological Watching Brief in the Chersey Abbey Scheduled Monument Area***

Johnson, K London : Compass Archaeology, 2008, 42pp, colour pls, figs, tabs, refs

*Work undertaken by:* Compass Archaeology

The watching brief produced no structures, burials or other cut features, which would have warranted preservation in situ. However, a number of deposits associated with the demolition of the Abbey after dissolution were recorded. Below alluvial silts were a number of rubble deposits largely composed of loose mortar and broken building material [red tiles and bricks, and Reigate and other moulded stone] considered to be the remains of successive phases of demolition of the Abbey buildings. A number of significant finds were recovered, notably a number of famous Chersey Tiles, preserved in good to poor condition. In addition, pottery provided evidence that these deposits dated to the 16th century. A coin retrieved during metal detection of the spoil dated to 1603. [Au(abr)]

A number of small pits were recorded across the site, mostly undated, but three seemed to be of Late Neolithic/early Bronze Age origin from finds of Beaker pottery. They were considered to represent one or more occupation sites. A molluscan assemblage from a late Neolithic/early Bronze Age pit illustrated the setting of the site was that of rough grassland and scrub. A single ditch thought to have been a boundary feature was tentatively dated to the middle or late Bronze Age. [Au(abr)]

A prior archaeological evaluation revealed the surviving remains of walls associated with a Victorian Mansion. The strip, map and record exercise detailed these remains further and provided a better understanding of the sites history. In general, the walls had been robbed of brick and/or stone. A linear feature outside of the footprint of the Victorian house was found to contain 16th-17th century pottery. [Au(abr)]

Edwards, C, Hogg, I & Carew, C Twickenham : AOC Archaeology Group, Report: 30129  
2008, 37pp, colour pls, figs, tabs, refs  
*Work undertaken by:* AOC Archaeology Group

An archaeological evaluation was carried out. Natural gravel terraces were identified, sealed by post-medieval and modern deposits of made ground, builders sand and garden soil. Other than evidently modern features, three pits and the terminus of a ditch were present in the western evaluation trench [Trench 1]. No archaeological remains were detected in the other evaluation trench [Trench 2]. Two small pits were present in the excavation trench [Trench 3]. One of the pits was dated to AD1070-1150, or possibly slightly later, by two sherds of pottery. Two of the pits had ceramic building material that dated them to later than the 14th century. The ditch contained a deer antler tine. The remains represented low density activity during at least two phases, possibly from settlement, in the western half of the site, while the natural deposits in the east had suffered significant truncation. Lowe, J Reading : Thames Valley Archaeological Services, Report: 08/105 2008, 9pp, colour pls, figs, tabs, refs

*Work undertaken by:* Thames Valley Archaeological Services

No archaeological finds or features were recorded during the course of the watching brief. No deposits relating to the medieval manor or post-medieval farm were found. The stratigraphy observed, comprised modern made ground overlying the natural geology which suggested that some truncation had occurred on the site, possibly when the modern floor was laid within the former barn. This truncation may have destroyed shallower features such as floors and drains associated with the original barn. However, deeper features such as medieval pits or ditches would have survived such a degree of truncation, so their absence may suggest that no medieval or earlier activity was present within the area examined on site. *Wickham House Walled Garden, Wickham, West Berkshire. An Archaeological Excavation*

Mundin, A & Pine, J Reading : Thames Valley Archaeological Services, 2008, 20pp, figs, tabs, refs

*Work undertaken by:* Thames Valley Archaeological Services

Small scale excavations took place in three areas within the walled garden at Wickham House. A previous evaluation had uncovered Roman features, and local find spots suggested a focus of activity to the south of the Roman road, between the village and Wickham House. The deposits revealed included Roman ditches and pits of 2nd to 3rd century AD date. The place name of "Wickham" was considered to be of early Saxon origin and thought to indicate the presence of Roman occupation known to the Saxon settlers. The excavations carried out here confirmed the presence of Roman occupation deposits at Wickham, though their date suggested abandonment well before the arrival of the first Saxon settlers and so any surviving Roman settlement seemed a less likely candidate for the origin of this place name. A few residual prehistoric struck flints and a post medieval ditch were also recorded. [Au(abr)]

#### ***An Archaeological Watching Brief at 45 Park Lane, with a Supplementary Historic Building Record during Repair and Maintenance Work at 45 and 47 Park Lane, Slindon, West Sussex***

Henderson, M Portslade : Archaeology South-East, Report: 2008198 2009, 78pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

An archaeological watching brief was carried out at 45 and 47 Park Lane, Slindon. The work involved the recording of historic fabric exposed during essential maintenance and the excavation of areas beneath the living room and bathroom floors within No. 45. The natural brickearth deposits were investigated, but no Palaeolithic artefacts or ecofacts were found. Sixteen struck flint pieces recovered during the watching brief, comprised a Neolithic flaked axe and undiagnostic debitage. The flints were predominantly recovered from a cluster of features in the southern part of the main excavated area. It was probable that there was prehistoric activity in the general area of the site, and two pits were potentially of prehistoric date. However, the pits could also have been assigned a medieval or later date on the basis that much of the struck flint waste could have been related to masonry knapping. A pit and a pit/post hole were likely of 13-14th century date. A number of other later features and layers contained small quantities of unabraded medieval pottery and tile and two (probable medieval) spindle whorls, which all pointed to medieval activity of some description on the site. The presence of flint nodules and some struck material in these contexts suggested that a building with elements of flint construction was located close by. The original clay floor and the make-up layer for the floor of 45 Park Lane sealed the earlier features and some of the features were cut into by the foundation of the house, which was built in 1647. Six possible post-holes or impressions in the centre of the clay floor of the living room area could be related to a historic phase of repair or renovation and represent the position of a scaffold or propping. Several other features that cut the floor were likely related to 18th and 19th century alterations of the property. A brick floor in the former bathroom within the house was of 18th or 19th century origin. The historic building record of the standing fabric of both 45 and 47 Park Lane was a supplementary record to the original reports prepared in 2005 and 2007. No new dating evidence came to light and as such the initial interpretations were unaffected by these works. A full digital photographic record of the work was prepared to show newly exposed fabric in addition to the current programme of repairs. A late-18th century child's shoe was recovered from a wall in 47 Park Lane, appearing to be an example of a deliberately placed or concealed object believed to aid in the protection of the house from evil spirits. [Au(abr)]

Hart, D Portslade : Archaeology South-East, Report: 20081 14 2008, 80pp, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

The fieldwork comprised the investigation of two excavation areas. A small assemblage of residual Mesolithic and early Neolithic struck flint attested to limited activity of this date in the vicinity of the site but it was not until the Late Bronze Age that the first concrete evidence of activity was seen on the site. This activity was largely agricultural in character, comprising a co-axial field system. Other features of Late Bronze Age date included two groups of possible placed deposits, as well as some isolated pits and postholes of unknown function. The end of the Late Bronze Age witnessed a hiatus of activity on the site and it was not until the Roman period that activity resumed. This too was largely agricultural in character, comprising field boundaries, a drove way and some low-level pitting. Other features of this phase included a potential cremation deposit. The end of the Roman period again heralded the abandonment of the site, with further agricultural activity resuming in the post-medieval period with the creation of further field boundaries. *Work undertaken by:* Southern Archaeological Services

Observations on the re-routing of a gas main revealed a series of modern services and wall foundations and a buried soil layer containing a mixture of Roman and later finds. An evaluation trench was excavated, and exposed modern wall foundations and a clay-lined floor, as well as a medieval pit and a large feature containing both Roman and medieval finds that extended beyond the limit of excavation. The excavation of a lift pit exposed only the buried soil layer seen earlier, and modern deposits. [Au(abr)]

#### ***Archaeological Watching Brief at Portsmouth Road, Fishbourne, West Sussex***

Whittaker, D Portslade : Archaeology South-East, Report: 2008161 2008, 18pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

An archaeological watching brief of a service trench and an area 25m x 3m revealed no archaeological horizons. A further 45m x 15m area was topsoil stripped, again revealing no archaeological remains. Natural, possibly truncated deposits, formed of alluvium and Reading Beds clay underlay modern road surfaces and services. Surface deposits consisted of mixed modern construction materials and various redeposited materials. No archaeological remains were observed except a late-19th and 20th century barrel-vaulted brick drain on the A259 Fishbourne Road. [Au(abr)]

Entwistle, R Aldermaston : Berkshire Archaeological Services, 2008, 12pp, figs, refs

*Work undertaken by:* Berkshire Archaeological Services

An archaeological watching brief was carried out at the West Heath Quarry during tree stump removal and topsoil stripping across a small area along the western edge of the quarry. A walk-over survey of an adjoining area to the south was also carried out. No archaeological finds were made during the work, and only two features were recorded. The first of these was a holloway, probably of post-medieval date; the second was a short stretch of bank in the southern area, which seemed likely to be part of a more extensive layout of post-medieval landscape boundaries. The holloway corresponded to a track depicted on a map of AD 1873, where it formed part of a network of routes crossing the heath. [Au(abr)]

**LAND TO THE REAR OF 45, 47 AND 47A HIGH STREET, CHURCH WALK, CRAWLEY*****An Archaeological Evaluation and Watching Brief on Land to the Rear of 45, 47 and 47a High Street, Church Walk, Crawley***

Porteus, S Portslade : Archaeology South-East, Report: 2008053 2008, 43pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

An evaluation and watching brief was undertaken on land to the rear of 45, 47 and 47a High Street, Crawley. Two medieval boundary ditches, possibly contemporary in date, were identified in addition to six small pits dating from the 14th to 16th centuries. A larger pit, containing post holes in the base and to the north side, was also identified though the exact function of this feature could not be ascertained. The parallel and perpendicular orientation of these boundary ditches in relation to Church Walk, suggested that the present day Church Walk followed an earlier medieval burgage boundary. A later boundary ditch running parallel to and approximately 30cm to the north of the earlier east-west orientated ditch was likely to be a relocation of the original boundary. Two large pits were excavated, one to the west of the

site dating from the mid-14th to mid-15th centuries contained large amounts of metalworking slag and was contemporary with other ironworking sites in Crawley. The site yielded a quantity of 16th century pottery, in addition to smithing and blast furnace slag, providing evidence for continued iron working in Crawley at a time when the town was in decline. Collinges, M, Allott, L, Barber, B, Butler, C & Raeman, EPortslade : Archaeology South-East, Report: 2008140 2008, 43pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

A watching brief was undertaken at Land at Forge Way, Billingshurst. Work was undertaken between the 29th January 2007 and 22nd May 2008 and comprised four stages of monitoring visits. The monitoring revealed four linear features of which three were intercutting. Two of the linear features produced pottery dating to the mid-13th to 14th Century AD, one to 14th Century AD, with the remaining feature undated. It was possible that all four related to continued activity on the site. Sixteen discreet features were recorded comprising of a possible hearth, seven possible pits and eight post holes. The features were fairly widely dispersed across the site and it was not possible to establish if they were contemporary with each other and the linear features. Collectively the features produced only a very small artefact assemblage. One post hole contained an abraded sherd of 11th to 12th century date along with early prehistoric flint and a possible pit/tree throw produced a sherd of 16th to 17th century AD date. The pottery assemblage recovered during the watching brief spanned the 11th century AD to the 19th century. However, the earliest piece and the later pieces could be resultant of various phases of manuring or similar activity and the pottery recovered indicated that the main phase of activity on the site dated to the mid-13th to 14th Century AD. A small assemblage of residual flint was recovered, mostly from the subsoil and was not considered diagnostic but included two possible Mesolithic pieces. Other isolated finds of Mesolithic date were recorded 600m to the east of the site further indicating the presence of early prehistoric activity in the area. [Au(abr)]

Archaeology South-East Ltd. Portslade : Archaeology South-East, Report: 2009003 2009, 22pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

A watching brief was carried out during works associated with the creation of a new doorway within the church. The section of wall into which the new doorway was inserted comprised the north wall of the North Chapel, which was added to the church in the 14th century, it was not clear how much original fabric was preserved. The work revealed the existence of an earlier door aperture which may have been inserted in the late-19th century. The opening was subsequently infilled, possibly owing to the collapse of part of the doorway arch. A few pieces of dressed stone were found within the infill material. Most of this material was probably 19th century in date, comprising waste material associated with 19th century alterations to the church; however, some pieces may have represented earlier material removed during 19th century modifications. Mundin, A Reading : Thames Valley Archaeological Services, Report: 08/93 2008, 20pp, colour pls, figs, tabs, refs

*Work undertaken by:* Thames Valley Archaeological Services

A large number of features were recorded on this watching brief. The presence of pits and a gully containing pottery and animal bone of early or middle Saxon date pointed to the presence of this location as an occupation site of this period. Less indicative was the presence of a single late Saxon or early medieval pit. Clearly, the finding of Saxon remains in Cookham was not unexpected in the context of the historical background, though the location of this site several hundred metres from the historic core of the village to the east was noteworthy. The presence of late Neolithic pottery, struck flint and a possible pit of the same date was also noteworthy due to the extreme rarity of both identified sites and stratified deposits for this period, although unfortunately none of the deposits containing this material here could be securely dated to the prehistoric period. Lowe, J Reading : Thames Valley Archaeological Services, Report: 08/87 2008, 11pp, figs, refs

*Work undertaken by:* Thames Valley Archaeological Services

The archaeological strip, map and sample and watching brief at the proposed Holyport Manor School did not identify any archaeological finds or features. However, the stripping for the proposed school pitches did not extend beyond the removal of topsoil and therefore did not expose the archaeologically relevant level. No archaeology was encountered during the strip for the access road, however like the strip for the football pitches, only a relatively small area was stripped of subsoil to the top of the natural. The extensive drainage excavated through the access road did provide an opportunity to observe the stratigraphy in this area and no archaeology was identified here. Due to the nature of the drainage trenches, however, the chances of identifying anything other than fairly substantial linear features was quite slim and it was possible that smaller discrete features could exist on the site below the subsoil. Nonetheless, based on the findings of these phases of work, the site appeared to be of low archaeological potential. [Au(abr)]

*Work undertaken by:* Thames Valley Archaeological Services

Despite the site lying within what was considered to be the historic core of Sonning, the groundworks observed revealed no finds nor deposits of archaeological interest. Yet although this watching brief and other similar small scale projects carried out in the village were necessarily of limited extent, they did, cumulatively, add to an understanding of the topography of the settlement and its development through time. It was possible, therefore, that the results of this project, taken with the negative results of the nearby watching brief at the Dower House, could indicate that development of this area of the village only took place in relatively recent [post-medieval] times. Longham, T Bristol : Bristol & Region Archaeological Services, Report: 2081/2008 2008, 36pp, colour pls, figs, refs

*Work undertaken by:* Bristol & Region Archaeological Services

A desk-based assessment found that the site had been occupied by industrial buildings since at least the 18th century. An archaeological watching brief encountered the in situ structural remains of a 19th century brass mill/paper mill and the former mill pond, and it was thought that further remnants of the 18th century brass mill could also be present. ***Archaeological Trial Excavation at Valley View, Fosseway, Cladown, Bath & North-East Somerset***

Avon Archaeological Unit Kingswood : Avon Archaeological Unit, 2008, 18pp, colour pls, figs, tabs, refs

*Work undertaken by:* Avon Archaeological Unit

A trial excavation was undertaken within the gardens of a private residence, "Valley View", at Cladown near Radstock. The property was situated on the north-western side of the route of a 1st century AD Roman road, now known as the Fosseway/Old Fosse Road. Three trenches were sited at key locations across the study area. On the basis of the evidence it was concluded that the large majority of the site, specifically the central and eastern portions, the areas evaluated by Trenches 2 and 3, had very low archaeological potential and were unlikely to contain important archaeological deposits. **114 JACOB STREET, OLD MARKET*****114 Jacob Street, Old Market, Bristol. Archaeological Watching Brief***

Sheldon, S Cirencester : Cotswold Archaeology, Report: 08058 2008, 17pp, figs, tabs, refs

*Work undertaken by:* Cotswold Archaeology

A watching brief was undertaken during groundwork associated with the redevelopment of 14 Jacob Street. The groundwork comprised the excavation of foundation trenches and test pits to determine pile locations. The remains of a probable 19th century well and cellar were exposed during the excavation of foundation trenches in the north-west of the site. The remains of a pennant slab floor, along with a number of sandstone wall footings were also identified. It was likely that these features related to the former 19th century malthouse/brewery that stood on the site. The natural substrate was identified close to the current ground level at the northern limits of the site. This was overlain by post-medieval cultivation soils and demolition debris. Across the remainder of the site the deposits were deeper and this activity may have truncated any medieval or earlier deposits. [Au(abr)]

Payne, R Kingswood : Avon Archaeological Unit, 2008, 10pp, colour pls, figs, tabs, refs

*Work undertaken by:* Avon Archaeological Unit

A watching brief was carried out as a condition of planning permission. Two structures were revealed during the groundworks, a brick foundation wall and a sandstone rubble-built chamber with an opening on its east side that may have connected via a culvert to the properties fronting Manor Road. The exact function of the structure was unclear, but it was possible that it may have been a type of cesspit, which serviced properties on Manor Road. These structures were thought to have been exclusively of later post-medieval origin. No evidence of earlier features was identified and no important archaeological deposits or finds were revealed during the course of the development work. [Au(abr)]

**THE THEATRE ROYAL, KING STREET**

***Archaeological Watching Brief at the Theatre Royal, King Street, Bristol***

Longham, T Bristol : Bristol & Region Archaeological Services, Report: 2077/2009 2008, 14pp, colour pls, figs, tabs, refs

*Work undertaken by:* Bristol & Region Archaeological Services

An archaeological watching brief during structural survey work at the Theatre Royal. The Theatre Royal was a Grade I Listed Building and lay close to Bristol city centre within the City and Queen Square Conservation Area. The Listed Building, which comprised the Theatre Royal was originally built in 1764-6 (altered 1903 and 1970-72). The Theatre Royal spanned the line of one of the defensive walls of the medieval city, known as the "Marsh Wall", which dated from the 13th century. The fieldwork was undertaken in November 2008. The manual excavation of two small trial pits revealed no significant archaeology, only modern concrete beams underpinning some existing brick partition walls. In addition, only loose modern fill associated with the major alterations to the building that were carried out in 1970-72 was recorded. However, two boreholes drilled within the basement both produced samples containing organic material. Three further boreholes were drilled just outside the footprint of the building, one at either end of an alleyway that gave access to the rear of the building from Rackhay, and a third on the pavement in King Street in front of the theatre. The latter intervention, it was hoped, would extend within the ditch that existed beyond (south of) the Marsh Wall until the mid-17th century. A single sherd of glazed medieval roof tile was recovered from spoil. [Au(abr)]

Coe, R Bristol : Bristol & Region Archaeological Services, Report: 2062/2009 2008, 20pp, colour pls, figs, tabs, refs

*Work undertaken by:* Bristol & Region Archaeological Services

The topsoil strip revealed occasional 19th and 20th century pottery sherds, and red brick, which was used as backfill for service trenches. No features or deposits of archaeological significance were observed and no artefacts predating the 19th century were recovered during intrusive groundwork at the site. A structure was uncovered during the topsoil strip towards the east corner of the site. The remains were of a rectangular shaped trench/pit with a wood lining or revetment. There was evidence that the structure was burnt and backfilled when it went out of use. There was also evidence that it may originally have had a roof. It may have been used as a machine gun trench or an air raid shelter. There were also two isolated areas of nails found buried at a depth of one metre in the feature, of a type used for nailing floor boards to floor joists. There were over 200 nails in each area. Davis, R Salisbury : WA Heritage, Report: 68630.01 2008, 21ppm colour pls, figs, tabs, refs

*Work undertaken by:* WA Heritage

A survey was carried out of the 20th century trench systems that crossed the site, to inform future management of these systems. They appeared to be of the type created in the Great War, although it had been suggested that they may have been multi-period. It was concluded that in Area A the trenches extended well beyond the limits accessible for the survey, and that the trenches were substantial. In Area B, there was a largely complete system of Great War type trenches with a number of feature evident. [Au(adp)]

*Work undertaken by:* Historic Environment Service Projects. Cornwall County Council

A watching brief was carried out on preparation works at a site close to the village's medieval core. The works revealed traces of walls and surfaces associated with one or more earlier buildings on the site, together with a number of infilled pits and hollows. The features all appeared to have been of 19th or 20th century origin, but earlier features may also have been present. [Au(adp)]

Cole, R Truro : Historic Environment Service Projects. Cornwall County Council, Report: 2008R079 2008, 20pp, colour pls, figs, tabs, refs

*Work undertaken by:* Historic Environment Service Projects. Cornwall County Council

A watching brief was carried out on a 700m water pipe. The western quarter of the pipeline corridor passed through a medieval field system [Anciently Enclosed Land], while the remainder crossed former rough ground [Recently Enclosed Ground]. A small number of pits and ditches were uncovered within the pipeline corridor, of which one ditch and a complex of four related pits were within the medieval field system of East Colliford. Two small parallel ditches and a single pit were recorded in the more recently enclosed land. There was no evidence to suggest that any of these features was medieval in date. The eastern perimeter of the medieval field boundary system was recorded in section, as was the profile of another boundary and former trackway that ran along its eastern side. [Au(adp)]

**PENCARRON HOUSE, 70, ST. NICHOLAS STREET, BODMIN**

***Cornwall County Council Historic Environment Record. Archaeological Watching Brief at Pencarron House, 70, St. Nicholas Street, Bodmin***

Salvatore, J P Exeter : Exeter Archaeology, 2008, 4pp, figs

*Work undertaken by:* Exeter Archaeology

Archaeological recording was undertaken during works on the renovation and extension of Pencarron House, which was dated to the second half of the 19th century, and shown on the OS map of 1881. The house may have occupied the site of the medieval chapel of St. Nicholas. A chapel known to have been located in the immediate area was described in 1778 as "the decayed chapel of St. Nicholas". A number of medieval architectural pieces including columns, capitals and window tracery had been re-used and incorporated into features and an arch within the garden of Pencarron House, these architectural fragments were elaborate and more likely to have been re-used from the nearby site of Bodmin Priory, and less likely to derive from the chapel. The architectural fragments were to be retained in the new development and only a basic photographic record was made. Observations on service trench works to the south-east of Pencarron House produced one undated wall. Features exposed in the trenching works were associated with 19th century drainage and water supply for Pencarron House. These included a disused drain or manhole on the south-east side of the house and a well of local shillet construction capped with a granite slab and concrete blocks. The well may originally have served within the kitchen area of the early 19th century house but it was probably capped in the later 19th century with further capping of concrete in the 20th century. No conclusive evidence for the Chapel of St. Nicholas was recorded. The corner of a wall constructed of large pieces of local shillet was located in a service trench on the west side of the house closer to the line of St. Nicholas Street than Pencarron House but this may have represented a boundary wall of which there is some indication shown on the mid-19th century Tithe map. Lawson-Jones, A Truro : Historic Environment Service Projects. Cornwall County Council, Report: 2008R125 2008, 18pp, colour pls, figs, tabs, refs

*Work undertaken by:* Historic Environment Service Projects. Cornwall County Council

Topsoil stripping at the site revealed a landscape prone to change. An old land surface was found closely linked to the collection of edible marine shells, resulting in shell middens that may have been related to the residual flint and stone assemblage found through most of the overlying layers. Use of the marine resources was suggested until at least the Roman period, since pottery diagnostic of this period was found in association with shells. At some point after the formation of the middens the area became inundated with sand, forming dunes. The significance of sand-blown deposits here was high, as such deposits can result in well-preserved archaeological remains. A former field boundary was also recorded, having

previously thought to have been lost. A rubble-filled trench and recent farm track were recorded. [Au(adp)]

West, A. Exeter : Exeter Archaeology, 2008,

*Work undertaken by:* Exeter Archaeology

"Monitoring was carried out during the removal of a hedgebank in advance of the construction of an agricultural building. A section across the hedge was examined and recorded. The hedgebank forms part of a medieval field system, altered by the enlargement of fields during the latter 20th century. The westernmost 32m of the bank had been removed prior to arrival (Fig. 1). The hedgebank (Fig. 2) measured 800mm high and 2.1m wide. The original ground surface (buried soil), had not survived; the hedge core (102 and 101) lying directly over natural subsoil (103). A shallow ditch was present to the south side of the hedge although this had been heavily disturbed by machine movement. There was heavy root disturbance throughout the recorded section." [OASIS]

*Work undertaken by:* Exeter Archaeology

Groundworks required for the construction of a stable block and provision of a new access road were monitored. The site lay directly to the west of Pines Cottage, Gosford Road, near to the known line of Roman Road from Exeter to Dorchester, and in an area of recorded prehistoric activity. The hedgebank to either side of a new access, to total length of c. 55m, was reduced to a height 0.85m above the adjacent road surface. A 12m length of the

hedgebank was removed to provide a new gateway. The hedgebank was comprised of topsoil overlying a yellowish-brown sandy clay hedgebank material. This clay material contained ceramics with a 17/19th-century production range. These were discarded following analysis. A 22m x 17m area, designated for the new stable, was stripped of topsoil. No archaeological features or deposits were observed. [Au(abr)]

***Watching Brief at Grey Cottage, 38 Church St., Sidbury : Devon County Council Historic Environment Record***

Goodwin, N Exeter : Exeter Archaeology, 2008, 2pp

*Work undertaken by:* Exeter Archaeology

A watching brief was undertaken during groundwork for an extension to the rear (south and east) of the cottage, which was situated 30m south of St. Peter and St. Giles Church. No. 38 was one of a pair of 19th century semi-detached cottages that lay along the eastern edge of Church Street. An existing 20th century extension was attached to the south of the cottage. The west side of the footprint for the extension was level with the road, but the ground dropped by c. 0.5m to the level of the garden to the east. The garden consisted of two plots, partly divided by a stone revetted earth bank and hedge. The works consisted of the bulk removal of a 0.5m depth of soil, followed by the excavation of foundation trenches and a service trench. No features were observed, and no finds dating to before the 19th century were recovered. There were no indications of any activity at the site dating from earlier than the 19th century. Rubble and building debris may have indicated the site of a former structure, but no foundations survived to confirm this. [Au(abr)]

***Archaeological Monitoring at the Tanyard, Woodbury, Devon***

Steinmetzer, M F R Exeter : Exeter Archaeology, Report: 08.68 2008, 17pp, colour pls, figs, tabs, refs

*Work undertaken by:* Exeter Archaeology

A watching brief was undertaken during groundworks on land at The Tanyard, Woodbury. Historic research established that a number of buildings existed within the boundaries of the site from at least 1829, with these shown as an indistinct mass of industrial buildings by 1888. Most of these buildings had been removed by the late 20th century. The monitoring of the access road uncovered evidence for part of one of the buildings depicted on 19th century maps, with identified remains including walls and a cobbled surface. In the area of Units 2 and 3 thirteen wood-lined vats associated with the tannery were found. The monitoring further revealed that across large parts of the site landscaping associated with the construction of the tannery had taken place. This had completely removed any underlying archaeological features or deposits on the higher ground to the south, while along the street frontage lower alluvial deposits survived underneath post-medieval deposits. No archaeological features prior to the early 19th century were found. Despite its previous land-use, the watching brief established that the site contained a generally poor survival of post-medieval archaeological features. No finds were recovered predating the post-medieval period. The documentary evidence and the character of the features indicated that they represented evidence for tanning activity dating to the 19th and 20th century. [Au(abr)]

#### ***St. David's Church of England First School, Dinham Road, Exeter, Devon. An Archaeological Excavation.***

Place, C Wincanton : Context One Archaeological Services, Report: COAS/EXC/08/SDE 2008, 27pp, colour pls, figs, tabs, refs

*Work undertaken by:* Context One Archaeological Services

An archaeological excavation was carried out at St. David's Church of England First School, Dinham Road, Exeter, Devon, over eight days between the 13th and 22nd of January 2008. The excavation formed the final stage of an archaeological programme of works in mitigation of the proposed development which commenced with an archaeological field evaluation carried out in 2005. The work was completed successfully and confirmed the presence of archaeological features of Roman date within the school grounds, although little detail had been added to the results of the earlier evaluation. A north-west to south-east aligned ditch, including a terminal, was located at the south end of the trench and appeared to share a

common alignment with one side of an "enclosure" examined during the evaluation. It was not known if this feature represented the south side of the enclosure or just one element of a larger co-axial arrangement. A second linear feature, to the south of and sub parallel to the first, was also excavated. This may also be of Roman date, but was not established conclusively. The paucity of Roman artefacts and other features tends to suggest that the Site was not located in proximity to a settlement site. In addition, a single elongated pit or ditch terminal was examined at the north edge of the site and can be ascribed a late medieval date. The remaining features were of late-19th and early 20th century date. These findings accorded with the generally held view that this part of Exeter remained undeveloped through the medieval and post-medieval periods prior to 19th development of the site as part of a charitable "village". Passmore, A J Exeter : Exeter Archaeology, Report: 09.42 2008, 17pp, colour pls, figs, tabs, refs

*Work undertaken by:* Exeter Archaeology

Standing building recording and a watching brief were undertaken on the site of a former bakery located just outside the Roman and medieval defences of the historic city of Exeter. No evidence was found, though, for features of any period relating to these defences. The site remained undeveloped until the later post-medieval period and fragments of a building dating to before the mid-18th century were identified. Further structures were added in a piecemeal fashion until the late-19th-century when the site was doubled in size and was occupied by a bakery. Above ground, the fronts of the ovens and a chimney survived from this bakery, and the watching brief exposed a series of flues associated with this use of the site. [Au(abr)]

Whiteaway, T Exeter : Exeter Archaeology, Report: EA 5642 2008, 2pp, figs

*Work undertaken by:* Exeter Archaeology

A watching brief was maintained during ground reduction and subsequent trenching operations, prior to redevelopment. The initial reduction of overburden exposed no archaeological deposits and was insufficiently deep to expose natural ground throughout. Return visits were therefore made during trenching operations. No features or deposits were present. A very simple stratigraphic sequence was exposed consisting of approximately 300mm of overburden overlying clean natural ground comprising red clay. The only exception to this sequence was in the south-east corner of the site where a 500mm thick layer of redeposited natural ground was exposed above natural subsoil and below modern overburden. No pottery or other dating evidence was found. [Au(abr)]

Goodwin, N Exeter : Exeter Archaeology, Report: EA6394 2008, 2pp, figs  
*Work undertaken by:* Exeter Archaeology

A watching brief was undertaken during works to renew the water mains supply in an area of the Lower Town. The route extended along Church Street from Fore Street, then southwards to Queen Square, terminating at Cockpit Hill, a total distance of c.200m. Along Church Street, the trench was excavated through areas of undisturbed in situ red-brown clay, exposed at a depth of 0.5m, directly beneath the modern road makeup. There was occasional disturbance from modern services. No archaeological features were observed. At the east end of Church Street the trench was excavated along the line of the previous main, leaving the fill of the earlier trench undisturbed on both the sides and the base of the trench. This use of the larger earlier trench continued southwards for c. 30m, and was reported to be the case for the remainder of the route. The spoil was removed from site with no opportunity to inspect it for finds. [Au(abr)]

*Archaeological Recording of a Redundant Agricultural Building and Site at Sturridge, Kennerleigh Road, Sandford, Devon*

Watts, M & Brown, S Cullompton : Martin Watts, 2008, 29pp, colour pls, figs, refs  
*Work undertaken by:* Martin Watts

A redundant agricultural building, formerly a grain barn, and remains of other agricultural and domestic buildings on a site opposite Sturridge farm were surveyed and recorded prior to development of the site for domestic use. The barn was the only complete standing structure of a small complex of buildings that continued in agricultural use into the early 21st century. There was formerly a row of cottages on and beyond the north-west boundary of the site, of which little had survived. The building complex appeared to be of 17th -18th century origin,

with additions and alterations into the 20th century. No significant evidence of earlier occupation or use was found. The standing barn was described and recorded before the commencement of site work in December 2007, and an archaeological watching brief was carried out during ground clearance and the excavation of service trenches in January and February 2008. The Archaeological monitoring strongly suggested that the standing barn and surrounding group of now ruinous farm buildings and cottages dated from the late-17th–20th centuries. The works were monitored for a period of five days, after which little of archaeological significance had been uncovered, so it was agreed to terminate the watching brief. [Au(abr)]

***Archaeological Monitoring at 32 Fore Street, Silverton***

Smart, C Exeter : Exeter Archaeology, Report: EA6681 2008, 2pp, figs

*Work undertaken by:* Exeter Archaeology

A watching brief was undertaken during the digging of foundations for two semi-detached cottages. The site lay within a medieval burgage plot aligned on Fore Street in the core of the historic village. It was clear that the ground level, when compared to adjacent areas, had previously been reduced by around 0.25m for the construction of a prefabricated bungalow, which sat on a concrete raft. Prior to the watching brief, the site had been cleared of hard standing and overburden, exposing natural subsoil over significant areas of the site. An extensive deposit of sandy clay, containing occasional fragments of slate, stone and post-medieval pottery was exposed beneath the footprint of the bungalow. This material probably represented introduced material resulting from the levelling the site of the bungalow prior to formation of the concrete slab. Away from the footprint of the bungalow natural subsoil was exposed at ground level as a result of the initial site clearance. The limited finds from the made ground included a single sherd of North Devon scraffito pottery (1660-1700), two sherds of South Somerset coarseware pottery (17th to 18th century), two of German Westerwald pottery (late-17th to early 18th century), several fragments of clay pipe (1800-1830), numerous transfer- printed "blue and white" ceramic sherds (late-18th to 19th century onwards) and a fragment of post-medieval floor tile. The finds represented debris and refuse spread across the rear of the burgage plots throughout the post-medieval period. No features, deposits or artefacts of archaeological significance were observed. [Au(abr)]

Austin, J Exeter : Exeter Archaeology, Report: 6626 2008, 2pp

*Work undertaken by:* Exeter Archaeology

Archaeological monitoring and recording was carried out during ground reduction prior to the erection of an agricultural livestock building. The site lay in an area of archaeological potential as demonstrated by aerial photography, which had identified settlement sites and funerary monuments to the north of the development site. Additionally, find spots of flint tools were recorded in the proximity of the development area. A single feature was exposed during the work, a small oval pit, containing a single fragment of animal bone. The feature most probably represented a post-medieval rubbish pit. The topsoil produced a small number of 19th and 20th century pot sherds. No flints or other artefacts were found. [Au(abr)]

**6 LITCHDON STREET, BARNSTAPLE**

***Archaeological Watching Brief of Groundworks for the Construction of an Extension to the Rear of 6 Litchdon Street, Barnstaple, Devon. Devon County Council Historic Environment Record***

Gillard, M South Molton : South West Archaeology, 2008, 5pp, figs, refs

*Work undertaken by:* South West Archaeology

Groundworks for the construction of a two-storey extension were monitored and recorded. Existing single-storey structures and their flooring were removed and an area was stripped to the level of the natural. A further area of garden to the rear of the proposed extension was reduced and a 1.6m wide breach made in the garden wall to the north-west to allow access to the site. The garden was 1.7m higher than the site of the proposed extension and reduction in this area did not reach the level of natural. The area of the proposed extension was covered with concrete flooring and hardcore; the removal of this material revealed several modern services, mainly in the south-west of the site. In the middle of the site was a shallow sub circular cut its fill contained 19th century or later pottery indicating a modern origin. In the west corner of the site was a circular well, backfilled with a loose silt-clay containing stone, brick, 19th century or later pottery and lime mortar with coal inclusions. The well evidently served the property at 6 Litchdon Street and had been filled in the 19th century or later. To the north-east the removal of modern retaining walls and the level reduction for access revealed a section through the garden. The structures formerly in this area may have truncated any older features as their floor level was about 0.5m lower than on the adjoining plots to each side. The reduced area of the garden and the section revealed by the removal of modern retaining walls, consisted of several thick layers of probable garden soils with some thin, intermittent layers suggestive of dumped material associated with pottery production. The ceramic evidence suggested this dumping occurred in the mid-16th century. There was no indication that the loose and unconsolidated layers represented in situ structures related to pottery production, but the presence of wasters and kiln furniture, and the unabraded character of the ceramic assemblage, indicated pottery production was taking place in the immediate vicinity. The source of this dumping was probably the Litchdon Street potteries, known to have been located nearby. Despite the small size of the area investigated, a considerable amount [>7kgs] of pottery was recovered. [Au(abr)]

Goodwin, N Exeter : Exeter Archaeology, Report: 6141 2008, 2pp, figs  
*Work undertaken by:* Exeter Archaeology

Groundworks for a new supermarket, associated car parking and a service yard were monitored. The north-eastern part of the site was formerly occupied by a factory (Brannoc Fibres). Reductions to formation level involved a "cut and fill" operation, with the level of the southern and eastern side of the site raised using material removed from the area to the north. The only intrusive works in the eastern part of the site were the removal of overburden and the excavation of a service trench near a pond, which exposed in situ subsoil below a 0.1m depth of topsoil and modern debris. A large part of this area had been disturbed, probably during the construction of the former factory. The south-western part of the site was covered by contaminated soil, probably also associated with the former factory. Much of the north-western part of the site was stripped of topsoil and monitored prior to the bulk removal of clay down to the formation level. A new retaining wall was constructed along much of the western site boundary. This produced a trench c. 150m long and up to 2.2m deep. No archaeological features or deposits were identified across the site. The few finds were typical of late 18th/19th century domestic assemblages. [Au(abr)]

**ORCHARD, LITTLE BRAY LANE, BRAYFORD*****Archaeological Watching Brief at the Orchard, Little Bray Lane, Brayford***

Exeter Archaeology Exeter : Exeter Archaeology, Report: 6405 2008, 2pp

*Work undertaken by:* Exeter Archaeology

An archaeological watching brief was undertaken in March 2008 to monitor groundworks for the construction of five units of local need housing with associated access road and parking. Evidence of Roman iron smelting had previously been identified at Sherracombe Ford and at Bray Vale within Brayford. Settlement at Brayford is first recorded in the 10th century, and the parish church originated in the 11th century. The removal of topsoil revealed only colluvium beneath, therefore, three trenches were excavated along the upper part of the site of sufficient depth to reveal either the natural bedrock or the top of in situ archaeological deposits. Trenches 1 and 3 were excavated broadly parallel with the site's eastern edge, and extended from the northern site boundary to within 7m of the southern boundary, it being necessary to maintain access to the site. Trench 2 extended west from the southern end of Trench 1, along the line of the proposed access road. No archaeological features or deposits were present. The soil profiles invariably showed that the turf and topsoil lay above a deposit of post-medieval colluvium 0.20m thick at the northern end of Trench 1, increasing to 0.34m in the west-facing side of Trench 3. Here, and in the southern end of Trench 1, the base of the colluvium contained a significant proportion of bluish-grey comminuted slate, and sealed a 0.12m thick layer of strong yellowish-brown silty clay loam (a buried soil?) of post-medieval date within which were a piece of clay tobacco pipe stem and an iron nail. This deposit thickened progressively to reach a depth of 0.24m at the western end of Trench 2. There was no evidence of material having been imported to the site, and it seems likely that the deep soil profiles are derived from erosion of the headland and (what was formerly) a much more substantial hedgebank that formed the site's eastern boundary, probably by ploughing, in the late post-medieval or modern period. ### **SITE OF THE FORMER CHURCH OF ST. MARY, DARTINGTON HALL, DARTINGTON**

***Devon County Council Historic Environment Record. Monitoring and Recording at the Site of the Former Church of St. Mary, Dartington Hall, Dartington, Devon***

Freeman, J South Molton : South West Archaeology, 2008, 3pp, figs

*Work undertaken by:* South West Archaeology

A watching brief was undertaken at the site of the former Church of St. Mary, Dartington Hall, during groundworks for the excavation of a cable trench and the removal of an existing paved path around the west and south side of the tower. Work was undertaken in February 2008 and consisted of the hand excavation of a trench to create a French drain running against the north faces of the tower. Within the part of the trench closest to the church tower the stratigraphy revealed consisted of turf which overlay mixed demolition rubble including mortar, roof slate and stone rubble. To the south of the tower the stratigraphy revealed consisted of turf overlying a clay soil. This soil contained frequent angular shale fragments and occasional bone fragments. Two features were revealed in this east-west run of the trench. One was a culvert with a slate base, mortared stone side walls and a slate capping slab. The white lime mortar bonding the side walls contained coal dust and appeared to be of a late date. The second feature was the top of either a narrow mortared stone wall, or a narrow culvert.. No grave-cuts, tombs or crypts were revealed in any part of the ground works. No structural evidence for walls or surfaces associated with the nave of the church was revealed adjacent to the tower. No articulated human remains were discovered. The only artefacts recovered were one sherd of Totnes-type post-medieval coarseware. The features and deposits revealed were quite typical for shallow excavation within churchyards. That no structural evidence for the nave of the church was revealed east of the tower suggested that disturbance caused by its demolition or later landscaping of the area extended to a depth of greater than 0.5m below present ground level. The French drain trench was dug by hand to a depth below that of the tower's internal floor level. The material excavated consisted of a single deposit dark brown humic soil containing abundant stone rubble, mortar fragments and roof slate fragments, and was of 19th to 20th Century date [from ceramic evidence]. Only one significant archaeological discovery was made. This consisted of a wall foundation extending north from the north-east corner of the tower. This was of well coursed stone rubble bonded with brown lime mortar. This footing corresponded with scarring visible on the wall face immediately above. It was therefore certainly the foundation of a wall springing north away from the north-east corner of the tower, presumably that of the north part of the west end of the now vanished nave. The wall extended to the full depth of the trench and was left in situ as it formed the east terminal of the French drain trench. No intact graves, tombs or crypts were revealed. A few small fragments of disarticulated bone were recovered for re-interment. The deposits through which this trench was dug appeared to have occurred as a single incidence of dumping raising the ground level against the north side of the tower. It is likely that this took place at the time of the destruction of the nave of the church. [Au(abr)]

Steinmetzer, M Exeter : Exeter Archaeology, 2008, 3pp, figs

*Work undertaken by:* Exeter Archaeology

The site lay adjacent to part of the Dartmeet Coaxial Field System, a prehistoric field system, which is a designated Scheduled Ancient Monument. It was therefore possible that associated remains or deposits of prehistoric date may have survived within the area of the development. A watching brief was maintained during the excavation of four test pits at the north-west end of the Dam and the subsequent construction of the auxiliary spillway and the Swincombe mains diversion. No features or dating evidence was found to indicate prehistoric or significant later activity within the site. [Au(abr)]

Jones, P Exeter : Exeter Archaeology, Report: 08.75 2008, 17pp, colour pls, figs, tabs, refs

*Work undertaken by:* Exeter Archaeology

Excavation and recording on land to the rear of Stokenham House, Stokenham exposed a number of archaeological features. Principal amongst these was a large curvilinear ditch containing pottery dating to the late-13th or 14th century. This ditch was likely to represent part of a large enclosure on, or near to, the site of Stokenham House. The ditch cut through a sequence of smaller, earlier ditches, also of medieval date. A series of post holes, evenly-spaced and forming an alignment along the inner edge of the ditch, represented the only potential evidence for contemporary activity within the enclosure. Further ditches, all of probable medieval date were identified, but their relationship with the ditch could not be established. [Au(abr)]

**THE CLOSE, STOKENHAM*****Watching brief at The Close, Stokenham, Devon. Devon County Council Historic Environment Record***

Jones, P Exeter : Exeter Archaeology, Report: EA 6398 2008, 2pp, figs

*Work undertaken by:* Exeter Archaeology

Archaeological monitoring and recording was undertaken during topsoil removal and reduction of ground levels in advance of the construction of a new driveway. The site lay within the historic settlement of Stokenham, which was likely to have originated in the early medieval period. The site of the driveway lay immediately to the south of the main house, overlooking the village green to the south-west. The village green itself had been the historic focus of the village and contains various earthwork remains of uncertain function and date. The initial works involved the stripping of topsoil and two underlying subsoils, to a maximum depth of 0.85m. The uppermost subsoil comprised 400mm thick brown clayey silt containing moderate mudstone flecks and very occasional clinker/fire waste fragments. Underlying this was a 350mm thick dark brown clayey silt containing occasional charcoal flecks. Beneath this material lay in situ bedrock. The bedrock was exposed throughout the stripped area and consisted of an eroded mudstone outcrop orientated in a north-east/south-west trend. No significant archaeological deposits or features were exposed during the reduction and no pottery or other artefacts were recovered. [Au(abr)]

**LOWER ASHTON MILL**

***Archaeological Monitoring of Groundworks in Association With the Diversion of the Leat Around the Existing Waterwheel at Lower Ashton Mill***

Watts, M Collompton : Martin Watts, 2008, 2pp, figs

*Work undertaken by:* Martin Watts

The groundwork associated with the creation of a leat diversion channel around the existing waterwheel for a new hydro-power installation at Lower Ashton Mill were monitored. A total length of about 15m by 1.5m wide was excavated to a depth of between 0.85m and 1.2m, and the base of the tailrace immediately downstream of the waterwheel was also excavated to a depth of 0.6m below existing tailrace floor level. Two sections of the existing rubble stone wall on the outer (west) side of the leat and wheelpit was also removed. Unstratified material and debris was removed from the wheelpit/tailrace, comprising silt and loose stone, broken glass and pottery, metal objects, including some car parts, all of which dated from the late-19th to 20th century, and some water-rounded stones. A layer of grey clay, c.0.3-0.4m thick, was found below the silt and debris layer, its top surface being about 0.8m below the top of the wheelpit wall. The excavation carried out for the leat diversion channel was about 0.85m deep at the upstream (north) end, increasing to 1.2m deep at the south end, due to the slope of the ground. The excavated material comprised top soil (>0.2m), a silt layer (0.15m) and natural material comprising shillet and sandy earth, with some water-rounded stones. Unstratified fragments of 19th-20th century pottery, small pieces of worked iron and pieces of coal and coke were found on top of the natural layer, the latter presumably being connected with the iron mill that was recorded here in the early 19th century. A single base sherd of green-glazed South Somerset type coarseware, dated to the 17th or 18th century was also recovered from the top of the natural layer. No earlier archaeological deposits or artefacts were exposed or recovered from these excavations. [Au(abr)]

Bell, J Exeter : Exeter Archaeology, Report: EA6488 2008, 2pp, figs

*Work undertaken by:* Exeter Archaeology

Archaeological monitoring was undertaken during groundworks for a new dwelling. Removed material comprised a garden soil, with frequent stones, and brick and glass fragments. Local pottery sherds, pottery wasters and kiln furniture of 19/20th century date were also recovered from this material in small numbers. Removed material was used to raise ground levels to the rear [north-west] of the excavated site in order to provide a car parking area. Foundation trenches for the proposed development were excavated within the reduced area. No features of archaeological significance were observed. The east-west foundation trench showed that the natural clays dipped away to the east, and it was suggested that the demolition material had been used to level the ground to create the garden. Personal communication with the owner/developer, revealed that a greenhouse with under floor heating pipes had formerly occupied the south-west corner of the site. It was likely that the demolition of this building and removal of the pipes resulted in the exposed demolition material. The recovery of local 19/20th-century pottery wasters and kiln material reflected the close proximity of the site to the known pottery works. No indication of this activity having taken place within the site was identified, however. [Au(abr)]

*Work undertaken by:* AC archaeology

A watching brief was carried out during ground reduction to create a level terrace for a new stable block, located in the north-east corner of a pasture field which sloped steeply down to the north-north-west. Due to the steep gradient and consequent shallowness of the ground reduction on the lower side of the site, natural ground was only encountered on the south side. Two small features were exposed at the level of the natural subsoil, neither of which were visible within the colluviums. The features comprised two post holes, neither of which contained any finds, but were thought to be modern in date and related to cable laying. [Au(abr)]

**LOWER ALSWORTHY FARM*****Lower Alsworthy Farm, Archaeological Excavation, Monitoring and Recording. Devon County Council Historic Environment Record***

Dean, R South Molton : South West Archaeology, 2008, 3pp, figs

*Work undertaken by:* South West Archaeology

A programme of archaeological work comprising monitoring of groundworks, excavation, recording and post-excavation report writing was undertaken at Lower Alsworthy Farm. A previous archaeological building survey had indicated that the settlement probably predated the Norman Conquest, and that a high status medieval house probably existed on or near the site of the present farmhouse. The area was probably first enclosed with hedgebanks during the Middle Ages. No finds were recovered from the topsoil but a linear cut through it was interpreted as a modern drainage ditch. A sub-circular cut, interpreted as a possible post hole was also found. There were no other post holes present have to indicated any associated structure. The second feature was a north-south trending linear cut, the feature extended beyond the limit of excavation. No archaeological finds were present in either feature. [Au(adp)]

*Work undertaken by:* Exeter Archaeology

The main north-south aligned hedgebank was probably medieval. The inconclusive dating, resulting from the presence of post-medieval ceramics, probably reflected considerable repair and enhancement in later periods. A smaller southern enclosure was likely to be of later date, although the degree of chronological separation between the two features was not clear, and a later medieval or early post-medieval date was considered probable. The origins of the current perimeter hedge were uncertain, but likely to be of some antiquity. [Au(abr)]

*Work undertaken by:* Exeter Archaeology

A watching brief was maintained during groundworks associated with a new water main between Newtown Reservoir and Lock's Beam. Six features were uncovered, all of which appeared to be post-medieval in date. Three lithics were recovered to the south and east of Lock's Beam, while five sherds of medieval pottery were found around Norwood Farm. Large quantities of post-medieval pot, ceramics, glass and clay pipes were recovered throughout the route of the pipeline. Twelve hedge banks were breached, all of which appeared to be post-medieval or modern in date. The area between Newtown Reservoir and Lock's Beam revealed little evidence of pre-1750 occupation, except for a small quantity of worked flint and residual medieval pottery. [Au(abr)]

Preece, C. and Laing-Trengove, D. Barnstaple : South West Archaeology, 2008, HER entry with plans and photographs

*Work undertaken by:* South West Archaeology

"South West Archaeology was asked to undertake a desk-based cartographic study, archaeological evaluation and historic building survey on an irregularly shaped plot of land representing the rear yard, garden and outbuildings formerly belonging to number 54 The Terrace, and off School Lane, Hartland. The plot is sited near to the centre of Hartland and is within the conservation area. The desk-based assessment showed that the land was probably part of a burgage plot in the medieval borough of Hartland and in the early medieval period may have been within a strip field system, but that a number of the boundaries and the remaining buildings on the site were of 19th century date. The building survey confirmed the rubble stone building with slate roof to be of 19th century date but of two phases. The evaluation revealed evidence predominantly from the 19th century use of the site as a garden. The exceptions were a N/S linear in the base of T2 which may be an earlier field division and an E/W linear in T5. In T4, the remains of the previously demolished barn were found at foundation level and a small portion of possibly earlier clay-bonded wall external to this to the west." [OASIS]

Goodwin, N Exeter : Exeter Archaeology, Report: EA6324 2008, 3pp, figs

*Work undertaken by:* Exeter Archaeology

Groundworks for a development of 32 dwellings in two fields in the village of Shebbear were monitored. A desk-based assessment undertaken in 2006 suggested that some field boundaries might have represented the remains of a medieval field system. Two hedgebanks were breached, a 25m section at the northern end of the western boundary and two sections of the east-west aligned hedgebank in the southern part of the site. The only finds were modern items recovered from the disturbed edges of the banks. A large portion of the site was stripped of topsoil down to in situ clay/degraded slate. This varied in thickness from 0.15m in the north-east to 0.4m in the south-west of the main field. No archaeological features were exposed. Only modern finds were retrieved. There were no indications of a second east-west aligned hedgebank in this area as indicated on the Shebbear tithe map of 1844 and the 1st and 2nd edition OS maps of 1885 and 1906. The hedgebank was not indicated on the 1955 OS map. There were no signs of a small structure indicated on the pre-1955 maps in the northern end of the site, near the entrance. [Au(abr)]

**DEVONPORT HOUSE*****Watching Brief, Devonport House. Devon County Council Historic Environment Record***

Austin, J Exeter : Exeter Archaeology, Report: 6066 2008, 4pp, figs

*Work undertaken by:* Exeter Archaeology

Archaeological monitoring and recording was undertaken during ground reduction and foundation trenching for a new dwelling situated between Devonport House and Little Devonport. The site lay at the edge of the historic core of Shebbear, which was known to have been a Royal Domesday manor with probable Saxon origins. 1880s Ordnance Survey mapping showed a number of curving field boundaries, typical of the medieval period, running through the village, and depicted the site as having been divided into three plots. Three buildings shown on the mapping lay within the footprint of the development. It was anticipated that remains of the foundations of these buildings, associated deposits, and possibly evidence of earlier occupation, might have survived within the site. On arrival it was evident that the site had previously been levelled to form a platform that extended northwards beyond the development area. The depth of the raised ground increased northwards to counter the drop in the natural slope, reaching a maximum thickness of 1m. Contained in the central western area of the site were the remains of a modern structure consisting of a concrete surface and remains of a block wall. A number of 19th and 20th century pottery sherds were recovered, which were more common towards the centre of the site. The same deposit also produced fragments of plastic, glass and brick. Natural ground was exposed at a depth of approximately 500mm but this varied across the site. Natural subsoil was generally overlain by an intermittent thin layer of topsoil, which was sealed by the modern made ground exposed during ground reduction. No archaeological features or significant deposits were present and no pre-19th century pottery was found. [Au(abr)]

*Work undertaken by:* Kayt Armstrong

Archaeologically interesting deposits were discovered in all of the trenches. Trench 1 proved the hardest to understand, due to its relative size to expected features. It had so much in it, it was difficult to say if it was a reflection of the natural subsurface on this part of this site or was archaeological material. The final interpretation was dependant on a re-analysis of the geophysical data taking into account the ground truthing data obtained here. Trench 2 successfully proved there was no ditch, and that the outer curving anomaly in radar surveys was related to the outer circle and disturbance of the ground in its reconstruction. It also located a recumbent stone from the 3rd circle, missed in the original reconstruction of the monument. This increased confidence in the reconstruction of the monument as it appeared the archaeologist did not go digging for stones or moved them very far to re-erect them. No features were discovered that were at odds with the visible surface archaeology of the stone circles. The interpretation of the site as a cairn with outlying circles seemed to have been vindicated by the material in the very eastern part of the trench [granite rubble]. Trench 3 provided the expected section through the bank. No buried palaeosols were identified, but a monolith sample and bulk samples were taken for further analysis. Trench 4 was speculatively located, over some anomalies and where archaeology was also expected, given the projected line of the stone rows. It seems to have proven at least one stone row [in the north of the trench] and another potential one, or some other setting in the southern part of the trench. [Au(abr)]

Archaeological monitoring and recording was undertaken during topsoil removal and reduction of ground levels in advance of the construction of a new agricultural building. The proposed development lay some 2.5km to the south-west of Tavistock within a field demarcated to the south by a Forestry Commission trackway and to the west and north by birch wood. Immediately to the south lay the site of the now disused 19th century Devon and Courtenay Mine. Initial works involved the reduction of ground within the footprint of the development including the associated driveway to a maximum depth of 0.20m. No significant archaeological deposits or features were exposed during the reduction and no pottery or other artefacts were recovered. [Au(abr)]

**HIGH WOOD, KINGSTON LACY ESTATE**

***Excavation of Enclosure in High Wood, Kingston Lacy Estate. Interim Report***

Papworth, M Swindon : National Trust, 2008, 1p  
*Work undertaken by:* National Trust

In May 2008 a trench was excavated across the bank and ditch of the High Wood enclosure where a gravel pit cut into the ditch. The backfilling of the ditch contained Roman pottery. The bank contained Late Iron Age pot. This covered occupation debris of Middle Iron Age date across the site, as well as residual flint debris of Neolithic to Bronze Age date. [Sec(abr)]

DIVERSION BUND (AREA 2)**

***Improvements to the Kingstone Lacy Car Park (area 1) and Diversion Bund (Area 2)***

Martin, P & Driscoll, S Trowbridge : Absolute Archaeology, Report: AA7/08/Eval 2008, 22pp, colour pls, figs, refs, CD  
*Work undertaken by:* Absolute Archaeology

An archaeological watching brief was maintained during topsoil stripping of the car park. The work revealed an extant pathway. Finds from within the matrix of the pathway suggested a Late Victorian date. Six areas of residual worked flint, probably forming a background scatter or possibly overlying in situ features, were plotted and recorded. No features were observed in the monitoring of Area 2, although a scatter of post-medieval roofing tile suggested a building of some description in the vicinity. Subsequent observation of trenching revealed no features. [Au(abr)]

***Archaeological Watching Brief. 37 South Street, Bridport, Dorset***

Clarke, C Bridport : Arrowhead Archaeology, 2008, 28pp, colour pls, figs, tabs, refs

*Work undertaken by:* Arrowhead Archaeology

Part of a 12th century building, represented by a beam slot and post holes, was recorded in a watching brief. The building was on a north-east to south-west alignment and it was likely to have been a component of a wider layout on this alignment predating the "new town" of the 13th century. The extension of the original stone building occupying the South Street frontage was dated to the mid-18th century on the basis of sealed deposits. Features of the extension and original building were recorded after removal of wall plaster and modern floor surfaces. [Au(abr)]

De Rosa, D Salisbury : Wessex Archaeology, Report: 57153.02 2008, 16pp, colour pls, figs, tabs, refs

*Work undertaken by:* Wessex Archaeology

Groundwork during the construction of a new medical centre revealed a topsoil horizon containing building material along with demolition rubble from previously demolished Victorian remains, overlying the natural chalk geology. Cellaring had occurred across the site. Within a trial trench and service channel in the north-west corner of the site, a north to south ditch running parallel to Weymouth Avenue was recorded. Although no dating material was recovered, it was thought that this could have represented part of the Roman roadside ditch that had previously been recorded to the south at the Station Master's House. No further archaeological remains were encountered during the watching brief. [Au(adp)]

Witchell, N Gloucester : Gloucestershire County Council Archaeology Service, 2008, 10pp, colour pls, figs, refs

*Work undertaken by:* Gloucestershire County Council Archaeology Service

No significant archaeological remains were encountered during the watching brief. The observations made from the watching brief, and from an earlier evaluation (Stratford 2007) demonstrated that the ground level of the library site and the surrounding area (especially that to the north) was built up and remodelled when the library was built. No significant archaeological deposits or natural geological deposits were observed. It was unclear whether the post-medieval soil recorded in many of the excavated areas was an accumulated layer or a levelling deposit associated with the library construction or dated to earlier groundwork. The Scheduled Monument area was subject to minor work, which followed the conditions attached to Scheduled Monument consent (HSD 9/2/10315). No work other than that outlined in the SM consent was carried out. [Au(abr)]

A programme of archaeological monitoring was undertaken at Watermoor Church of England Primary School and Children's Centre, Cirencester, Gloucestershire. The archaeological watching brief was carried out at the request of English Heritage as the groundworks were within the Scheduled Monument of Corinium Roman Town (SM 361). The fieldwork took place on the 28th and 30th October 2008. The works involved the laying of new surfaces and the erection of a fence and gates. No archaeology was exposed during the monitoring of the groundworks. [Au(abr)]

Archaeological recording showed a simple sequence of deposits comprising natural sand overlain by thick layer of garden soil. Although a single modern pit feature was recorded in one of the trenches, no archaeological deposits were observed within the footprint of the development. An absence of residual finds during the excavation appeared to suggest that there was little activity within the boundary of the site. [Au(abr)]

9pp, tabs, refs*Work undertaken by:* Gloucestershire County Council Archaeology Service

An archaeological excavation was carried out at Grange Hill Quarry, Naunton [Phase 5b]. The work involved the archaeological supervision of machine stripping for an extension to the existing quarry and subsequent excavation and recording of archaeological features. A number of features were cut into the natural limestone brash, including clusters of post holes and linear ditches dating to the Iron Age period. Two distinct areas suggested possible roundhouse structures. The area showed evidence of being truncated by later quarrying pits and later activity, including a modern water pipe trench and variations in the depth of machining. Dating evidence retrieved from the quarry pits showed that it took place in the post-medieval period. [(Au(abr))]

Gloucestershire County Council Archaeology Service were advised by Gloucestershire Police that a skull and other fragments of human bone had been discovered by a builder at Dower House, Brockhampton. Gloucestershire Police requested that GCCAS attended to identify and establish the relative date range of the burial, i.e. that it was over a hundred years old. The remains were identified as coming from one adult human, probably from a previously disturbed burial. Given the condition of the bone, it was highly likely that the bones were buried over one hundred years ago. [Au(abr)]

Hood, A Swindon : Foundations Archaeology, Report: 633 2009, 38pp, figs, tabs, refs  
*Work undertaken by:* Foundations Archaeology

The excavation programme identified and recorded significant archaeological features and deposits, which represented three phases of activity. Phase 1 comprised a cobbled terrace, which was tentatively dated to the earlier Roman period. Possible stone-built structures were represented by stone rubble spreads; however, due to truncation in antiquity, the activities associated with the terrace remained unclear. Phase 2 was dateable to the 3rd-4th centuries AD and included a stone-built structure with contemporary cobbled pavement and a large refuse pit. This phase was associated with evidence for iron smelting and on-site smithing. A number of pits and ditches were demonstrably later than the Phase 2 activity. These were poorly dated, although one of the ditches was associated with medieval and post-medieval pottery. [Au(abr)]

Hart, J Cirencester : Cotswold Archaeology, Report: 08225 2008, 22pp, figs, tabs, refs  
*Work undertaken by:* Cotswold Archaeology

An archaeological excavation was undertaken on land at Charfield Road. Three areas of the development site were identified as having archaeological potential on the basis of preliminary works undertaken during a desk-based assessment, geophysical survey and evaluation. These parts of the site were mechanically stripped and then archaeologically recorded. Archaeological remains consisted of two Roman ditches, two undated pits and a small number of post-medieval/modern features. The results of the excavation correlated well with those of the geophysical survey and evaluation. Although small quantities of Roman building material was recovered, the absence of structural remains on the site suggested that the Roman ditches formed part of a field system and that any associated settlement lay beyond the site. The ditch fills were darker and more finds rich towards the southern end of the site, suggesting that any such settlement might lie to the south, perhaps on or close to the top of the valley side on which the site was located. Williams, P Worcester : Mercian Archaeology and Historic Buildings, 2008, 22pp, colour pls, figs, tabs, refs

*Work undertaken by:* Mercian Archaeology

During a watching brief, one significant archaeological deposit was noted, a buried deposit [possibly a ditch or pit fill] was encountered at the south-western boundary of the site. The deposit was seen either side of the present churchyard wall in this area, indicating that it predated the wall, which was constructed sometime after 1880. A sherd of pottery found within the deposit, which also included burnt stone fragments, burnt clay, slate fragments and deposits of pinkish limey mortar, dated from the late-17th or 18th century. Unfortunately, the lifting of the nave floor was carried out without archaeological supervision. However, finds beneath the floor were stacked outside the church. These included fragments of 15th-16th century glazed floor tiles and sections of broken grave stones, including one dating from 1814. [Au(abr)]

Saunders, K Cirencester : Cotswold Archaeology, Report: 08061 2008, 15pp, figs, tabs, refs

*Work undertaken by:* Cotswold Archaeology

An archaeological strip, map and sample exercise was undertaken on land adjacent to 54 Barton Street. Three parallel ditches and two pits, all dating to the Roman period, were uncovered, along with a single medieval pit. One of the pits contained pottery of 1st to 2nd-century AD date, and may have represented early Roman quarrying activity. The ditches may have dated to the later Roman period and probably represented boundary or drainage ditches. These features were located immediately to the south of Barton Street, with any potential further features to the south removed by post-medieval cellars and other modern intrusions. [Au(abr)]

**TEWKESBURY EARLY YEARS CENTRE, CHANCE STREET*****An Archaeological Watching Brief at the Early Years Centre, Tewkesbury Church of England Primary School, Chance Street, Tewkesbury, Gloucestershire***

Witchell, N Gloucester : Gloucestershire County Council Archaeology Service, 2008, 11pp, colour pls, figs, refs

*Work undertaken by:* Gloucestershire County Council Archaeology Service

Much of the excavation work was shallow and did not impact on archaeological deposits pre-dating the Victorian era; concrete engineering piling used in the foundations of the new Early Years Centre building will have impacted on any archaeological remains extant within the footprint of the building. The archaeological monitoring recorded three features, a metalled surface, a probable pit and a linear ditch. The metalled surface was the earliest feature; it appeared to be a pathway running east to west, with limestone edging; no dating evidence was observed within the makeup of the path. The Pit was largely truncated during the excavation of the trenching. Although three pieces of Roman pottery were recovered from the fill they were very small and abraded, and were probably residual. The linear ditch dated to the late medieval or post-medieval period, further investigation of the feature could not be carried out as a large and potentially dangerous pile of rubble was built up next to the edge of the trench. As well as three features, the watching brief recorded a subsoil or possible alluvial deposit, which contained 3 pieces of a Roman 'Severn Valley Ware' pottery vessel; it was thought possible that the finds came from an unidentified feature. **ABBEYFIELDS COMMUNITY CENTRE, WINCHCOMBE*****Abbeyfields Community Centre, Winchcombe, Gloucester, Assessment of Damage Caused by Unauthorised Works***

Gloucestershire County Council Archaeology Service Gloucester : Gloucestershire County Council Archaeology Service, 2008, 10pp, colour pls, figs, tabs, refs

*Work undertaken by:* Gloucestershire County Council Archaeology Service

An assessment was made of the impact of unauthorized works carried out within Winchcombe Abbey Scheduled Monument at Abbeyfields Community Centre. The works were carried out prior to full planning permission being received and without Scheduled Monument Consent. Given the amount of archaeological information known about most of the areas of the Scheduled Monument little was known about the condition of the archaeological deposits beneath and adjacent to the footprint of the school, constructed in 1911. Even less was known about the survival beneath the Horsa huts and the tarmac area which connected the two sets of buildings. The nearest archaeological interventions were carried out to the immediate east of the Horsa buildings by Hinchcliffe in 1972 (Ellis 1986). In addition to the trenches excavated across the burgh bank fronting onto Back Lane, the large trench excavated here revealed the natural deposits at a depth of less than 0.5m and cut into this were two ditches of Saxon date and a medieval building and boundary. It is probable that the construction of the school, Horsa buildings, playground, various service runs and localised terracing within the boundaries of the school had a significant impact on the archaeological deposits. It is probable that there are areas of total truncation, but between, there are likely to be areas in which archaeological deposits have survived relatively unscathed. In the normal process an archaeological evaluation within the footprint of the ramps would have been desirable to establish the levels of truncation and survival of the deposits for the position of each ramp. On this occasion this process was not followed, therefore it was not possible to establish potential survival in this instance. In addition it was difficult to assess the exact depth of and extent of the footings as no information was provided either in the form of plans or photographs, therefore it was not possible to accurately state if any damage was caused to archaeological deposits if they existed in these locations. However, given the probable shallowness of the foundations required for such light structures and the building up of the ground level in the front of the Horsas and the evidence for significant drainage it was unlikely that significant damage was caused. #### **WYTCH FARM PIPELINES**

#### ***Wyтч Farm Pipelines 2208. Post-excavation Assessment Report***

AC archaeologyChicklade : AC archaeology, 2008, 18pp, colour pls, figs, tabs, refs

*Work undertaken by:* AC archaeology

An archaeological evaluation, excavation and subsequent monitoring was carried out prior to, and during, the installation of new pipelines within the existing Wyтч Farm oilfield. The evaluation identified two areas that were considered to have been used for salt working during the middle ages, one of which had been identified and examined during the previous oilfield development in 1987. Subsequent excavation at the latter site identified two phases of archaeological activity, medieval and post-medieval. A large medieval midden representing industrial waste from salt production was revealed with six medieval ditches and gullies cutting it. The post-medieval features appeared to be associated with agricultural and landscape management. [Au(abr)]

Hurst, D & Miller, D Woodbury : Worcestershire County Council Historic Environment & Archaeology Service, Report: 3039 2008, 68pp, colour pls, figs, tabs, refs

*Work undertaken by:* Worcestershire County Council Historic Environment & Archaeology Service

This project was thought to be only the second survey of a length of river corridor to be undertaken in the West Midlands. As a result, the project represented an early stage of knowledge and expertise, and its conclusions must be regarded in this light. Two main points stood out from the evidence. In the first place, many of the documented sites could not be identified on the ground. This was especially clear in the case of the fisheries, fords and ferries. Where maps or photographs record these sites these records themselves were the principal evidence. This may have reflected that the river had a habit of scouring away and burying its own history, and that much of that history, until more recent times, was not associated with any substantial structures that would leave any obvious archaeological trace. In the second place, in contrast to this dearth of evidence for earlier activities in the vicinity of the river, there were extensive monumental remains of the mid to late-19th century that survived despite the great floods that had occurred over the last 150 years. These attested the grand scale of the designs of this period, and are the equal of other contemporary monuments to the expansion of the transport industry that are to found on the canal and rail systems. Compared to other parts of the historic environment record for the Worcester to Tewkesbury stretch of the River Severn, a great deal survived of the original Diglis complex, which formed a major part of the 19th century river improvement scheme. All the locks in the survey area built in the 19th century continued in use through to the time of survey. Apart from the locks, further clues to the river's commercial past in this period were the sunken barges, such as at Saxon's Lode, or on Diglis Island. These provided a tangible link with the navigation heritage of the river, though only with the last stage of this era. The whole of this stretch of the River Severn was a continuing legacy of 19th century engineering, given that the raised water level achieved in this period through weirs and locks, was still intact. It was clear that, apart from these comparatively youthful survivals at the sites of the main locks, there was very little obvious remaining to represent the use of the river in more remote times. The historic environment record, therefore, reflected in the main a rich documentary record and folk memory relating to specific points on the river rather than any more tangible archaeological survival. The recorded sites probably only revealed a very incomplete view of the history of the river. [Au(adp)]

Birbeck, V Salisbury : WA Heritage, 2008, 20pp, colour pls, figs, tabs, refs

*Work undertaken by:* WA Heritage

An archaeological excavation was carried out within the footprint of a proposed extension to the museum. A desk-based assessment had established that the site was located on a Roman cemetery, and six stone coffins had previously been unearthed from the grounds. A previous extension to the building, which was Sydney Hotel, was shown on maps of 1854 and 1855, and appeared to have replaced an earlier extension that incorporated a first floor bandstand over a colonnaded veranda. No evidence was located for Roman burials within the

excavation area. The earliest features encountered comprised a row of 18th century post holes and a large masonry cellar, presumably part of the original cellars of the Sydney Hotel, overlain by a made ground deposit that covered the majority of the area. Later features consisted of four column pads and an associated drain, possibly part of the colonnaded veranda and bandstand. A pit, the remains of the mid-19th century extension, and 20th century garden features were also recorded. A further watching brief was scheduled. [Au(adp)]

Morris, N Chicklade : AC archaeology, Report: AC1199/1/0 2008, 10pp, colour pls, figs, tabs, refs

*Work undertaken by:* AC archaeology

Archaeological monitoring was conducted on the site of the Bruton Flood Storage Reservoir during works to improve the dam and spillway. During previous work in 1984 to construct the dam, a 9th-11th century sword was discovered and the area was therefore considered to have some archaeological potential. The work consisted of stripping large areas, and the removal of natural clays, creating a "borrow pit" and an extension to the dam culvert inlet structure. No pre-modern archaeological features or deposits were observed during this monitoring although a few prehistoric archaeological artefacts were recovered. [Au(abr)]

Allum, C & Pegg, F Wincanton : Context One Archaeological Services, Report: 28215 2009, 12pp, figs, tabs, refs

*Work undertaken by:* Context One Archaeological Services

The watching brief recorded four inter-cutting ditches and a tiny assemblage of medieval pottery, providing an earliest possible date of the 11th/12th century for one ditch. A single residual late Bronze Age flint was also recovered from this ditch together with a few cattle and horse bone fragments, while similar cattle bone fragments were found in an undated ditch. A residual medieval pottery sherd was also recovered from the topsoil. The high water table and the homogenous nature of the ditch fills prevented the establishment of stratigraphic relationships between the ditches. Also, the site had been subject to significant disturbance from the pre-existing farm building which once occupied the northern area. [Au(abr)]

Archaeological monitoring was conducted at the site of the Curry Moor Pumping Station during the construction of a new outfall structure, buried pipe trenching and creation of an earth bank. The location of the site lay adjacent to three Scheduled Monuments and within 1.5km of an area of High Archaeological Potential. Monitoring consisted of observation during topsoil stripping and excavation prior to construction of the outfall structure and pipe trenching. It was not possible to obtain a profile of the river bank due to the nature piling employed in the construction of the cofferdam and no earlier riverbank sections were observed in the service trench excavations. #### ***Warren House, Prior's Park Wood, Otterford, Somerset. An Archaeological Survey & Watching Brief***

Brigers, J Bridgwater : James L Brigers, 2008, 13pp, colour pls, figs, ref

*Work undertaken by:* James L Brigers

During replacement of supports for overhead power lines, access for equipment required the partial clearance of the remains of Warren house, an isolated ruined building situated in Priors Park Woods. The ruins appeared to be those of a dwelling of three principal rooms with a two room out-shut standing in a large enclosure. The investigation provided evidence to suggest that the building was originally a two-room plan no earlier than the 17th century and was subject to at least two extensions. The survey revealed that the north-eastern, and largest, room was served by a large fire place and probably functioned as the principal living accommodation throughout the period of occupation of the house which seemed to have ceased in the first half of the 20th century. *Work undertaken by:* Michael Heaton

Removal of lead sheeting and two phases of counter boarding from the roof of Dunster Castle was carried out during the Autumn and Winter of 2006 prior to repairs undertaken in 2008. It revealed a minimum of six separate roof structures representing about five phases of roof construction between the 17th and the 20th century. The most significant of these were a flat roof, possibly of three sub-phases, dated to c. AD1611, their conversion into king post trusses in c. AD1728, and the insertion of wrought iron "I" beams in c.1865-72, probably under the supervision of the architect Anthony Salvin. [Au(abr)]

*Work undertaken by:* JW Archaeology Services

The watching brief recovered the remains of an isolated pyre burial together with relatively large assemblages of pottery, indicating that the site was of significance during the late 3rd and early 4th centuries AD. The HER had indicated other burials in the area, and the site was thought to be regarded as a Roman cemetery, in use until at least the 4th century AD. The presence of a large section of wall foundations and the storage jar with spatula indicated that there was a Roman building [possibly early to late 4th century AD] located on the site. [Au(adp)]

West, AExeter : Exeter Archaeology, Report: EA6689 2008, 3pp, figs  
*Work undertaken by:* Exeter Archaeology

Monitoring was carried out during the removal of a hedgebank in advance of the construction of an agricultural building. A section across the hedge was examined and recorded. The hedgebank formed part of a medieval field system, altered by the enlargement of fields during the latter 20th century. The westernmost 32m of the bank had been removed prior to the watching brief. The original ground surface (buried soil), had not survived. A shallow ditch was present to the south side of the hedge although this had been heavily disturbed by machine movements. There was heavy root disturbance throughout the recorded section. [Au(abr)]

Fitzpatrick, V, Mephram, L & Boylston, A Salisbury : Wessex Archaeology, Report: 65081.01 2008, 45pp, colour pls, figs, tabs, refs

*Work undertaken by:* Wessex Archaeology

A watching brief was undertaken during demolition and construction groundwork at the former Thames Valley Foods site. The potential had been highlighted for the survival of human remains following a previous discovery, during the construction of an extension to the existing factory, of a series of inhumation burials. A Civil War context was intimated due to the proximity of the site to skirmishes of that time and the well-preserved state of the skeletal remains. During the watching brief evidence of extensive modern truncation was observed, especially on the lower slope of the development area from service trenches associated with the construction of the factory in the 1960s. The groundworks were monitored on the upper south-east part of the site and subsequently human remains were discovered. The burials revealed comprised a number of disturbed inhumation graves dated to the Saxon period by an iron knife found with the disarticulated skeletal remains. The watching brief results led to

an archaeological excavation that comprised two areas. The areas were separated by the site compound and access route where no impact on potential archaeology from residential development was to occur. The archaeological excavations found part of a middle Saxon cemetery containing 26 inhumation graves. Of the skeletal remains recovered eight were a good state of preservation, seven were in a fair condition and 11 were in a poor state. Disarticulated human bones were also retrieved from the former landsurface/subsoil layer. Disturbance and loss of skeletal material was attributed to truncation from the factory and associated development construction. There were 16 extended supine burials, four were flexed, two crouched and a single burial in a prone position. The results of the human bone assessment highlighted at least one case of leprosy from the site. Finds from the graves included a seax, other iron knives and a double sided bone comb found buried with the human remains. Other artefacts considered to be either residual or intrusive were also recovered; these included pottery sherds, worked and burnt flint and animal bone. [Au(abr)]

King, D Swindon : Foundations Archaeology, Report: 635 2008, 11pp, figs, tabs, refs  
*Work undertaken by:* Foundations Archaeology

The watching brief revealed two possible archaeological features in the house extension footings and no archaeological features, deposits or artefacts within the garage footings. Intact subsoils were observed across the monitored area. The gully was undated, although could be of some antiquity as it was sealed by the subsoil. It is possible, however, it was a natural feature as opposed to an archaeological feature. The possible pit feature was of more recent origin as it cut the subsoil; however, no dating evidence was present within it. It may have related to the construction of Dorwyn. Further conclusions on the origin of the features were not possible due to the restricted size of the area observed. No artefactual evidence was present in the watched area. There was no clear evidence of archaeological features or deposits relating to the World Heritage Site of Avebury. [Au(abr)]

Ford, S Reading : Thames Valley Archaeological Services, Report: 05/61c 2009, 7pp, colour pls, figs, tabs, refs

*Work undertaken by:* Thames Valley Archaeological Services

An open-area excavation took place on the line of a public footpath between two quarried areas, prior to extraction of aggregates. The site lay adjacent to an area of previously excavated intensive archaeological activity. The continuation of a probable pit alignment, two possible roundhouses and a possible gully terminal were identified. Little dating evidence was recovered. The double pit alignment was probably of Late Bronze Age/Early Iron Age date, but may have been later. The roundhouse features were of probable Bronze Age date. [Au(adp)]

Andres, P & Goller, R Salisbury : Wessex Archaeology, Report: 58522.01 2009, 22pp, colour pls, figs, tabs, refs

*Work undertaken by:* Wessex Archaeology

The excavation was part of an ongoing programme at the site. The most significant and unexpected discovery in the 2008 season was an earlier building beneath the bath-house. The high status of the building was indicated by the exceptional quality of some of the painted wall plaster, the remains of a mosaic floor, a few fragments of window glass and a probable column base. Too little of the building was excavated to fully understand its function, but it was thought to be of 2nd century AD date and a possible bath-house, temple or shrine. To the north of the bath-house, the promontory excavations revealed a sequence of deposits relating to lime/mortar preparation, most likely of Roman date. If so, this represented a rare discovery of what once must have been a commonplace feature on many villa and other sites that had substantial stone structures. [Au(adp)]

*Work undertaken by:* Wessex Archaeology

The watching brief identified archaeological features, comprising an undated grave of likely Roman date or earlier, a section of prehistoric ditch and tree throws. It was thought that the airfield had the potential for the survival of significant remains. The ditch was thought to be an extension of the Wessex Linear, a previously recorded feature that formed part of an important phase of prehistoric land management. The grave may have been part of a wider number of prehistoric and Roman isolated and group burials in the area, and was not unexpected. [Au(adp)]

**STONEHENGE RIVERSIDE PROJECT 2008**  
***Stonehenge Riverside Project 2008. Interim Report***

Parker Pearson, M Sheffield : Stonehenge Riverside Project, 2008, 138pp, colour pls, figs, tabs, refs

*Work undertaken by:* Stonehenge Riverside Project

The 2008 season of excavations, the sixth year of eight, were the largest in the history of the project. Excavations at the end of the Stonehenge Avenue recovered the northern part of a small henge, about 20m in diameter. This lay buried beneath the bank of the River Avon, and was tentatively dated to around the mid-third millennium BC, yielding bone and antler tools, pottery and flint artefacts. The feature was cobbled with flint for walking on, and was broadly contemporary with the Stonehenge Avenue, when Stonehenge was at its zenith. A setting of four pits was arranged in a square in the henge's centre, perhaps once holding posts or standing stones. This was the first major henge discovered in the area for 200 years, and showed that Stonehenge was part of a larger complex of monuments, highlighting the importance of the River Avon for the people who built them. Excavation of an Aubrey Hole also revealed that the bluestones arrived at Stonehenge in the decades after 3000 BC, much earlier than previously thought. The hole originally held a standing stone, removed in prehistory but leaving a tell-tale patch of crushed chalk and packing material. This excavation followed up clues from archaeological diaries in the 1920s. The project also discovered a stone-dressing area next to Stonehenge, a tomb along the cursus and field boundaries demonstrating that the Stonehenge palisade was part of a Bronze Age farming landscape. Wessex Archaeology Salisbury : Wessex Archaeology, Report: 60517.01 2008, 58pp, colour pls, figs, tabs, refs

*Work undertaken by:* Wessex Archaeology

The excavation followed an earlier evaluation which revealed the presence of archaeological remains spanning the medieval and post-medieval periods. The site produced the first archaeological evidence for early-mid Saxon settlement in Wilton, previously only indicated from historical sources. The presence of a large sunken featured building reflected occupation in the valley bottom and suggested the presence of further features in the vicinity. This may have represented part of the early settlement of Ditchampton, the extent of which was unknown, and two spearheads found during small scale building work could have indicated the presence of an associated cemetery. The sunken feature building contained a large assemblage of loomweights and animal bone, but very little pottery. Charred plant remains were abundant and allowed some understanding of the cereal economy of the period. The site lay just within the extent of the late Saxon town, defined to the north-west by the burgh defences and adjacent to the important West Street. The late Saxon/early medieval and medieval remains, largely comprising pits, spanned the 11th to 14th centuries and included several boundary ditches. The pottery assemblage was one of the largest as yet recovered from the Wilton/Salisbury environs. [Au(adp)]

Cudlip, D Cirencester : Cotswold Archaeology, Report: 09028 2008, 29pp, figs, tabs, refs  
*Work undertaken by: Cotswold Archaeology*

Following on from the results of a previous desk-based assessment and two phases of evaluation, two areas were excavated. In one area, four pits identified during an evaluation in 2002 were located. A further group of three medieval pits was identified. Walls and surfaces relating to buildings depicted on an 1885 Ordnance Survey map were also identified, along with boundary walls and ditches of a similar date. The service ducts and floors of the Usher's Brewery bottling plant which once stood on the site were also encountered. It appeared that the brewery buildings closely followed the Victorian street plan. In the second area, two phases of a substantial post-medieval town house, Conigre House, were revealed, along with subsequent walls and surfaces associated with the Usher's Brewery bottling plant and a later car park. Mc Nicol, D Edgbaston : Birmingham Archaeology, Report: 1857 2008, 18pp, colour pls, figs, tabs, refs

*Work undertaken by:* Birmingham Archaeology

An excavation was undertaken in advance of a proposed development at Boiler House Drive, Metchley Roman Fort. Two trenches were excavated, natural subsoil was not encountered in either of the trenches, and it appeared that the entire area had been built-up prior to the construction of the surrounding buildings. It was possible that this build-up was associated with either the construction of the Birmingham to Worcester Canal between 1791 and 1815, or the railway in the early 19th century, both of which were located directly to the east of the site. No features, or possible features of archaeological interest were identified, and no finds were collected. [Au(abr)]

Duncan, M Edgbaston : Birmingham Archaeology, Report: 1816 2008, 19pp, colour pls, figs, tabs, refs

*Work undertaken by:* Birmingham Archaeology

A watching brief was undertaken in advance of the replacement of a steam main feed to the Health Services Research Centre at the Medical School, University of Birmingham. The area was located within Metchley Roman fort, and in particular within a Scheduled Ancient Monument. The design of the new steam main was intended to minimise disturbance to below ground deposits of archaeological importance. The only possible Roman deposit identified during the fieldwork was a pebble surface. Other features and deposits were modern in date, probably related to construction of the adjoining Medical School. The scheme design therefore resulted in only very limited disturbance to archaeological deposits of Roman date. [Au(abr)]

Tyler, R Edgbaston : Birmingham Archaeology, Report: 1613 2008, 56pp, colour pls, figs, tabs, refs

*Work undertaken by:* Birmingham Archaeology

Aston Hall was one of the most important 17th century houses in the Midlands, built between 1618 and 1635 by Sir Thomas Holte, probably to the design of the renowned architect John

Thorpe, and was a Grade I Listed Building. The watching brief concentrated on the extant stables, the former cart shed to the north of the stables and the remains of the northern service range. A vaulted structure, representing an oven, was revealed beneath the 1930s floor of the former cart shed, probably dating to the mid-19th century. Details of the structure of the rest of the buildings was recorded, otherwise nothing else of archaeological significance was encountered. [Au(abr)]

Hewitson, C Edgbaston : Birmingham Archaeology, Report: PN 1827 2009, 58pp, colour pls, figs, tabs, refs

*Work undertaken by:* Birmingham Archaeology

An evaluation revealed a buried garden soil containing 17th century pottery. A watching brief carried out on all subsequent groundwork revealed limited evidence of occupation, possibly associated with a structure dating to the 13th to 14th centuries, although later truncation made interpretation of this evidence difficult. Evidence of activity dating to the late-15th to 16th century dominated the archaeological record with survival of evidence for pits, post holes, hearths, foundation walls and a possible drain. Much of this was associated with industrial waste and metalworking slag which had accumulated in layers within cut features. Later into the 17th and 18th centuries there was evidence of further occupation, including drains, beam slots, brick built walls and two cellars. [Au(abr)]

Hughes, J & Vaughan, T Wodbury : Worcestershire County Council Historic Environment & Archaeology Service, Report: 1669 2008, 27pp, colour pls, figs ,tabs, refs  
*Work undertaken by:* Worcestershire County Council Historic Environment & Archaeology Service

A watching brief was undertaken at Rookery Street/Well Lane, Wednesfield, Wolverhampton. Four trenches were monitored, yielding post-medieval artefacts and modern deposits, the remains of modern domestic and industrial structures. The remains of modern wall boundaries and ditches were also recorded but stratified post-medieval deposits were not encountered. However, residual fragments of 17th century pottery, assumed to have been manufactured in the Wednesbury potteries, were found in later deposits. The project followed a number of previous site investigations which had revealed 12th-13th century pits/post holes, 17th century boundary ditches and ironworking, and 19th century cellars along Rookery Street. This watching brief did not reveal any further in situ remains of medieval or post-medieval date. However, the alignments of the modern ditches and brick buildings exposed respected Rookery Street's frontage and confirmed that, along with earlier property boundaries recorded during previous excavations in Areas A and B, this area of Wednesfield took its present shape during the 17th century. ### **MOLINEUX HOTEL, MOLINEUX STREET, WOLVERHAMPTON**

#### ***Archaeological Watching Brief at Molineux Hotel, Molineux Street, Wolverhampton***

Vaughn, T Worcester : Worcestershire County Council Historic Environment & Archaeology Service, Report: 1597 2008, 31pp, colour pls, figs, tabs, refs  
*Work undertaken by:* Worcestershire County Council Historic Environment & Archaeology Service

The project aimed to record surviving traces of the layout of the former gardens, their development and any associated buildings, as previously identified on cartographic sources. The brick foundation for a flight of steps was observed at the north corner of West Range. This appeared to be that depicted on a map of 1852, which had been removed by 1886. A brick wall adjacent appeared on the OS map of 1919, built during alterations to the bank and terracing to the immediate north of the Hotel. The cellars below the north-west range appeared to date from the original construction of the range in the mid-18th century. However the internal cellar walls and cellar steps were modified when the wing was enlarged in the early/mid-19th century. Exposure of the foundations below the west wall of the West Range indicated that it was altered or rebuilt during the late-19th century. Trenching through the cellar floor, within the South, West and Garden Ranges revealed 20th century engineering bricks. Similar late-19th/early 20th century engineering bricks were used to replace the steps down to the cellar below the north-west Range, and to surface Molineux Fold yard to the south of the hotel. A substantial brick buttress lay to the south-west side of the excavations for the new archive storage building, which appeared to be part of the range of buildings alongside Molineux Alley. Although first recorded on a map of 1788 it was unclear if the

structure related to this period or to a later rebuilding. Unfortunately no areas beyond the extant building, the immediate north of the West Range and the footprint for the new Archival Storage building were made available for archaeological monitoring. Therefore no further elements of the gardens, ancillary buildings or the landscape around the Hotel were identified or recorded. [Au(abr)]

Lewis, D Hereford : Archaeological Investigations Ltd., 2008, 12pp, colour pls, tabs, refs

*Work undertaken by:* Archaeological Investigations Ltd.

An archaeological watching brief was undertaken prior to development. Remains of a Roman road were discovered and was probably the continuation of the road from Stretton Grandison that ran just east of Kenchester and onwards up the Wye valley to Clyro and Brecon. The road probably meandered in the immediate area of the site as previous archaeological work in the property immediately east found no trace of the road. Within the scope of the watching brief condition it was not possible to fully expose the width of the Roman road and determine its true orientation. However, the work determined that the road was in the vicinity of the modern one and within the site was in a good state of preservation. [Au(abr)]

**THE DUNGEON, GOODRICH CASTLE**

***The Dungeon, Goodrich Castle, Herefordshire, Excavation and Building Recording***

Doyle, D Hereford : Archaeological Investigations Ltd., 2008, 26pp, pls, colour pls, figs, refs

*Work undertaken by:* Archaeological Investigations Ltd.

Goodrich Castle was a Scheduled Ancient Monument overlooking the Wye Valley. Work was carried out to remove modern gravel overburden which was covering the dungeon floor to

establish the source of flooding at the entrance which was preventing public access. The gravel was removed to bedrock and the floor was cleaned and a photographic record made of the floor, walls and vaulted ceiling. A contour survey was also undertaken of the floor. A few stones were found at the entrance indicating that a stone floor may have been in place at some point. The north-west wall contained a small recess and a sealed passage leading to the keep. The bedrock surface was c.30cm higher at the rear of the dungeon this created a gradual slope to the entrance, causing the flooding. All of the walls showed some chalk markings which related to previous survey work. [Au(abr)]

***Castle Green Bowling Club, Hereford, Archaeological Evaluation and Excavation***

Rouse, D & Craddock-Bennett, L          Hereford : Archaeological Investigations Ltd., 2008, 19pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Investigations Ltd.

An evaluation was undertaken on the site of the Castle Green Bowling Club. The evaluation was required to enable a decision to be made by English Heritage to decide whether to grant Scheduled Monument Consent to erect new gates for the bowling green. The evaluation identified the ground level part of the site as it was at the time of the English Civil War at a depth of 0.39m below the present ground level. The dating of the former ground level was aided by the finding of a silver shilling of the reign of Charles I that was dated by the mint mark to 1644-5. Medieval pottery and a small amount of human bone were identified in a deposit overlying the Civil War levels. This material was deemed likely to have originated from medieval contexts elsewhere on the site and would have been incorporated as redeposition during landscaping that was carried out in the 18th century. Based on the findings of the evaluation, permission was given to erect the gates. The post holes were excavated and the same sequence of deposits found as in the evaluation. [Au(abr)]

Lewis, D Hereford : Archaeological Investigations Ltd., 2008, 36pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Investigations Ltd.

The supervision of contractor excavations on the Wye bridge were undertaken. The bridge spanned the River Wye at the southern end of Bridge Street. It was built of red sandstone towards the end of the 15th century and is a Scheduled Ancient Monument. Due to open fractures in the road surface Scheduled Monument Consent was sought to grade the tarmac surface. Although previous work on the bridge uncovered a fragmentary cobbled surface, the trenches recorded during this phase of work were devoid of any archaeological deposits or features. [Au(abr)]

*Work undertaken by:* Church & Site Archaeological Services

Drains were dug around the church walls along with two soakaways and earlier brick and concrete drainage channels were removed from around the church. Concrete beneath the north-east corner of the chancel suggested under-pinning at some stage. Stonework was revealed on the north side which appeared to form part of two substantial walls at right angles, with one perhaps acting as a buttress. Excavations around the tower showed it did not sit squarely on its foundations. There were a few finds, the majority dating to the 20th century. [Au(adp)]

Lewis, D Hereford : Archaeological Investigations Ltd., 2008, 17pp, colour pls, figs, refs

*Work undertaken by:* Archaeological Investigations Ltd.

The Barn was a former farm building to the rear of 17th century timber-framed tenements that front East Street. The building had recently been demolished and an archaeological watching brief was undertaken during the excavation of foundation trenches. The only archaeological features recorded during the course of the work were the floor and wall foundations of the Barn, which were exposed during the initial site clearance. Within the foundation trenches themselves, no archaeological deposits were encountered. Although the site lay within

possible remnants of medieval burgage plots there was no evidence of medieval occupation. If any medieval archaeology survived at the site it was likely to be closer to the street frontage. [Au(abr)]

*Work undertaken by:* Mercian Archaeology and Historic Buildings

The bases of two former pottery kilns were identified during stripping and clearance work at the site, following earlier "grubbing out" of the concrete raft and demolition of parts of the present building complex. The remains were from a mid-19th century kiln, which was firing yellow wares with some red and white wares, mainly earthenware domestic cooking and table wares, though there was also evidence for fine white wares being fired. The kiln did not appear to continue in use to the 20th century. A further kiln suggested that the structure had 7 or 8 fireboxes, with the entrance from level into the oven chamber at the eastern end. The kiln was demolished around 1940 and the walls built across with bricks reused from the structure. [Au(adp)]

*Work undertaken by:* Archenfield Archaeology

The site lay within the grounds of Morville Hall, a National Trust property. A Benedictine priory was also sited in the vicinity. The work to be carried out was for the provision of toilet and basic kitchen facilities in the church vestry at the bottom of the church tower. As part of this work the floor of the tower needed to be removed. Two trenches were also excavated, one for the installation of the water supply and the other to connect drainage pipes to an existing sewer in the adjacent field. The site-work was carried out in 2008. The only archaeology present consisted of fragments of disarticulated human bone from within the tower and, at a deeper level, four further disarticulated skeleton remains including crania, scapulae, vertebrae and phalanges. A 20th century brick soakaway, which assisted with drainage from the roof, was also found. [Au(abr)]

**LAND OFF ASTON STREET, WEM*****Land off Aston Street, Wem, Shropshire. Archaeological Excavations***

Chales, M & Jones, L Edgbaston : Birmingham Archaeology, Report: 1679 2008, 50pp, colour pls, figs, tabs, refs

*Work undertaken by:* Birmingham Archaeology

Archaeological excavations of land off Aston Street were undertaken by between August and September 2007 and April 2008. Two open area excavations took place in advance of a proposed residential development and aimed to locate and investigate evidence of possible 17th-century Civil War defences that a previous evaluation in March 2007 had uncovered. Previous trial trenching of the site, in 2001, investigating the area corresponding to the course of the defences, first depicted on the first edition Ordnance Survey map, found no evidence of the defences. The excavations confirmed the existence of a defensive ditch and provided evidence of its profile, alignment and Civil War origin. The investigation suggested that the projected line of the defensive circuit shown on historic maps since 1881, that was probably originally based upon a description dating to the first half of the 18th century, was only partly

correct. Excavation also provided evidence that a more complex defensive system may have incorporated pre existing field boundary ditches. These were later reinstated by recutting the silted up ditch as a property boundary after the conflict ended. The invaluable evidence produced shed some light on an area of conflict archaeology within a small town context that has rarely been investigated before. [Au(abr)]

Frost, P Pontesbury : Casterling Archaeology, Report: 285 2008, 36pp, colour pls, figs, refs  
*Work undertaken by:* Castlering Archaeology  
 In January 2008, excavations for the footpath around the castle uncovered the foundations of walls extending at right angles from the ashlar plinth of the castle on the south, west and north sides. On the south-west corner of the Keep, the stonework remained of what appeared to have been a stepped entrance to the existing level interior of the Keep. The foundations on the south side appeared also to be part of a feature recorded in 1878. The "stepped" feature on the south-west corner, however, was unrecorded as part of the medieval castle in 1878 and therefore was more likely to date to the 18th/19th century occupation of the site by cottages. Finds recovered during the watching brief dated entirely to the post-medieval to modern period. [Au(abr)]

***Site of Watermill at Sheinwood Farm, Sheinton, Shropshire***

Hannaford, H Shrewsbury : Shropshire County Council Archaeology Service, 2008, 2pp, figs

*Work undertaken by:* Shropshire County Council Archaeology Service

An inspection was made of a weir and confirmed that the weir represented the site of a stone and timber water mill, possibly of late medieval but certainly early post-medieval date. There was a large quantity of stone building rubble in the stream bed below the weir. Post-medieval pottery was evident. A bypass channel which now carried the end of the Whitwell Brook to the Sheinton Brook, ran east from above the mill site. The bypass channel ended with a fine and largely intact stone-built overflow weir some 30m to the east of the remains of the mill. From here, a leat, represented by a dry ditch, led to the north toward another mill site. [Au(abr)]

*Work undertaken by:* Castlering Archaeology

During 2005, site works concentrated on the removal of the single storey addition to the barn and the reduction of ground level. This revealed post-medieval ceramic material and a late-19th century cobbled floor. In February 2008, the excavation of two trenches revealed dark greyish brown topsoil deposits. Comparison to the 1964 excavation worked showed that Trench 1 was a section of backfilled Area 1 excavations undertaken by Barker in 1964. Trench 2 also recorded a similar matrix but also a mortared stone rubble not evident in the 1964 excavation. [Au(adp)]

*Work undertaken by:* Archaeological Research Services

All areas of the tower were recorded in accordance with the brief. The only portions of the stonework which were actually removed and reinstated as part of the renovation were in the upper areas of the circular section of the tower and this was recorded prior to any work. It was most likely that the round tower was constructed in a single episode during the major period of building at the towers during the period 1810-40. Clear evidence of phasing in the structure was evident, with a second phase of working involving blocking some of the windows on the western face, date unknown, and some renovation brickwork in the lower portion of the eastern elevation. ### **LAND OFF LANEHEAD ROAD, ETRURIA**

***Archaeological Excavations on Land off Lanehead Road, Etruria, Stoke-on-Trent, Staffordshire***

Cramp, R Hanley : Stoke-on-Trent Archaeology, Report: 235 2008, 99pp, colour pls, figs, tabs, refs

*Work undertaken by:* Stoke-on-Trent Archaeology

An archaeological evaluation/excavation was undertaken on the site of former workers' housing on Garibaldi Street. The houses were built from the mid-1860s onwards and stood until 2005. The project was undertaken between the 9th and 26th September 2008 and initially involved the excavation of two evaluation trenches, targeted on the yards and rear ranges of numbers 11, 13 (Trench 2) and 23 (Trench 1) Garibaldi Street. It was originally proposed that if the evaluation revealed good evidence of the survival of archaeological deposits and features, Trench 1 would be extended to encompass the footprints of Numbers 23 and 25. The evaluation trenching, however, revealed few remains within Trench 1, but a far greater degree of survival in Trench 2. As a result, it was this latter trench that was extended to the maximum excavation area. Trench 2 contained the remains of Numbers 11 and, to a lesser extent, 13 Garibaldi Street. Number 11 comprised two main ground floor rooms, with a cellar under the front room, and a rear kitchen or scullery range. It was likely that Number 13 featured a similar layout. The two properties were separated by a side passage, which would have provided access to the rear yards. Although little remained of the yards, the privies of Numbers 11 and 13 had survived and each contained sealed, artefact-rich primary fills. These appeared to have been deposited in the privies during the early to mid-1870s and provided an insight into the material culture of some of the first residents of the two houses. [Au(abr)]

*Work undertaken by:* Stoke-on-Trent Archaeology

The watching brief monitored trenching in the market square and within the existing building. Four cut features, at least one of which was a drain, and a small number of brick walls, probably relating to the late-19th century market hall were discovered in the square. A made-ground deposit encountered across the market square contained a substantial quantity of early 19th century pottery waste, possibly produced at one of the two works owned by Thomas Wolfe during this period. ## Birmingham Archaeology

Mann, P Edgbaston : Birmingham Archaeology, Report: 1762 2008, 48pp, colour pls, figs, tabs, refs

*Work undertaken by:* Birmingham Archaeology

Three trial trenches were excavated during the evaluation and a foundation trench was recorded during the watching brief. The earliest evidence for activity on, or in the vicinity of, the site was a sherd of early to middle Saxon pottery which appeared to be a residual find in a later context. This suggested archaeological features or deposits of a similar date, relating to Saxon pre-urban settlement could be present in the vicinity. The evaluation identified two archaeological features of potential archaeological significance. In one trial trench a small pit or possible gully terminal contained no dating evidence, but may have dated to the 14th or 15th centuries, or earlier, on the basis of evidence from the layer sealing it. A large shallow pit in a second trial-trench, also contained no dating evidence, but may have dated to the 17th century, or perhaps earlier, on the basis of evidence from the layer sealing it. It was possible that this pit was utilised to deposit waste from bone working or leather manufacture, although the evidence from the animal bone was not conclusive. Traces of a third possible pit, in the same trial trench, were also recorded. It was probable that these features were associated with medieval or early post-medieval back plot activity associated with crafts or small-scale industries within burgrave plots, to the rear of structures fronting onto Long Street. The potential for survival of medieval and early post-medieval features was enhanced by the presence of possible medieval or post-medieval layers sealing these features, across most of the site, and by the apparent lack of major development to the rear of the Three Tuns. Two brick structures recorded by the evaluation appeared to relate to late-19th or early 20th century outbuildings on the site, depicted on Ordnance Survey maps of 1903 and 1924. The watching brief recorded an undated small post hole or gully terminal which, in view of the results from the evaluation, could potentially be of medieval or post-medieval date. [Au(abr)]

*Work undertaken by:* Warwickshire Museum Field Services

Three areas were excavated within the Grimstock Hill Romano-British settlement, concluding an archaeological programme which began in 2005. A small area adjacent to those examined in 2006-7 revealed only a couple of pits, further to the east a complex series of at least seven bowl-shaped hearth/oven features with several linked possible flues and stoke holes were revealed. These were filled with charcoal debris, but no other evidence of industrial activity was apparent. Two possible phases of use were suggested, but the exact function of the hearths was not clear. The features could have been the truncated remains of one or more corn drying ovens. The second area, to the south-west revealed a length of boundary ditch and a pit. [Sec(abr)]

**LING HALL QUARRY EXTENSION, AREA BA/BB**

**Ling Hall Quarry Extension, Area BA/BB**

Palmer, S.C Warwick : Warwickshire Museum Field Services, 2008, 1p

*Work undertaken by:* Warwickshire Museum Field Services

The quarry extension contained extensive cropmark evidence for later prehistoric and Romano-British land division and settlement. Extensive features were discovered which were then excavated (Area BA/BB) in July and August 2008. The area lay immediately to the east of Area Z, excavated in 2001, and north of Area AB, excavated in 2004. Cropmark evidence for the new area included two rectangular enclosures attached to the major late Bronze Age pit alignment which continued through from Area AB. The enclosures had been sampled during the 1989 evaluation but both were found to be empty of features and devoid of finds. The pit alignment crossed the southern part of Area BA from south-west to north-east. South of the alignment was a small building with an eastern entrance was defined by a pennanular gully. Quantities of decorated late Bronze Age pottery were recovered from the unusually deep gully terminals and similar pottery was recovered from two deep troughs dug outside the entrance. This represents new evidence for late Bronze Age pioneer settlement on Dunsmore. On the south side of the pit alignment an Iron Age ditched enclosure was cut along the spine of the infilled pits (encompassing the small late Bronze Age building). Unfortunately its southern extent had been quarried away without record the previous year. A sequence of poorly preserved structures in the north-east corner of the enclosure yielded a few abraded pottery sherds. An additional structure outside this enclosure but possibly lying in the north-western corner of a further enclosure, utilised a square, four-post arrangement which was unique in the region. A linear arrangement of pits aligned along the southern side of the pit alignment were similar to an arrangement observed in Area AB but remained enigmatic. On the north side of the pit alignment the previously sampled enclosures, resolved into a small rectangular enclosure with an eastern entrance incorporating a sub-circular enclosure, and a larger, rectangular enclosure with a southern entrance added to the eastern side. An absence of finds from these enclosures suggested that they were associated with animal husbandry rather than settlement. The western side of a further enclosure fell just inside the eastern edge of the excavated area, a few Iron Age sherds were recovered from its fill. Between it and the enclosure to the east there was a narrow curving slot representative of a building with an eastern entrance. Another, similar, but more complete building lay to the north, on the far side of a smaller structure. These three features which dated to the later Iron Age were similar to buildings with extended porches excavated in Area Z. [Sec(adp)]

**Ling Hall Quarry Extension, Area BC**

Palmer, S C Warwick : Warwickshire Museum Field Services, 2008, 1pp, colour pls, figs, tabs, refs

*Work undertaken by:* Warwickshire Museum Field Services

Extraction Phase 2 [Area BC] of the new concession was fieldwalked in 2008. An initial transect survey produced 50 worked flints and a single sherd of medieval pottery. A higher density of find-spots on the eastern side of the field provoked the intensive survey in the vicinity of a ring ditch cropmark. The gridded survey yielded a small number of worked flints but no evidence that they were associated with the cropmark. The flints were primarily flakes with very few retouched pieces, two blades and a few cores of possible Mesolithic/Early Neolithic date. During the course of the transect survey it became apparent that there was an inherent collection bias caused by a lesser visibility of flints in the sandier and more dusty soils on the western side of the field, compared to those on the lower ground to the south and to the east. It was also apparent that there was a significant amount of natural flint across the entire field in the form of nodules. [Sec(abr)]

**COMPTON VERNEY HOUSE*****Archaeological Observation of Groundworks for a New Grounds Maintenance Building at Compton Verney House, Compton Verney, Warwickshire***

Coutts, C Warwick : Warwickshire Museum Field Services, Report: 0928 2009, 1p

*Work undertaken by:* Warwickshire Museum Field Services

Recording of ground reduction for a new maintenance building in July 2008 revealed an 18th-century brick culvert with a barrel vault. A buried horse skeleton was recorded and a square memorial stone inscribed "Jack October 1896" was found just below the turf. This suggested that this area may have been used as an animal cemetery in the late-19th century. [Sec]

Coutts, C Warwick : Warwickshire Museum Field Services, Report: 0850 2008, 11pp, colour pls, figs, tabs, refs

*Work undertaken by:* Warwickshire Museum Field Services

Excavation was carried out of the Grade II Listed Ice House on the site, in advance of proposals for the reconstruction. The Ice House was built in 1772, after the completion of Compton Verney House by Robert Adam in 1769, and situated in grounds landscaped by Lancelot "Capability" Brown. The walls were made of brick as was the external dome. Post-medieval and modern finds were recovered. [Au(adp)]

Coutts, C Warwick : Warwickshire Museum Field Services, Report: 0867 2008, 1p

*Work undertaken by:* Warwickshire Museum Field Services

Monitoring of the reinstatement of historic footpaths in Icehouse Coppice revealed an outer circuit of paths with a gravel surface overlying a base of limestone fragments, probably laid out by Capability Brown between 1768 and 1774. The cross paths, largely made of limestone fragments, were likely to be of 19th century date. The central north-north-east/south-south-west path had been repaired with cinders. [Sec(abr)]

Collins, P &amp; McNicol, D Edgbaston : Birmingham Archaeology, Report: 1783 2008, 18pp, colour pls, figs, tabs, refs

*Work undertaken by:* Birmingham Archaeology

During April and June 2008 an archaeological watching Brief was undertaken at St. Thomas à Becket House, formerly St. Thomas à Becket Church, Ettington. The site was approximately 10km south-east of Stratford upon-Avon. The site was in use as a church and cemetery between 1798 and 1913. All groundwork was excavated under supervision in order to determine if any archaeologically significant remains were present and would be disturbed, including human inhumations. Foundation trenches, a drain trench and septic tank pit were dug using a mechanical excavator with toothless bucket. No significant remains were seen either around the site of the church, nor in the area of the proposed car port or drainage trench. However, a single human skull was found during the excavation of the septic tank pit. The skull was left in situ and it was therefore impossible to tell whether it represented an articulated burial or when it dated to. The location of this pit was subsequently moved so as to avoid any disturbance. [Au(abr)]

Archaeological evaluation, excavation and salvage recording were undertaken within a cropmark of a large, rectangular enclosure. A significant Late Bronze Age/Early Iron Age pit group and a ditch were recorded, as well as a scatter of Iron Age and Roman features including pits, a ditch and post holes. Several undated field boundary gullies and a large steep sided hollow of unknown date and function were also examined. The enclosure ditch was sampled but undated apart from a few residual Iron Age and Roman pottery sherds. The Late Bronze Age/Early Iron Age pit group yielded an important assemblage of pottery, querns, rubbing stones and charred plant remains. [Au(abr)]

Greig, I Warwick : Warwickshire Museum Field Services, Report: 0911 2009, 1p, colour pls, figs, tabs, refs

*Work undertaken by:* Warwickshire Museum Field Services

Observation and recording was carried out on groundworks for new landscaping of the gardens. The gardens included an existing canal basin, now used only for leisure purposes, and a former second basin, backfilled when the gardens were created in the 20th century. Most of the works consisted only of shallow landscaping and footpath creation, and were not observed. Isolated areas of deeper excavation for vehicle access, bridge replacement and other works revealed the foundations for industrial buildings and other structures that once surrounded the canal basins, together with evidence for the blocking off of the western canal basin in 1901 and the landscaping of the existing gardens in the 1930s. The only features predating the canal were a buried soil from the riverside meadows and the line of a former stream channel. [Au(abr)]

Wainwright, J & Vaughan, T Worcester : Worcestershire County Council Historic Environment & Archaeology Service, Report: 1627 2008, 16pp, colour pls, figs, tabs, refs

*Work undertaken by:* Worcestershire County Council Historic Environment & Archaeology Service

An archaeological investigation exposed the natural subsoil and medieval deposits. The presence of 13th and 14th century pottery suggested medieval agricultural occupation at the site. Nearby ridge and furrow was thought to have possibly continued into the site area. Quantities of 15th and 16th century pottery was found, and thought to relate to a pottery kiln to the east of the site. This reinforced the notion that Hanley Swan was an important pottery production centre during this period. A pit and gully excavated to the south of the pond probably dated from the early post-medieval period and may have been representative of some sort of activity other than agriculture taking place in the vicinity of the site. The infilled pond could have originally been a clay or marl extraction pit providing material for the pottery industry. Two modern cat or dog burials were recorded situated close to each other. ***The Use of Hoggin for Punchbowl Gates to Court Drive at Croome Park, Worcester: Archaeological research and a specification for repair and new use in other paths, drives, tracks and carriageways***

Milln, J Swindon : National Trust, 2008, 1p

*Work undertaken by:* National Trust

Archaeological intervention was carried out to explore the route of a drive which ran between Dry Arch Bridge and Croome Court, as suggested by the Snape Map of the 1790s, and other plans. A mechanical excavator was used to excavate 10 trenches of typically 7-8 metres in length running across the feature at approximately equal intervals along the entire 490 metre length. The presence of Hoggin was noted in all ten trenches at a depth of 35mm to 90mm below the surface. Two layers of Hoggin were observed laid over a hard-core or scalplings base, the first at a width of about 12 feet and the second, which is strongly cambered, at a width of 9 feet. [Au(adp)]

**CROOME ROTUNDA FLOOR, CROOME PARK**  
***Croome Rotunda Floor Watching Brief, Croome Park***

Engineering Archaeological Services (EAS) Ltd Blaenau Ffestiniog : Engineering Archaeological Services (EAS) Ltd, Report: 2008/19 2008, 1p  
 Work undertaken by: Engineering Archaeological Services (EAS) Ltd

The National Trust was in the process of restoring the Rotunda as part of a much larger project to restore the landscape park. The stone floor sat on small dabs of lime mortar and was bedded on a layer of sand. This layer sealed the top of a construction horizon containing builder's rubble including stone and plaster fragments. Dating evidence, in the form of a stamped clay pipe stem, however suggested that the floor was probably laid sometime after 1823 and was not part of the original design. Some of the material from the construction layer did not appear to directly relate to the construction of the Rotunda and may have been evidence for an earlier structure or for the use of the Rotunda site as a base for works elsewhere on the estate. Below the level of the plasterwork, recesses in the brick wall were assumed to be the position of supporting timbers for the base of the plaster, before the stone floor was laid or evidence for the structure of an earlier floor. **RAF DEFFORD OCCUPATION SITES**  
***Croome Park, RAF Defford Occupation Sites around Walled Garden***

Milln, J Swindon : National Trust, 2008, 1p

Work undertaken by: National Trust

Excavation and field walking were carried out at Croome Park. Three trenches were excavated across the terrace embankment on which were located the officers mess, bath house and racquets court associated with RAF Communal Site B. This was located west of the avenue. The purpose of the trenching evaluation was to determine the extent of earth moving which took place during World War II and to assess the level of survival of any remains of RAF Defford and the Brown period parkland beneath the terracing. A considerable amount of redeposited material was encountered consisting of a heterogenous mix of clay lump, soil and grit. In Trench A this had been abutted by a hard core sub base of a WWII concrete road suggesting the road was introduced soon after the deposition of context 003. Top soil was used to cover the redeposited material in trench A, however, in trench B and C stone hardcore [context 002] had been laid over context 003 suggesting a parking area for military vehicles. Below the redeposited material in trenches B and C were undated, broad, shallow depressions interpreted as medieval cultivation furrows suggesting large scale landscaping had not been carried out in this area of the park. In addition a field walking survey was carried out south of the Walled Garden in an area overlooked by the Rotunda referred to as RAF Site No.5. Located in this area were the ablutions and latrines, recreation

hut and accomodation blocks. It was decided no major levelling had occurred in this area which was cleared during the 1970s, so only a walk over archaeological survey was carried out. This confirmed the area had been heavily disturbed and WWII debris encountered. Nothing remaining in situ was observed. [Au(adp)]

Mercian Archaeology and Historic Buildings Worcester : Mercian Archaeology and Historic Buildings, Report: PJ96 2008, 22pp, colour pls, figs, tabs, refs

*Work undertaken by:* Mercian Archaeology and Historic Buildings

The results of an historic building recording exercise determined that the stable building was contemporary with the house and was built at some time in 1792/3. Sometime during the following two to three decades, a lean-to piggery with a fowl house was added to the western end of the stable. A brick wall was inserted, probably to form a tack-room. The watching brief on the site monitored the lowering of the floor level inside the stable and the excavation of a new service trench. The internal work identified a truncated and damaged former floor surface by cobbles in a puddle red clay matrix. This may have represented a building that stood on the site prior to the stable, but may equally have been a yard. [Au(adp)]

Milbank, D Reading : Thames Valley Archaeological Services, Report: 04/65j 2008, 35pp, colour pls, figs, tabs, refs

*Work undertaken by:* Thames Valley Archaeological Services

The digging of service trenches and other groundworks allowed the recording of a range of deposits probably relating to the later post-medieval use of the site. Most of the deposits encountered related to the later 19th and 20th century porcelain works along with 19th century burial remains associated with the graveyard of St. Peter's Church. The only certain earlier material comprised a single sherd of medieval pottery. It was possible that some of the undated human burials recorded were earlier than the 19th century. The late post-medieval boundary wall of the churchyard encountered in previous work enclosed a smaller area than that inferred from cartographic evidence, and the presence of articulated and semi-articulated human remains beyond the wall to the south suggested that in the medieval or early post-

medieval periods the churchyard may have extended further to the south. Wall 1021 was visible in section only, and although it appears to be on a similar alignment to the civil war defences, it was not substantial enough to suggest it might have formed part of these. No earlier remains were encountered which might have supported suggestions of a Roman or Saxon origin for the church. [Au(abr)]

Mann, A Worcester : Worcestershire County Council Historic Environment & Archaeology Service, Report: 1618 2008, 42pp, colour pls, figs, tabs, refs

*Work undertaken by:* Worcestershire County Council Historic Environment & Archaeology Service

A watching Brief was undertaken at 82 Main Street. Two Iron Age pits [4th-1st century BC] were identified on the site. Although the original function of these features could not be established it confirmed that the prehistoric settlement identified on the opposite side of Main Street, extended over the road. The limited quantity of prehistoric remains made it impossible

to define the nature of the settlement in this area. A partially truncated horse burial excavated on the site was thought to be post-Roman in date and rather than representing a ritual event, it was thought it represented the everyday burial of a carcass. No other significant archaeological remains were identified on the site that was dominated by post-medieval and modern features and services. [Au(abr)]

Pre-Construct Archaeology Ltd. Brockley : Pre-Construct Archaeology Ltd., 2009, 70pp, colour pls, figs, tabs, refs

*Work undertaken by:* Pre-Construct Archaeology (Lincoln)

Archaeological investigations were undertaken at the site in advance of the construction of a balancing lake to take surface water run-off. The site lay within the boundaries of a medieval deer park, and contained well preserved earthwork remains ["The Reins"] that defined the north-western portion of the deer park. The remains were Scheduled and were considered to be the best preserved of their kind in the East Riding of Yorkshire. The earliest evidence for activity at the site was provided by struck flint, some recovered from archaeological features, the rest from the colluvium, and all probably residual in context. Two distinct industries were represented, the earliest the product of a blade-based industry characteristic of Mesolithic or Early Neolithic forms and the later pieces comprised products of a flake-based industry characteristic of Later Neolithic to Early Bronze Age forms. Part of a substantial feature running north-east to south-west was exposed and thought to be the terminal of a palaeochannel. Features of probable Roman date were recorded cutting into the colluvium within the central and western parts of the main excavation area. Most notable was a system of substantial parallel ditches extending across the area on a rough north-east to south-west orientation, and was probably indicative of a boundary. Evidence for medieval activity was demonstrated by the remains of a series of ditches and gullies, as well as a boundary or drainage ditch that produced 12th century pottery. A contemporary feature was recorded slightly to the south. Redefinition of a Roman ditch in the medieval period may have served to demarcate the limit of the medieval deer park, or may have indicated an agricultural boundary. Two shallow, parallel gullies and a feature running at right-angles were interpreted as land division of some kind. Post-medieval activity within the area was represented by a north-west-south-east oriented ditch, as well as a sort feature that produced 18th century pottery. Linear features were thought to represent land division. [Au(adp)]

Monitoring of groundwork associated with the rehabilitation of water mains recorded evidence for post-medieval structures close to the west end of the Church of All Saints, in the historic core of the village. These probably represented a service area attached to another, unknown, building. Cobbled surfaces were also recorded within the village core, with some lanes possibly having been repositioned. An undated clay-floor building was also identified. [Au(adp)]

Adamson, N G Kingston upon Hull : Humber Field Archaeology, Report: 278 2008, 28pp, colour pls, figs, tabs, refs

*Work undertaken by:* Humber Field Archaeology

A monitored soil-strip and targeted recording of archaeological features was undertaken in advance of a free range chicken unit. The site was located within a significant archaeological landscape with evidence of prehistoric and Roman settlement known from the vicinity. In the event, three features of archaeological significance were encountered, a crouched human burial of prehistoric date, a linear field boundary of a probable post-medieval date, and a horse burial of relatively modern date. Excavation of a soakaway pit and a narrow service trench were also monitored though no archaeological features were recorded. [Au(abr)]

*Work undertaken by:* Humber Field Archaeology

Certain features of the house, such as the pitch of its roof, the string course detailing and the presence of internally chamfered and stopped beams, suggested that the property could be older than the mid-18th century date assigned to it when Listed. The most interesting internal feature, was a now truncated staircase between ground and first floor, which would have allowed separate access to possible living accommodation in the attic. Thus the house may, for a period, have been segregated between the farmer's family and seasonal, or even permanent farm workers. [Au(abr)]

Dennison, E & Richardson, S Beverley : Ed Dennison Archaeological Services Ltd., Report: 2007/314.R01 2008, 27pp, colour pls, figs, tabs, refs

*Work undertaken by:* Ed Dennison Archaeological Services Ltd.

The archaeological work took place as four separate phases of activity between the 31st July 2007 and the 18th March 2008. Phase 1 comprised the recording of the excavation of a number of test pits around the outside of the church. Phase 2 comprised the recording undertaken during the excavation of a French drain around all of the church's external footprint [Trench 1]. The Phase 3 recording work was carried out during the excavation of the new drainage trenches through the churchyard [Trenches 2, 3, 4 and 5], and Phase 4 comprised the monitoring of a trench for a new gas pipe running along the west side of the existing path [Trench 6]. Apart from a single in situ burial, recorded at a shallow depth in Test Pit 7, the deposits encountered within the churchyard comprised only topsoil and sub-soil, with only small quantities of ex situ or residual human bone fragments being recovered. The excavation of Trench 1 around the outside of the church exposed some new information about the footings of the structure but it was difficult to place the new information within its proper architectural context. The two most significant pieces of new structural information uncovered during the watching brief were some spread chalk footings recorded on the north side of the north aisle, and a brick structure on the south side of the tower. The appearance of the former, with their properly faced north and south edges, the distance they lay from the aisle wall, and their alignment indicated that they were not just spread footings for the north aisle, but probably represented an earlier phase of building. Quite what this is was unclear, but it may have been part of a separate free-standing structure or part of an earlier chalk aisle. The brick structure predated the late-17th century tower, and may have been earlier aisle extension or an early vestry. [Au(abr)]

Though no archaeological features were encountered at the site, 931 sherds of pottery was recovered from the uppermost layer encountered on the site. It consisted almost entirely of jars ["cookpots"] of medieval sand-tempered coarseware, in all probability locally manufactured and of late-12th or 13th century date. It would appear that a kiln site remained to be discovered in the area. [Au(adp)]

*Work undertaken by:* Humber Field Archaeology

Monitoring of the excavations revealed a sequence of in situ inhumations [within cists and individual grave cuts] as well as a significant number of disarticulated human remains which appeared to have originated from heavily truncated graves within the development during the construction of the extant house and other later works. Artefacts recovered during the current programme of work included pottery, clay tobacco pipe, stonework and small denomination coinage. [Au(abr)]

Atkinson, D &amp; Jobling, D Kingston upon Hull : Humber Field Archaeology, 2008, 17pp, colour pls, figs, refs

*Work undertaken by:* Humber Field Archaeology

Monitoring of the excavations at the site revealed archaeology dating to the post-medieval and later periods. A fairly large post-medieval roadside ditch was recorded running along the western boundary of the site, running parallel with Station Road. One small linear ran parallel to this, although a further later 18th or 19th century ditch was also recorded running on a south-west/north-east alignment. Artefacts recovered during the excavations were limited to a complete brick dating to the 17th or 18th century and late-19th century blackware pottery. [Au(abr)]

*Work undertaken by:* Humber Field Archaeology

Monitoring of groundwork for a two-storey extension were carried out and recorded five pits, three of which were quite substantial with near vertical sides. The style and formation of the pits suggested that they were use for some kind of craft or industrial activity, possibly tanning. Although no dating evidence was recovered from the pits, those recorded on a previous evaluation recovered material of medieval date. [Au(adp)]

*Work undertaken by:* Humber Field Archaeology

Archaeological monitoring was carried out and revealed substantial differences in the quality of the medieval foundations of the church, with the north aisle, at least in part, being supported by very large cobbles. The south aisle lacked any such support. Excavation in the churchyard produced a single sherd of a coarse sandy ware cook pot dating from the late-13th to early 14th century. Two coffin fittings were recovered and found to date from the period c. 1768-1842, and comprised a drop-handle form coffin grip, with attached grip-plate and winged cherub decoration, together with an identical plate without a handle. *Work undertaken by:* Field Archaeology Specialists Ltd.

The watching brief encountered a brick-built well and a series of pits containing homogeneous soil or demolition material all dating to the 18th to 20th century. The subsoil within the development area proved to be a dense homogeneous clay overlain by a seam of sand. The pits were concentrated within the area of clay subsoil and may have been excavated originally to quarry clay followed by backfilling with a variety of soil and demolition material including brick and handmade pantiles. A possible partially subterranean earth fast structure was encountered and identified tentatively as the remains of an air-raid shelter. [Au(abr)]

**FORMER GAS WORKS, OLD MILL LANE, BARNSELY****Archaeological Watching Brief at Former Gas Works, Old Mill Lane, Barnsley, South Yorkshire**

Raynor, T Sheffield : ARCUS, Report: 1075b.2 (1) 2008, 22pp, colour pls, figs, tabs, refs

*Work undertaken by:* ARCUS

A watching brief was undertaken during remediation works at the Old Mill Gas Works site, Barnsley. A desk-based assessment of the land indicated that the site had industrial archaeological potential of local importance. Documentary research revealed there were no known prehistoric, Roman, medieval or 16th to 18th century sites or find spots within the development site. The area became developed when The Barnsley Gas Light Company purchased the site in 1867, with the first OS map depicting the gas works dated 1890. The gas works continued production until some time during the early 1960s, with much of the plant being demolished by 1964. By 1973 the works had been demolished fully apart from Gasholder No. 3, and the site was occupied by a depot. The surviving structures of the Gas Works recorded during the watching brief were Gasholders No.1 and 2, the retort house, exhaustor house, coal store, tar and liquor tanks, possible meter house, purifiers, CWG [Carburetted Water Gas] plant, boiler house, oxide shed, oil tank, scrubbers, Dri gas plant and booster house. The investigations revealed that there was at least three phases of development of the Gas Works with the second phase being undertaken prior to 1930 with the construction of the CWG plant and associated buildings, and the third phase relating to the construction of Gasholder No.3 and its associated buildings. Features relating to the 1970s development were also revealed during the works, some truncating the Gas Works structures. The watching brief enhanced the understanding of the development of the site, and corresponded well with existing cartographic evidence. [Au(abr)]

Muldowney, M & Richardson, J Morley : Archaeological Services WYAS, Report: 1769 2008, 33pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Services WYAS

An archaeological excavation at the site identified a number of field/enclosure boundaries that were preceded and succeeded by numerous drainage gullies, confirming the low-lying, seasonally waterlogged nature of the site. Pottery found in association with the gullies was probably of Iron Age date. The stratigraphically earliest field/enclosure was radiocarbon dated to the 1st century BC, while the south-western limits of a subsequent enclosure had been previously identified as a crop mark. It was apparent that the site formed part of the wider landscape of enclosures, settlements and field systems already known nearby. [Au(abr)]

Rayner, T Sheffield : ARCUS, Report: 852e.1(1) 2008, 40pp, colour pls, figs, tabs, refs  
*Work undertaken by:* ARCUS

The archaeological works comprised test-pitting within Cells 2A and 2B, watching briefs in Cell 2B and the Lagoon area, fieldwalking of Cell 2B and the Southern Ring Main, auguring and trial trenching within areas of high archaeological potential and monitoring excavations through three locations along the main palaeochannel. No deposits or artefacts of archaeological significance were identified within the test-pits. Watching briefs of Cell 2A and the Lagoon area revealed a series of tree-bowls in an area bounded by two east-west linear features that correlated to a former tree-plantation shown on 19th century cartographic sources. Two possible palaeochannels were recorded in the north-west corner of the site. Fieldwalking identified an area of modern material. Auguring revealed sandy deposits. [Au(abr)]

*Work undertaken by:* ARCUS

A programme of auguring and an archaeological watching brief was required as part of Scheduled Monument Consent for the clearing and de-silting of two ponds. The ponds were initially hand-augured to assess the depth of the deposits. The results of the auger survey concluded that the upper pond had a consistent depth of approximately 1.30m. Most of the pond was filled with silty grey deposits of well rotted vegetation. No artefacts were recovered. The lower pond was shallower and silt deposits were encountered at a depth of 0.25m. During the de-silting of the ponds a brick-lined culvert was uncovered in the northeast corner of the upper pond. This led to the north-east in the general direction of the uppermost pottery pond. Brick samples were taken and provided a 17th and 18th century date for their manufacture. A small T-shaped piece of leather from a shoe was also recovered. The lower pond had been used as a dump and contained a small amount of bricks and stones, probably from the farm buildings that had previously stood on the south-west of the site. [Au(abr)]

***St. Helen's Church, Treeton, South Yorkshire. Archaeological Watching Brief***

Dennison, E Beverley : Ed Dennison Archaeological Services Ltd., Report: 2008/340.R01  
2008, 21pp, colour pls, refs

*Work undertaken by:* Ed Dennison Archaeological Services Ltd.

A watching brief at St. Helen's Church, Treeton, was undertaken. New drainage works were being undertaken as part of a programme of restoration to the church. Although the area of excavation was relatively small, the remains of seven human burials were uncovered, all aligned east-west and, apart from one skeleton, all of adults. The density of burials, with several intercutting others, was not unexpected, given the age of the churchyard. The grave cuts indicated that they had all probably been buried in coffins, but no remains of these survived. In accordance with accepted practice, the burials were not "chased" beyond the limits of excavation, and the majority of the bones were carefully removed and rebagged for later reburial elsewhere by the church authorities. In the absence of any coffin furniture or other dating evidence, the age of the skeletons could not be determined. The burials ranged in depth below the existing ground level and, apart from the lowest burials, all the skeletons were in a good condition. It was probable that the slightly higher burials were of 17th or 18th century date, while the lowest burials could have been 15th century or earlier. [Au(abr)]

**HODGSON STREET, SHEFFIELD*****Assessment Report on Archaeological Mitigation on Land at Hodgson Street, Sheffield***

Cobbald, T Sheffield : ARCUS, Report: 1040c.1(1) 2008, 57pp, colour pls, figs, tabs, refs  
*Work undertaken by:* ARCUS

The mitigation work followed on from an archaeological evaluation which had revealed the well preserved remains of 19th century back-to-back housing. The mitigation took the form of an open area excavation. A row of structures were encountered along the line of Hodgson Street and along the line of the former Milton Lane, with a large open area between these rows of structures. Upon cleaning, it became apparent that the structures identified were the cellars of the back to back housing seen on historic maps. It was agreed that a further trench would be placed within the open courtyard area between the rows of housing to attempt to locate an early toilet block seen on the historic maps. No structural elements of the actual toilet block were encountered. A sandstone capped, brick sided drain was located however, and this was likely to have been associated with the toilet block. **ST. JOHN'S CHURCH, CHAPELTOWN*****Archaeological Watching Brief at St. John's Church, Chapeltown, Sheffield***

Jackson, R Sheffield : ARCUS, Report: 1234.1 (1) 2008, 13pp, colour pls, figs, tabs, refs  
*Work undertaken by:* ARCUS

An archaeological watching brief was undertaken during the insertion of a drainage pipe into the graveyard of the former church of St. John's, Chapeltown. The monitored works comprised a 25 metre pipe trench excavated from the north-west corner of the church to a nearby existing drain. Despite the close proximity of standing gravestones, no human remains were impacted upon during the monitored excavations. [Au]

Bell, S Sheffield : ARCUS, Report: 745f.2(1) 2008, 145pp, pls, colour pls, figs, tabs, refs  
*Work undertaken by:* ARCUS

An archaeological evaluation and mitigation on the site of the former Union Grinding Wheel, Alma Street, Sheffield, a large tenement cutlery-grinding building extant from 1817 to 1959, was undertaken. Ten workshops on the ground floor (out of a total of 22) were subject to rapid archaeological evaluation and partial excavation. Two of the workshops were subject to full excavation. Levels of preservation were variable, with truncation of the archaeological structures at or below ground level, and varying degrees of disturbance from the foundation piles of more recent buildings on site. The archaeological investigations identified evidence for the power transmission system on site, with line shafting running along the length of the building, and power transmitted by leather belts into each workshop. A large assemblage of

pottery and industrial residues was recovered from sub floor infill deposits, and this material had the potential to extend our understanding of early refuse management strategies in Sheffield. Stratified deposits relating to the use-life of the building were recovered from sub-floor pits and channels. The material from these contexts related to the entire use history of the building, and has allowed reconstruction of the variety and chronological sequence of production on site. [Au(abr)]

**UPPER CHAPEL, NORFOLK STREET, SHEFFIELD*****Archaeological Works at the Upper Chapel, Norfolk Street, Sheffield***

Baker, K & Baker, S Sheffield : ARCUS, Report: 732f.3(1) 2008, 125pp, colour pls, figs, tabs, refs

*Work undertaken by:* ARCUS

A watching brief, evaluation, and recovery of human burials was carried out during the construction of an electricity substation and associated cable trenches in the former Unitarian burial ground to the rear of the Upper Chapel, active between about 1700 and 1855. A buried soil deposit was encountered, protected along the northern edge of the site by the footings of a wall along the line of Pepper Alley. This deposit contained a significant assemblage of medieval pottery dating between the 12th and 15th centuries, including waster sherds and fragments of kiln furniture suggesting that pottery production may have taken place on or near the site. The evidence suggested that this was one of the most important assemblages of medieval pottery to have been excavated in Sheffield in recent years as it represented the first excavated evidence for medieval industry within the medieval core of the town. Four human burials from the 18th-19th century burial ground were recovered during the archaeological investigations, in varying states of preservation. The Upper Chape was unique from other recently excavated cemeteries in Sheffield, as it could be confidently demonstrated to have the potential for all the graves to be present in an undisturbed state. Given the importance of the potential for the burial ground to exist in a hitherto undisturbed state of original preservation and the potential for at least a proportion of the skeletons and coffins to be exceptionally well preserved due to the waterlogged ground conditions, it was of paramount importance that any further disturbance to the graveyard in the future is carried out under appropriate archaeological supervision. **Aberford to Pannal Natural Gas Pipeline. Preliminary Excavation Report**

Daniel, P Lincoln : Network Archaeology, Report: 548 2008, 57pp, colour pls, figs, tabs, refs, CD

*Work undertaken by:* Network Archaeology

The excavation of a 22m length of the Scheduled Ancient Monument known as Becca Banks [SM No.31519] was undertaken in advance of the construction of a natural gas pipeline. Remains of human activity were found dating from before the monument was built, up until the present day. Pre-monument activity was represented by an extensive buried soil found preserved beneath the monument bank. This contained evidence of prehistoric flint working. This palaeosoil was cut by a north to south aligned field boundary ditch, which was accompanied by banks on both sides, and which was presumed to form part of a pre-

monument, Late Iron Age field system. Also present before the construction of Becca Banks monument was a sub-linear group of substantial post holes, also considered to be Late Iron Age. The construction of Becca Banks monument marked the end of the use of the features, as the bank material, upcast from the excavation of the ditch, was found partially infilling and sealing them. Shortly after the construction of Becca Banks monument, the hillside above the open ditch collapsed into it via a landslide that involved a staggered, or stepped, series of soil blocks shearing off from the hillside and into the ditch. Also at some point after the construction a series of field boundary ditches was set out. These were found to contain Romano-British artefacts, and their spatial configuration suggested that they post-dated Becca Banks. Two pits also contained Romano-British artefacts were found on the site. One of these cut the remains of Becca Banks earthwork. These pits were sealed by a layer of colluviums that accumulated against the side of Becca Banks earthwork. Following the landslide, the ditch continued to infill via more conventional means, until it was full and level with the surrounding land surface to the south. The infilled ditch became used for arable agriculture at this time, and the scarp slope that the monument utilised represented a field boundary. This was used as a rubbish dump in the 19th to 20th centuries, to judge by the large amounts of modern material recovered from it. At some point in the 20th century, probably the 1940s, the upstanding remains of Becca Banks' bank were pulled or bulldozed to the south to level out the scarp slope that the monument followed. The field boundary that Becca Banks had hitherto formed was erased, and the single large field that existed currently was created. The rudimentary construction of Becca Banks, the fact that it was built over existing enclosures, and its rather unstable nature, were taken to suggest that it was conceived under emergency conditions and erected in a hurried manner. These conclusions supported earlier interpretations that the monument was a native British response to the arrival of the Romans in the south of the country. Such a model would suggest a mid to late first century AD date range for the construction of the monument. This was in accordance with the Late Iron Age to Early Roman date suggested by the artefactual and stratigraphic dating evidence, although this evidence was, at this preliminary stage, somewhat tentative. Dennison, E & Richardson, S Beverley : Ed Dennison Archaeological Services Ltd., Report: 2007.307.R.01 2008, 8pp, colour pls, figs, tabs, refs

*Work undertaken by:* Ed Dennison Archaeological Services Ltd.

A survey was carried out of Becca Banks, part of the Aberford Dykes complex. Within the survey area, the remains of Becca Banks had been extensively ploughed out over a considerable period. As a result the surviving earthworks were spread and rounded, with no clean breaks of slope in an area of ground that fell gently from north to south. The survey confirmed that this part of the monument conformed to the overall pattern noted elsewhere throughout the excavation, although with some discrepancies relating to ploughing, infilling and erosion. Scurfield, C Barnsley : CS Archaeology, Report: 22 2008, 106pp, colour pls, figs, tabs, refs

*Work undertaken by:* CS Archaeology

The proposed development area consisted of a series of historic farm buildings, part of an isolated farmstead west of High Ackworth. Though partially demolished the recording of all of the historic farm buildings was undertaken. The farm buildings historically consisted of an L-shaped building range, set around a rectangular farmyard. The farm buildings included a threshing barn, stables/cow house, a pigsty with poultry house, an extension to the stables/cow house and a small lean-to shed abutting the main range. The barn survived largely in its original form but was re-roofed during the 19th century. The single storey stables/cow house was extensively remodelled during the late-20th century resulting in a general loss of historic features. A number of the buildings did survive up until 2007 relatively unmodified. The report recorded the extant buildings and reconstructed, as far as possible, the recently demolished buildings, through a series of historic digital photographs. The watching brief recorded a range of archaeological artefacts and deposits which complemented the archaeological knowledge of Ackworth Old Hall. [Au(abr)]

***Drury Lane, Wakefield, West Yorkshire. Final Archaeological Report***

Holderness, H Sheffield : ARCUS, Report: 1043c.1(1) 2008, 81pp, colour pls, figs, tabs, refs  
*Work undertaken by:* ARCUS

Archaeological evaluation and a watching brief were undertaken on a site fronting Drury Lane. During the evaluation phase three trenches were located across the site. Trenches 1 and 2 formed a T-shape with Trench 3 being sited to the north-west of them. The features and artefacts uncovered suggested there were significant archaeological deposits on the site and further work was needed. The mitigation phase expanded the areas already established by the evaluation. Trench 4 ran long the frontage of Drury Lane, Trench 5 was located immediately to the south of Trench 3 and Trench 6 was situated around Trenches 1 and 2. A watching brief was conducted to monitor the cutting of a pipe trench that ran along the south-west boundary of the site. Six archaeological phases were identified, the earliest stratified deposits contained medieval pottery from the 11th century, although a rogue fragment of Roman Samian ware was found in a drain fill. This date was corroborated by a radiocarbon date of between 1060AD and 1210AD on charcoal from a drain backfill. The southern area of the site contained the earliest archaeological features: clay lined pits, some of which had the remains of wooden barrels in them. The uses of the pits were likely to be related to industrial processes such as dyeing or fulling cloth. The chronology of individual pits remained elusive as they were dated from the backfilled deposits, but they predate the 1550s. Wakefield was a major centre for the production and selling of woollen cloth from the medieval period and references to this trade are found around the city. The area adjacent to the site was known as a drying field prior to the 1750s which implied that the drying of cloth was being carried out in the immediate area. Along the north-east of the site the remains of red brick buildings, probably from the late-17th or early 18th century, were found. From the cartographic and documentary evidence it was known that houses were standing when the land was sold in 1741. There were few discrete deposits within the structures and most of the finds came from make-up layers and the backfill of construction cuts. Below two of the walls in the northern part of the site were a pair of stone walls. These appeared to predate the brick walls and probably survived from an earlier structure. In the central and southern part of the site were thick layers of garden deposits that included a quantity of mixed pottery which dated from the 16th to 19th century. These were from the formal gardens that belonged to the dwelling houses on the site and to Mansion House, a large Georgian townhouse now across the road from it and are known to have existed in the early 19th century. The latest features of the site were the walls of a building that was constructed in the early 20th century. [Au(abr)]

Monitoring of the site exposed an area of brickwork close to the north-west corner of the dock, which may have been associated with the original dock build of 1809. It may have been part of a retaining structure for the dock wall. Two small culverts exposed near the north-east corner of the dock, that ran parallel to its east wall, appeared to date from the mid-19th century or later. [Au(adp)]

Adamson, N & Steedman, K Kingston upon Hull : Humber Field Archaeology, 2009, 28pp

*Work undertaken by:* Humber Field Archaeology

Archaeological investigations on the site found part of a substantial timber-built structure, laying close to the predicted position of the West Jetty, a structure of probable late medieval or early post-medieval date. It was thought that the south-western corner of the structure was encountered, and comprised a number of horizontal and vertical pine planks. Following reclamation, the remains of the jetty were entirely buried beneath imported soils, over which a large brick-built warehouse or workshop was constructed, with an associated boiler house or engine shed including iron steam or hydraulic pipes. *Work undertaken by:* Humber Field Archaeology

Previous archaeological work in the area suggested that features and artefacts dating from the Iron Age through to the medieval period could have been present on the site. Following the topsoil strip, one small linear feature was recorded. This feature did not contain material which could provide a date, although it was considered likely to have been of prehistoric or early medieval date. In addition, the excavation of two small trial pits through the natural subsoil revealed the presence of marine and estuarine clays. [Au(abr)]

*Work undertaken by:* Northern Archaeological Associates

Monitoring of groundworks during the upgrade of a water main encountered a Roman-period cremation and the remains of three roundhouses and an associated network of ditches. This suggested that the area around Kirk Hamerton was an occupied and managed landscape during this period. Near the River Nidd and Roman road, three post holes, a probable Roman-period roundhouse ring gully and a complex of ditches that may have been drains, boundaries or both. These were interpreted as "high status" Roman activity, and may have been representative of a Roman signal station or minor fort. Many finds were recovered during topsoil stripping, and in certain fields, may have indicated the buried archaeological remains of settlement activity. They may also have represented the ploughing-in of midden material for the enrichment of topsoil throughout periods of agricultural activity in the Vale of York. [Au(adp)]

Daley, M      Branston : Allen Archaeological Associates, Report: 2008/021 2008, 10pp,  
figs, tabs, refs

*Work undertaken by:* Allen Archaeological Associates

A watching brief was carried out during groundworks for the redevelopment of an existing building at the rear of 36 and 37 Alexandra Road and the corner of Dolphin Street, Cleethorpes. The site was located within an area formerly occupied by the hamlet of Oole, that was first recorded in the 12th century as one of the Thorpes of Clee that also included the nearby hamlets of Itterby and Thrunscoc. During the 16th century the economy of Cleethorpes consisted of an expanding fishing industry that was complemented by mixed arable farming centred upon the higher till outcrops of the marshland. By the 18th century a significant oyster catching industry had also been established in the town. Cleethorpes' rise to prominence as a tourist destination gained momentum with the extension of the railway from Grimsby to Cleethorpes in 1863. The promenade, the pier and seafront properties, including the buildings that front onto Alexandra Road were developed from the end of the 19th century and throughout the 20th century. The monitoring of the groundworks revealed a sequence of re-deposited silts and clays indicating a gradual build up of materials that were probably deposited as a consequence of 19th/20th century development along Alexandra Road. No archaeologically significant deposits or features were encountered during this scheme of archaeological works. [Au(abr)]

***Report on an Archaeological Scheme of Works: Photographic Survey and Archaeological Watching Brief on Land off Ferry Lane, Winteringham, North Lincolnshire***

Clay, C & Piirainen, M Branston : Allen Archaeological Associates, 2008, 23pp, pls, figs, tabs, refs

*Work undertaken by:* Allen Archaeological Associates

An archaeological scheme of works comprising a photographic survey and watching brief was undertaken in an area of significant archaeological interest, with a substantial Romano-British settlement to the east of the modern village. The village served as an important crossing point over the Humber from the Roman to medieval periods, and the site was located in an area that developed as a planned market town in the 13th century. The photographic survey recorded a range of brick and stone cartsheds of 19th century date. Brick outbuildings had been added to either end of the range, and a number of bays had been converted to form storage areas and animal sheds. Few archaeological features and deposits of significance were recorded during the watching brief, and no finds were recovered. Three furrows of possible medieval age and two probably modern refuse pits were recorded in Plot 1, and a possible culvert and a barn foundation or stone footpath were identified in Plot 2. An archaeological record resulted from the discovery of a well, during site reduction works, in the back garden of Allonville. The circular well had an internal diameter of 0.95m and measured 1.8m to the top of the well's fill. It was constructed of courses and faced sandstone with two flagstone capstones. The well was probably contemporary with the house and therefore dated to the late-18th/early 19th centuries. [Au(abr)]

*Work undertaken by:* Organisation for the Research of Coastal Artefacts

The crash site was on a steep bank in the vicinity of Bank Foot. The area was forested in 1966 and was known as Batteby Plantation. The impact point was scattered with small fragments of wreckage consisting of aluminium skinning and molten aluminium. Scattered amongst the exposed rocks were small piles of wreckage which previous visitors to the site had placed out of sight. One piece of wreckage which had a bracket attached bore the manufacturer's numbering stamp which indicated the aircraft was a Whitley Bomber, serial Z6663, which crashed on June 9th, 1941. [Au(adv)]

***Archaeological Watching Brief. 1 Manor Farm Cottage, High Worsall, Yarm: Summary Report***

CS Archaeology Barnsley : CS Archaeology, Report: 19 2008, 3pp, colour pls

*Work undertaken by:* CS Archaeology

The site strip revealed the lower course of a post-medieval boundary wall. The wall was three brick width and consisted of roughly fired bricks bounded with lime mortar. The revealed wall was offset and parallel with the existing dwelling's gable wall and extended out of the site to the north and south. The wall appeared to be consistent in material and construction to the adjacent cottages. A representative sample of finds from the topsoil was recovered, including transfer decorated pottery, glass, fragments of red clay pantiles, plain and decorated clay pipe stems, a mass produced button with the impressed label "Buttons Limited", two nickel plated buttons and a Victorian penny dated 1865. Finds were retained by the land owner. The site had been truncated by two modern drains, to the north and south trenches. The northern trench had a glazed earthenware drain aligned east-west. The south trench featured a very modern clay pipe with plastic couplings that channelled the surface water from the cottages into a soak away which was dug towards the south-west corner of the site. The site contained no archaeological deposits neither did it feature any notable variation, indicative of ploughing or other agricultural processes, suggesting that it had been historically levelled. This may

have been carried out in association with the construction of the cottages and the construction of the revealed boundary wall and probably occurred post 1856. [Au(abr)]

*Work undertaken by:* JB Archaeological Services

The watching brief, during groundwork for a new bungalow, recorded the remains of parts of two 18th century cottages. These were demolished in the 1950s, and the site became part of a refuse dump. A small amount of late-19th/early 20th century pottery was recovered from the topsoil, along with two sherds of 18th century slipware and a single sherd of late medieval/early post-medieval pottery. No other archaeological features were recorded. [Au(adp)]

Ambrey, C Barnard Castle : Northern Archaeological Associates, Report: 08/114 2008, 57pp, colour pls, figs, tabs, refs

*Work undertaken by:* Northern Archaeological Associates

The investigations revealed a number of gullies with a fence line running parallel. A circular pit was located 1m to the west of this, yielding stone fragments that may have been part of a quern. A number of ring-gullies were also recorded, and indicated four potential phases of activity through the later prehistoric and Roman period. A series of enclosures were encountered on an alignment differing from that of a section of previously unrecorded Roman road, demonstrating evidence for pre-Roman occupation of the area. The road itself differed from the supposed route followed by the A59, and probably crossed the River Nidd at the same location as the 19th century Skip Bridge. A number of roundhouses and enclosures respected the line of this road. Three or more kiln features also provided further evidence for settlement. The importance of the site lay in its location as a bridge head settlement at the point in which Dere Street crossed the River Nidd. It provided evidence for the rural industry that existed within York's hinterland in order to maintain the position of York and an important urban centre within the Roman period. [Au(adp)]

A watching brief during works for a domestic extension identified the demolition layer and some foundations probably associated with the 18th century Deanery known to have existed on the site until the mid-20th century. A solid brick and stone construction at the north of this building may have been the base of a garden feature, associated with either a late modification of the Deanery or with the first occupation of the extant house. The remains of

the Deanery suggested, at least in the part of the site monitored, had been disturbed not only by its demolition but also by the construction of the house. [Au(adp)]

Gaskell, N Alston : North Pennines Archaeology Ltd., Report: CP/576/08 2008, 17pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

A watching brief was undertaken at Forcett Quarry. The works involved a structured watching brief to observe, record and excavate any archaeological deposits from the extraction area. The watching brief proved to be a good opportunity to locate, expose and record the history of land use on the site, relating to post-medieval agriculture practices, such as ploughing and drainage. The recovery of a horseshoe large enough to fit a heavy draught horse such as a Shire or Clydesdale was indicative of the ploughing techniques employed on the area in the past. The blade like implement retrieved may also be connected to ploughing. Examples of numerous horseshoe-type field drains were recovered, themselves providing a good date range for when the land was improved, probably in the latter half of the 19th century. The survival of late-19th century deposits within the site was of restricted local interest. As nothing of an earlier date was observed throughout the watching brief it was surmised that no further

deposits, artefacts, features or layers remain in the quarry expansion area, despite features being located just beyond the perimeter of the present extension. [Au(abr)]

Speed, G Barnard Castle : Northern Archaeological Associates, Report: 08/85 2008, 18pp, colour pls, figs, tabs, refs

*Work undertaken by:* Northern Archaeological Associates

A watching brief was carried out during topsoil stripping for a quarry extension and discovered part of the Scorton Cursus, a major middle Neolithic monument, crossing the north-eastern corner of the extension area. All four of the known ditch features related to the cursus were part-excavated and recorded, as well as the ditches. Evidence for the central bank had been lost due to modern ploughing. The external "ditches" were found to almost certainly have been palisade trenches, although no individual post holes could be identified. A south-western flanking feature was more complicated, and appeared to have been a small palisade trench that had been cut away by a wider feature that had posts along each edge with a central line of gravel packing. The top had been truncated by a shallow ditch. An isolated heavily burnt pit, a series of square four-post structures, small ditches forming part of a field system, several isolated and undated small pits and post holes and features relating to medieval and post-medieval field systems were also recorded. [Au(adp)]

colour pls, figs, refs  
*Work undertaken by:* Humber Field Archaeology  
Monitoring of the excavations at the site revealed a sequence of naturally occurring deposits, comprising limestone, sands, subsoil/hillwash and the topsoil. Features were noted cutting into the subsoil. These consisted of an undated small and shallow elongated pit, and a chalk filled land drain. A single sherd of Romano-British pottery and a fragment of 19th century roof tile were recovered from the site. [Au(abr)]

*Work undertaken by:* Humber Field Archaeology

Monitoring of topsoil stripping followed by targeted excavation where necessary revealed a small amount of archaeological material overlying a succession of natural chalks, gravels and silt sands. The base of a south-west to north-east oriented undated linear slot was recorded cutting into chalks. An undulating shallow valley in the north-eastern and central areas of the site had been filled by hillwash deposits. The foundation remains from a 20th century structure were found. No artefacts were encountered. [Au(abr)]

Milsted, I York : York Archaeological Trust, 2008, 5pp, colour pls, figs

*Work undertaken by:* York Archaeological Trust

An existing 19th century brick-built, two-storey barn, was substantially modified during the watching brief. Groundworks to install new drains and a geo-thermal heating system were undertaken in the paddock to the east of the barns. During demolition of the extension and general ground reduction nothing of archaeological significance was encountered. Within the 19th century barn, originally a granary, a ground reduction of 0.35m exposed the top of two courses of stepped brick footing for the exterior walls. [Au(abr)]

*Work undertaken by:* York Archaeological Trust

The site was located on a terrace of approximately 1.5m lower than Silver Street. There was a retaining wall along the eastern edge of the site. The original building was 23m long and divided into three rooms. Within the central room there was a circular feature which appeared to be a well. In the northern room, there was a metal circular feature of uncertain function associated with a brick built channel. The metal feature was found to be a drum 0.75m radius and 0.75m deep. A possible interpretation for the metal drum, brick surface and channel was some form machine base associated with an earlier use of the building. [Au(adp)]

Claydon, M Durham : University of Durham, Archaeological Services, Report: 1854 2008, 17pp, colour pls, figs, refs

*Work undertaken by:* University of Durham, Archaeological Services

Archaeological monitoring was conducted during the excavation of test pits within Whitby Abbey Lodge. A stone wall was identified in pits 2 and 3, the alignment of which was consistent with the present boundary wall for the courtyard in front of Abbey House. It was probable that the upper part of the wall was removed to accommodate the lodge when it was built in 1866. A flagged floor, probably the original floor surface, was reached at a depth of 0.15m. No further features, deposits or finds of archaeological significance were identified. [Au(abr)]

Dean, G &amp; Winterburn, A York : York Archaeological Trust, Report: 2008/61 2008, 13pp, colour pls, figs, refs

*Work undertaken by:* York Archaeological Trust

In the trenches excavated in the courtyard areas near to the main buildings of Hazelwood Castle, there was little evidence for archaeological deposits with the majority of the yard surfaces laid directly onto make-up material. It was only in the section of trench closest to this entrance that archaeology was exposed, sealed beneath an extensive layer of make-up. This consisted of one possible robber cut for a wall that may have corresponded with a wall observed in the 2006 evaluation and an area of cobble surface. The only feature of note recorded during the work was a substantial limestone drain, in the section of a trench that ran parallel to St. Leonard Chapel. It was likely that this was of an 18th century or later date. [Au(abr)]

Toop, NYork : Field Archaeology Specialists Ltd., Report: FAS2008 397 YBP301 2008, 70pp, colour pls, figs, tabs, refs

*Work undertaken by:* Field Archaeology Specialists Ltd.

The structural watching brief established the presence of surviving in situ elements of the floor and roof structures within the north range of the palace. Dendrochronological dating of these elements provided a date of c. 1502/3. To the south of the palace, 19th century structural activity was attested by wall footings and a quarry tile floor, interpreted as part of a demolished bake house. Service trenches dated to 19th to 21st century were observed. Potential 17th and 18th century activity was represented within the palace, where a brick wall may have represented part of an early form of the palace. In the wider area outside the palace, preparation layers that may have formed part of the wider landscaping of the 18th century were defined, as well as the foundations of the current 18th century gatehouse. The watching brief encountered remains of medieval to modern date. Extensive layers of buried soil, interspersed with cobbled surfaces, were consistently found throughout much of the area. A single inhumation burial was encountered to the west of the palace, and was dated to the 14th century or later. This burial lay to the west of a series of limestone walls which had been interpreted as medieval buildings associated at one time with lead-working. The robbed-out foundations of two parallel walls were identified in the vicinity of the 18th century gatehouse. [Au(abr)]

Spall, C York : Field Archaeology Specialists Ltd., Report: FAS2008 395 YGF349 2008, 39pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Field Archaeology Specialists Ltd.

A watching brief and area excavation was undertaken intermittently between 3rd September 2007 and 8th May 2008. The earliest archaeological deposit encountered related to late medieval cultivation and nightsoiling dated by an assemblage of pottery to the mid-14th century. A timber-framed building was erected at the front of the plot dated by pottery to the late-14th to 15th century. This structure was represented by a rear and internal wall footing containing accumulative floor surfaces associated with a stone and tile hearth. The building stood until the late-18th century when it was demolished and rebuilt in brick with internal York stone flag floor. The building could be identified on the first edition 1852 Ordnance Survey map of York and appeared in the earliest available historic photographs of Ogleforth dating to the 1880s, as a workshop/warehouse. The building stood at the site until the 1980s when it too was demolished and the site given over to car parking. [Au(abr)]

**20 FETTER LANE, YORK**

***20 Fetter Lane, York. Watching Brief Report***

Evans, D York : York Archaeological Trust, Report: 2008/73 2009, 31pp, colour pls, figs, refs

*Work undertaken by:* York Archaeological Trust

The watching brief recovered valuable evidence for activity from the Roman period to the present day. Due to the nature of the dating recovered, any interpretation of the available evidence had to be tentative but it appeared that the Roman terracing, known from the site at 18a-19 Fetter Lane may also have been present on the site and some of the deeper obstructions encountered within the pile holes may have been parts of Roman stone structures, also well known in the general area. The waterlogged organic deposits seen across much of the site were likely to be of Anglo-Scandinavian date and were likely to have represented a rich archaeological resource worthy of investigation should the opportunity arise. Medieval stone walls were encountered but again interpretation was difficult although they probably were the remains of structures of some note and significance fronting onto Fetter Lane. Later structures, deposits and features had largely been removed by post-medieval and modern activity but may have survived in patches across and around the site. [Au(abr)]

*Work undertaken by:* York Archaeological Trust

The site had been archaeologically investigated previously and found to contain rich and complex deposits. No well stratified finds from the timber piles below a wall were recovered from this watching brief. Perhaps the most significant was a wall on the line of the present above ground boundary/retaining wall. Since construction of the wall was dated to the later 14th century it appeared that the current above ground brick and stone boundary/retaining wall had been in existence in some form for at least six centuries. Another significant fact was that the below ground stone wall appeared to be pieced at intervals by gaps. An arch provided a parallel for these and it was possible that they were all vaulted drains, with some vaults removed during the rebuilding of the wall in the past. Further portions a wall and a cobbled surface were also detected. [Au(adp)]

York Archaeological Trust York : York Archaeological Trust, Report: 2008/89a 2009, 4pp, colour pls, figs

*Work undertaken by:* York Archaeological Trust

The earliest deposit noted from a borehole was a mixture of gravel and mid brown sand with some mid brown clay. No finds were recorded from any of the recorded deposits. The presence of a substantial timber pile, possible 3.6m long, was of considerable interest since the depth at which it was recorded may indicate a Roman date for it. The silts recorded

around and above the possible pile were of uncertain date but may span the Roman to medieval periods. [Au(adp)]

Dean, G York : York Archaeological Trust, Report: 2008/11 2008, 18pp, colour pls, figs, refs

*Work undertaken by:* York Archaeological Trust

Four trial pits were monitored during excavation near the south-transept approach to York Minster. This identified modern services, sand bedding for the present flagged surface, a clinker path, kerbs for iron railings and a limestone wall. These features were above deposits that contained a relatively high quantity of disarticulated human bone. Also observed was a layer of limestone mortar with a backfill of dark silt at regular intervals through the mortar there was evidence for stake holes, presumably derived from a setting out line for the construction of steps. *Work undertaken by:* Field Archaeology Specialists

"An archaeological watching brief was carried out during groundworks for a new two-storey block of flats. The groundworks were carried out to a maximum depth of 1.10m below ground level, revealing a consistent sequence across the site. The modern hardcore and 19th-century brick foundations overlay a pack of made-ground (c.0.5m deep), containing clinker, CBM and modern glass. This had been deposited over a possible turfline at 0.90m BGL, which overlay a clean brown clayey silt." [OASIS]

*Work undertaken by:* Northern Archaeological Associates

A topographic survey was carried out of three Bronze Age burial cairns on the summit of Thirl Moor, as part of the ongoing survey and management of major archaeological monuments in the area. The cairns were spread over a distance of some 70m, with one smaller satellite cairn [c.5m in diameter] recorded on the southern edge of the northernmost cairn. All the cairns were made of local stone, and ranged in diameter from 16m to 20m. Damage had been inflicted on most of the cairns, however, no cists had been exposed in any of them, and it was likely that any burials they may have contained would have remained intact. [Au(adp)]

Ronan, D & Robinson, G      Barnard Castle : Northern Archaeological Associates,  
 Report: 08/24 2008, 52pp, colour pls, figs, tabs, refs

*Work undertaken by:* Northern Archaeological Associates

Ten structures and 35 features were recorded as part of an ongoing programme of survey. Overall, the condition of the site was fair but in gradual decline, under medium vulnerability from quad-bike tracks and livestock. The remains were separated into two broad phases of activity based on visible relationships between features and spatial considerations. The earliest phase was based on a tentative interpretation of a sub-circular enclosure as part of an Iron Age/Roman enclosed farmstead. Phase B comprised the medieval and post-medieval settlement and field systems. The remains at the site were an important example of upland settlement, with the potential to further expand the understanding of the nature of medieval and possibly earlier exploitation of the area. Dating from the late early 17th century, Dukinfield Old Hall Chapel was a roofless Grade II\* Listed Building which was on English Heritage's register of buildings at risk, in Category C (Poor). It was described as the former domestic chapel of Dukinfield Hall and later a transept of a Congregational chapel, neither of which were extant. Emergency consolidation works had

been undertaken in the past, and discussions had taken place with the local authority on the repair of the building as part of the redevelopment of the surrounding site. The areas which needed the most urgent attention were the north wall of the nave and the south wall of the chancel. Other parts of the building, notably the west end of the south wall of the nave, also need attention in the near future. [Au(abr)]

*Work undertaken by:* Oxford Archaeology North

Historical research indicated that the original plans for the park produced by Thomas Mawson were not implemented. The reason for this probably reflected the lack of funds after the war. In 1921, the land was purchased by the council for the park and the laying of paths commenced. Later that year, a war memorial and was erected. This was followed by two shelters, an open air stage and a further memorial for nine local people killed in an air crash in 1970. All of these features still survived within the park, although only the remains of the bandstand survive as it was burnt down in 1956. Knight Hill House ceased to be a museum in 1952 and was then used as a day care centre for the elderly. In the south-east part of the park, bowling greens and tennis courts were set up in 1923-4 and two pavilions were built next to the greens. Later additions have included a public bath, which later became a leisure centre, a children's play area, a ball court, a skate park and a youth centre. [Au(abr)]

*Work undertaken by:* Wessex Archaeology

A rapid archaeological appraisal highlighted potential for prehistoric and post-medieval remains on the site, in response to proposals for a wind turbine and associated electricity cable. Levelled Bronze Age barrows were recorded in close proximity and may have formed a linear barrow cemetery positioned along a prominent chalk ridge. The proposed cable route was also situated in a Grade II Registered Park and Garden [Appuldurcombe Park]. Geophysical and walkover surveys were carried out over an area of approximately 2.4ha. Magnetometer survey suggested that the site was magnetically quiet with some anomalies of archaeological interest, such as boundaries or drains. Some of the anomalies may have related to a crash between two Spitfire aircraft in World War 2. It was thought that there was a moderate potential for archaeological remains to be affected by the development. [Au(adp)]

*Work undertaken by:* Nathalie Barrett

Shornmead Fort was built in the 1860s as part of the restructuring of the River Thames defences. Behind the casements, it was found that the fort was largely destroyed, the accommodation and office ranges and the roof and rear casements were demolished by the Army in the 1960s. Its partial demolition offered a cross-sectional view of the construction of a Palmerston Fort. Buried remains of earlier fortifications at the site may also have survived. A small semi-circular battery was built on the site in 1795 and an early polygonal fort was constructed from 1847. [Au(abr)]

Archaeology South-EastPortslade : Archaeology South-East, 2008, 6pp

*Work undertaken by:* Archaeology South-East

An archaeological and historic landscape survey of the Nymans Estate, Handcross, was carried out. The core of the property comprised a nationally significant 20th century garden set around a ruined mansion of medieval origin, but largely remodelled in the 19th and 20th centuries. The wider estate comprised a large area of ancient woodland, ghylls, parkland and farmland. The aim of the work was to produce a definitive and up-to-date review of the archaeological and historical development of the property, and was intended to inform future development proposals. The work involved a review of readily available existing primary and secondary historical and archaeological sources and a landscape survey to identify and record features of archaeological significance within the property and its immediate environs. Dudley, P Truro : Historic Environment Service Projects. Cornwall County Council, Report: 2008R008 2008, 34pp, colour pls, figs, tabs, refs

*Work undertaken by:* Historic Environment Service Projects. Cornwall County Council

The assessment was carried out in order to better inform its future management and conservation. Most of the woodland at the site dated to the mid to late-18th century, and was perhaps contemporary with the construction of the estate wall in 1785. The property's historic character was enhanced by this grand estate wall and the sinuous line of and interesting parkland boundary that was partly destroyed in WWII by an American serviceman who used it as a practice trench. Other features included the remains of former boundaries, prospecting pits, a quarry and a mound. In the light of the archaeological features identified by the assessment, the general management recommendations included guidance on boundary maintenance and future woodland planting. [Au(adp)]

### **MOUNTS BAY, TRENOW**

#### ***Archaeological Assessment of Mounts Bay: Trenow, Cudden Point, Sidney Cove, Lesceave Cliff, Rinsey East Cliff and Trewavas, Cornwall***

Adam, S Truro : Historic Environment Service Projects. Cornwall County Council, 2008, 1p

*Work undertaken by:* Historic Environment Service Projects. Cornwall County Council

With the acquisition of Trewavas Cliff and its iconic but increasingly unstable engine houses an archaeological assessment was undertaken of the property. The assessment was broadened to look at another group of properties in Mounts Bay comprising Cudden Point, Sydney Cove, Lesceave Cliff, Rinsey East Cliff, and Trenow. These coastal properties lay in an arc around the eastern part of Mounts Bay. Mining had taken place in four of the properties, Trenow, Lesceave, Rinsey East Cliff and Trewavas Cliff. At Trewavas, the engine houses were amongst the most spectacularly sited anywhere in Cornwall. Trewavas presented a number of particular challenges, in particular the need to stabilise its two engine houses, matters relating to public access to them and to manage public safety in relation to open mine shafts and areas of vertiginous cliff edge. [Sec]

*Work undertaken by:* Historic Environment Service Projects. Cornwall County Council

Lostwithiel was an historical gem within the county, being a planted town and a former capital of the Earls of Cornwall. A series of seven historical themes were identified to underpin the town's character. Foremost among these was the planted borough and the importance of the town in this period, with the borough retaining its influence in later centuries. Later industrial and trade activity brought prosperity to the town, with expansion in the 19th century with the introduction of the railway. [Au(adp)]

**THE DODMAN AND PENARE, LAMBSOWDEN, LAMLEDRA AND BODRUGAN**  
***Archaeological Survey for the National Trust of Dodman and Penare, Lambsoeden, Lamledra and Bodrugan***

Parkes, C Truro : Historic Environment Service Projects. Cornwall County Council, Report: 2008R078 2008, 11pp

*Work undertaken by:* Historic Environment Service Projects. Cornwall County Council

The survey was undertaken to identify and evaluate the archaeological resource of land on and around Dodman Point, a prominent headland on the south coast of Cornwall. It provided new detail and assessment of some 220 sites, including 30 already known and a further 190, many of which had not been previously recorded. The topography of the area was varied, its archaeological sites and landscapes reflected its varied uses for people over some 10,000 years. Traces of buried features resembling early fields on the neck of the Dodman, revealed by geophysical survey, suggested that in later prehistory permanent settlement and farming were established here. A cluster of Bronze Age barrows, and an exceptionally large Iron Age cliff castle, showed that Dodman became a regional focus, related perhaps to its location between land and sea. While the massive ramparts of the cliff castle on the neck of the point were recorded by early antiquarians, fresh evidence of the scale and complexity of activity here was emerging. The seaward ends of the ramparts, and the steep slopes in the interior, formerly hidden by scrub, had been exposed through clearance and grazing. The geophysical survey showed likely buried features such as pits inside the ramparts. Elsewhere along the coast, other possible barrows, single or in smaller groups were identified. At Lamledra, and Hemmick, field-names indicated possible sites of enclosed farming settlements of the later prehistoric to Roman periods. A slightly dished platform above the beach could be the ploughed down remains of this enclosure. Within and beyond its cliff castle, the Dodman had a well preserved medieval strip field system. The core fields throughout the area are derived from medieval strips. Land at Bodrugan formed part of a more prestigious later medieval site, a deer-park, associated with Bodrugan, a Domesday manor. A ramped way down to a sandy inlet at Bodrugan cut into the rock, could be associated with the dramatic escape from pursuit of the last Bodrugan, Sir Henry, in 1486/7, commemorated in the name of nearby cliffs, Bodrugan's Leap. The role of the coast in national defence through the centuries could be seen at a range of sites, from a possible early breastwork at Hemmick, to a well-preserved Napoleonic signal station on the Dodman, and scatters of World War II bomb craters. ### **WATER MILLS IN THE UPPER TAME VALLEY**

***The Origin and Development of Water Mills in the Upper Tame Valley: Masters Course at University of Manchester***

University of Manchester Archaeological Unit Manchester : University of Manchester Archaeological Unit, 2008, 49pp, pls, figs, refs

*Work undertaken by:* University of Manchester Archaeological Unit

This essay examined how water-powered mills transformed the upper Tame valley, encompassing Saddleworth, from a centuries-old settlement pattern of isolated farms and hamlets, scattered along the valley sides to several industrialised villages along the valley bottoms in around one hundred years. It considered how most of the initial proto-industrial and the industrial development in the upper Tame valley was generated from within the area by small indigenous small clothiers responding to both internal and external drivers to expand their original operations during the late-18th to early 19th centuries. Before 1770, factories were few and key inventions were still to be fully exploited. By the mid-19th century, factories predominated. Water-power was the key to the transformation of the upper Tame valley over several decades, from scattered upland domestic textiles to mechanised valley-based industry. Without water-powered fulling and scribbling mills enabling freeholder and tenant clothiers to take advantage of opportunities given by the Flying Shuttle and Spinning Jenny to increase production, their proto-industrial trade would have died out much earlier. Water-power was utilised for longer here than elsewhere, until it struggled to meet operational requirements. The other great impetus was the early 1780s stampede into scribbling mills, alongside existing fulling, following revocation of Arkwright's carding patent in 1781. Single-site multifunctional led some far-sighted entrepreneurial clothiers to include teasing and slubbing at their watermills with spinning and weaving later as a complete factory production system. Saddleworth, economically marginal, was eager to exploit its water resources. Before 1791, the absent Lord exploited constraining manorial rights on water and permits to build watermills, while freeholders pushed to exploit their resources. After the 1791 manor break-up, tenants became freeholders, free to build watermills, but a sizable prospering group rose

up as masters, mechanising all production beyond water-power's capabilities with a captive workforce forced economically from domestic textiles. [Au(abr)]

#### **DARBY FURNACE AND ASSOCIATED STRUCTURES**

#### ***Conservation Statement for the Darby Furnace and Associated Structures***

Belford, P Coalbrookdale : Ironbridge Archaeology, Report: 225 2008, 59pp, colour pls, figs, refs

*Work undertaken by:* Ironbridge Archaeology

The site was a Scheduled Ancient Monument ("The Darby Furnace and Associated Structures"), SAM 345. The Scheduled area included the entire basin in which the furnace and adjacent buildings were situated; the southern edge of the Scheduled area was the top of the slope down from the green. The Darby Furnace was an extremely significant site globally, nationally and regionally. This significance was primarily for its associations with coke smelting but also with the early development of the foundry trades and as part of a complex landscape of contemporaneous structures and features. The existence of the furnace was instrumental in the site being inscribed on the UNESCO list of World Heritage in 1986. Although the site was extremely well conserved and in a good state of repair, its significance was not well served by current presentation and interpretation. Issues included physical access, the state of the cover building, and the paucity of onsite interpretation. [Au(abr)]

**MONUMENTS IN THE CARE OF THE IRONBRIDGE GORGE MUSEUM TRUST**

***Audit of Monuments in the Care of the Ironbridge Gorge Museum Trust***

Belford, P Coalbrookdale : Ironbridge Archaeology, Report: 204 2008, 52pp, colour pls, figs, refs

*Work undertaken by:* Ironbridge Archaeology

It had been over 15 years since the last general programme of conservation was undertaken on the monuments of the Ironbridge Gorge Museums, although some individual sites had received attention since then. With this in mind, the overall condition of most of the monuments was generally very good. Of the 31 sites or elements of sites graded in this report, only 9 were graded as requiring urgent repairs. Three of these were particularly serious, the piers of the Hay Inclined Plane, the Boiler House at the Blists Hill Brick and Tile Works and the Bower Yard Lime Kilns. In all three cases the need for repair was due to exceptional circumstances, geological movement at the Hay Inclined Plane, uncompleted initial conservation at the Brick and Tile Works, and complete lack of any conservation at Bower Yard. Apart from the Quaker Burial Ground, the other 6 sites in the "urgent" category were all elements of larger sites which were generally in good order. Only one site, the Shropshire Canal at Blists Hill, was identified as a medium priority and a programme of clearance should be implemented for this monument within the next 2-3 years. Improvement and reinstatement of this site was fundamental to the understanding of the associated structures and would also enhance the canal area as a visitor amenity. [Au(adp)]

***Archaeological Condition Assessment of the Ha Ha Wall at Kersoe Farm, Elmley Castle, Worcestershire***

Williams, P Worcester : Mercian Archaeology and Historic Buildings, 2008, 17pp, colour pls, figs, tabs, refs

*Work undertaken by:* Mercian Archaeology and Historic Buildings

The survey work determined that overall, the wall could be said to be in poor condition, though there were several areas where the wall remained generally intact. The survey identified three main threats to the integrity of the wall. These comprised damage from tree roots and scrub, erosion/subsidence damage, and damage caused by animals (the latter may be split into damage from burrowing/wild animals and damage by stock animals). It was not thought that the watercourse running into/along the ditch was a direct cause of damage to the wall, though rapid silting was clearly causing the ditch to become ill-defined in areas. The cause of some areas of damage to the wall fabric could not be determined, though the effect on the fabric was clear and unless a programme of consolidation of these areas was undertaken, further damage would undoubtedly result. Pritchard, H & Johnson, M York : York Archaeological Trust, Report: 2008/27 2008, 51pp, colour pls, figs, tabs, refs, CD

*Work undertaken by:* York Archaeological Trust

A building survey identified a sequence of development ranging from the late-17th century combination barn, through to a 19th century model farm to 20th century agricultural use. The farm was part of the adjacent Hathersage Hall estate and operated as a mixed agricultural steading, until the 19th century when the emphasis shifted and the main focus was as stabling and coach housing for the hall. After separating from the hall in the 20th century, the farm returned to primarily agricultural use, particularly dairying and sheep. [Au(abr)]

Sheppard, R Nottingham : Trent & Peak Archaeological Unit, 2008, 14pp, colour pls, figs, tabs, refs, CD

*Work undertaken by:* Trent & Peak Archaeological Unit

Of the five agricultural buildings or ranges at Firs Farm, only two were found to retain historic timbers, the others having been re-roofed in modern times. Timbers recorded included those making up eight trusses in Building A and a single truss and two bridging beams in Building A, together with purlins in part of Building A and throughout Building B. The timberwork was typical of that used in farm buildings before general mechanisation of timber-yards. The beams were slightly irregular in shape and varied in general dimension. [Au(abr)]

***Archaeological Building Recording at Loughborough Technical College, Loughborough, Leicestershire***

Barnes, J      Sheffield : ARCUS, Report: 1199.1 (2) 2008, 40pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* ARCUS

A programme of archaeological building recording was undertaken. A small workshop lay to the north of the building fronting Orchard Street; this was also included within the archaeological recording. The building at Loughborough was fairly unique in its character (although it could be argued that the building was typical as an industrial unit) there were many features relating to the educational nature of the building. The decorative frontage and ornamental entablature for the building outlined the building as not merely a factory unit but also an important educational establishment. Internally the inclusion of a mezzanine observation floor and glazed partitions throughout would have been key in enabling observation of work taking place both for students and staff. The partitions were also of note as a feature indicative of education as they divided the space up for different processes. The building fronting Orchard Street (building 2) was of little historic interest. Little evidence remained relating to its purpose apart from evidence for the garage but it was likely that the building acted as a small scale workshop. It appeared to have no link to the technical college building. [Au(abr)]

*Work undertaken by:* TR Projects

The first floor of the west, gable wall of the Grade II Listed Building, a farmhouse, was built of 18th and 19th century brick which rose from a substantial, ground floor wall of irregular, uncoursed granite and slate waste. The proposed works sought to remove a quantity of the ground floor stonework, and would have impacted on the brickwork. The works would also involve the demolition of an 18th century three bay brick outhouse. A late 18th to early 19th century cart hovel was to be refurbished and retained. [Au(adp)]

**THE OLD RECTORY, LEIRE**  
***An Archaeological Building Survey of The Old Rectory, Leire, Leicestershire***

Shepperd, R Nottingham : Trent & Peak Archaeological Unit, 2008, 24pp, colour pls, figs, tabs, refs

*Work undertaken by:* Trent & Peak Archaeological Unit

It was proposed to carry out a major alteration to the west and to part of the south side of the former rectory. The building was Grade II Listed. Historical documentation for the village of Leire was relatively sparse, but structural changes to the rectory were recorded, some in

detail. The rectory was rebuilt in the 1770s, and a date-stone survived with the name of the incumbent at the time, Rev. George Mason, and the date of the rebuild of 1781. This rebuild [which may have retained part of an existing service quarter] was shown on plans drawn up in 1840. The plans showed an existing two storey building consisting of an east wing with a central eastern entrance [later moved to the north side], and a service area on the west side. A number of single-storey rooms around the property had been added in the intervening 60 years. These included a laundry on the north side of the east wing [since lost], and a near octagonal library/study on the south side. Other service rooms had been added south and west of the kitchen. The builder, Richard Law, in 1840 proposed a major alteration and enlargement of the rectory. Most of his proposals, shown in plans drawn up at the time, seemed to have been carried out. These included the widening of the east wing and its heightening to three storeys, along with a partial rebuild of the service section. The building was again altered in the second half of the 19th century [before 1887]. A new room with a large bay window was added at the south end and the octagonal library/study truncated, with its west side carefully retained. Staircases were moved, several rooms reconfigured and a new block added to the south side of the kitchen. The coach-house was rebuilt, and a range of outbuildings built. [Au(abr)]

### **THE FORMER ATKINS WORKS, LOWER BOND STREET, HINKLEY**

***An Archaeological Standing Building Survey of the 1926 Extension to the Former Atkins Works, Lower Bond Street, Hinkley***

Richards, G    Leicester : University of Leicester Archaeological Services, Report: 2008-163  
2008, 28pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Leicester Archaeological Services

The building formed part of an extensive hosiery manufacturing complex owned by the Atkins Brothers until 1995. Factory 2 was built in 1926, replacing an earlier factory building on the same site. Some parts of this earlier factory were incorporated into the southern parts of the building. Internally the factory had been stripped out, leaving little of interest. Some limited traces of the manufacturing process could be seen. The building was very modern in appearance for 1926 and unlike any of the contemporary and earlier buildings within the proposed development area. The choice to build this design could be seen as a bold move by a confident company. [Au(adp)]

Taylor, G Sleaford : Archaeological Project Services, Report: 93/08 2008, 21pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Project Services

A programme of building recording was carried out at the former Methodist Church, a building of historical interest built in the 1870s when Methodism was the major religion in Binbrook. The examination indicated that the building survived largely as constructed in 1877-8. Much of the interior of the church was as initially built, with the pulpit and most of the pews still in place, as well as decorative roof timbers and ceiling roses. Two minor extensions, a toilet cubicle and a coal or store shed were added in the 20th century and a new opening was created for a doorway. This led to a kitchen and a large open room beyond, both 20th century installations. [Au(adp)]

*Work undertaken by:* Rupert Lowe Chartered Architect

The building, as it stood, was of a late-18th century date and constructed in the Georgian style, and was located within the Conservation area but not Listed. It was likely that a building had existed on the site a long way before the 18th century. The building was likely rebuilt, extended or altered during the late-18th century as a high-quality dwelling house, with probable business quarters on the lower floor and accommodation on the upper. "Building survey of a group of farm buildings at Bunkers Farm, Welton le Wold, Lincolnshire; carried out prior to redevelopment. The farm was probably established following the Parliamentary Enclosures, but its presence can first reliably be established in 1856, and provisionally in 1849. The farm was extensively updated and enlarged during the 'High Farming' period in the mid- and late 19th century, developing the distinctive E-shaped layout associated with the 'planned farms' of the period. Later alterations attest to the installation of steam-powered machinery." [OASIS]

"Historic building survey in advance of the conversion of a group of farm buildings to private housing. Research showed that the buildings were constructed between 1839 and 1842. They constituted part of a 'planned' or 'model' farm, built of a piece on a previously greenfield site. Grange Farm, uniquely in Lincolnshire, is laid out in a fan-shape, flaring towards the south to maximise light and space in the crew yards - the product of an agricultural practice specific to the period of its construction." Cope-Faulkner, P & Taylor, G Sleaford : Archaeological Project Services, Report: 97/08 2008, 23pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Project Services

Recording was carried out of the site, a Grade II Listed Building of 16th century origin. The whole of the complex was photographically recorded, and floor plans and elevations produced. Features of architectural, historic or functional merit were recorded in further detail. Both buildings had been altered in the late-19th century, mostly by blocking some doors and windows and the installation of others. More significant changes occurred in the 20th century when upper floors and internal walls in the southern block were removed. Additionally, the northern block was truncated by the removal of the east-west range, and it was re-roofed. Overall, the barns were considered to have low to moderate significance. [Au(adp)]

AOC Archaeology Group Twickenham : AOC Archaeology Group, 2009, 1p

*Work undertaken by:* AOC Archaeology Group

A 3D laser scan survey and historic building analysis of the Gothick Ruins and Cascade located within The Wilderness, Belton House, were carried out. The Ruins were an early example of the fashionable 18th century "Gothick", and appeared to have been first built c.1742 by the Viscount Tyrconnel. They were extended, and probably largely rebuilt, in the mid to late-19th century. The main structure contained fragments of 14th and 15th century windows which may have been taken from Normanton Church. The recording included a full measured survey of the buildings, including a plan, elevations and photographic survey. The elevations and plans were produced using a laser scan allowing 3D images of the ruin to also be produced. [Au(adp)]

**THE GREYHOUND INN, FOLKINGTON*****Building Survey Report , the Greyhound Inn, Folkington, Lincolnshire***

Dailey, M Branston : Allen Archaeological Associates, Report: 2008/016 2008, 32pp,  
 colour pls, figs, tabs, refs

*Work undertaken by:* Allen Archaeological Associates

The Greyhound Inn had undergone many changes over time, both to its internal and external fabric. Most significantly was the loss or damage of internal architectural features as a consequence of modern alterations and poor maintenance. Fire damage sustained in 2005, although destructive, was fortunately confined to the western corner of the southern range. The building has also undergone significant phases of redevelopment and modification, resulting in a diverse collection of features present with a chronological range from the 17th to the 20th centuries. However, a sufficient number of surviving features of architectural interest provided some insight into the phased development of the structure. The earliest part of the building appeared to be the southern block in the Western Range, dated by the 17th century fire surrounds, and its physical relationships with the adjoining buildings. The detailing of the eastern range, particularly the moulded stone fire surround on the ground floor of the southern block, suggested this part of the inn was 18th century in date. The southern extent of the eastern range had been modified to accommodate the eastern mid Georgian style staircase and landings. This style of staircase would have been slightly out of fashion by the time of the well documented renovations of 1789. At this time the brick façade was added to the front of the building and the carriageway arch was built. Development continued into the 19th century evidenced by the insertion of late 18th and early 19th century style hob grates into the rooms on the top floor of the Southern Range. An early 19th century canted window was also added to the western façade of the eastern range around this time. The main entrance was created by the insertion of a moulded stone doorway into the carriageway arch of the southern façade during the 19th century. The northern blocks of the West and East ranges both had their roofs re-tiled with S-profiled 19th century pantiles. Throughout the 20th century there have been a number of intrusive elements introduced into the fabric of the inn, as a consequence of its changes in usage over time. The insertion of modern bathrooms, toilets, bars and kitchen facilities throughout the building has damaged much of the internal fabric. The construction of a glass atrium over the central carriageway although visually intrusive, did enclose this outside space with very limited impact upon the building. The flat roofed lean-to that had been attached to the northern extent of the atrium was constructed in both a style and using materials that had a negative impact upon the overall visual character of the building. The site comprised a farmhouse that had clearly undergone successive adaptations in use which had resulted in significant alterations to the original fabric of the structure. The external facades, however, did retain some original detailing, despite needing some remedial works. The Granary on the site also retained much of its original fabric. The stables were for the most part structurally sound, with the threshing barn having been modified with the blocking of the original full height doorways with modern brick. This was thought to detract from the overall character of the site. [Au(adp)]

Clay, C Branston : Allen Archaeological Associates, Report: 2008/060 2008, 29pp, colour plates, figs, tabs

*Work undertaken by:* Allen Archaeological Associates

A photographic survey of a range of agricultural buildings at Swinthorpe, in the parish of Snelland, was carried out. The buildings comprised an L-shaped range of brick farm buildings, with an adjacent cart shed, and represented several phases of construction during the 19th century. The earliest structure recorded was a threshing barn of early 19th century

date, which formed part of an east- west range along the road frontage with a possible two storey stable and hayloft, and a single storey cow house. A date plaque on the west end of these buildings suggested their construction occurred in 1842. The threshing barn was abutted by a later north-south range comprising a cow house, which was later adapted as a milking parlour, and a small outbuilding at the north end of the range. There was evidence for a further north-south range that had been demolished in the later 20th century, and a southern boundary wall enclosing the yard, with map evidence suggesting that part of the yard was covered in the late-19th/early 20th century. Soden, I, Wolfram-Murray, Y, and Walker, C Northamptonshire Archaeology : Northamptonshire Archaeology, Report: 08/117 2008, A4, heat bound, blue spine, clear cover  
*Work undertaken by:* Northamptonshire Archaeology

"The farmhouse at Weedon's Manor Farm was built on the Watling Street in the early 18th century, perhaps 1710-1720 in the local vernacular style of a simple, three-cell plan. It was later extended twice, the first time around 1800, the second before 1860. For much of the 18th and 19th century it was better known as the Bull Inn, a coaching inn. It is listed Grade II. A series of outbuildings, listed by curtilage, lie to its rear. These constitute a complex of farm ranges which have grown through a process of accretion, being of different phases of construction. The earliest is probably coeval with the farmhouse, while the others are of a variety of dates as late as 1885-1905, depicted variously on a long sequence of maps. Together they constituted a working farm given over to a mixed arable and pastoral regime. Few interior fixtures or fittings survived in the farmhouse while none survived to be recorded in the outbuildings. Numerous other outbuildings are attested in documents, but which did not survive into the modern period. The complex was much denuded, inside and out." [OASIS]

**THE DOWER HOUSE, PRESTON*****An Archaeological Building Survey of The Dower House, Preston, Rutland***

Sheppard, R Nottingham : Trent &amp; Peak Archaeological Unit, 2008, 29pp, colour pls, figs, tabs, refs, CD

*Work undertaken by:* Trent & Peak Archaeological Unit

The Dower House was a small to moderately sized two storey building consisting of a principal living section that was of double-pile plan [two rooms deep and with an M-shaped roof], and extensions to the rear west side. The main east part was built of coursed ironstone rubble, plastered and dressed with a plinth, string course and quoins on three sides. At the back there was a kitchen extension which, although not tied into the main building, was likely to be of the same date, implying that the Dower House was of L-shape plan from the outset. There were few features to help date the original structure but the building's form, internal brickwork and fittings such as fireplaces supported a date of about 1800. Extensions were added to the west and south sides during the 19th century. An added conservatory and a bay window had since been removed. This part of the building had been much altered by the insertion of windows, doorways, an upper floor and changes to floor level. Proposed changes would primarily affect the same part of the building. [Au(abr)]

Mellor, V Sleaford : Archaeological Project Services, Report: 47/08 2008, 22pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Project Services

A programme of archaeological building recording was undertaken prior to the construction of an extension at Bridge Cottage. The building was a 17th century Grade II Listed Building of

vernacular architectural and historic interest. In the area of the proposed extension the structure, ground plan, external elevations and internal details were recorded. In use as a kitchen, this wing may previously have functioned as a pigsty, although it was unclear whether it was purpose-built for that role. A single piece of wood within the surveyed wall may have represented the remains of an opening for a pig feeding trough, although this remained unproven. The wing butted and was likely to be later than the main building, which was of 17th century date. The materials used in the building were on the whole undiagnostic or possible additions, and so the dating of the surveyed wing remained unclear. A mid to later 19th century date for the wing was possible, although was suggested tentatively. Old Ordnance Survey maps showed the wing was in existence by 1888. [Au(abr)]

Henderson, M Portslade : Archaeology South-East, Report: 2008217 2008, 37pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

Historic building survey was carried out on a number of buildings at the RAF Station Wyton, in advance of the demolition of the buildings prior to redevelopment. The surveyed buildings represented a cross section of the types, form and function available to military establishments from the first half of the 20th century through the Expansion Period and into the 1970s. Each building type was of a standard design that was not unique to RAF Wyton, but was supplied to many military facilities. The only differences recorded was in the use of building materials common to the areas where the stations were located. The surveyed buildings included those situated within a military transport compound, comprising an early 'Type T' hangar and a series of garage, repair and maintenance facilities. The structures dated to the early years of the station with the exception of the hangar, which was purpose built between 1940 and 1942. A series of H-plan barrack blocks were also surveyed. The H-plan structures were designed in 1937 to replace the T-plan facilities and were used as accommodation and office blocks. Two further structural types were surveyed. Both were officers' mess and accommodation facilities, and comprised a central block with a display façade flanked by cross wings providing accommodation. One of the blocks was a Type B building designed by S. Bullock in 1938 in a neo-Georgian style. [Au(abr)]

Letch, A Braintree : Essex County Council Field Archaeology Unit, Report: 1906 2008, 45pp, colour pls, figs, tabs, refs

*Work undertaken by:* Essex County Council Field Archaeology Unit

Recording works were undertaken on a late-18th century farmstead. The group was formed by two barns, a byre and stables, plus two small dilapidated Victorian structures. The buildings were timber framed and boarded with corrugated asbestos roofs. All were formally thatched and the two barns had their upper walls plastered. The byre, barn 2 and the stables were constructed in the same unusually steep primary bracing, but there was evidence to suggest that the byre was a rebuilt 16th century structure, perhaps contemporary with the farmhouse. Barn 3 had a very different character to the others and appeared to be constructed from elements of broadly contemporary pre-existing barns. All buildings had been neglected, but not from modern farm development, therefore historic wall treatments such as wall and daub plaster and features such as a brick threshing floor, and feeding troughs remained. Letch, A Braintree : Essex County Council Field Archaeology Unit, Report: 2009 2008, 20pp, colour pls, figs, tabs, refs

*Work undertaken by:* Essex County Council Field Archaeology Unit

Recording works were undertaken on the remains of a 19th century farmstead. The group comprised a barn and stables, the latter originally built as a cow shed. Other elements of the farm were believed to have been demolished when large pre-fabricated grain silos and sheds were erected in the mid to late-20th century. The buildings were timber framed with later corrugated asbestos roofs. The barn had been adapted for grain storage. There was few internal fittings or fixtures in either building. Little Nunty's over time adopted the form of a Victorian mixed farmstead with a barn and animal ranges set around a central yard. Although the buildings had limited architectural value their vernacular character and preservation as part of the rural landscape was deemed important. [Au(adp)]

Lister, C Colchester : Colchester Archaeological Trust, Report: 475 2008, 42pp, colour pls, figs, tabs, refs

*Work undertaken by:* Colchester Archaeological Trust

Rayne Foundry lay on the north side of the Roman road known as Stane Street, the main route from Colchester to St. Albans, today called simply "The Street" in the centre of Rayne parish. A foundry was in continuous operation at the site from at least as early as the 1820s right through to its closure in 2001. Eighteen buildings were recorded in the course of the survey. Little of the early foundry survived, apart from a few external walls to the south and east of the current complex, with the current building dating mostly to the 1930s/1950s. At the time of its closure, the foundry used 20th-century equipment and machinery, and no original fixtures and fittings had survived. The Roper cupola furnace was one of the last remaining examples of its type in the region and, with the closure of Rayne Foundry, the last operational iron foundry in Essex had disappeared. *Historic Building Recording at Brentwood School, Ingrave Road, Brentwood Road, Essex*

Letch, A Brentwood : Essex County Council Field Archaeology Unit, Report: 1874 2009, 57pp, colour pls, figs, tabs, refs

*Work undertaken by:* Essex County Council Field Archaeology Unit

The historic structures recorded during the survey formed a diversely functioning group of late-19th and early 20th century buildings whose origins were not all associated with Brentwood School. Most were built during the expansion of the school c. 1910, but two of the structures, the former vicarage and its outbuilding, were built some 40 years earlier and were incorporated within the layout as the school expanded. Despite changes, the outward appearance of all the structures remained largely unaltered, even if their landscape setting significantly changed as the school grew. Otway House was the oldest of the group, given its origins as a Victorian vicarage. It was well built and with its Gothic themes stylistically typical of its date, representing a good example of a modest late Victorian middle class residence. Adoption of Otway House as a boarding house by the school coincided with building the 1928 extension and it was likely the two were fitted out at the same time. The former gymnasium and marshal's lodge were Edwardian buildings and added historic value and diversity to this part of the school. Externally they had changed very little, especially the lodge, with its ornate architectural character. Internally, the gym had been altered considerably, while the lodge had developed over time as a contemporary family home. The modern Marshall's office and former gymnasium extension had no architectural merit. [Au(abr)]

The front ground floor range of buildings consisted of two shop fronts and an access passage to the rear range. The passage was 19th century with a door of the period. The two shops fronts were dated from the early and late-20th century. Behind this range was a frame of a 17th century stair tower. Two rear wings to the north and south developed eastwards towards Hemmel Street. The north range was two storey and survived relatively complete. The south side had three sections developed in succession, with a side lean-to. Beyond these was a 1930s single/double storey flat roofed building. To the north of the stair tower a 19th century passage way linked the shop side passage and rear range. [Au(abr)]

 Heritage Conservation Consultants, 2008, 86pp, pls, figs, tabs, refs  
*Work undertaken by:* Kathryn Sather & Associates  
 Heritage Conservation Consultants

A programme of archaeological building recording was carried out at Thorpe Maltings, Thorpe-le-Soken, Essex, prior to the removal of the drying towers and collapsed roof and unstable gable to eaves level. The recording included a photographic survey, with specific high level access to the roof structures of the drying towers. Existing plans and cross sections of the complex were adjusted and annotated to provide the drawn record, as safe access to all areas of the complex to obtain further drawings was not possible at this time. The Maltings complex was erected between 1876 and 1878. The complex consisted of two multi-storey linear ranges, aligned east/west and canted slightly to the south. They were later joined by a central link structure used for storage. Both ranges were constructed in Flemish bond of yellow brick with red brick details and dressings. The roof structures were all of timber and slate. The complex extended to three storeys with a semi-basemented ground floor. The Maltings complex is listed Grade II. [Au(abr)]

Letch, A Braintree : Essex County Council Field Archaeology Unit, Report: 1821 2008, 76pp, colour pls, figs, tabs, refs

*Work undertaken by:* Essex County Council Field Archaeology Unit

Recording works were undertaken on a large multi-phase farmstead. The eleven buildings recorded ranged from the 17th to early 20th century in date. The oldest structures were two 17th century timber framed barns each grade 2 listed. A byre was likely to be contemporary with them and also a granary cart shed (although this was perhaps a 18th century build) The byre was enclosed in the 18th century to form a stable. From a post-medieval layout centred around a single yard the farm was improved in the 19th century for cattle. Brick shelter sheds were built and stock yards around a central open yard. A stable and new farmhouse were built and a tall structure built against the granary. This building was interpreted as a machine store. Subsequent development in the modern period was minimal and the buildings maintained to a high standard. The farm was a well preserved example of an evolving farm complex. [Au(abr)]

Capon, L Twickenham : AOC Archaeology Group, Report: 30275 2008, 36pp, colour pls, figs, tabs, refs

*Work undertaken by:* AOC Archaeology Group

Historic building recording was conducted on the stables at Harps Farm, a farmstead whose origins lay in the medieval period. The farmhouse was a Grade II Listed Hall House comprising a 15th century hall and cross-wing with 17th century and later additions. To the east of the farmhouse was a Grade II Listed granary and a Grade II Listed 16th century barn. The 19th century stable range lay immediately south of the Listed barn. The stables were of several phases, and formed a building facing into a courtyard. Many repairs and replacement beams within the building were clear, but the older parts were potentially of late-18th century or early 19th century date. The report provided an enhanced Level 2 record of a not untypical post-medieval farm stable. The building was functional but had some degree of design. The report described the stable, its materials and phasing, and set the building into its local and regional context. [Au(abr)]

Watkin, E & Watkin, B Chelmsford : Elphin & Brenda Watkin, 2008, 30pp, pls, colour pls, figs, refs

*Work undertaken by:* Elphin & Brenda Watkin

The old forge was a brick and tile building with full gabled ends. It appeared to date from the late 19th century, the tiled roof was probably a later addition [in sales information from 1923 reports it was reported to have had a slate roof]. The building comprised a main gabled front unit and a continuous rear lean-to with access at both ends. The main range had double doors to the western area fitted out originally for the tethering of horses. The main central area opened through to the lean-to and had one original catch still on the stable type door. Little remained of its life as a forge. A much rebuilt chimney stack, an area of heavily boarded flooring and enough space behind the hearth position for bellows was all that remained. [Au(abr)]

Watkin, E & Watkin, B Chelmsford : Elphin & Brenda Watkin, 2008, 20pp, pls, colour pls, figs, refs

*Work undertaken by:* Elphin & Brenda Watkin

The building from the late 19th century had the appearance of the typical kit type building popular at the time. Locally Boulton & Paul of Norwich were the best known but John Sadd of Maldon also produced similar buildings. Many were seen covered in corrugated iron and it was about these that most had been written. The manufacturers name, if on the building, was usually somewhere within the structure. The addition of a porch, decorated gables, the transverse "transept feature" type gables and fine ashlar lined finishing, replicating stone, to the lime render provided a customisation to make the building stand out as something different. An example of a similar building but finished to a lower standard could be found re-erected at the East Anglian Museum of Rural Life. This building originally erected at Great Moulton in Norfolk was built by Boulton & Paul in the 1890s for £105-18s-0d. It had an original side extension but was finished in corrugated iron with minimum detailing. Of special interest were the vertical sliding, sash windows that have three vertical panes over three as at High Roding, and also that the panes in the lower sash were obscure glass. As the church is a considerable distance from the village one can see a need to provide a closer place of Worship and the small scale reflected the village size. In towns it was very different with places such as Halstead having a new 19th century church at the other end of the town that actually rivalled the original in size and impact. It was mainly the non-conformist religions that made use of these small prefabricated timber mission halls and chapels to house the dramatic increase in the number of worshipers during the Victorian era. They were cheap and efficient in providing a good open area of building and the companies producing them sent them all over the world. Documentary sources for this building had proved, on the searches made, to be non-existent and the only firm detail was the notice on the front door relating Mission Hall. Moulded timber corbel blocks were attached to the posts. The gable front had the same design of scalloped pierced barge board as the main roof. [Au]

The old congregational chapel was erected in 1793 as a large utilitarian building, built of lath and plaster on a timber frame. It was partly rebuilt in c.1865 with a neo-Georgian frontage and vestry both in brick, a replacement roof and inserted internal gallery. Despite its conversion to a light electrical industrial use in 1971 the gallery survived. Although many of the original features had been lost over time the chapel was significant for its survival of the gallery and the Victorian panelling around two sets of stairs. Externally the brick frontage survived in good condition. [Au(adp)]

Capon, L Twickenham : AOC Archaeology Group, 2008, 41pp, colour pls, figs, tabs, refs

*Work undertaken by:* AOC Archaeology Group

The Lodge showed many states of construction. It started as an 18th century two-storey bay cottage and by the end of the 19th century it had been enlarged into a villa with an impressive frontage. Alterations to the house from the mid-1950s removed much of the potential historic fabric, reducing its value as a heritage resource. Recent removal of fireplaces and stone floors further reduced the value of the property, which was also subject to damp, and was likely to degenerate rapidly without remedial action. North of the main lodge was a stable block of largely 20th century date, but its northern gable end was constructed of a wooden frame which appeared to be of 17th century character, possibly earlier. Doyle, K, Prosser, L, Williamson, A & Lamprey, C Hertford : Archaeological Solutions,  
Report: Report No: 2966 2008, A4 ringbound document  
*Work undertaken by:* Archaeological Solutions

"In January 2008 Archaeological Solutions carried out a programme of historic building recording of the Old Forge at Cromer, Hertfordshire prior to its proposed alteration. The building originated in the earlier part of the 19th century, initially comprising a small roadside unit with a loft above, and an adjoining, low rear range. In the later part of the 19th century the building was expanded by extensions to the rear, and the original rear range was heightened to provide additional loft space. The building has been extensively altered and refurbished in the later part of the 20th century probably in connection with its conversion for use as offices. Now effectively only the external shell survives with no evidence for the earlier internal layout, and its origin as a forge is only readily traced through historical sources. However, an inventory made in 1888 lists the buildings then present on the site. The site was further developed in the 20th century when it formed the premises of Newman's Garage, although these buildings have recently been demolished, leaving only the buildings relating to the Old Fore surviving." ***Station House, Aspenden Road, Buntingford, Hertfordshire. Historic Building Recording***

Prosser, L & Williams, M Hertford : AS, Report: AS report No. 3117 2008, A4 ring bound document

*Work undertaken by:* AS

"In July 2008 AS carried out a programme of historic building recording at Station House, Aspenden Road, Buntingford, Hertfordshire. The purpose of the work was to investigate and clarify the origins and development of the existing building prior to a substantial proposed redevelopment. Further, the programme aimed to record the building systematically in its existing state before the commencement of the works. The building was constructed as the terminus to the Ware, Hadham and Buntingford branch of the Great Eastern Railway in 1863. It was built in typical Victorian style, with exterior embellishments, and modest internal decoration. The south wing was occupied by the Station Master's house, with offices, public lavatories and waiting rooms to the north, spanned by the ticket hall. The station was closed

to passengers in 1964, with final closure to freight occurring the following year. Since that time, the platforms, associated goods shed and other features have been lost to a housing development nearby. Investigation found that, despite extensive modification, many high quality details remain in situ, with few alterations from its initial construction. Some reorganisation has occurred in the central and northern wings to adapt the building to its later use, but extensive decorative features survive nonetheless." [OASIS]

***Bell Barns, Baldock Road, Buntingford, Herts. Historic Building Record and Archaeological Monitoring Report***

Winter, M & Wilcox, S Letchworth : Heritage Network, 2008, 36pp, colour pls, figs, tabs, refs

*Work undertaken by:* Heritage Network

A programme of building recording and archaeological monitoring was undertaken. Cartographic evidence had demonstrated that the barns and cottage were originally built as four ranges around a central yard between 1838 and 1869. Since then the layout had undergone a number of alterations, including the demolition of the original southern range and its replacement at the southern end of the surviving barns by small annexes added in the 20th century. Examination of the existing barns demonstrated several phases of reconstruction. Monitoring of the ground reduction revealed the remains of a two features, including a modern rubbish pit. [Au(abr)]

*Work undertaken by:* Archaeological Services & Consultancy Ltd.

The cottage was a late-19th century brick structure, built on the site of an earlier smallholding, which was created at the time when the farms of the Giltston Park Estate were being remodelled according to late Victorian farming models. The cottages had been inhabited by the current owner's family for three generations, and were completely renovated in the 1970s. [Au(abr)]

Williams, M & Prosser, L Hertford : Archaeological Solutions, Report: 3148 2008, 42pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

Building appraisal found the premises formed half of a fairly modest, Grade II Listed 17th century timber-framed row of shops which appeared to have been occupied separately until the 20th century. When separate, both elements seemed to have been refurbished in the 19th century. The outbuilding probably originated as four discrete cart or carriage sheds with storage lofts above in the mid-19th century. It was Listed Grade II as part of the curtilage of the main building. There was no evidence to suggest that they were used as stables, as had been suggested. Much original fabric survived intact, and little change had occurred since its construction. The redevelopment scheme for the main building would have very little adverse impact upon its historic fabric and that the proposals were broadly sympathetic to the house. However, conversion of the outbuilding would result in substantial impact and loss of historic fabric, retaining only a cosmetic sense of the original scale and purpose. [Au(abr)]

***7 Cowbridge, Hertford, Hertfordshire: Historic Building Appraisal***

Prosser, L & Collins, T Hertford : Archaeological Solutions, Report: 3143 2008, 35pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

A historic building appraisal found that the building, most recently occupied by a motorcycle dealership, now consolidated three properties: 7 Cowbridge, 2-4 Dimsdale Street and 6-8 Dimsdale Street which were listed separately. The central range was a late-15th century timber-framed building with a crown post roof, preserved substantially intact. The main street frontage was added in the early 17th century, while a rear, service range probably dated from the later 17th or early 18th century. Other elements, such as the staircase probably dated from a refurbishment carried out at a similar date. The building had undergone much modification during its existence, and many internal fixtures and fittings such as original doors

and window joinery had disappeared. However, other important elements remained in situ, including the main structural frames, which allowed the building to be analysed with a high degree of accuracy, as well as its principal staircase and other minor decorative features. The appraisal found that the proposal would have a varying impact; largely uncontentious in many places, but with considerable and detrimental impact in discrete areas, involving the loss of historic fabric such as door surrounds and some primary structural elements. Additionally, division of the upper chamber of the central range would destroy the unity of the crown post roof, thereby losing its original architectural sense and purpose. Installation of electrical services and under-floor pipes could also have an impact on historic walls, joists and floorboards, which could not be assessed during the appraisal. [Au(abr)]

Williams, M. Prosser, L & Doyle, K Hertford : Archaeological Solutions, Report: 3076  
2008, 69pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

Historic building recording concluded that the building was principally of one phase dating from 1881 with a small extension dating from shortly after 1923. Site investigation noted several features of particular interest which related to the building's original function, most notably a secure cast iron gate and metal sheeted doors. External architectural features of note were also observed including high quality carved brick and sandstone mouldings and a finely laid Portland stone door case. All of these details were photographed along with each room and all accessible external views. In addition, existing drawings were checked for accuracy and amended where necessary. [Au(abr)]

Collins, T, Prosser, L, Doyle, K &amp; Henry, K Hertford : Archaeological Solutions, Report: 3140 2008, 59pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

A programme of historic building recording found the buildings comprised a 5-bay barn with a smaller L-shaped building attached to the west. The western part of the barn, comprised two bays, substantially preserved timber-framing consistent with a 16th century date, which originally had wattle and daub panels. The remaining elements were predominantly primary-braced and so later, but re-using occasional elements of the older structure. Evidence suggested an 18th century date for this remodelling. In the modern period, the roof had been replaced, and render applied over the original weatherboarding, which survived. The smaller 'L' shaped building to the west was probably of 18th century or earlier date, but had undergone extensive remodelling and renovation, with many historic timbers reutilised or replaced. Williams, M &amp; Prosser, L Hertford : Archaeological Solutions, Report: 3149 2008, 40pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

A historic building appraisal of the grade II Listed Central Malting was carried out. The building was one of three parallel maltings of early 19th century date. The appraisal found that the building was in a fairly good state of preservation with some original features intact, though the original malting floors were removed in the 1980s. However, the three discrete sections which corresponded with the malting process could still be discerned. These sections were structurally different, accommodating the needs of the malting process through the use of timber and iron. A number of original features were found to survive, most notably the cowls and some of the underlying kiln structure, along with original windows, timbers, trusses and two cast iron stanchions. Many of the timbers were found to have Baltic bracking marks. The proposed development would have a fairly light impact upon the structure if sympathetically designed, and could be beneficial by removing 20th century additions. However one area of possible impact to the west may affect the remaining cast iron stanchions and timbers retaining the best Baltic marking. [Au(abr)]

**'LITTLE PATCHETTS' 72 HILFIELD LANE, ALDENHAM*****Desk-based And Historic Building Assessments: 'Little Patchetts' 72 Hilfield Lane, Aldenham, Herts***

Semmelmann, K Milton Keynes : Archaeological Services & Consultancy Ltd., Report: 1045 2008, 61pp, colour pls, figs, tabs, refs, CD

*Work undertaken by:* Archaeological Services & Consultancy Ltd.

Desk-based and historic building assessments were undertaken of 'Little Patchetts', Aldenham. This suggested that Aldenham was first settled in the 1st century AD, but little was known of this or any possible early or middle Saxon settlement. There were spurious documents stating Offa granted lands at Aldenham to either Thorney or Westminster Abbey in 785 and the ownership of the manor was disputed by Westminster and St. Albans Abbeys until at least 1256. The Extent of Aldenham records William Patchett tenancing 10 acres of land in 1260 and in 1316 Alice Forester held a plot of land called Patchetteswyk. The area was noted as having been heavily wooded until fairly recent times. Little Patchetts was a Listed timber framed building that dated from no later than the 15th century. It was a two-storey L-shaped structure comprising a 3-bay south range, which was originally a cross passage house, to which a late-15th/early 16th century range had been added. Later extensions included a single storey range to the east elevation, an outshut to the west elevation and an L-shaped addition in the north-west corner of the building. Little of the timber frame was visible from the outside as the house was partially encased in brick in the 19th century. Other parts of the building were tile hung or weather boarded. The interior of the building, however, retained much of the original layout and many timbers had been left exposed. The house was part of a large complex now functioning as an equestrian centre. The creation of the centre and its facilities as well as the high level of maintenance afforded the buildings and the grounds would suggest that the proposed development is liable to disturb little of archaeological interest below ground. The proposed additions to the building were unlikely to be unduly detrimental to the historic core of the building, with the possible exception of the removal of the east wall in the main ground floor room in the south range. Indeed, the works may reveal further clues to the origin and development of the building. [Au(abr)]

**67 HIGH STREET, HARPENDEN*****Historic Building Recording. 67 High Street, Harpenden, Hertfordshire***

Zeepvat, B Milton Keynes : Archaeological Services & Consultancy Ltd., 2008, 44pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Services & Consultancy Ltd.

Historic building recording of 67 High Street, Harpenden, was carried out. The building was Grade II Listed, and probably dated from the 17th century. No. 67 High Street was a two-storey building constructed largely of brick, under a tiled roof. As originally built it had one room on each floor. From the presence of a large brick chimney stack shared with No. 65, and external features on the wall shared with No. 69, there was evidence to suggest that it was constructed as an infill between the adjoining buildings. During the latter half of the 19th century it formed a single unit with 65 High Street, the two buildings were physically connected on both floors. In the late-19th or early 20th century, brick extensions were built to the rear of both buildings. Later in the 20th century the two buildings were again in separate use: at that time the present stairs were probably installed. 67 High Street retained a number of interesting features. In addition to the chimney stack, the south wall of the first floor had a section of plank and muntin panelling at its east end, and a section of painted plaster at its west end. Both were recorded. The latter was to be subject to specialist examination in due course. [Au(abr)]

Williamson, A & Prosser, L Hertford : Archaeological Solutions, Report: 3041 2008, 53pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

In 2008 a programme of historic building recording was carried out of a small house known as Hillside in Lamer Lane, Lower Gustard Wood. The building originated as a two-bayed timber-framed house, most probably in the late-17th/early 18th century. The building was subsequently extended at the rear and in the 18th/early 19th century, in keeping with other buildings in the area, the building was refaced in red brick. Several other alterations were made to the building in the late-19th/early 20th century. Local history records that in 1835 the house was converted to a beer-house called The Royal Exchange. Some of the modifications to the building may be attributed to this period of use, as well as its reversion for use as a domestic dwelling which probably occurred in the earlier part of the 20th century. The building (Grade II Listed), was likely to have been built between 1698 and 1700 for the 1st Earl of Essex. The residence originally consisted of the neo-classical frontage, a kitchen and an outhouse built in the vernacular style to the rear as well as other subsidiary buildings. The kitchen appeared to have been incorporated into the main body of the building by 1700 and the other outhouse, which was presumably a scullery, was joined on later. The classical building was given a single storey extension to the south-east in the early 19th century, when a fair amount of rebuilding also took place on the south elevation. [Au(abr)]

Wilcox, S & Hillelson, D Letchworth : Heritage Network, Report: 487 2008, 40pp, colour pls, figs, tabs, refs

*Work undertaken by:* Heritage Network

As the result of an archaeological condition on planning consent for the conversion to residential use of the milking parlour of the former dairy at Lockley Farm, Welwyn, a record of the building prior to refurbishment was undertaken. The brick and flint milking parlour was built in the mid-19th century, and was extended in the early part of the 20th century to provide almost double the number of milking stalls. Lockley Farm originally formed part of the Lockleys Estate and was built around two 17th century timber framed barns, which later bordered the courtyard. The inclusion of a dairy as part of the farmstead provided clear evidence of the diversification in farming during this period and follows a pattern of changing farming practice seen elsewhere in the region. **THE CHURCH OF ST. LAURENCE, BRUNDALL*****The Church of St. Laurence, Brundall. Statement of Significance***

Heywood, S Gressenhall : Norfolk Landscape Archaeology, 2008, 8pp, colour pls, figs, refs

*Work undertaken by:* Norfolk Landscape Archaeology

The church retained only a small amount of its original medieval fabric and had been thoroughly restored and extended during the 19th and 20th centuries. Its most distinctive feature was the bell cote which had lost some of its pride of place through the 1963 extension. Internal features which required special care were the Romanesque capital serving as a corbel and the lead font. In light of the proposals which may include the removal of the north aisle there was no significant loss of historic fabric of particular artistic merit, provided that suitable places were found to keep the Romanesque capital and the St. Laurence glass roundel. It appeared that much of the discussion revolved around the need for a bell tower. [Au(abr)]

*Work undertaken by:* Norfolk Landscape Archaeology

The building had a complex history which all took place within the 18th century. It was constructed of four different types of brick work. The earliest and best quality work was the eastern end of the barn on both side of the present gable-end. Of special interest were the honeycomb ventilation openings. [Au(abr)]

Wooler, F Norwich : NAU Archaeology, Report: 1899 2008, 28pp, colour pls, figs, tabs, refs

*Work undertaken by:* NAU Archaeology

Building survey was undertaken of redundant buildings to the rear of the former Service Station at Salhouse. The service station was located on the site of a windmill, shown on the 1883 Ordnance Survey map and which stood until the 1930s. The evidence indicated that the windmill was constructed at some point between the production of the Tithe Award Map of 1840 and the publication of the First Edition Ordnance Survey map in 1883. Between 1883 and 1906, other buildings were constructed to the north-west of the windmill, which may have related to a maltings. The buildings which were the subject of the 2008 survey included three brick-built structures (Buildings A, B and C), and modern garage buildings (Buildings D and E) which had utilised the earlier buildings. Buildings A and B were two-storey structures with regularly spaced windows, which appeared to have been industrial buildings. Building C was constructed of a different bond, suggesting it may have been built later, but evidence suggested that it was contemporary. The need for further survey work during demolition work was not considered to be necessary. [Au(abr)]

**17 HARRISON'S MEADOW, BLUE BOAR LANE, SPROWSTON*****An Historic Building Assessment of 17 Harrison's Meadow, Blue Boar Lane, Sprowston, Norwich***

Bartrum, B Norwich : NAU Archaeology, Report: 1836 2008, 9pp, colour pls

*Work undertaken by:* NAU Archaeology

The dwelling surveyed was constructed of red brick and was of two distinct phases. The earliest phase of brickwork dated from the late-18th century and the heightening of the building dated to the mid to late-19th century. The extension to the western elevation dated from the end of the 19th or early 20th centuries. The brick wall dividing the kitchen/dining area was thicker than the other internal walls and extended through the ground and first floors.

This may have represented a former external wall. An area of exposed flint foundation below the external brickwork at the south-west corner may have been foundations or the remains of an earlier building. The present building demonstrated no architectural features which would warrant it being listed or preserved. If a proposal were made to demolish the property it was recommended that a full and thorough record be made of the property prior to and during its demolition. [Au(abr)]

Cope-Faulkner, P Sleaford : Archaeological Project Services, Report: 91/08 2008, 20pp, colour pls, figs, refs

*Work undertaken by:* Archaeological Project Services

The buildings recorded were an 18th century barn and courtyard arrangement with later additions. A second, poorly preserved courtyard was to the east. The earliest of the buildings was a threshing barn that occupied the north side of the complex. An intact brick threshing floor still survived. A small building occupying the south-west corner of the courtyard was the remnant of a west range, known from 19th century maps. The absence of a wall along the west side indicated that this range was open-sided, perhaps a cart shed or livestock shelter. The east wall of the courtyard was a later addition. [Au(abr)]

Strickland, J Norwich : NAU Archaeology, Report: 1994 2008, 32pp, colour pls, figs, tabs, refs

*Work undertaken by:* NAU Archaeology

A Level 2 archaeological building survey was undertaken of an ancillary building to the rear of Lime House, East Rudham. This Grade II Listed Building was said to be visible on the First Edition Ordnance Survey map. The structure comprised a set of stables that were thought to relate to a 17th century inn. The inn was subject to alterations in the 19th century and it was thought that the stables may date from this period. The building survey revealed that the stable building dates from at least the mid-19th century and was constructed of coursed flint on the north-east, north-west and south-west elevations, with knapped flint on the south-east elevation. The stable building was in good condition, with the exception of the timber floor of the loft having decayed. This building was a good example of flint architecture once common in the area, but disappearing from the Norfolk landscape as a result of more modern developments. [Au(abr)]

Mellor, V Sleaford : Archaeological Project Services, Report: 123/08 2008, 28pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Project Services

A programme of archaeological building recording was undertaken prior to the conversion of farm buildings at the site. The buildings were of vernacular, architectural and historic interest. The survey recorded a carrstone and brick barn which had apparently been built for hand threshing and the storage of grain and straw. Examination of brickwork suggested a probably later 19th century date for construction of the barn. The depiction of the building on the first edition Ordnance Survey map of 1888 indicated it had been built by this time. Numerous variations noted within the masonry suggested a series of ad hoc repairs to the building and repointing, whilst the south gable end had been entirely rebuilt. It was tentatively suggested that an original large doorway in the eastern wall had been subsequently infilled, and that a partial first floor level may have been inserted and later removed. Much of the two shelter sheds were found to be modern, although one of these matched the location of a building depicted on the 1888 map, and elements of each of these buildings were likely to date to the 19th century. One of these shelter sheds may have been erected in the mid to late-19th century as cattle accommodation, with an open area to the north possibly forming an associated cattle yard. A range of buildings to the north were beyond the scope of the survey, but also formed part of the farmstead, and had apparently been used as stables and a dairy. [Au(abr)]

Phelps, A Norwich : NAU Archaeology, Report: 1979 2008, 15pp, colour pls, figs, tabs, refs

*Work undertaken by:* NAU Archaeology

A Level 2 archaeological survey was undertaken on the Old Dairy, a disused L-shaped agricultural building of brick and flint construction that formed two sides of the yard at Poplar Farm. The survey identified three separate structures (A, B and C) all of which appeared to have been built in the 19th century. None of the buildings were visible on the 1839 tithe map, but had been constructed by the publication of the 1st edition OS map in 1886. The plan and surviving fixtures and fittings strongly supported the interpretation of Building A as a cow shed. Limited survival of evidence meant that Building B's function was more difficult to ascertain beyond its general agricultural use, but structural details suggested it was a later addition that linked Buildings A and C. Building C is likely to have had a dual function as a cow shed and cart shed, and has a weather-boarded upper storey accessed externally from the southern gable wall. All three buildings are likely to have been built within 50 years of each other. Buildings A and B are of the same bond and share other constructional similarities, implying a broadly contemporaneous construction, while Building C was mostly of flint and may be slightly earlier, perhaps pre-1850 when brickwork was more expensive and used only at the critical structural points. Fletcher, T Bar Hill : Oxford Archaeology East, Report: 1057 2008, 67pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology East

An building recording was undertaken of Mill Hall in July 2008, prior to major alteration. An additional record of a 19th century agricultural building was undertaken within the grounds of the site, also scheduled for renovation. The survey of the main house revealed four main phases of development. The earliest phase, was a three storey timber framed structure built upon a brick plinth. This early phase had a lobby plan layout with back-to-back fireplaces on the ground floor and a box winder staircase providing access to the first floor. Stylistically and relative to the later phase, this build was dated to the early to mid-17th century. The second

phase was dated 1624 by a date found over the fireplace on the first floor. This phase added a cross-wing to the earliest phase and was also a timber-framed structure on a brick plinth. The third phase of development saw the rebuilding of part of the second phase in the 20th century. Breeze block and reset timbers in positions for aesthetic rather than for structural purposes characterised this phase. The final phase was the addition of the conservatory and substantial additional building. Cartographic sources provided evidence of a date of construction post 1985. The additional outbuilding was dated to the early-middle 19th century. Although much original material survived in situ it had been massively altered reusing original bricks and covered with a modern contemporary roof. [Au(abr)]

*Work undertaken by:* Suffolk County Council Archaeological Service

Oak Farm occupied a conspicuous site which commanded fine views of the Stour valley to the south and the Box valley to the north, approximately 500 metres west of the hamlet of Thorington Street. The farm buildings consisted of an early 19th century timber framed barn to the west of a mid-19th century yard of brick cattle sheds and shelters that had already been converted into office accommodation. A pair of single storied brick and slated sheds adjoining the southern gable of the barn were built in two phases during the mid-19th century, and comprised a former cattle shed to the north and a cart lodge to the south. Neither shed retained any significant fixtures or fittings, and they were not of particular historic importance. The five-bay barn retained a substantial area of rare external weatherboarding with original red ochre pigment, preserved within a lean-to shelter shed. Its walls consisted of early 16th century timbers with evidence of arched doors and mullioned windows that may remain partly in situ. The presence of such a building combined with its proximity to the Duke of Norfolk's park at Tendring Hall and its commanding location suggested the site may have been occupied by a medieval park lodge. **HALL FARM BARN, DRINKSTONE HALL, DRINKSTONE**

***Hall Farm Barns, Drinkstone Hall, Drinkstone, Suffolk: Archaeological Record***

Alston, L Ipswich : Suffolk County Council Archaeological Service, 2008, 18pp, colour pls, figs, CD

*Work undertaken by:* Suffolk County Council Archaeological Service

The complex of agricultural buildings at Drinkstone Hall was a self-contained, single-build 'model farm' of the mid-19th century which represented a well-preserved and historically important example of its type. The farm lay to the south of a medieval moat which probably marked the site of the main Domesday manor, held by the Abbot of Ely and still the centre of a substantial 287 acre tenanted estate at the time of the tithe survey in 1838. The scattered traditional farm buildings of 1838 were demolished and replaced on the same site with the present unified complex in the 1850s or possibly the 1860s. It consisted of a timber framed and pantiled barn with twin porches and a continuous, skirt-like lean-to roofed with slate which extended eastwards to form a pair of sheds enclosing two cattle yards. The yards were divided by a central range containing back-to-back shelter sheds separated by an axial partition. Each of the three yard ranges terminated in a brick gable with carved, Mock-Tudor barge boards and doors to enclosed storage sheds. These ranges were unfortunately much altered during the late-20th century when they were converted into the stables, replacing the original timber framed walls with concrete blocks, but their original layout and purpose could be established with reasonable accuracy. A circular feature which presumably represented a horse mill was shown on early maps, but no trace of this remained. At the start of the present conversion work, which began prior to inspection, the complex remained among the best preserved model farms in southern Suffolk, where they are relatively rare in comparison with other parts of the country. **ABBAY FARM BARN, EYE**

***Abbey Farm Barn, Eye, Suffolk: Archaeological Record***

Alston, L Ipswich : Suffolk County Council Archaeological Service, 2008, 47pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Suffolk County Council Archaeological Service

The Tudor brick building known as Abbey Farm Barn was marked on the Ordnance Surveys of 1905 and 1926 as the 'remains of a chapel'. The Schedule of Listed Buildings describes it as 'a former ecclesiastical building of unknown function' dating from c. 1500 and used as a house from the mid-16th century and as a barn from the 18th century (the structure was Listed at Grade II). The building had also been interpreted as a Tudor stable block, and a malting house. An inventory of Eye priory taken in 1536, included a 'Bakhous and Brewe hous' among its buildings, and another of 1650 refers to a 'malting and brewing house'.

Large, detached service buildings known as 'bakehouses and brewhouses' were standard features on monastic and other high-status sites in the Middle Ages. The majority of monastic examples were destroyed in the wake of the Reformation, and Abbey Farm Barn represented the finest and best-preserved of just four known survivors in England (the others being at Lindisfarne, Norwich and Canterbury). As such, it was of exceptional historic importance and merited Listing at Grade II\* or Grade I. The brickwork and carpentry details indicated a date in the late-15th or early 16th century but the narrow window arches were in the style of the 13th century and may have deliberately reflected the medieval buildings of the priory church and cloister. The eastern elevation, in contrast, was provided with only a small number of windows in the usual style of the period. The interior contained a low granary or malting loft along most of its length, but a substantial area against its southern gable remained open to the roof but apparently possessed one or more platforms or galleries (as found in several domestic Tudor brewhouses elsewhere in Suffolk). The walls of this open area contained a variety of niches, drains and recesses. The inventory of 1536 lists several great vats which probably occupied this space, and archaeological evidence of furnaces and ovens was likely to remain intact beneath the present floor. The fire-backs were unusual features, and the nature of the structures to which they belonged was impossible to determine without excavation. The building was converted into stabling and cattle accommodation during the 18th century, which resulted in considerable mutilation to the eastern elevation but left the western façade largely intact. The roof and ceiling were replaced following a fire in c. 1900, but three original binding joists still survived. Abbey Farm Barn never operated as a barn in the normal sense of the term, and belonged to a priory rather than an Abbey, but this misunderstood structure was among the most precious monastic survivals in Britain, and offered a unique opportunity to understand the mechanics of medieval brewing and baking. Alston, L Ipswich : Suffolk County Council Archaeological Service, 2008, 16pp, colour pls, figs, tabs, refs

*Work undertaken by:* Suffolk County Council Archaeological Service

The United Reform Church at Haughley was built in 1835 or 1843 as a daughter establishment of the Congregational Church in neighbouring Stowmarket (there was conflicting documentary evidence of the precise date). The chapel was set back from the medieval street frontage behind a small yard, but there was no evidence that it possessed a burial ground. Designed as a timber structure with a rendered exterior it was cased in red brick during the 20th century and its original arched windows lost, but the northern entrance porch and panelled benches survived from its foundation. The benches were good examples of their type, with raised tiers for children flanking the central entrance, but the building had been too heavily altered to merit listing. A small side vestry was added to the simple rectangular hall in the mid-19th century, and replaced in 1995. A detached wooden hall to the rear was built in 1932 to accommodate a Sunday school and other ancillary activities and was not of sufficient age or rarity to merit listing or retention. [Au(abr)]

***Gissings Farm, South Green, Hoxne, Suffolk: Archaeological Record***

Alston, L Ipswich : Suffolk County Council Archaeological Service, 2008, 18pp, colour pls, figs, CD

*Work undertaken by:* Suffolk County Council Archaeological Service

The grade II Listed farmhouse dated from the 16th century, but of the farm buildings shown on the Hoxne tithe map of 1842, only the barn to the south-west of the site survived. This barn was a late-16th century timber framed structure in five bays which adjoined a large pond at its southern gable. The framing of the side elevations remained largely intact, with internal wall braces and cranked arch-braces to the tie-beams, but the gable studs and the roof were replaced in the 19th century. The barn contained a well laid stone threshing floor and a granary storey had been inserted at its southern end. A porch (shown on the Tithe map) projecting from the original entrance was removed as part of a mid-19th century refurbishment, which appeared to have included the insertion of the western entrance. A small brick cart shed was built against the western wall and a pair of enclosed horse or cattle yards with an open-sided clay-lump shelter (building 5) were added to the west. A timber framed granary with grain bins on its upper storey and cart sheds beneath was erected to the north of the barn (building 4). In the final quarter of the 19th century a brick stable or neat house was built to the south of the enclosed yard adjoining the barn, and the earlier shelter shed was extended. The yards were provided with covers in the 20th century, and were used to house riding horses at the time of inspection. The 16th century barn was a fine example and was worthy of Listing, despite the loss of its original roof. The timber framed granary, brick stable and clay-lump shelter were also typical of their respective periods and remained of some historic interest despite the lack of original fixtures and fittings. ***Ringshall Free Church, Ringshall, Suffolk. Historic Building Record***

Alston, L Ipswich : Suffolk County Council Archaeological Service, 2008, 12pp, colour pls, figs, CD

*Work undertaken by:* Suffolk County Council Archaeological Service

Ringshall Free Church was built in c. 1860 as a red-brick single roomed Baptist chapel with a slate roof. The site is shown as an empty and relatively isolated field on the tithe map of 1838, but the present building appeared on the First Edition Ordnance Survey of 1886 along with a small group of adjacent cottages. The presence of a Baptist chapel was noted in a trade directory of 1869 but not in an earlier edition of 1855, and the first recorded baptism occurred in 1859. The church was believed to have become independent (i.e. a Free Church) in 1951 and to have become redundant in 2006. The original church was aligned at right-angles to the nearby road. Its single hall was lit by three large sash windows in each side elevation and was entered by a central door in its southern gable. The symmetrical exterior was embellished with moulded window sills in gault brick and a pedimented door case which was obscured by a later porch. A small additional room was added to the northern gable before 1886, and a number of further rear extensions were built piecemeal in the 20th century. The building was a good example of its type, but its interior has been re-fitted and its windows replaced, although a rail of coat pegs with acorn terminals may have been an original feature. Until its expansion in the 20th century the building occupied a narrow plot of land. An area between the southern gable and Lower Road may have operated for a short time as a private Baptist burial ground but there were no obvious records of interments. [Au(abr)]

*Work undertaken by:* Suffolk County Council Archaeological Service

White House farmhouse was a grade II-Listed early 19th century building of white brick and slate. The farm contained 142 acres in 1840, and a substantial complex of farm buildings lay to the south of the house. In recent years the farmyards and adjacent land were sold for development, and only the main barn still survived at the time of inspection. The timber-framed and weather boarded barn was not separately Listed, but was of considerable historic interest. It dated from the mid-19th century in its present form, but represented the reconstruction of a late-16th or early 17th century barn and stable, shown as separate structures on the tithe map of 1840. The stable was raised in height but its wall framing remained largely complete and was a rare survival, with evidence of original doors and diamond-mullion windows. [Au(abr)]

*Work undertaken by:* Suffolk County Council Archaeological Service

The farmhouse was a Grade II Listed timber-framed structure of the mid-16th century which formerly formed part of the "Town Estate". The barn was a timber-framed building of the early 17th century which was initially thatched and rendered externally but was pantiled and partly clad in 19th century weatherboarding. Its structure survived largely intact, complete with its clasped-purlin roof (albeit lacking its original wind-braces), and contained evidence of a contemporary stable and hay loft in its southern bay. The loft was accessible to the open barn in the manner of a crog loft, and required the inclusion in the structure of a narrow bay that was deemed unique. As a substantially complete 17th century building the barn merited listing at grade II in its own right, and was of particular historic interest given the unusual manner in which it incorporated its stable. A pair of late-19th century brick shelter sheds flanked a cattle yard to the east, but had been altered beyond recognition. [Au(abr)]

Alston, L Ipswich : Suffolk County Council Archaeological Service, 2008, 24pp, colour pls, figs, tabs, CD

*Work undertaken by:* Suffolk County Council Archaeological Service

Hall House was a Grade II Listed Building of the early 18th century that was known as Hall Farm until the mid-20th century. It was occupied in 1842 by the farm bailiff of Walsham House, a substantial mansion which lay immediately to the south, but had since been rebuilt as The Willows. The mansion was later known as Walsham Hall, but the site of the medieval manor of Walsham Hall is believed to have stood in the paddock to the north, and the area is of great historic interest with potential for medieval archaeology. The present barn and stable range appeared on the tithe map of 1842 but not the Walsham enclosure map of 1819. The latter shows the site bisected by two medieval roads that were entirely removed as part a major refurbishment which included the construction of the present buildings. The barn was built in two phases between 1819 and 1842, with the first structure of four bays later extended by a further two bays to the west and provided with a new lean-to shed and cattle yard to the south. Despite its relatively late date, the barn was of considerable historic interest as the lean-to shed has preserved its external weather boarding with original red ochre pigment. Red ochre was commonly used to decorate barns in this way before tar became available during the second half of the 19th century, but survivals are rare and this example was among the finest in Suffolk. The eastern range of the cattle yard was demolished in the mid-20th century and the western range converted into stabling. [Au(abr)]

Alston, L Bury St. Edmunds : Suffolk County Council Archaeological Service, 2008, 17pp, colour pls, figs, tabs, refs, CD

*Work undertaken by:* Suffolk County Council Archaeological Service

The 19th century brick façade of the grade II-listed farmhouse concealed a timber-framed structure of the early-17th century which preserved its original internal layout with a central hall flanked on the north by a cross-passage and twin service rooms and on the south by a chimney and parlour. Its roof was raised and rebuilt in the 19th century, and a service lean-to added to the rear to create an L-shaped ground plan. The lack of internal decoration suggested the house belonged to a relatively modest holding of perhaps thirty or forty acres, rather than the hundred or more acres associated in the 17th century with Yeoman status. The contemporary three-bay timber-framed barn of standard type that lay to the north-west occupied an east-west alignment and evidently faced a yard immediately behind the farmhouse. The southern façade and both gables of this barn were rebuilt in brick early in the 19th century, but the rear northern elevation retained original studwork with substantial areas of wattle-and-daub infill and external render. The building was shorter than the farmhouse by approximately 1.5 m, but wider by a similar degree. The roof structure of wind-braced clasped-purlins remained largely intact, complete with original tie-beam braces, and its steep pitch suggested it was designed for thatch rather than the present pan-tiles. The easternmost stable was an early 17th century timber-framed structure which retained evidence of an original window with 'diamond' mullions, but had been truncated to the west and re-faced in 19th century brick to match the barn. The western stable was a reconstruction of the early 19th century with a brick front elevation and timber-framed rear. Despite their various alterations, it was rare to find complete groups of early 17th century farm buildings in which the house, barn and stable survived from the same period, and in this respect the complex was of considerable historic interest. Conversion work had begun prior to inspection and no fittings or fixtures relevant to the buildings' previous functions survived. [Au(abr)]

*Work undertaken by:* Suffolk County Council Archaeological Service

The tithe map of 1839 shows the present house, which dated from the 17th century, and a single outbuilding on the site of the small complex of farm buildings. The existing farm buildings included a narrow shed and a small two-bay barn of the mid-19th century, the former possibly representing the outbuilding shown in 1839. The shed was heavily altered in the 20th century when a milking parlour was inserted at its southern end and the rest was enlarged to form a stable. A small cattle yard with the remains of a 20th century shelter lay to the north. The barn was largely intact and was of some historic interest as it retained substantial areas of original wattle and daub and evidence of an unusual layout with only a single external entrance. The buildings are shown on the Ordnance Survey of 1903, and probably formed middle 19th century cart-lodges or animal shelters. The structures underwent considerable alteration in c.1996 when they were converted into a workshop, car port and office, and their original form was no longer apparent. The conversion was understood to have been undertaken by a previous owner, but was left unfinished. The nearby barn was later a private house in separate ownership. Given the extent of the buildings' alterations it was determined that insufficient historic fabric remained to merit recording. [Au(abr)]

*Work undertaken by:* Suffolk County Council Archaeological Service

Church Farm formed a modest tenanted holding of 54 acres in 1840. The three historic buildings formed an unusually complete farmyard, which has altered little since the early 19th century, but the adjacent farmhouse was demolished in c.1960 and was replaced by a bungalow. A three-bay timber-framed barn of c.1600 was adjoined by a rare early 17th century stable and hay loft which may represent the smallest example of its period in the county. A detached timber-framed neathouse (cow shed) to the south of the site dated from the 18th century and was unusual in that it too possessed a hay loft. The most impressive of the three buildings was a mid-17th century bake house which retained a complete 18th and early 19th century interior with no fewer than three coppers, an oven, boarded pump and stone sink. The structure was originally timber-framed with a fine brick gable and integral chimney which still survived, but its external walls were later rebuilt in brick. Bake houses of

this kind were once common in East Anglia but are now rare in anything approaching original condition. Both the barn and bake house merited listing at grade II. [Au(abr)]

Alston, L Ipswich : Suffolk County Council Archaeological Service, 2008, 16pp, colour pls, figs, CD

*Work undertaken by:* Suffolk County Council Archaeological Service

Poplar Farm adjoined a medieval green and probably occupied a medieval site as its unlisted farmhouse contained part of a substantial 16th century timber frame. The outline of the farm buildings had changed very little since the Ordnance Survey of 1884, with a series of animal yards flanked by a barn and several sheds, but the northern half of the complex had already been converted for domestic use and precise analysis was hampered. The unlisted three-bay timber-framed barn was a good example of its type, dating from the early 18th century but consisting largely of re-used timbers. It retained much of its original clasped-purlin roof structure and several panels of wattle and daub. A narrow porch with an unusually wide and low door was added to the rear elevation later in the 18th century, along with a pair of lean-to sheds. A separate clay lump shed was added in the mid-19th century. Although of considerable historic interest the farm buildings were not of sufficient age or sufficiently well preserved to merit listing. ***Decoy Farm, Old Church Road, Melton, Suffolk***

Alston, L Ipswich : Suffolk County Council Archaeological Service, 2008, 18pp, colour pls, figs, refs

*Work undertaken by:* Leigh Alston Architectural Historian

Decoy farmhouse was a grade II Listed building which lay to the north-west of its farm yard, and contained a 17th century timber framed rear wing behind its early 19th century front (western) range (Schedule of Listed Buildings). The only other historic building nearby was the early 18th century mill house at the former site of Melton Mill some 50m north-east of the church. The lack of any rectory or manor house in the immediate vicinity of the medieval church was unusual, and suggested other buildings may have been lost. The former stable at Decoy Farm was the only historic farm building within the proposed development area to survive in its original form, and even this had been much altered. The farm complex was designed a single build 'model farm' with a horse yard to the west of a central barn and a cattle yard to the east, and was of considerable historic interest until its recent partial demolition and piecemeal conversion. With the exception of the northern shed, which appeared to survive largely intact but was in separate ownership, the various buildings had been extensively altered and their historic integrity lost. Only the southern stable retained its original façade, but even this had been stripped of its roof covering, ceiling and all internal fixtures and fittings. [Au(adp)]

Alston, L Ipswich : Suffolk County Council Archaeological Service, 2008, 19pp, colour pls, figs, index, CD

*Work undertaken by:* Suffolk County Council Archaeological Service

The Willows was a substantial timber-framed listed farmhouse of the late 16th or early 17th century with a 19th century façade on the north-western edge of All Saints Common. The contemporary Grade II Listed timber-framed and weather boarded barn that formed the subject of this report lay immediately south-east of the house but was in separate ownership. The barn was typical of its period and region, with two bays of equal length flanking a narrow central bay which contained evidence of an original south-eastern entrance door. The oak framing remained largely intact, along with a roof structure of double butt-purlins and wind braces, although the studs of the north-western gable were entirely removed when the barn was extended in the 19th century. Fragments of original wattle and daub infill and external render still survived, but most was replaced by tarred weatherboarding in the 19th century and any evidence of the rear door was lost when a new full height doorway was inserted at the same time. The early structure was of modest proportions. The steeply pitched roof was designed for thatch but was covered with galvanised corrugated iron. A good red brick stable with a hayloft and arched mock-Gothic fenestration was built against the south-eastern gable in the early 19th century, and an apparent cattle yard with open-sided shelters added to the south-west, but conversion work was well underway at the time of inspection and few agricultural fixtures or fittings remained. Gill, D Ipswich : Suffolk County Council Archaeological Service, Report: 2008/193 2008, 22pp, colour pls, figs, refs

*Work undertaken by:* Suffolk County Council Archaeological Service

A survey to record the round tower of All Saints church, Mettingham was undertaken as part of project to repair and stabilise the structure. The survey results suggested that the original nave, tower and belfry were constructed in three closely spaced phases in the period between the Norman conquest and c. 1200. The church continued to be developed and enlarged throughout the 14th-16th centuries to arrive at its present form. The fitting of the present bell-frame in the late medieval period required the opening up of the top of the tower to lower the bell frame in before rebuilding the belfry around it. Dendrochronological analysis was to be undertaken to confirm the date of this event. [Au(abr)]

Collins, T, Lamprey, C, Prosser, L & Unger, S Hertford : Archaeological Solutions, Report: 3030 2008, 43pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

The buildings comprised a four bay timber framed barn with brick outbuildings forming an enclosed courtyard. The use of wide course braces, jowled principles and jogged butt purlins in the roof suggested a 17th century date. The wall panels utilised primary bracing usually found dating from the 18th century onwards. This suggested a date for construction in the latter half of the 17th century and was probably contemporary with the Elms farmhouse. 18th century underpinning had occurred, and the early 19th century saw existing out buildings constructed, two outshuts were of a similar date. Minor alterations occurred in the 20th century with the insertion of steel framed windows in the outbuildings and replacement of original roofing. [Au(abr)]

*Work undertaken by:* Suffolk County Council Archaeological Service

The farmhouse was a Grade II Listed timber-framed structure dating in part from the mid-16th century and in part from the early 17th century. The timber-framed barn was probably contemporary with the later part of the house, and was a typical example of its period, with three bays and a central entrance in its eastern elevation. The walls were originally rendered externally, but were later weatherboarded, and its roof was a low-pitched replacement of the 20th century covered with corrugated asbestos. The original barn would have been steeply pitched for thatch like that of the farmhouse. A 19th century lean-to shed with 20th century alterations extended the length of the rear, western elevation, and a small 19th century brick

stable and hayloft adjoined the southern gable. No historic fixtures or fittings survived in the brick stable, but an 18th century timber-framed stable and hayloft which lay between the barn and farmhouse retained an unusually low hay rack and manger. As a late Elizabethan or Jacobean structure the barn was of considerable historic interest, particularly as it illustrated the layout of the farm in conjunction with a contemporary house, but it was not sufficiently complete to merit separate listing in its own right. Alston, L Ipswich : Suffolk County Council Archaeological Service, 2008, 19pp, colour pls, figs, CD

*Work undertaken by:* Suffolk County Council Archaeological Service

The brick and pantiled barn at Glebe Farm was built in c. 1830 and was probably contemporary with the adjacent Grade II Listed rectory (now 'The Grange') to which it originally belonged. The building contained a three-bay barn to the south and a shed and loft to the north which was too narrow to operate as a stable, and was more likely to have served as a vehicle shed. The barn possessed a central porch to the west and a wide, low door to the east which faced the entrance to the site. Parts of the brickwork survived from an earlier structure and were probably of late-17th century origin. The distinctive outline of the building was created by a number of later extensions, shown on the tithe map of 1845, and the structure had remained largely unaltered since this date. The church was not mentioned in Domesday, when the area was probably served by St. Mary's church (in neighbouring Willingham parish), but the existing fabric dated from c. 1300 and a rectory was likely to have occupied the site of the barn since its construction. The tithe map shows no other buildings in the vicinity, but a nearby medieval settlement may have been abandoned. [Au(abr)]

Corrigan, A Bar Hill : Oxford Archaeology East, Report: 1051 2008, 107pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology East

A building recording was undertaken, a previous survey was conducted on the house itself, a grade 2 listed manor house, that gradually fell into the status of a working farm. There was 10 surviving buildings that were associated with the original house. Adjacent to the north of the house was a courtyard enclosed by a service wing and a row of buildings consisting of a brew bake house (later converted to a cottage) a coach house and a stable. The cottage contained structural elements that predated the manor house. The stable contained many original fittings and fixtures. A second courtyard north of these buildings was enclosed by a grade 2 listed threshing barn and a structure containing both cow sheds and a granary building. There

was a further farm building to the east of these and finally a Grade II Listed dovecote that retained its original features. [Au(adp)]

#### **DAGENHAM BOROUGH CONTROL UNDERGROUND BUNKER**

*Dagenham Borough Control Underground Bunker. London Borough of Barking and Dagenham. A Historic Building Record*

Capon, L Twickenham : AOC Archaeology Group, Report: 30088 2008, 33pp, colour pls, figs, tabs, refs

*Work undertaken by:* AOC Archaeology Group

The bunker at the Civic Centre in Dagenham was a good example of local defence measures undertaken in the early 1950s, when emergency planning was devolved to borough level. The poor condition of the furnishings and the presence of wet rot were rapidly diminishing the value of the building. The surviving evidence appeared to show facilities typical of those around other county controls. The main room of the bunker was the control room, where officials would coordinate their activities in response to information supplied from the message room. The control room would have had its own external telephone lines, as well as contacts to the message room and messengers rooms. The "County Message Switch" [CMX] in the message room contained a layout of telecommunication similar to that displayed in the Home Office 1989 handbook. The bunker was designed to contain all useful items in the event of nuclear attack. Beyond the essentials of the control room, the plant room provided emergency power, ventilation and filtration. The facilities for basic human needs were also present, comprising a kitchen, dormitories and lavatories for men and women. The condition of the shelter varied. The basic concrete structure was very solid, with walls over 0.62m thick. The weak points were the entrances, which allowed water in, which contributed to damp. The interior wall finishes were suffering wet rot, particularly partition walls, boarded surfaces over concrete and ceiling panels. Any wooden or rubber elements had an advanced state of mould. Maps and soft furnishings had degraded. [Au(abr)]

*Work undertaken by:* WA Heritage

Fourteen unlisted pre-1948 buildings were scheduled for demolition, and as a result recording was carried out. The central administration block was protected by a Grade II Listing, and was

beyond the scope of this report. The structures included ward blocks, nurse's homes, service blocks, medical staff residences and ancillary medical buildings. The Hospital was constructed in a form and layout typical of its date and construction between 1898 and 1900, and opened in 1900 as the Central London Sick Asylum for the treatment of London's sick and poor. By WWII the hospital was treating people with TB as well as casualties of air raids. [Au(abr)]

The site was originally a ferry crossing on the River Lea. The building of a timber bridge, later replaced by an iron one, and the canalisation of the river caused the transformation of this traditional farming area into an industrial and commercial site. The existence of a canal dock within the site determined the distribution of the different houses and industrial buildings around it throughout its history. [Au(adp)]

*Work undertaken by:* Museum of London Archaeology Service

The survey determined that the barn had been constructed in three broad phases. Phase 1 was the four-bay barn with a projecting wagon entrance, constructed in the 17th or early 18th century. Phase 2 was the southern extension with catslide roof, constructed shortly after Phase 1 and providing additional storage space and allowing for the rearrangement of the internal spaces. Phase 3 was constructed in the late-19th century, and allowed for the storage of machinery and vehicles associated with the increased mechanisation of farming. The building had undergone a number of changes to its external appearance, with the removal of brick cladding and nogging to the external walls, the renewal of timber weatherboarding and the removal of the thatched roof covering and its replacement with pantiles. *Work undertaken by:* English Heritage

Manor Farm was built in 1505-6 as a manorial home farm of King's College, Cambridge. It was one element of a multi-period site, comprising a motte and bailey of early Norman date, within which a small, non-conventional Benedictine priory was established in the later 12th century. Manor Farm functioned primarily as a manorial farm court and secondarily as a working farmhouse. The building had a ground floor of brick and close-studded timber farming above. It's L-plan comprised a three-bay hall range with a coeval of two-bay cross wing. The site was of significance as an early and little altered example of a fully-floored hall house with an integral stack. It was also a rare example of a documented, early 16th century court hall. Alterations and additions undertaken from the 16th century onwards related largely to reconfigurations of service functions and circulation within the house. [Sec(adp)]

*Work undertaken by:* Northamptonshire Archaeology

Salopian House was a small, early 19th century cottage, once one of a semi-detached pair reputedly built in 1807, which had been successively enlarged on mainly the ground floor but also the first floor in the 19th and 20th centuries. Few original features survived and only a few from any date during the late-19th century. Numerous alterations inside had left clear evidence in the fabric, particularly related to the renewal of decorative schemes and the upgrading of the property. [Au(abr)]

The buildings were statutorily Listed Grade II as being of special architectural or historic interest, the buildings were to be altered, and ancillary buildings to their rear were to be demolished, in connection with construction of a railway viaduct. The buildings, situated on the south side of Park Street, were documented as constructed in 1831 (Henry Rose, architect), probably with small yards at the rear, replacing previous buildings on the same street frontage. The 1831 buildings were originally in the form of a terrace of seven houses, built of brick, three storeys high with a basement, and slated pitched roofs. They were on land that formed part of the endowment of a local charity, Cure's College or Cure's Almshouses, and were built to let in order to provide an income for the charity's benefit. A gap between Nos. 11 and 13 gave access to the almshouses, which were formerly situated to the south-east. The houses were originally probably intended to function as commercial premises, with shop fronts on the ground floor and living quarters on the upper floors; at least one additional cellar was constructed behind No. 5, which also had a fourth storey constructed in its roof space. The yards behind were partially infilled with small one or two-storey brick buildings. In 1862-3 the almshouses were demolished and a railway viaduct was built at a distance of about 2m from the rear wall of the back yards of the houses. Some of the space between this wall and the viaduct, and the arched spaces under the viaduct, subsequently came to be used by the occupants of the houses. The basement and ground floor of the buildings were used generally by fruit and vegetable traders in Borough Market, to the north-east of Park Street, and at least one was a public house. Most recently the buildings were food shops and a café. The upper floors housed offices or living accommodation. The buildings were vacated in the summer of 2008 and the ancillary buildings to their rear demolished later in 2008–2009. [Au(abr)]

The assessment recorded the standing structure of the site, built in 1899 onwards in order to generate electricity. The oldest structural remains were the western parts of the original turbine hall and a partly underground boiler house adjoining to the south. These were extended to the east between 1903 and 1913, but a much larger power station was being built at Stepney which saw the Osborn Road site converted to a substation for the local distribution

of electricity. The site stopped generating in 1918, and was damaged by bombs in the Second World War. This was repaired by 1954, and the building continued in use as a power station and vehicle yard after this. [Au(adp)]

A detailed record of the condition on the Listed Buildings on the site was carried out prior to their refurbishment. For the two gymnasias to be demolished, this provided a permanent record. Although the buildings on the site differed from other Listed Buildings in the area in that they were of a younger age, they were of interest because they had not been altered from their original state and many of the original design and architectural aspects survived intact. While the outer elements of the buildings had shown significant signs of age and refurbishment was timely, the interiors of the buildings had generally survived the passage of time and translated well into a modern school context. Adams, J, Annis, R & Claydon, M Durham : University of Durham, Archaeological Services, Report: 1822 2008, 44pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Durham, Archaeological Services

There were eight Listed Buildings with dates ranging from the 11th to the 19th century, and one Scheduled Ancient Monument to the east of the survey area. The site did not lay within a Conservation Area. There were a number of cropmarks identified from aerial photographs in the area around the site. Most of these were of undetermined date, and two may have been Iron Age. Roman evidence in the area was scant, though Roman coins had been found at Hallgarth to the east of the study area. The area was occupied during the medieval and post-medieval periods, when the study area was probably in use as agricultural land. Broomside House was first recorded in the period 1844-50. The farmhouse and buildings were characteristic of their period. None of the structures were of any particular significance, the older buildings had been altered or removed, as changes in farming practice dictated. As a group, the Broomside House was a typical and unexceptional example of a 19th century County Durham farmstead. [Au(abr)]

Hardie, C and Middleton, P Durham : Archaeo-Environment Ltd., Report: Rpt No. 0036-1/08 2008, Spiral bound A4 report, 42 pages of text plus illustrations all bound in a single volume. Document also saved on disk as a word document and PDF

*Work undertaken by:* Archaeo-Environment Ltd.

"In February 1940, plans were drawn up to build four air raid shelters for the young children attending the village school in Easington., County Durham. The area was targeted by the Germans in order to destroy the coal industry and the wealth of engineering and manufacturing sites, as well as ports and harbours, along the East Coast. Some 67 years later, in 2007, Easington CE Primary School, now located in a new building within the grounds of the old village school, sought permission to demolish two of their four air raid shelters in order to create more car parking space. The shelters had been capped and buried since the end of the war in 1945. A planning condition was imposed requiring that the shelters be recorded before being demolished and that an outreach programme take place with the school children. Archaeo-Environment was commissioned to carry out this work which was divided into three parts: survey, outreach and watching brief." [OASIS]

### **'THE HIND'S COTTAGE', BROADWOOD, FROSTERLEY**

*Report on an Archaeological Building Recording Project of 'The Hind's Cottage', Broadwood, Frosterley, Co. Durham*

Wooler, F Alston : North Pennines Archaeology Ltd., Report: CP/830/08 2008, 48pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

An archaeological building recording was undertaken of a redundant property known as 'The Hind's Cottage' and adjoining byre. The redundant buildings were attached to the grade II Listed property, Broadwood, one of several farms in the valley created in the 12th century when land was being enclosed from waste. A map of 1610 suggested that there may have been an important house at Broadwood at that date, but this was not repeated on later mapping, and it was not until the middle of the 19th century that the form of the buildings, which appeared to include the 'Hind's Cottage' and the byre, were accurately shown. The building recording revealed that the 'Hind's Cottage' was an example of a two-storey, single-pile cottage, more latterly used by farm servant's or 'hinds', with a single-storey extension to the north housing a semi-circular bread oven. The byre displayed some evidence of being the earlier of the two structures, and may have been an example of a bastle-derivative house. There was also evidence that the byre, or at least the first floor of the byre, had been used as living accommodation. The 'Hind's Cottage' and the adjoining byre were examples of vernacular structures which may predate the other buildings on the site, but were utilised to form the northern range of the present farmstead. There was no evidence for the modernisation of the cottage, despite it being occupied until the middle of the 20th century. [Au(abr)]

Carey, C Gateshead : Archaeological Research Services, Report: 2008/28 2008, 42pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Research Services

Historic mapping showed that the Moor House and the associated barn which was the present workshop were constructed in 1858 but no earlier maps were found during the investigation that showed the buildings in detail and an exact date for construction could not be assigned. The breaking of the ground for Towneley Main Colliery occurred in 1847 and it was possible that the house and barn were built around this time. Hedgefield House to the east of the study area was constructed in 1840 and was similar in style to Moor House. Bradley Hall in Crawcrook to the west was also of similar style and was constructed in 1750, suggesting that Moor House could have been built as early as the mid-18th century. [Au(abr)]

**ST. HILDA'S CHURCH, HEDGEFIELD, RYTON, GATESHEAD*****Archaeological Building Recording of St. Hilda's Church, Hedgefield, Ryton, Gateshead, Tyne and Wear***

Peters, C &amp; Wooler, F Alston : North Pennines Archaeology Ltd., 2008, 75pp, colour pls, figs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

The building recording found that St. Hilda's was a nice example of a late 19th century church built in the Arts and Crafts style. Externally, the church contained elements of the style of architecture such as mock battlements, arrow slits and Gothic windows as well as the unusual feature of random patches of red sandstone amongst the dominant yellow masonry. Internally, the chancel was originally the main focus of the building, decorated in vivid reds and greens, some of which still survived on the woodwork. Illustrated canvases on the ceiling of the chancel were removed in the 1950s although their design could still be seen. [Au(abr)]

Carlton, R J Newcastle upon Tyne : The Archaeological Practice Ltd., 2008, 37pp, pls, colour pls, figs, refs

*Work undertaken by:* The Archaeological Practice Ltd.

The site of the Benwell Waterworks appeared to have remained undeveloped until the mid-19th century when the waterworks was constructed by the Whittle and Dean Water company. Although it had been undeveloped there was no direct evidence for previous human activity on the site, apart from the post-medieval parking, despite the close proximity of Conderdum vicus and the early medieval village. The existing pumping stations were recorded. [Au(abr)]

The Sanderson Hospital operated in various guises for over a hundred years on the Alter's Road site. Originally, it was established as a home for destitute and crippled children. From the earlier period, the survey showed that a phased extension of buildings on the site was intended. The first phase occurred immediately before the Great War with subsequent additions during the 1920s and 1930s. [Au(abr)]

Ian Farmer Associates Newcastle upon Tyne : Ian Farmer Associates, 2008, 46pp, colour pls, figs, tabs, refs

*Work undertaken by:* Ian Farmer Associates

An assessment found little evidence for the Hall's age and history beyond being clearly shown on an estate plan in 1841. The survey showed that while the primary building was intended to be two storeys high, the southern façade possibly started out as part of an outhouse that had been progressively extended. Although stable like in appearance, little evidence survived as to the original function of the internally heavily remodelled kitchen block. [Au(abr)]

The Jones Marine Building occupied part of the site of the Leazes Brewery established in 1837 in the premises previously used as the water powered Snuff Mill, built c. 1782. The earliest structural remains within the Jones Marine Building were two parallel brick built ranges, built after 1782 but before 1831, which formed part of the later use of the snuff manufactory. It was possible that one, if not both, were part of a rebuilding after a fire at the Snuff Mill in 1788. [Au(abr)]

***An Archaeological Building Recording of Fulwell Lime Kilns, Mill Garages, Sunderland***

Carey, C Gateshead : Archaeological Research Services, Report: 2008/71 2008, 39pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Research Services

The works were carried out prior to the proposed demolition of a modern building which was constructed against the lime kilns in the 1950s. The kilns were constructed in phases during the 18th and 19th centuries in order to process minerals from the adjacent limestone quarry. These were constructed from coarse limestone rubble with rubble and brick dressings. Three kilns were situated within the showroom, making up the south-west wall. The removal of the modern building would be beneficial to the historic kiln structure, as it would expose those areas presently hidden and would improve the overall setting of the monument. *Work undertaken by:* North Pennines Archaeology Ltd

"This watching brief took place during the installation of services across the parade ground at the Heugh Gun Battery. The work recorded a number of foundations of former buildings within the parade ground, although the service trenches were generally shallow in depth and narrow in width provided a limited window of examination. A programme of building recording also took place during the refurbishment of a number of the standing structures at the Heugh Gun Battery (HER 0698). The Barrack Block (HER 6789), Magazine (HER 6784) and Observation Post (HER 6786) were the principal features studied. The records for the work

include a written description and photographic recording. The report for the work provides and interpretative account of each structure within the context of the battery." [OASIS]

*Work undertaken by:* Peter F Ryder

Building Recording was undertaken on of a series of 18th and 19th century farm buildings grouped around a foldyard, and attached to Newton Greens farmhouse. The farmhouse was the subject of a standing building assessment in April 2008. This assessment dealt with the associated group of traditional farm buildings to the north and west of the house. The earliest part was a barn dated 1744 incorporated in the West Range, most parts were late-18th or early 19th century and included a piggery/henhouse and Cart Shed. [Au(adp)]

**THE BOTHY, NUNNYKIRK HALL, NETHERWITTON**

***Report on an Archaeological Building Recording Project at The Bothy, Nunnykirk Hall, Netherwitton, Northumberland***

Wooler, F Alston : North Pennines Archaeology Ltd., Report: CP/847/08 2008, 49pp, colour pls, figs, tabs, refs  
*Work undertaken by:* North Pennines Archaeology Ltd.

An archaeological building recording project was undertaken of The Bothy, Nunnykirk Hall, Netherwitton, prior to the demolition of the south wall to allow for the erection of a new classroom block, and the refurbishment of the building. The Bothy was a Listed Building sited within the historic curtilage of Nunnykirk Hall, itself a Grade I Listed Building. A rapid desk-based assessment was undertaken to place the property and site of Nunnykirk Hall into its historical context. The rapid desk-based assessment revealed that there was some evidence for early medieval use of the site at Nunnykirk Hall from the discovery of an 8th/9th century cross shaft built into a cottage wall, although the original provenance is not known. Documentary sources suggested that there was an ecclesiastical site at Nunnykirk during the medieval period, hence its name, although nothing remains of such a site. A "tower" was mentioned in documents from the 17th century, although there was also no evidence for this on the site. The later hall was constructed in the 1820s by leading architect John Dobson for William Orde, and was a remodelling of an earlier manor house. Gardens were known to have surrounded this earlier house, however, the present landscape around Nunnykirk Hall was believed to be a rare example of Dobson's work. Cartographic sources did not show a building on the site of The Bothy until the 1860s when it was much longer and was shown to have had glasshouses against the south elevation. The building recording project revealed that The Bothy is a masonry built structure, with the unusual feature of having a brick-built south elevation, possibly constructed in the middle of the 19th century. The brick wall may have had a practical function in allowing for the retention and radiation of heat for glasshouses located against it. Further evidence for the possible presence of a heating system to provide warmth for vulnerable plants in the glasshouses was observed in the form of a possible "coal hole" in the north elevation, blackening of some stone and brickwork in the south-west internal corner of the building, and the presence of a chimney on the south elevation. Surviving low stone walls, or footings, and holes at the top of the south elevation, provided evidence for a building against the south elevation of The Bothy. The remains of walls and cartographic evidence indicated that further building or buildings originally extended from the west elevation and glasshouses occupied the south-side of these buildings up until at least the 1920s. Parker, J South Shields : Tyne & Wears Museum Archaeology Department, Report: 846 2008, 34pp, colour pls, figs, tabs, refs

*Work undertaken by:* Tyne & Wears Museum Archaeology Department

Building recording was carried out on a cluster of post-medieval farm buildings, prior to their conversion for residential use. The buildings formed a quadrangle around a central courtyard and were constructed from roughly hewn and roughly coursed sandstone. The north, east and half of the west range had been constructed by the time of the 1841 Tithe map, with the remainder of the west range and the south range built by 1856. The southern half of the courtyard had been covered by 1898, with the rest following by 1919. At some point, the southern range was converted into stables and the roofs removed from the courtyard. No further work was recommended. [Au(adp)]

*Work undertaken by:* Tyne & Wears Museum Archaeology Department

The Pier Road Maltings had been designated a Grade II Listed Building earlier in the year, as it represented a rare surviving example of a mid-19th century maltings. It contained well-preserved features of the maltings process. The individual building parts were distinctive in their character and appearance, and retained significant interior detail associated with their functions within the malting and other industrial processes. The exterior of the building demonstrated a complex functional and architectural history. Nine phases of activity were recorded by desk-based study, seven of which could be associated with the building itself. [Au(adp)]

Carey, C Gateshead : Archaeological Research Services, Report: 2008/63 2008, 26pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Research Services

The suite of buildings on the site comprised a main building with a car port/open barn constructed on the east end of the north-west elevation, and an open cattle court on the west end of the south-east elevation. A small barn was also recorded, and was scheduled for demolition. The main building was shown on mapping as early as 1842 and it was possible that it was associated with stables or a coach house, given the wide nature of the arched entranceways that existed in the south-east elevation. The small open barn was constructed between 1860 and 1897 and the car port/open barn between 1920 and 1960. There were few internal features of archaeological significance, apart from some examples of graffiti in the south wall of the Loft Area. [Au(adp)]

Ridings, C Lancaster : Oxford Archaeology North, Report: L9980 2008, 64pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology North

A building investigation of a townhouse was undertaken prior to its potential demolition. Historical research in conjunction with an addendum to a desk-based assessment revealed that the house was built in the late-18th century and not c. 1830, as had originally been assumed. The empty plot was purchased by a carpenter John Edleston the Elder, who built the existing townhouse, which he and his son [also John Edleston] would occupy till the early 19th century. During the 19th century, the house was acquired by a local calico magnate called James Pearson, then a surgeon called James Pickup, before being sold and used as the superintendent's residence for the new County Police Station, which was built on the site of the demolished 51 King Street. The townhouse was a solitary reminder of what was once a very desirable residential area of Blackburn. Unfortunately, the only other structure of comparable age and status that still remained was 61 King Street, whilst the rest of the buildings comprised modern 20th century shops of assorted descriptions and a builder's merchants. The property appeared to be structurally sound from the exterior, but the interior was in a poor state of repair. The townhouse had been stripped of most of its internal features, but the decoration, which appeared to date to the early 19th century, was still retained. In most other aspects, the building appeared to be essentially the same as it was when it was first built in the late 18th century. [Au(abr)]

*The Barns, Tower Drive, Turton, Lancashire. An Archaeological Roof Timber Survey*

Gurney, R Mawdesley : Archaeological Excavation Services, Report: 0608 2008, 42pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Excavation Services

A building survey and recording was undertaken prior to renovation and remedial work on the roof timbers at The Barns. The building was a 17th century Grade II Listed, detached, later two-storey, stone built barn. The building had undergone substantial renovation in the late 60s and early 1970s which had removed virtually all of the internal archaeological features and substantially altered areas of the external fabric. The roof structure and timbers, although repaired at this time, were however retained and were the focus of this recording programme. The timbers had retained evidence of the original carpenters marks and proved suitable for dendrochronological sampling, the result of which appeared to concur with the date-stone bearing the initials "I.C." and the date "1697". Although the stone may have belonged to the barn, it was not in its original location. [Au(abr)]

*Work undertaken by:* J. M. Trippier

An archaeological building survey was undertaken of a barn at Top o'th Quarlton Farm, off Ramsbottom Road, Hawkshaw, Bury. The buildings were found to be a Lancashire style combination barn with an adjoining cow house, latterly converted into a shelter shed, and both were constructed of coursed sandstone rubble probably during the late 18th century. They were situated in an isolated rural location which was still redolent of the pre-industrial period and were an interesting illustration of the effects of the agricultural revolution of the 18th century on the design of agricultural buildings. Ambrey, C & Johnson, P G Barnard Castle : Northern Archaeological Associates, Report: 08/75 2008, 58pp, colour pls, figs, tabs, refs

*Work undertaken by:* Northern Archaeological Associates

Saighton Camp was originally built as a militia camp in 1939 to provide for the basic training of volunteer and conscripted soldiers during the Second World War, and subsequently anti-aircraft crews. The camp had a number of roles after the war. A range of military buildings were recorded within the camp, including H-plan huts, "spider" block barrack buildings, kitchen/refectory buildings, an infirmary complex, stores and numerous rectangular huts and buildings. Due to the temporary nature of the buildings, they were not classed as of regional or national importance and were in poor repair. It was considered that the survey had produced a sufficient record of the surviving standing buildings. [Au(adp)]

University of Manchester Archaeological Unit Manchester : University of Manchester Archaeological Unit, 2009, 1p

*Work undertaken by:* University of Manchester Archaeological Unit

Yew Tree Farm was a brick-built, double depth, central staircased, three storey property with a single storey range to the north. The property dated from the 18th century and had a number of original features surviving such as doors and parts of the staircase. North of the farmhouse was the one and two storey brick-built L-shaped main range, which dated from the 19th and 20th centuries. South-west of the farmhouse lay a set of rambling mid-20th century Dutch barns and covered yards. [Sec]

Woole, F Alston : North Pennines Archaeology Ltd., Report: CP/801/08 2008, 88pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

A level 3 building recording was undertaken on a redundant farmhouse and farm buildings at Whitrigg Hall. A rapid desk-based assessment was undertaken prior to the building recording project, and this revealed that there appeared to have been a property on the site since at least the early 19th century, as buildings were shown in the approximate location of Whitrigg Hall on the Enclosure map of 1811. There may have been a property at Whitrigg Hall as early as the 1770s, as the hamlet of Whitrigg was shown to have had three properties on a map of 1774, although this could not be confirmed. The building recording project revealed that the farmhouse was an example of a double-pile house, i.e. two rooms deep, with a single-pile extension to the east. The house had a date stone of 1708, however the present property is likely to be later in date, possibly early 19th century. The farm buildings, which adjoined the house, may have been contemporary with the double-pile house, constructed to provide accommodation for a small number of cows, for the storage of hay and a cart shed. The main range of farm buildings contained evidence for having been used primarily for the housing of cattle and the storage of hay, with extensive lofts and accommodation for animals. There was a small threshing barn, but unlike many farmsteads, it was not the dominant structure. The survival of a section of wooden floor boarding in the barn is an interesting feature. This may have been used for the hand flail threshing of crops, to provide a springy surface. The presence of a tall doorway in the threshing barn was also an interesting feature as they clearly related to the large double doorways, and therefore may have been utilised in the winnowing process. Barns B and C appeared to have been constructed towards the end of the 19th century, replacing earlier single storey structures. Whitrigg Hall was an interesting farmstead with well-built farm buildings displaying a hint of architectural detail. [Au(abr)]

Martin, G Carlisle : Gerry Martin Associates Ltd., Report: 45 2008, 19pp, colour pls, figs, refs

*Work undertaken by:* Gerry Martin Associates Ltd.

The archaeological building survey at Henna Hall strongly suggested the buildings under review were generally no earlier than the late-18th century and were most probably of 19th century date, demonstrating agricultural practice and the development of farming during that century. Due to the inaccessibility of the site and the high level of adaptations and alteration,

the buildings, perse, had little merit and produced no substantive diagnostic evidence other than material for low-level interpretation. [Au(abr)]

Elsworth, D Ulverston : Greenlane Archaeology Ltd, 2008, 34pp, colour pls, figs, refs

*Work undertaken by:* Greenlane Archaeology Ltd

The building recording revealed four phases of development and alteration within the range of buildings. The earliest element of the site cannot have been constructed until some time between 1850 and 1889, the earliest forming an unusual tower-like building of two storeys. This was subsequently extended with a building that was probably used to house animals in some form, perhaps most likely as a stable. Curiously, the whole structure was then reorganised and largely rebuilt in brick, with a new internal division. [Au(abr)]

Ryder, P Riding Mill : Peter F Ryder, 2008, 9pp, colour pls, figs, refs

*Work undertaken by:* Peter F Ryder

A survey noted that the barn had four cruck trusses. The upper sections were clearly re-used. The plaster of the internal faces of the barn, much of which remained in the two eastern bypass, bore various scratched and scribed patterns, some of which could be identified as atropaic markings, thought to have been made as a means of invoking protection against evil spirits. The earliest timber felled was from 1527. Virtually all of the timbers of the barn showed re-use. [Au(adp)]

The excavations in the north tower revealed the remains of three stone drain courses, and provided evidence of the flushing of the garderobe. The drains contained dark silty deposits and were likely to have been covered by the post-medieval period. The observation also concluded that the tower dated to the early 16th century, which was earlier than the date on a date stone on the tower. [Au(adp)]

Clarke, S Ulverston : Greenlane Archaeology Ltd, 2008, 26pp, colour pls, figs, tabs, refs

*Work undertaken by:* Greenlane Archaeology Ltd

Following a planning application for the demolition of buildings at 18-22 Woolpack Yard, a programme of archaeological investigation was undertaken. The work comprised a desk-based assessment followed by a Level 2 recording of the standing buildings to be affected. While few early records pertaining to these buildings could be found, map regression illustrated that cottages were present on the site from at least as early as 1787, when Todd's map of Kendal was produced. The recording revealed that despite their poor condition much of the original arrangement of the buildings could still be ascertained, although the majority of the original features had been removed. At some time, probably fairly recently, doorways were knocked through the partition walls of the cottages and the building converted into a hostel or Bed and Breakfast accommodation. No. 20 and 22 were quite heavily modified with new rooms added and staircases removed and repositioned. The cottage at the west end, No. 18, retained most of its original features and offered a good opportunity to record the living arrangements and conditions of 18th century working class Kendal residents. Dawson, J Ulverston : Greenlane Archaeology Ltd, 2008, 36pp, colour pls, figs, tabs, refs

*Work undertaken by:* Greenlane Archaeology Ltd

A Level 2 recording of three standing buildings was carried out. The earliest buildings on the site were three cottages, two of which were knocked together to form Building 2. While few early records pertaining to these buildings could be found, a map regression illustrated that they were present at least as early as 1787 when Todd's map of Kendal was produced. The map regression also indicated that Building 1 was constructed between 1853 and 1859, once again other references to this building proved elusive. The building recording revealed that Building 1, which appeared to have been a coach house, had remained largely unchanged since its construction until basic modifications were made to allow it to function as a garage workshop, presumably in the latter half of the 20th century. Five broad phases of development and alteration were identified within the two cottages that formed Building 2. The conversion of the cottages into a pie factory only really affected the ground floor of these buildings and effectively preserved the upper two floors. The presence of original roof timbers and room layouts, including some of the lath and plaster partitions, offered an opportunity to record the living arrangements and conditions of late-18th century Kendal residents. This could have been furthered by the examination of Building 3, another cottage, but unfortunately its condition did not permit internal recording. [Au(abr)]

***Thompson Fold, Lupton, Cumbria. Archaeological Building Recording***

Elsworth, D & Clarke, S Ulverston : Greenlane Archaeology Ltd, 2008, 36pp, colour pls, figs, tabs, refs

*Work undertaken by:* Greenlane Archaeology Ltd

A programme of archaeological work comprising archaeological building recording of buildings affected by development was undertaken in February 2008. The farmhouse at Thompson Fold was Grade II Listed and the farm buildings were listed on the Cumbria Historic Environment Record as being of 18th century origin. A rapid desk-based assessment revealed that the earliest recorded reference to the site dated from 1690, at which time it was known as "Thompson's Houses". There were some documentary sources relating to the owners and occupiers during the 18th century, but a large collection of deeds relating to the sale of the property in 1864 provided considerable information over an almost 100 year long period. Later owners and occupiers were identifiable from various sources, while maps of the site, the earliest of which only dated to the mid-19th century, showed that the majority of the buildings had been constructed by the 1840s. The building recording revealed seven phases of development and alteration within the range of buildings, and the presence of two date stones coupled with the stylistic evidence of constructional details and the documentary evidence allowed a relatively detailed understanding of these to be established. The earliest part of the standing buildings was dated 1701, and was evidently constructed as a threshing barn in that year. This was soon extended to the north with the addition of a double shippon, and a further shippon was added to the north shortly after. An additional threshing barn was added after this, which is dated 1835, and smaller outshuts were subsequently added to the north and south-west. At a later date, probably in the early 20th century, a granary was added to the first floor at the south end, accessed by a flight of steps. The buildings formed an interesting group of interlinked structures, not least because of the relative abundance of date stones, but also the various types of truss, which were particular to different phases. It was an extremely good typological example of the gradual development of an agricultural building through various periods of use and the change in the relative importance of arable and dairy farming. **OASIS DATABASE: MOSS END FARM, MOSS END LANE, PRESTON PATRICK Moss End Farm, Milnthorpe, Cumbria: historic building recording project**

Sproat, D Edinburgh : AOC Archaeology Group, 2008, A4 bound paper report  
*Work undertaken by: AOC Archaeology Group*

"A programme of historic building recording was required as a condition of planning consent at the site of Moss End Farm near Milnthorpe, Cumbria by Time and Tide Homes. This consisted of a Level 3 survey to English Heritage guidelines. This work included a detailed photographic, written and drawn record of the buildings prior to their renovation. Moss End Farm is an 18th century farmstead associated with Moss End farmhouse opposite the range to the south. Originally part of a U-shaped farm, later 19th century barns were constructed enclosing the former courtyard and the range now consisted of the stone rubble buildings surrounded by modern steel sheds. The farm is known to date from at least the early 1770s and throughout the 19th century was owned largely by one family, the Parkers, who were renowned seed merchants. One of the earliest barns had been converted to a seed storage and dispatch area, with the pulley wheel mechanism still in place set within the timber roof trusses. This report provides a synthesis of the results of the on-site building recording which, together with the archive, will form a detailed record of this building prior to its renovation. No further historic building recording work is recommended." [OASIS]

St. Anne's Parish Hall comprised the original 1835 "Georgian" style single storey stone building with round arched windows and doorways with sandstone architraves. This building was first commissioned in 1833 and finally built in 1835. To the west of the original 1835 "Georgian National School" was a 1887 "Victorian" style single storey stone extension with annex to south, and cellar/basement to the west. In 1959, to the south of the foyer space, a single storey toilet extension was built. Since the closure of the school, the building had been used as a parish hall to St. Anne's Church, and comprised a main hall in the Georgian School, secondary hall in the Victorian extension, small meeting room and kitchen in the annex, and the toilet block. The only part of the building that was Listed was the 1835 Georgian National School which was Grade II Listed. The listing, dating from 1972, made no reference to the 1887 Victorian extension and annex. [Au(abr)]

Developing Planning Partnership Manchester : Developing Planning Partnership, Report: MB/KL/923907/R003m 2009, 38pp, pls, figs, refs

*Work undertaken by:* Developing Planning Partnership

20/22 Dale Street was built in 1895 as a textiles warehouse by JW Beaumont. The four storey building with two-storey attic over raised basement was eclectic Jacobean in style, constructed in red brick with red sandstone detailing and glazed-white bricks along the Little Lever Street elevation. The building fronted onto Lever Street with symmetrical 4-bay windows. The Dale Street elevation incorporated 8 regular bays, with the basement level windows currently exposed without glazing ban. The brickwork cladding was set in front of a steel frame structure which allowed the building to command the corner of Dale Street and

Lever Street. The main pedestrian entrance was located on this corner, with a distinctive roof turret and water tower. The main entrance to the property fronted the corner of the plot, incorporating a 3-bay open arcade set around banded arches on polished granite columns. The pattern and style of the architecture of the building was repeated more comprehensively along the north west facing elevation fronting Dale Street. 20/22 Dale Street was Grade II Listed in 1994. Aside from the defined architectural interest of the building, the listing description identified the group value the building had in association with the predominance of industrial and commercial warehousing found along Dale Street. Internally the interest of the building lay in its open plan form and range of supporting beams and metal columns. The building was severely damaged due to its proximity to a fire which destroyed neighbouring 25 Dale Street in April 2007. The majority of fire damage was concentrated to upper floors, with the rest of the building affected by subsequent water inundation. 20/22 Dale Street was clearly of importance (it is included in the statutory list of Buildings of Special Architectural or Historic Interest). It was however notable that it was identified for its group value, and the combined contribution it made together with a range of other buildings on Dale Street. It was unique in its architectural detailing and ornamentation. [Au(abr)]

Newell, M, Arrowsmith, P & Nevell, R Manchester : University of Manchester Archaeological Unit, 2008, 59pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Manchester Archaeological Unit

A building survey was undertaken on 51 Hilton Street (built between 1808 and 1819) prior to redevelopment. It was two storeys, in handmade brick in Flemish and English Garden Wall bond with a hipped roof and a rear octagonal brick chimney. Between 1831 and 1845 a machine manufactory building, 8 and 10 Brewer Street, was erected to the south-east of the works. Adjoining this on the north and to the rear of 51 Hilton Street was an engine house and boiler house range, built between 1848 and 1888 and possibly between 1869 and 1874. The power system served a factory which operated on the first and second floors of 51 Hilton Street and 8 and 10 Brewer Street and which in the 1870s was used by a cloth cap manufacturer and in the 1890s by a hat block manufacturer. ***Knoll Mill, Greenfield, Oldham: Historic Building Recording Report***

Waterman CPM Cirencester : Waterman CPM, Report: H3106\_02a 2008, 38pp, colour pls, refs

*Work undertaken by:* Waterman CPM

The examination and recording of the standing buildings at Knoll Mill demonstrated that the complex which developed as Wellington Mills between 1854 and the late-1990s comprised a number of phases of building. Mill 5 was a good late example of the mill building style common in the 1820s and 30s. The later 19th century improvements in design relating to efficiency and fire prevention were well evidenced in the construction of the Mill 5 extension, as well as the Bath stone offices and Mill 2 engine house. The design of the Mill 2 engine house and photographic evidence of the earlier Mill 1 engine house demonstrated the high status afforded to mills in Greater Manchester; in the early 20th century. Overall. The buildings at Knoll Mill comprised a good example of the development recorded at other mills across the Greater Manchester area. The mills were subject to a number of renovations and changes of use, particularly their conversion from cotton to woollen and worsted production. Combined with clearing of the mills after their closure, this has resulted in only a limited amount of the formerly numerous pieces of machinery surviving. An area of below ground potential was identified in the area to the south of Mill 2 relating to remains of the 'Old Mill' demolished in 1925 and the Mill 1 engine house. This area included the footprint of the existing engine house. However, the engine house had been internally stripped and remodelled. There was also limited potential for remains relating to the beam engine and boilers below ground. Archaeological monitoring of ground works in this area may be required. Some additional monitoring during stripping within the Mill 2 engine house may be appropriate. [Au]

**UNITY MILL, HEYWOOD**

***Unity Mill, Heywood. Historic Building Recording***

Mellor, I & Roberts, S Leeds : Scott Wilson, 2008, 92pp, colour pls, figs, tabs, refs

*Work undertaken by:* Scott Wilson

A building recording of Unity Mill, Heywood, was undertaken. Unity Mill was constructed in 1907, possibly as an integrated cotton-spinning and weaving mill, shortly before the decline of the Lancashire cotton industry. The mill comprised four buildings, including a shed (Building A), engine house (Building B), main mill building (Building C), and small north-light shed (Building D). The buildings were constructed in red brick, and ranged from one to four storeys. The mill closed in 1959 due to the Government's reorganisation of the cotton industry. Leeson took over the site in the following year. Latterly, the site was operated as

warehousing. Unity Mill formed a typical example of early 20th century mill architecture and retained a number of features which aided the understanding of how the mill functioned and the distribution of power across the site. However, the site had been subject to high levels of alteration in the mid and late-20th century, and as such, formed a much altered example of a common type of building. [Au(abr)]

***The Hare and Hounds 2-6 Rochdale Road, Middleton. An Archaeological Building Survey***

Trippier, J Bolton : J. M. Trippier, 2008, 27pp, colour pls, figs, tabs, refs  
*Work undertaken by:* J. M. Trippier

An archaeological building survey was required as a condition of conservation order consent for the redevelopment of "The Hare and Hounds". The building was a public house which was allegedly licensed as long ago as in 1744 but was latterly a J.W.Leey's house. Although it had been refaced in the early 20th century with a tiled frontage the building had been "soft stripped" at the time of survey. It was found to be a double-pile building constructed largely of handmade bricks and had largely hand cut roof timbers, which along with a massive centrally located fireplace all suggested a late-18th century date. As well as its documented early use as an inn there were windows and a taking-in door which also suggested an early textile use during the early days of the industrial revolution. [Au(abr)]

*Work undertaken by:* J. M. Trippier

The buildings were found to be a small stone built combination barn and cottage which were attached to the adjoining house to form a laithe house type farmstead which was typical of this moorland region. Whilst laithe-houses could date from 1650 to 1880 the peak of development was between 1780 and 1820 (Brunskill 1987, 110) and this farmstead fits well within this period as demonstrated by the watershot stonework and the cartographic evidence. Both the barn and the adjoining cottage contained a number of attractive hand-cut roof timbers which appeared to be largely in situ although it appeared that the barn roof had been raised at some point. **VICTORY WORKS, HEYWOOD**

**Victory Works, Heywood. Historic Building Recording**

Roberts, S Leeds : Scott Wilson, 2008, 78pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Scott Wilson

Historic building recording was undertaken of Victory Works, Heywood. A survey of the works, including annotated block plans, a photographic record and a comprehensive architectural and archaeological description of the buildings was undertaken, supplemented by documentary research. Due to a fire at the site in 2007, the buildings were in a dangerous structural condition. This limited access to the interior of the building. Victory Works was constructed in the 1850s, with rapid expansion of the site throughout the following decades. By the 1890s, the site displayed a plan form similar to that surviving today. At that time the site operated as an integrated spinning and weaving mill under the name "Rose Hill Mill". The mill complex consisted of seven main structures, including the main mill building, a weaving shed, engine house, infill building, warehouse, north light shed and warehouse and a terraced house. The buildings were constructed in local red brick, ranging from one to three storeys in height. The mill was vacant by 1937, and by the mid-20th century operated as two separate concerns. Victory Works, manufacturing paper rolls on the main part of the site, and a Cotton Waste Mill to the north-east. The site was vacant, following a fire at the site in 2007. Victory Works displayed an unusual plan form for a mid to late-19th century mill, reflecting its piecemeal development. Small in scale, it displayed little technological innovation, nor architectural decoration. As such, it was a modest, if slightly unusual, example of a mill building of this date in this area. [Au(abr)]

Nevell, M Manchester : University of Manchester Archaeological Unit, 2008, 20pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Manchester Archaeological Unit

Briar Cottage was a two storey brick structure, rendered, with a slate roof. The ground floor had six room spaces including the hallway, and the upper storey had five room spaces including the landing. The southern elevation formed the main façade. This was rendered and contained two bays, on the ground floor a projecting rectangular three-light casement window at the western end, and at the eastern end a two storey bay window with five lights in the ground floor bay. The upper storey followed a similar pattern although the western casement window did not project. The report concluded that Briar Cottage, in its current state, made little contribution to the character and appearance of the Roe Green Conservation Area. [Au(abr)]

Arrowsmith, P, Grimsditch, B & Nevell, M Manchester : University of Manchester Archaeological Unit, 2008, 105pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Manchester Archaeological Unit

Hulme Hall was a Grade II Listed Building comprising a three-bay timber-framed eastern wing and a larger late-19th century western wing, which in turn had additions of the 20th century. The study found that the timber framed element formed part of a larger structure, the remainder of which was known from mapping evidence to have been mostly on the site of the late-19th century western wing. The later building showed two phases of construction. The first and most extensive of these was begun in 1867 by Isaac Storey, the occupant of the neighbouring Birch House, and the second was carried out around the 1880s by the Manchester merchant William Hudson who made Hulme Hall his home. ### **CRESCENT ROAD MILLS, DUKINFIELD, ASHTON-UNDER-LYNE**

#### ***Crescent Road Mills, Dukinfield, Ashton-under-Lyne: Historic Building Appraisal & Impact Assessment***

The Architectural History Practice Ltd London : The Architectural History Practice Ltd, 2008, 57pp, colour pls, figs, tabs, refs

*Work undertaken by:* The Architectural History Practice Ltd

Crescent Road Mills comprised three separate multi-storey mill buildings and ancillary buildings, developed on a roughly triangular site, in phases between c.1819 and 1872, as cotton spinning and weaving mills. The earliest mill on the site was the northern part of Mill 2 which included an integral engine house, built for Joshua Binns in 1819. Each mill appears to have been built with separate power generation and transmission. The site was fully developed as a cotton manufacturing complex by c.1870, but its use for this purpose ceased in c.1876, when cotton trade in the area suffered a slump. After the 1870s, the site and the existing buildings were used for a wide variety of industrial processes. Soap manufacture had a significant impact on the site, resulting in remodelling of ancillary buildings in the north-west corner of the site. These structures were of low significance. The mills are of high significance as Grade II listed buildings. They are either fire-proof cast iron column and brick vaulted internal structures, or timber beam and column floor construction; this structure is of high significance, as are the roof structures which also appeared to be original, although the roof to mill 2 was extended and remodelled in the later 19th century and repaired in the late-20th century. The integral engine houses to Mills 2 and 3 were of a high significance. The office to Mill 3 was a modest building of medium significance, as were the stair towers and privies, all apparently built for the cotton mills. The later office to Mill 2 was of low significance. The ancillary buildings to Mill 1 had been mutilated by partial demolition, either in the second half of the 20th century or more recently in 2008, due to their poor condition. They were of less significance as extant historic structures, although they were of archaeological significance. Later changes, particularly those made in the late-20th century had a negative impact on the site, including lift shafts, loading bays, inserted walls and floors. The proposals for residential conversion retained the three principal mill buildings, with some adaptation to their elevations and internal structures. The exterior of the buildings would be repaired; Welsh slates to be used on the roofs. Ancillary buildings that were partly demolished early in 2008 would be either reinstated to the same design and scale or rebuilt to a similar form and scale in a complementary design. [Au(abr)]

Trippier, J Bolton : J. M. Trippier, 2008, 49pp, colour pls

*Work undertaken by:* J. M. Trippier

The building was found to be a former Wesleyan Methodist Sunday School erected in 1877 on the site of an earlier such building. The brick-built building was three storeys high but only contained a ground floor open to the underside of an arch-braced mansard roof and a first floor gallery. Apart from the roof the main features of interest were the sandstone embellishments to the front (west) elevation and remnants of its former use such as a Superintendent's office and scholars' coat hooks and lockers. The farmyard paddock was located on the northern plane of the River Bollin. The house was late-18th century with a 19th century wing built in English garden bond brick work with a slate roof. "U" shaped second storey plan with a lean to against the right hand gable. Four bays, with gabled cross wings dated to the late-19th century. A porch added between the cross wings was of a similar date. There was a total of 71, two or three light casement windows with glazing bars, stone sills and cambered brick arches. Six bay rear elevation with 10, one, two or three light casement windows. Exposed chamfered beams to entire ground floor including one re-used bressummer beam". The 1838 tithe map clearly shows an "L" shaped building with no westerly wing. It was presumed that this wing was built after 1840. [Au(abr)]

*Work undertaken by:* University of Manchester Archaeological Unit

A building survey was undertaken on the quadrangle of two storey buildings, in the centre of which was a dovecote. The earliest 18th century fabric visible within the complex lay in the northern range. The length of this earliest fabric and the presence of a blocked cart-entrance towards the eastern end suggested that this original building may have been a combined threshing and hay barn that was incorporated within the 1820 quadrangular court. The majority of the fabric within the two storey quadrangular farmyard was of a single phase. According to a date stone in the eastern range this was 1820, meaning that the courtyard was built by the 6th Earl, George - Harry Grey. The dovecote within the centre of the courtyard also dated from this period. The expanded complex included; a threshing and hay barn of six bays in the southern range; ten cart sheds with segmental brick keystone arches on heavy stone columns with hay loft above forming the eastern range; and a converted northern range that housed cow houses and later shippens, and at the eastern end line-shafting driven by steam; and a western range containing stables and loose boxes. Granaries and root stores were to be found on the first floors. Around 1910 the northern and western ranges were converted to shippens, milk-houses and garages. [Au(abr)]

Brookheyes farm lay on the northern side of Sinderland Brook, on the northern edge of Dunham Massey. The complex was a new farmstead built in the early 19th century. The farmhouse was a brick built, two storey structure from the mid-19th century. The main range was most likely built in the 1820's as a combined threshing barn. It was extensively altered in 1937 when it was converted into a shippen. There were also a number of mid to late-20th century farm structures including a steel framed Dutch Barn, a wooden open shippen and a steel framed covered yard. [Au(abr)]

*Work undertaken by:* University of Manchester Archaeological Unit

The building was a large two storey, brick built farmhouse, roughly H-shaped. The earliest part of the complex was the southern two bays of the central farmhouse range which was early to mid-18th century and originally formed part of a two or three bay two storey farmhouse. In the late-18th or early 19th century a block at right angles to the primary range and attached to its south-east end was added, to form an L-shaped range. An L-shaped aviary was added to the east during this period. Between 1839 and 1877, the farmhouse was extensively re-modelled. The double depth Lodge wing was added to the south of farmhouse and involved the rebuilding of part of the earlier to late-18th century south-western wing. In the 20th century the property was divided into two dwellings. [Au(abr)]

#### **IVY HOUSE, ASTMOOR INDUSTRIAL ESTATE, RUNCORN**

*Ivy House Astmoor Industrial Estate: Runcorn: Historic Building Recording: June 2008*

Frost, P Pontesbury : Castlering Archaeology, Report: 297 2008, 14pp, colour pls, figs, tabs, refs

*Work undertaken by:* Castlering Archaeology

A programme of building recording and site assessment was prepared to accompany an application for Listed Building Consent to demolish the property known as Ivy House. The property was a Grade II Listed Building designated in April 1978 which stood in isolation on a strip of land wedged between Astmoor Industrial Estate and the A588 Expressway. Ivy House was a two-storey mid to late-18th century house with cellar and attic rooms built in Georgian style with a two-storey rear wing. Throughout the 19th century and for most of the 20th century the property was known as Astmoor Farmhouse. In the late-18th century the Tannery and Astmoor Farm appeared to have been constructed. The depression of the 1930s may have aided the demise of the farm. By 1937, the Tannery had expanded north and housing developed along the north side of Marsh Lane. During this period, the farmhouse may have been renamed as Ivy House and split into 1a and 3a Marsh Lane. The closure of Astmoor Tannery in 1962 signified major changes. In 1964 Runcorn was designated as a New Town to house the overspill from nearby Liverpool. The countryside retreated and buildings in the countryside were demolished as the modern town expanded in the late-1960s–70s period. By the early 1970s the industrial estate at Astmoor was completed erasing all buildings apart from the former farmhouse( Ivy House). The last known use of the building was as a cattery before purchase by the current owner. Since this time the house had remained empty and been subjected to considerable vandalism. The Listed building could not be reconciled with its modern surroundings and the integrity and setting of Ivy House was totally compromised. The building had been on fire, most of the roofline had fallen in, walls were unstable and the building was derelict. The report concluded that despite its designated status, it was no longer practical to retain the building in this location. The programme of work ensured that a record was made of the building prior to any future works. [Au(abr)]

*Historic Building Record, Albion Mills, Cooper Street, Burnley, Lancashire*

O'Flaherty, C J Lancashire : C.J. O'Flaherty, 2008, 51pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* C.J. O'Flaherty

The former Albion Mills was a small complex of vacant and derelict industrial buildings dating from the first half of the 19th century and situated at the south eastern end of the Weaver's Triangle. Comprising a pair of co-joined structures on the corner of Cooper Street and Exmouth Street to the south side of Finsley Gate and immediately north of the Leeds

Liverpool Canal, the buildings were of stone construction, part rendered, beneath slated gable roofs. To the interior of the Exmouth Street building there was a supporting structure of cast iron columns carrying iron beams a brick jack arches which represented an early incarnation of fireproof construction. There was evidence of past alteration and extension and map evidence revealed that a large portion of the building fronting Cooper had a 20th century origin, built in the angle of the Cooper Street and Exmouth Street parts, but had since been demolished. Other parts had also suffered partial collapse. Now obsolete and incapable of economic repair/reuse, planning permission was granted for demolition and site clearance followed by redevelopment of the plot. In recognition of the building's historical interest as part of Burnley's industrial legacy, it was made a condition of planning approval that the site was recorded before work commenced. [Au(abr)]

*Bluestone Barn, Bluestone Lane, Mawdesley, Lancashire.*

Gurney, R Ormskirk : Archaeological Excavation Services, Report: 08/1 2008, 44pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Excavation Services

A building survey was undertaken of a barn at Bluestone Lane prior to its conversion to offices. The subject building was a disused, detached two-storey stone structure. Two mid-20th century single storey brick extensions had been added to its southern elevation. The barn was first shown in its current form on the Ordnance Survey map of 1849 although there appeared to have been an earlier stone structure. The nearby associated farmhouse had a pane of glass dated 1706, although the building appeared to predate this by some 20-30 years and probably replaced an earlier house. The barn was an example of a four bay/one threshing floor combination or "Lancashire" barn constructed in the first half of the 19th century. It demonstrated the way that farms were becoming smaller as agriculture gave way to industry resulting in the replacement of the traditional threshing barn with mixed-use buildings which also housed beasts and restricted grain storage facilities to the loft areas. ### **OASIS DATABASE: ELLEL HOUSE, CHAPEL LANE, GALGATE, LANCASHIRE: ARCHAEOLOGICAL BUILDING RECORDING**

#### ***Ellel House, Chapel Lane, Galgate, Lancashire: Archaeological Building Recording***

Whitehead, S & Elsworth, D Ulverston : Greenlane Archaeology Ltd, 2008, A4 spiral bound full-colour report printed double-sided

*Work undertaken by:* Greenlane Archaeology Ltd

"Ellel House is situated next to the Galgate Silk Mill, which is thought to have been the earliest water powered silk mill in the country, established in 1792. The historical connection between Ellel House and the silk mill is uncertain; it was probably built to provide a home for one of the mill owners, probably in the late 18th or early 19th century, and was certainly used as a home for the mill manager in the later 19th century. The building recording revealed five clear phases of development of the site, although the first of these was unlikely to be genuine and is based on doubtful documentary sources. The main part of the building was almost certainly built in the early 19th century, perhaps between 1800 and 1820, and took on much of its present form at that time. It was subsequently extended with an addition to the service wing, again in the first half of the 19th century, and further smaller additions in the form of outshuts and porches were added by the end of the 19th century. In the later 20th century it was subject to several changes of use and a large number of unsympathetic alterations were made including the insertion of partition walls and new doorways and the removal of numerous features, particularly the fireplaces. While an architecturally interesting building in its own right Ellel House is perhaps more significant as part of a wider landscape of structures associated with the silk mill, although all of these have since been put to other uses. Its poor condition and vulnerable situation makes any proposals to re-use it a valuable means to prevent further decline and help restore the appearance of at least part of the larger site. It is recommended that every effort be made to preserve those original features that remain and where possible remove the most obtrusive modern additions." [OASIS]

### **THE WAGON AND HORSES, ST. GEORGE'S QUAY**

#### ***Report on an Archaeological Building Recording Project at the Wagon and Horses, St. Georges Quay, Lancaster***

Wooler, F Alston : North Pennines Archaeology Ltd., Report: CP/604/08 2008, 102pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

An archaeological building recording project was carried out at the Wagon and Horses, St. George's Quay, Lancaster, prior to the demolition of an external storage building, internal alterations and the erection of a new extension. The property was a Grade II Listed Building and was located within Lancaster Castle Conservation Area. The cartographic evidence indicated that the properties which made up the Wagon and Horses Public House were constructed between 1754 and 1778 as part of the development of St. George's Quay as an area primarily for warehousing, manufacturing, commercial and associated domestic use. No's 27 and 28 St. George's Quay appeared to have been constructed as two houses, however, by 1898, No.27 was a beerhouse, although it was not named in trade directories as the Wagon and Horses at this date. The property was certainly known as the "Waggon and Horses" by c.1900, when Thomas Woodhouse was licensee. The building survey revealed

that the ground and first floors of the property retained little in the way of original features, however, the second floor and the attic space still had some original 18th century door fittings. During the renovation work several original timber framed internal walls were identified, one of which was to be removed, this allowed for a study of the form of construction and materials used. An excavated area to the rear of the Wagon and Horses provided some evidence for former buildings on the site, as shown on historical mapping. [Au(abr)]

**MAWSON HOUSE, 4 FENTON STREET, LANCASTER**

***Mawson House, 4 Fenton Street, Lancaster, Lancashire. Archaeological Building Recording***

Clarke, S , Mace, T & Elsworth, D Ulverston : Greenlane Archaeology Ltd, 2008, 39pp, colour pls, figs, tabs, refs

*Work undertaken by:* Greenlane Archaeology Ltd

An archaeological building recording was undertaken on Mawson House, one of a pair of Georgian townhouses which were Grade II Listed. An examination of the documentary sources revealed that Fenton Street was a planned expansion of Lancaster laid out as building plots in the late-1790s by its owner. Initially the development of the plots was very slow, with only a single new building having certainly been added by 1812. The remainder of the street did not develop until later in the 19th century, and it appears that Nos. 4 and 6, built as a matching pair, were not constructed until some time before 1821. Details of the owners are uncertain until the 20th century, when it became the property of the Lancaster Friends, and was used as a school prior to the construction of the Friends' Hall in 1904. In the 19th century No. 4 seems to have been occupied by a succession of professional people. The building recording identified four phases of construction and alteration within the building, the earliest being the initial period of construction in the early 19th century, followed by two small additions, and then a phase of decline during the late-20th century when many original features were removed. The granting of Listed status in 1995 probably prevented further loss. No. 4 was a good but incomplete example of a late Georgian town house, and it was fortunate that No. 6 has survived in better condition as it gave some indication of the property's former glory. **PYE WAREHOUSE, FLEET SQUARE, LANCASTER**

***Pye Warehouse, Fleet Square, Lancaster, Lancashire: Archaeological Building Recording***

Mace, T & Elsworth, D Ulverston : Greenlane Archaeology Ltd, 2008, 66pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Greenlane Archaeology Ltd

Following submission of a pre-planning application enquiry by The Lancaster and District YMCA for the refurbishment and provision of new facilities at the Pye Warehouse, Fleet Square, Lancaster, archaeological recording of the structure was undertaken. The building was Grade II Listed, and as the planned refurbishment was likely to involve alterations to some or of the building, a building recording exercise was recommended. An examination of

the documentary sources revealed that James Bibby built the present five storey warehouse and mill on the site of an earlier two storey warehouse in c1881. Although the building was initially owned and occupied by Bibby, subsequently trading as J Bibby and Sons, who were corn merchants and millers, it was occupied by W & J Pye (latterly Pye Bibby Agriculture) for most of the time since its construction. Initially the building was used as a warehouse and mill forming part of the wider quay-scape, and has been used for offices at first utilised by W & J Pye and by the Lancaster and District YMCA, whose headquarters it later became. The building recording identified four or possibly five phases of construction and alteration within the building, the earliest being the initial period of construction c.1881, followed by relatively minor alterations shortly after associated with the removal and replacement of a gas powered engine and associated machinery. This was followed by the change of use of the building into offices, with the associated insertion of various partition walls, a lift, and a staircase. Other minor amendments were also made following the acquisition of the building by the YMCA, although these were mainly concerned with changes required by fire regulations and associated changes in use. The building was an interesting example of a warehouse that incorporated its own processing facilities, in this case the milling of grain to produce animal feed and flour. It was likely to have taken advantage of modern improvements to milling machinery that were taking place in the late-19th century and was clearly part of a worldwide trade in grain that was taking place at the time. The construction of the building utilised cast iron columns supporting beams of immense span, an innovation that had developed in the late-18th century. [Au(abr)]

**MIDDLE BROWS FARM, CARR LANE, MIDDLETON**

***Middle Brows Farm, Carr Lane, Middleton, Lancashire. Archaeological Building Record***

Elsworth, D & Clarke, S Ulverston : Greenlane Archaeology Ltd, 2008, 46pp, colour pls, figs, tabs, refs

*Work undertaken by:* Greenlane Archaeology Ltd

Following an application to convert a former barn and renovate the derelict farmhouse at Middle Brows Farm near Middleton, a request was made for an archaeological building recording to be carried out. The house and barn were Grade II Listed and thought to be of at least 18th century origin. The earliest reference to Middle Brows farm appeared to be from the 1720s but as the farm formed one of a group of three with similar names identifying it in the early records was difficult. The farm was owned and occupied by several generations of the Catons during the late 18th and early 19th centuries. It appeared then to have become part of the Middleton Tower Estate before passing to the Rev. William Batley at the end of the 19th century and then to the Gorst family, who occupied it from at least 1891 and owned it from 1920 until 1955. The earliest detailed plans of the site showed that much of the present range of buildings had been constructed by the early 19th century, and that only minor alterations and additions were made after this. The building recording showed that the farmhouse is the earliest element of the site, and was probably built in the late 17th or early 18th century, although there is evidence for reused material within the site, which might have suggested that an earlier building originally stood on the site. The barn was subsequently added, probably in the late 18th or early 19th century, followed by extensions to the north and west side of the house, some time before 1833. In the later 19th and early 20th centuries a number of minor alterations were made, and during the late 20th century the house gradually became derelict while the barn was modified by the addition of outshuts to the north and east sides. **KEEPERS COTTAGE, ABBEYSTED*****Keepers Cottage, Abbeystead, Lancashire: Archaeological Building Recording***

Elsworth, D & Dawson, J Ulverston : Greenlane Archaeology Ltd, 2008, 34pp, pls, colour pls, figs, tabs, refs, index, CD

*Work undertaken by:* Greenlane Archaeology Ltd

Keepers Cottage was a traditional double pile house that was thought to predate 1770. It was within the hamlet of Abbeystead, which was shown to consist of ten buildings on an estate plan compiled in 1653. Unfortunately, it was not known whether there was a building at the site of Keepers Cottage at this time. The layout of the building appeared to have remained unchanged since its construction and only minor renovations had taken place. Very little information specific to the cottage could be found, although it appeared to have been a gamekeepers cottage in recent times. [Au(abr)]

O'Flaherty, C.J Lancashire : C.J. O'Flaherty, 2008, 33pp, colour pls, figs, tabs, refs

*Work undertaken by:* C.J. O'Flaherty

Building recording was undertaken on a field barn, visible to the east of the A6 Milnthorpe Road. The barn was of stone construction and comprised two adjoining rectangular parts with gabled roofs, there was a cow house to the north side and a combination barn, for cattle and feed storage, to the south. The configuration of the two adjoining parts was somewhat unusual [particularly at roof level] and, given evidence of past alteration, there was good cause to believe that the building was either constructed in two phases or perhaps stood as the product of a rather unplanned scheme of reconstruction. Comparison of historic maps dating from the 1840s and 1890s suggested that the footprint of the building changed significantly during the latter half of the 19th century, with the latter map apparently portraying the layout as it exists today. Such was the contradictory evidence, both physical and documentary, that firm conclusions to the original configuration of the building remained elusive. It was, however, fair to say that the building was an unusual and non-typical example of rural vernacular architecture which dated from at least the first half of the 19th century and possibly earlier. In terms of ownership, it was possible that the barn and surrounding fields were once part of the Hyning Hall estate. [Au(abr)]

*Work undertaken by:* Stephen Haigh Buildings Archaeologist

A visit was made to the site in May 2008, to re-examine the building in better lighting conditions than a previous building recording in 2007. Significant evidence remained for the building to have late medieval origins, but in its present form it suggested a barn dating from the 18th-19th century constructed using earlier materials, which may have derived from the earlier building or others in the vicinity. It was deemed likely that the outline followed that of a medieval predecessor, but no external faces of the earlier building remained. [Au(abr)]

*Work undertaken by:* Stephen Haigh Buildings Archaeologist

Noyna Bottom was a stone barn probably of 17th century date, associated with the nearby Noyna Hall (later demolished). It was partly converted into a house in the 18th or 19th century, and had later agricultural additions. Archaeological building recording was carried out in August 2008 before the conversion of the barn to a new dwelling. Architectural features including the chamfered and stopped doorways, two of them with splayed and rebated jambs, the general quality of the masonry, and the surviving oak roof truss, indicated that the barn dated to the 17th century, and the appearance of the west end, combined with the earlier name of "Noyna Out Laith" all demonstrated that the building was originally a four bay structure given over solely to agricultural use, and while there was no known documentary evidence to prove it, it was almost certainly built by the Barcrofts to serve their Foulridge and Noyna Hall estate. It was built as a combination barn with housing for livestock, hay, and crops, and threshing would also have been carried out in it, but the function of the west end, before it was made into domestic accommodation, remained uncertain. The fourth bay meant it was a relatively large barn, and the quality of some of the features suggested it was intended for the home farm rather than a tenant, the gable doorway at the north-east corner was a rather unusual feature, as gable entrances were usually provided for a shippon in the barn, and normally in a symmetrical arrangement. In the 18th or early 19th century it was established as a farm in its own right, with the conversion of the west end to a house and the addition of another bay for living accommodation, although it was not clear which part of the present house was occupied first. Further additions were made to the east end of the range, with the present arrangement being established only in the early 20th century. [Au(adp)]

Two of the buildings were Listed. Internal access to the buildings was not available which limited the scope of the investigation. Mapping evidence showed the existence of a yard to the rear of The Old Dog Inn as early as 1822 but it was not recorded in the Trade Directories until 1898. The building of the 'Old Dog' was remodelled in 1886 but was probably of at least 18th century in date. Further buildings shown were obviously removed when the Ritz Cinema was constructed at Nos. 134-134a in the 1930s and scars visible in the extension confirmed this. [Au(abr)]

Haigh, S Silsden : Stephen Haigh Buildings Archaeologist, 2008, 19pp, pls, figs, tabs, refs

*Work undertaken by:* Stephen Haigh Buildings Archaeologist

The stable at Lane Side dated from around 1800 and was a small three-bay structure of two storeys, attached to the farmhouse. On the ground floor it contained stalls for four horses but these had been altered, and this area was last used to house cattle. There was also a small granary on the first floor reached by outside steps, as well as a loft over the stable. Archaeological building recording was carried out in October 2008 before the conversion of the building to a holiday cottage. It was likely that the stable at Lane Side was built in the late-18th or early 19th century to house four horses with their feed, and also to provide a domestic store and granary in the west end of the building, while the large barn on the south side of the road would have housed the majority of the farm's livestock and crops. It was characteristic for a stable to be placed close to the house, and although there was a tradition that the building formed equestrian accommodation for a coaching inn, the fact that the stable held four horses suggested that it was in fact used only for the farm's horses, four being a common number for the family farms of the district where there was little arable cultivation necessitating large teams of plough horses. It was not clear why the building should have incorporated a large doorway in the front elevation but it is possible that it allowed a cart or trap to be brought into the building, although there was only limited space inside. The only features which recalled the building's original purpose were the three boskins or stall dividers on the north side, which are were in poor condition and appeared to have been altered. **WESTFIELD*****Buildings at Westfield. Historic Building Report***

Miller, G St. Helens : Garry Miller Architectural Historian, 2008, 40pp, colour pls, figs  
*Work undertaken by:* Garry Miller Architectural Historian  
Westfield was a small farmstead located in an isolated position north of the village of West Bradford. The farmhouse itself was dated 1897, and comprised a small double-depth building with the date upon a plaque which was also inscribed Westfield House. This appeared to be a rebuilding of an earlier structure of earlier 19th century date at least, which conformed to its present footprint. The house was not affected by the planning application, and was thus not covered by this report. It did however affect four other structures on the site, which were a small lean-to attached to the south-west end of the house and, at one and a half storeys lower than it. This appeared, on map evidence, to have been built in two stages, the earliest the portion at the rear dating from prior to 1883 and the remainder probably of around 1897. Three former cottages were attached to the north-east end of the house. These were long uninhabited and later used as stores, the third [the most north-easterly] was partly derelict. Each was built at a different time, the first [adjoining the house] probably in the mid-18th to early 19th century, the second probably the first half of the 19th century, the third probably between 1851 and 1861. A small store with attached former pigsty, located immediately northeast of the cottages dated from the late-19th early 20th century. A small store/animal shelter located south-east of the cottages dated from pre-1883, with modern alterations. The buildings were all are of poor construction, which was in accordance with the fact that Westfield was in the 19th century a smallholding of around three acres. [Au(abr)]

Trippier, J M Bolton : J. M. Trippier, 2008, 21pp, pls, figs, tabs, refs

*Work undertaken by:* J. M. Trippier

A photographic survey of outbuildings and an open passageway immediately to the west of Crawshaw Hall was undertaken prior to alterations. Crawshaw Hall was a stone built Grade II\* Listed Building which was built in 1831 and was the subject of an earlier survey in 2007. Both the west elevation, which would be affected by the alterations, and the small range of lean-to outbuildings were constructed of 'water-shot' stone. This style is characteristic of the vernacular architecture of the early 19th century and was in contrast to the other more publicly visible elevations of Crawshaw Hall, which were faced with ashlar blocks. **HEALD FARM, PARKHEAD LANE, BARNACRE**

***Historic Building Record A Barn and Stable Range, Heald Farm Parkhead Lane, Barnacre, Preston***

O'Flaherty, C.J Preston : Chris O'Flaherty, 2008, 29pp, colour pls, tabs, refs

*Work undertaken by:* Chris O'Flaherty

A building recording was carried out on the farmstead at Heald Farm. It occupied an elevated position on the western edge of the Bleasdale Moors west. The farmstead comprised a collection of domestic and agricultural buildings that included a detached farmhouse, a large combination barn with attached stable and shippon, and a long former shippon range which had been converted for domestic use. Since the farm was no longer an ongoing agricultural concern, conversion of the remaining disused buildings was proposed which involved the barn and shippon. Owing to the historic significance of the barn which represented an example of regional vernacular architecture a record was made before commencement of work, in order to preserve evidence of the building's physical form and historic development. The barn bore a date stone with the inscription "T C 1696". Whilst this might have indicated the construction date of part of the structure, there was clear evidence that the building had been subject to significant enlargement and alteration in the past, including the addition of the stable and small shippon range which were attached to the barn on its northern side. It appeared that the barn was originally built for a combination of uses, with a shippon and loft to the north-western end, a central cart entry bay and a full storage bay, possibly also once housing a shippon to the south-east. The stable and shippon addition, which, according to map evidence, seemed to have been built during the second half of the 19th century as part of a campaign of major rebuilding on the site, appeared to be largely unaltered. The campaign of rebuilding also included the construction of a new farmhouse and a long shippon range to the north, these buildings essentially repositioning the farmstead around the old barn, having formerly been centred on a site just west of the current position. Taylor, K Lancaster : Oxford Archaeology North, Report: L10021 2008, 44pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology North

Planning permission was granted for the conversion of a barn to a dwelling. The barn was illustrated on the first edition Ordnance Survey map of 1844. Hankinson's Farm was a small farmstead with buildings of varying dates clustered around a central yard. The complex consisted of the barn under investigation, together with a contemporaneous farmhouse, pigsty and late-19th century multi-phase milking parlour which was located to the east of the barn. Some large sheds of late 20th century date had also been erected. The investigations found no evidence of a historic link or connecting block between the barn and the milking parlour to the east. It was recommended that as much of the original hand-made brick fabric of the barn as possible was to be retained. It was also recommended that the original layout of the barn be retained, where possible. [Au(abr)]

*Work undertaken by:* J. M. Trippier

A range of agricultural buildings at New House Farm, Winmarleigh were subject to an archaeological building recording prior to their conversion. The subject buildings comprised a large threshing barn and cart-shed/granary building to which various cow houses (shippons) had been added. The original buildings were built of good quality sandstone blocks and dated from the early 19th century or possibly slightly earlier. The later buildings were a combination of stone and brick and were added in the late-19th and early 20th century. The buildings reflected changing agricultural practices from an arable or mixed economy c.1800 to a pastoral one in the late-19th century. [Au(adp)]

Historic building recording at a post-medieval farmhouse revealed four phases of development. The earliest phase of construction related to a small two-cell timber box-framed dwelling, standing on a sandstone plinth. This was probably constructed in the 17th century. The house was rebuilt and enlarged in brick, in about 1723. During the mid to late-19th century, the house was extended again. In about 1900, some demolition and internal alteration was undertaken. Historic building record of a medieval gentry house found the earliest fabric dated to around 1300, whilst the major components of Storeton Hall comprised a solar block and part of the great hall, erected c.1372 by the Stanley's. The house appeared to have been abandoned as a residence in the early Tudor period. Probably in the 17th century, the farmhouse was

constructed and a farm building attached to the earlier medieval house. During the 19th and 20th centuries a number of other farm buildings were erected at the site, including a large brick-built barn. [Au(adp)]

It appeared from the documentary evidence that the building was the "brick shed" described in 1848 as housing the steam-powered scouring engine. The building certainly displayed signs of an industrial past. It was difficult to assess any relationship between the building and its immediate environs, the yard and house. All buildings in the immediate area appeared to have had later extensions added to them, or at least superficial surface details. One impact of the conversion was the removal of the original brick floor, although this had already been heavily damaged. [Au(adp)]

Historic building recording of The Methodist Church was undertaken as a condition of planning permission for the conversion of the building to a dwelling. The church was first built in 1869 as a single cell primitive Methodist chapel. A meeting room was added to the south of the church within 30 years of its foundation to form an L-shaped building. A kitchen, lobby and cloakroom were added in the late-20th century to create a rectangular structure. The building was entirely brick -built under a tiled roof. The window and door openings of the church itself were decorated with contrasting white bricks, apart from in the rear elevation. All the windows had been replaced by modern UPVC units. The main entrance, however, retained the original, diagonally panelled double doors with reproduction gothic hinge straps. The interior of the church had been stripped before this project was undertaken, leaving only the wall benches and staining to the matchboarding to indicate the seating arrangements. [Au(abr)]

Underdown, S Oxford : Oxford Archaeology, Report: 4058 2008, 46pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology

Recording of the historic fabric revealed at 23-25 High Street Marlow during redevelopment was undertaken. This followed a trial trench evaluation in the rear yard of the property. The property originally consisted of two timber framed structures located on the high street frontage of long burgage plots in a medieval market town. Firstly a two bay open hall building at the south end of the frontage and later a single bay floored building adjacent to the north, both with queen strut and clasped purlin trusses supporting ridged roofs aligned parallel to the street. A large proportion of the timber framing survived on the first floor but the southern truss of the south building had been replaced by a brick wall. The north building had no surviving southern truss and may have been built against the north building but this was not certain. The two buildings were later connected by a doorway cut through a truss and the roof of the north building was raised to match the south one. A floor was inserted in the south building perhaps in the later 16th century. In the late-18th or earlier 19th century the front walls were replaced with a unified and higher brick façade with parapet and sash windows. At around the same time a new higher front slope was added to the roof and new extensions with ridged roofs at right angles to the main roof were added to the rear, a small south gable being the earliest of these (possibly an earlier phase). The first floor rooms were raised by cutting off the medieval common rafters at collar level and ceilings were inserted at that height. The rear (east) wall was heightened with additional framing but elements of the medieval wall plates and some early wattle and daub infill panels were preserved within it. The rest of the early infill of the framing had gone although there were grooves for staves in the ties and collars of the southern trusses. All the trusses contained later studwork for supporting lath and plaster and some of this consisted of re-used hardwood including ovolo moulded 17th century window jambs and a few other moulded pieces. This studwork was probably originally an 18th century insertion possibly prior to the heightening of the roof and walls and was extended largely in softwood in the 19th century as part of those major alterations. On the ground floor less early fabric survived. The only evidence of the early framing was a main post at the north-east corner of the south building, a plate supporting the floor of the north building adjacent to this post had a rebate for a doorhead showing the location of an early rear entrance. [Au]

Martin, D & Clubb, J Portslade : Archaeology South-East, 2008, 38pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

The earliest identifiable structures on this site appeared to be later totally demolished. A probable aisled hall [part of the footprint of which was taken up with the complex's extant front range] with, to its east and probably detached, a fairly small, low, stone building, gabled on its western end. This, if not itself of Norman date, incorporated the remains of a Norman doorway or window. The age of the conjectured aisled hall was impossible to judge. In the 15th century, three schemes of work were carried out. These appeared to be of a similar date, but the evidence regarding the precise sequence of construction was contradictory. The 16th/17th century modifications were noted, as well as the usual sequence of 19th and 20th century internal modifications. [Au(abr)]

*Work undertaken by:* Archaeology South-East

A programme of recording was undertaken at Itford Farmhouse after the tile roof cover had been removed from the roof structure in order to assess requirements for the repair of the underlying elements. The roof structure bore clear evidence of a historic failure and the subsequent repairs. The historic repairs comprised some replacement of the original fabric in addition to the insertion of strengthening members. The proposed schedule of repairs involved the addition of members and supports to the current structure but unlike earlier works, no historic fabric was removed from the roof, ensuring a minimal impact upon the existing structure. Bull House comprised within it four structures, the northern three being timber-framed, whilst the rear, southern section was of both timber framing and mass construction. This southern range, which later became the Westgate Chapel, had not been viewed internally and, except for cursory references, and was excluded from the present study. The entire property was still one in 1698, but the southern part was soon after that time extensively altered to convert it

into a chapel, and this part was separately conveyed to trustees of the chapel in 1719. The two parts had evolved separately from that time onwards. [Au(abr)]

***Garden Structure to the Rear of School Hill House, High Street, Lewes. Historical Building Recording***

Williamson, A Portslade : Archaeology South-East, Report: 2008112 2008, 33pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

The structure was the subject of an earlier assessment, undertaken in an attempt to clarify whether the building could accurately be described as an ice house, as it had been referred to in previous documents. The assessment concluded that it was unlikely to have been constructed or used as such. The building formed two distinct, but inter-linked structural elements, representing two different phases of construction. The basic function of the building seemed to have been to allow passage between formal and domestic garden areas, but the degree of embellishment that had been afforded to it suggested that it also served as a garden feature, popular in high status 18th/19th century gardens. A subsurface chamber was added in the later part of the 19th century and was most likely related to a greenhouse shown adjacent to it on a 19th century Ordnance Survey map. It may have served a function related to the heating of the greenhouse, such as a coal store. It was located between two main garden areas so may also have served as a store for tools. [Au(abr)]

***Chyngton Bunker, Chyngton Farm, Exceat, East Sussex: A Summary Archaeological Survey***

Barber, L & Russell, J Lewes : Sussex Archaeological Society, 2008, 25pp, pls, figs, tabs, refs

*Work undertaken by:* Sussex Archaeological Society

The main structure appeared to have essentially been constructed in one phase, presumably around the middle of 1942, as part of the pre-planning for the re-establishment of cable links to the Continent following the allied invasion. A terrace would have been cut out of the bank and the longitudinal walls 2/4 and 3/5 constructed, leaving a gap for the entrance. The timber cills were then added onto which the iron trusses and timber purlins were constructed to form the shell of the Nissan hut. The corrugated sheet former was added to the purlins prior to the concrete being poured (presumably using exterior formwork as well). Once set it is likely the two brick shafts/vents as well as the timber and bitumen sheet formwork on the east and west ends were constructed with the concrete end walls then being poured (again also using external formwork). It appeared likely that the retaining walls for the entrance were then added (further observation would be needed to check this), quite possibly at the same time as the internal walls were inserted, followed by the floors. It was possible the entranceway was intended to have a pair of staggered blast walls which were never built as the guard-room was considered enough protection (or potentially was added late in the design). The internal room functions were not certain (with the exception of Room 5) but it appeared that

Room 1 was a guard room, Rooms 2 and 3 were for offices and stores, Room 4 was an entrance lobby with chemical toilets, Room 5 was the main equipment area and insulated/sound-proofed Room 6 was probably for an emergency generator. All rooms appeared to have been well equipped with electric lighting. The internal cable ducting, both underfloor, above floor and that exiting/entering the structure were obviously a mix of phases. Some were contemporary with the build, having been cast in the concrete floors. However, some had clearly been cut through the internal walls after they were built. This need not be an indicator of a significantly later change as many of the lighting ducts were also cut through the walls. It may simply have been the result of the electricians/GPO staff undertaking their work after the building was completed by a separate contractor. It was interesting to note that the pipe ducts leaving the structure on the east and west ends were of different types, suggesting not all were laid at the same time and that some alteration was needed during the lifespan of the building as equipment and requirements changed. It was possible military and post office archives existed that may shed light on the changing internal arrangements of the building. The structure was in very good condition and retained a number of notable internal fixtures and fittings. It was one of the few cable stations built along the south coast in anticipation of the Allied landings in Europe. Whether the other stations at Dover, Southbourne, Swanage and Dartmouth survived was unknown. These sites represent a vital, but usually unknown, aspect of the wartime infrastructure. It was recommended that the structure should not be allowed to deteriorate further. [Au(abr)]

Martin, B & Martin, D Portslade : Archaeology South-East, Report: 3456 2008, 31pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

Historic building survey was carried out of the building, a long, four-bay continuously-jettied structure built from timbers felled between 1477 and 1501. It was erected as a pair of handed, near-identical units. The plan type was not standard, the building showed no obvious evidence of a heating system. The structure may have incorporated commercial functions. No alterations were recognizable until the mid/late-17th century when repairs were made to the first-floor joisting. At about the same time ceilings were inserted into at least some of the first-floor chambers. The house was fully upgraded in the 18th century, and around 1800 was returned once more to two occupations. Many modifications were carried out in the 19th and 20th centuries. [Au(abr)]

Matthews, C Salisbury : WA Heritage, Report: 64731.01 2008, 35pp, colour pls, figs, tabs, refs

*Work undertaken by:* WA Heritage

The buildings on the site, a house and an outbuilding, were not Listed but lay within the Sedlescombe Conservation Area, and were 19th century in date. The earliest phase of the outbuilding was a timber-framed building, probably of 17th century date. This underwent several phases of alteration, also forming part of a William Piper's felmonger's yard in 1843. The earliest part of the house was built between 1875 and 1898, replacing an earlier, possibly non-residential, building. The house may have been built when the tanyard closed down. Further extensions and alterations were made in the 20th century. [Au(abr)]

Martin, D & Clubb, J Portslade : Archaeology South-East, 2008, 31pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

The initial build dated from c.1560. It was a three-cell structure with a centrally-placed floored-over hall with services to the east and a small parlour bay to the west. The house was fully floored on the upper storey, but the three chambers at this level were open to the roof. There was a simple one-flue chimney stack, with the cross passage behind the ground-floor fireplace. The front was continuously jettied and the external walls were close studded. In the late-16th or early 17th century a heated, single-bay rear range was constructed at the eastern end of the period-A house, enlarging the service accommodation. The ground-floor room was entered from the cross passage, but the means of access to the first floor was unknown. Alterations undertaken during the mid/late-17th century were extensive, as were later modifications. [Au(abr)]

Martin, D Portslade : Archaeology South-East, Report: 1330 2008, 14pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

A survey was carried out of the building. Though the barn appeared to be in a semi-derelict state, this extended mainly to the external weatherboarding. The main frame was complete and appeared to be in a generally good state of preservation. To judge from the architectural features, and in particular the style of its roof [of which three other similar local examples were known] this five-bay barn dated from the late-16th or early 17th century and was built for the storage and processing of arable crops. Originally it incorporated lean-to cattle outshuts at each end, though both these had since been removed. In 1847 a stone-walled stable was built at the north-eastern corner of the northern lean-to, which was still extant at this date, and at this same general period improvements were made to the southern end of the barn. Here a low boarded partition and associated raking struts were added to the south of the threshing floor. The 1st edition 1:2500 Ordnance Survey map indicated that by 1874-5 the southern end lean-to had been removed, and that the northern end had been replaced by a cart shed. This was open-fronted to the north with a Sussex-bonded brick wall towards the west and made use of the stable wall on the east. To the west of the barn was shown an attached yard, with a second range of north-south aligned buildings delineating its western side. This 19th-century brick-built range still survived, though it was semi-derelict. The 1847 stable appeared to have been sized down by the removal of its southern wall; a small shelter was erected backing onto the cart shed to the west, with two pens in front. In its later phases the barn appeared to have been used solely for animal housing. The former crop-storage bays to the south of the wagon way were now accessed via an external doorway cut through the west wall, reached via the yard shown in the 1874-5 O.S. plan. The area was partially divided by a low axial partition, a feeding rack was attached to the front walls, with troughs against the rear wall and southern end wall. At the other end of the barn three separate stalls, with brick feeding trough, were formed by short divisions projecting southwards from the northern end wall. [Au(abr)]

A measured historic building survey was carried out of the toilet block associated with the former School Buildings at the Holy Cross Church Centre. In addition to the measured survey, a photographic record was prepared of the school buildings. The school was built in 1850 and extended in 1884. The toilet block was built between 1874 and 1898 and may have been built as part of the 1884 programme of works carried out at the site. [Au(abr)]

Nothing survived of the earliest house, which was probably of medieval date. Its eastern end was retained when the western part was rebuilt in the mid-16th century. On the ground floor the period-B two-bay range housed a large floored hall, heated by some form of chimney built against the rear wall with a divided parlour. The retained period-A part was assumed to have

been the services of the medieval house. The same period-B room arrangement was adopted at first-floor level, with a large attic room above. The construction was timber framing with walls of foot braced small-panel type. The roof [later rebuilt] was steeply pitched with a hipped western end. It seemed in the 17th century that the retained period-A part of the house was destroyed, at which time a new two-flue chimney was constructed against the eastern wall. The period-B rear chimney was demolished. Forming part of this phase, a lean-to outshut was constructed along the rear wall. Between the mid-18th and early 19th centuries periods of modification were carried out. A later period of alteration entailed under building the ground-floor walls, cladding the first floor framing with tile hanging, reconstructing the steeply-pitched roof to a shallower pitch re-using much of the original material, and adding a chimney into the south-western corner of the lean-to outshut. The new roof was the only securely datable element of these works, and must have been constructed during the first half of the 19th century, and not any earlier. The other alterations could be contemporary or carried out earlier, during the mid/late-18th century. A new symmetrically-fronted range with end chimneys and a central entrance was built in front of the earlier house in the late-19th century. The 1:2500 ordnance survey plans confirmed that this had not been constructed in 1873, but had been added by 1898. The range housed two rooms on each storey, separated on the ground floor by a central entrance passage: the equivalent space on the first floor housed closets. Some associated alterations were made to the earlier house, incorporating a new staircase and landing [both since removed]. Little alteration had been made to the building since the construction of the front range. A small pitched-roofed extension had been constructed to the south-east of the rear range and the windows in the rear part had been adjusted. An external doorway in the western wall of the rear range had been converted to a window and French doors cut through the rear wall of the lean-to outshut. Internally some subdivision had occurred, particularly in the hall chamber where two bathrooms had been formed. The period-F stairs had been removed, access to the first floor once again being solely via the period-B triangular-tread flight which was retained when the new stairs were added. [Au(adp)]

**THE OLD VICARAGE, HIGH STREET, WADHURST**

***The Old Vicarage, High Street, Wadhurst, East Sussex. Interpretive Historic Building Survey***

Williamson, A. Portslade : Archaeology South-East, Report: 2008211 2008, 44pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

An interpretative historic building survey was carried out to inform proposals for alterations. One of the most prominent houses within the village, the building originated in the early 18th century as a double-pile house comprising two storeys plus attic rooms and cellar. Despite various alterations over the course of its history it retained a wealth of historic fixtures and fittings meriting its Grade II\* Listed status, including a mid-18th century staircase in the Chinese Chippendale style. The most significant alterations to the property, including the insertion of the main staircase and the erection of an extension at the rear, were probably carried out in the mid-18th century when it was occupied by a local iron-founder Richard Tapsell. Although no longer in existence, this extension was illustrated on historic plans of the house and was alluded to in a mid-19th century history of the village. Around 1935, the rear extension was removed and replaced with a smaller one which survives to this day, and other associated modifications were carried out. Whilst this extension partly overlay the footprint of the former extension, there was no evidence that it retained elements of the earlier structure. [Au(abr)]

Wheeler, R Southampton : Gifford, Report: 13966/R121 2008, 30pp, colour pls, figs, refs

*Work undertaken by:* Gifford

The reservoir structure survived in a largely complete condition, although severely overgrown in places. The majority of the reservoir floor paving slabs remained in place. The entire exterior was densely overgrown between the bund and the perimeter wall. The reservoir was an important surviving part of the victualling yard created by George Ledwell Taylor and George Rennie at the behest of the Duke of Clarence during the 1820s-50s. Its shape retained the shape of a field on the Weevil House estate, on which it was built. The reservoir replaced earlier, smaller reservoirs of the 18th century, as the operations of the victualling yard grew and the demand for water increased. The reservoir was built to a high standard, with a perimeter wall, an earth bund paved on the internal surface and a walkway of limestone slabs along its ridge, and substantial limestone slabs paving the reservoir floor. Wilson, M & Wheeler, R Southampton : Gifford, Report: 13966/R 122 2008, 15pp, colour pls, figs, refs

*Work undertaken by:* Gifford

The Granary was a four-storey building, constructed of red and occasionally vitrified bricks laid in a Flemish bond. String courses of Portland stone ashlar blocks were set at the top of each floor. The bottom string course had a dentilled underside, the second was undecorated, the third had an "S"-moulded profile to the bottom half, and the much repaired top string course had an "S"-moulded thin section along its top, below the cornice of the roof. Rubbed brick voussoirs fanned out above the 20 light wooden-framed windows, with ashlar sills beneath, complete with filleted corners and sloping surfaces to aid water run-off. The building had a slated mansard roof with flat roofed dormer projections set behind a low parapet. A cornice of "S"-moulded ashlar masonry ran underneath the parapet and above the top string course. The "S"-moulding and the string course have been repaired with applied render. They continued around the top of the "nib", and the render may have been applied after the adjoining miscellaneous store had been demolished. [Au(adp)]

*Work undertaken by:* Wessex Archaeology

A survey was made of two buildings identified as boiling houses used as part of the coastal salt industry thought to date from the 18th century. The larger of the two buildings was the remnant of a much longer building thought to be directly involved with the salt brining process. The internal timber-framed aisled construction survived as two cross frames. It was likely that this building was deliberately shortened to serve another purpose such as storage. The smaller building to the south was different from the north building as it was not built with an aisled inner timber frame but a simpler A-framed roof spanning between the east and west walls. It was thought that originally the building was used for storage. [Au(abr)]

***The Barn, Little Moatenden, Maidstone Road, Headcorn, Kent. Interpretative Historic Building Survey***

Williamson, A Portslade : Archaeology South-East, Report: 2008051 2008, 34pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

Historic building survey of the Grade II Listed barn at Little Moatenden, Headcorn, was carried out. The building comprised a timber-framed barn with later, lean-to structures added on two sides. The framing of the barn was characteristic of late-16th or earlier 17th century construction techniques, and was probably built shortly after the farmhouse at Little Moatenden, which was thought to be of a similar date. Its surviving plan form was of three bays, with the midstrey later forming the eastern bay, it was clear that the barn originally extended for at least one or two further bays. The barn was constructed as a traditional threshing barn, with a full-height double doorway on one side of the midstrey and a smaller doorway opposite to create the through-draught necessary for winnowing. Although the original doors were missing, three of the jambs preserved applied grooved blocks for securing lower leapboards. The two lean-to structures were later additions to the barn. They were most likely added in the 18th century, but had both subsequently been modified in the 19th century. The date 1888 accompanied by the initials "E.J.M." added to a timber at one end of the barn may have dated part or all of this work. The lean-tos probably served the purpose of providing the barn with increased storage capacity, but by the 19th century, one had been modified for use as an open-fronted shelter. In the earlier part of the 20th century, the barn and open shelter were reduced to their existing length. [Au(abr)]

**CHARTWELL, WESTERHAM*****Chartwell, Westerham, Kent. Historic Building Survey***

Henderson, M Portslade : Archaeology South-East, Report: 2008050 2009, 40pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

A programme of alternate or progressive rebuild resulted in the current layout of the historic core of the existing house. The earliest visible surviving remains were those of a north-south three-bay, four storey building with significantly tall storey heights constructed between 1515 and 1546. The roof over the range was original to the construction, and was of the clasped purlin type, utilising substantial timbers of medieval scantling. It was clear that this surviving structure was part of a larger complex in the construction details which were tailored around an already existing northern range. The northern range may have been a projecting cross wing [projecting out to east and west of the later main range] which was later rebuilt in the early 18th century. The Library ceiling was representative of the 18th century rebuild with the western end of the ceiling clearly truncated. The truncation was carried out to create a uniform façade of Flemish bond brickwork symmetrical about a central projecting porch. The house was then significantly extended throughout the 19th century, first to the east of the main range, followed by the south end and then the north block built as a service block for the Campbell-Calquhoun family in the late-19th century. The final significant phase of development at the property was undertaken by the architect Philip Tilden for Sir Winston Churchill in the 1920s. The Churchill family owned the property until 1946 but remained in residence until Sir Winston's death in 1965. [Au(abr)]

WESTERHAM ROAD, WESTERHAM, SEVENOAKS**

*Former Farm Buildings (Garage Cottages), Valence School, Westerham Road,  
Westerham, Sevenoaks, Kent TN16 1QN. An Historic Building Survey*

Potter, G London : Compass Archaeology, 2008, 65pp, colour pls, figs, tabs, refs  
*Work undertaken by:* Compass Archaeology

A survey was made of two residential cottages that stood at the western end of a group of buildings that originated as a 19th century model or planned farm. Prior to this the land appeared to have been largely undeveloped, although within the historic Valence estate. The farm buildings, referred to as the Farm Homestead, may have been designed by the architect Lew Vulimy, who was recorded as working on the estate in 1839. Superficially, the cottages formed a fairly simply two storey structure, or rough stone construction at ground level with brickwork above and a slate covered gabled roof. The previous use of the building was conjectural but it could have been the barn that was mentioned in the 1857 estate details. [Au(abr)]

*Kingpost, Elham, Kent. Interpretive Historic Building Survey*

Henderson, M Portslade : Archaeology South-East, Report: 2008197 2008, 47pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

An interpretive historic building survey of the Grade II\* Listed Building of Kingpost, Elham, was carried out. Kingpost was originally a three cell hall house with a central hall of Wealden type, originally with parlour and chamber to the north and a cross passage with low end rooms to the south. The Wealden phase of construction was of probable late-15th century origin. The house was altered in the early to mid-16th century with the addition of a jettied first floor over the high end of the hall between the surviving open and closed trusses. At the same time, a smoke bay was created to the south of the former open truss. The next phase of development to the property included the insertion of a substantial brick chimney into the former smoke bay opening with the gap between new stack and the front of the smoke bay floored over. This insertion occurred in the early 17th century and was soon followed by the rebuilding of the southern part of the property to form the current two storey block with attics and cellar fronting onto the street and square. The new build, of probable mid-17th century origin re-orientated the building as a whole, relocating the principal elevation of the house from the west to the south. The mid-17th century also saw the addition of a second brick stack to heat the new rooms including a four-centred brick arched fireplace at first floor level, as well as modifications to fixtures and fittings throughout the house, including the former hall window at ground floor level. Later modifications to the main fabric of the house were most significant on the south elevation which was re-faced in brick in the 18th century and subsequently altered over time by changes to the fenestration. Modifications to the remainder of the structure in the 19th and 20th century were for the most part confined to the rear of the property and to interior fixtures and fittings. [Au(abr)]

Building survey of the air raid shelter at Minster in Sheppey Primary School was carried out. The air raid shelter was built to serve the school under the Air Raid Precautions Act of 1936 [revised in 1938]. The structure was constructed of yellow brick in English bond, with several small ventilation openings just below the oversailing roof level. The shelter was rectangular in plan with a concrete roof and two traverse entry doorways in the western elevation. The interior of the structure had two separate chambers with access between them. The traverse entries had in situ doorways with traces of a further diagonally set doorway within the passage. A later set of double doors had been inserted into the north elevation of the building. Matthews, C Salisbury : Wessex Archaeology, Report: 68522.01 2008, 15pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Wessex Archaeology

The assessment established that the motel buildings incorporated part of the west wall of the original 17th century house and 19th century additions that were added to this side of the house as service areas. In addition, the motel incorporated an accommodation block for stable or garden staff. This red brick building was 19th century in date and had architectural details picked out in contrasting gault brick. Outside and adjoining the site, a stable block and coach house built in the second half of the 19th century were of a similar style. [Au(adp)]

A survey record was made of a large Elizabethan style farmhouse, rectangular in plan. It was constructed by the Mann Cornwallis family, landowners, in 1855 as a model farm estate manager's accommodation. The house was essentially of all one period, with minimal additions to the exterior, namely the addition of a 20th century rear porch. Of note was the

Flemish bone brickwork with combined burnt headers to form a decorative pattern, crows stepped gables and large chimneys that dominated the structure. [Au(abr)]

***An Archaeological Interpretative Survey of Pest House, Cranbrook, Kent***

Martin, D & Clubb, J Portslade : Archaeology South-East, Report: 3565 2008, 20pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

The house was built in the early/mid-17th century as a two-bay structure with an end chimney to the east and a lean-to covering three-quarters of the rear wall. It was originally fully timber-framed apart from the brick chimney stack, with four rooms on the ground floor, two rooms on the first floor and a fully usable garret. The house had survived in a fairly complete state. There were few historic changes to the property, most of which could not be attributed to a single phase of alterations, but would have probably occurred over time, as function dictated. It was likely that the isolated location of this house was the reason for its use as a pest house, an "isolation unit" for those towns people suffering from contagious diseases, where they would be quarantined to prevent spreading their illness to the rest of the population. Rumley, P Bromley : Peter Rumley, 2008, 3pp

*Work undertaken by:* Peter Rumley

The primary phase structure of this symmetrical Grade II\* Listed brick building was a rare and virtually complete c.mid 16th century banqueting house, one of two entire extant buildings [the other being the Tower] associated with the ruined mansion, front range and landscape. Of note was the English bond brickwork combined with decorative tumbled-brickwork on the four gables and the orientation of the mullion and transom windows to take in the landscape views. The building was separate to the mansion, being located on the north-west corner of the site, and built specifically to take advantage of the northern views over the northern Park Pale and the Weald landscape beyond. Whilst much of the original historic building survived, later windows, a staircase and doors had been inserted and the mullion and transom windows restored in the 1930s. At least five later phases of development had occurred as the use of the building changed. The c.1560 primary phase comprised a structure built against the south elevation since replaced by the extant 17th century extension and two extensions to the west elevation constructed in 1934 and 1983. The primary structure was significant as if formed part of a substantial mid-16th century mansion complex, built by the Baker family, which had the specific function of a banqueting house or pavilion. **THE OLD CASTLE, SCOTNEY, LAMBERHURST*****An Archaeological Interpretative Survey of The Old Castle, Scotney, Lamberhurst, Kent***

Martin, B, Martin, D & Goulding, R Portslade : Archaeology South-East, Report: 3297 2008, 228pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

A watching brief to be carried out during quinquennial repairs to the Old Castle, Scotney, together with an interpretative historic building survey of the structure and a geophysical survey of the areas within the moat. The 14th century castle sat on the northern of three islands contained within a single moated enclosure, with the central island having served as an outer court. During the medieval period the main [northern] island was surrounded by a low curtain wall with corner drum towers, the south-western of which survived as the Ashburnham Tower. Aligned across the centre of the island stood the medieval house and its associated service building, facing towards the gatehouse. In the mid-16th century a western range [the extant roofed building] was constructed against the southern curtain wall, infilling the space between a kitchen building to the south of the main house and the Ashburnham Tower. It was probably late during the same century that the southern end of the kitchen area was rebuilt as a lofty structure extending out slightly into the moat. An existing single-flue kitchen chimney sited between this new section and the west range was modified in order to form a first-floor passage bridging the flue, a smoking chamber, and a complex secret compartment. Although apparently originally detached from the main house, either by or at this period the kitchen complex and west range were joined to the medieval house, giving an exceptionally long building extending continuously across the full width of the island. During the 1630s a major campaign of reconstruction was embarked upon which, if completed, would have converted the house into a lofty and impressive three-storied mansion, complete with piano mobile housing state apartments. The reconstruction was noteworthy for the design of its garden front. Tragically, the builder, William Darell, died before anything more than the first phase of the reconstruction could be completed and the scheme was abandoned, leaving the medieval hall, high-end accommodation and west range intact. In order to compensate for the uncompleted scheme, a new staircase was inserted into the west range. By the middle years of the 18th century the house had been sized down by demolishing the medieval hall and high-end accommodation, replacing them with a small service outshut. The demolition seriously compromised access to the principal rooms of the house on the first floor. An attempt to overcome this problem was made between 1758 and 1783 when a front porch and a flight of external steps was added, rising to a new first-floor front door. Part of the front elevation was stone clad at the same time. In 1837 the then owner, Edward Hussey, moved to a new house overlooking the castle and pulled down much of the main range, deliberately ruining it to form a picturesque landscape feature. [Au(abr)]

Assessment of the Grade II Listed Building showed that it was probably built in the 18th century as house. Identified features relating to this early use included the remains of a staircase with rooms to either side. This early building was extended to the north-west, perhaps in the late-18th or early 19th century. Further extensions took place in the 20th century, when the building was established as a pub. The principal historic elements were largely consistent with the listing description. [Au(adb)]

A survey found that the house seemed to have had a medieval antecedent, but was remodelled more than once in the 17th century, reaching its present form shortly after the Civil War. This creation was largely the work of the Bennet family, descendants of a Lord Mayor of London. Since then, much of the time it was a tenanted farm, which contributed significantly towards preserving it in its original form, unsullied by modern accretions. [Au(abr)]

#### **BOUNDARY AND OTHER WALLS, BREWER STREET**

#### ***Boundary and Other Walls, Brewer Street, Oxford. Historic Building Assessment and Recording***

Gill, J & Amadio, L Oxford : Oxford Archaeology, Report: 4236 2008, 37pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology

An assessment was made of free-standing boundary walls and external walls from some standing buildings. Nos. 7 and 8, Brewer Street were both Grade II Listed Buildings and were not included in the development plans or the study. The walls on the site divided into three distinct groups, modern walls [e.g. Nos. 2, 3, 6, 9, 10, 12, 17, 18], surviving elements from historic or former buildings [5, 7, 8, 19], and potentially historic boundary walls [1, 4, 14, 15, 16]. Other than Wall 1 the potentially old boundary walls were all either side of a long plot to the rear of No. 6a Brewer Street which was the only plot on the site to remain largely intact from Brewer Street to Rose Place [formerly the Trill Mill]. Loggan's map from 1673 suggested that this plot had been established by this date and the boundary layouts were likely to be significantly older than this. Although there was an element of uncertainty with interpreting early maps it was possible to pinpoint this plot with reasonable confidence on the Loggan map as there was a long north to south range (stables?) shown on the plot immediately to the west (to the rear of No. 7 Brewer Street). Although the layout of this plot and the alignment of the boundary walls were likely to be old it was difficult to accurately assess the date of

construction for the actual walls either side of the plot. As with any similar rubble stone walls this was partly due to the lack of diagnostic features found in timber framed or brick constructions and well-weathered, later 19th-century rubble stone walls can sometimes appear very similar to 16th or 17th century walls. It was also difficult because the walls showed areas of repair, patching and rebuild so that even if there are old elements they cannot reliably be classed as old walls. Boundary walls such as these are relatively basic constructions which would be very likely to require periodic rebuilding and it was significant to note that part of Wall 16 had collapsed and required rebuilding. It is likely that most of the fabric in these stone walls dates to a construction not earlier than the 18th century (albeit possibly reusing older stones). However, due to the difficulties with dating these structures this cannot be certain, and there was the possibility that sections survive from the 17th century or earlier. They were relatively basic constructions but the interest of boundary walls and tenement plots is usually not so much in their fabric than as topographical features and particularly when they survive as well-preserved groups of adjacent plots. The proposed development site does not represent a coherent well-preserved block of tenement plots and this fragmentary nature reduces the significance of the walls (as does their generally poor condition. Rev Salter's map of the medieval tenements in Oxford suggests that the block to the south of Brewer Street was filled with north to south tenements almost as far east as St. Aldgate's. Immediately to the east of the development site these tenements have been lost by the construction of Campion Hall and at the west end of this block (partially within the development site) they have been replaced by east to west plots facing Littlegate. These plots at the west end are shown on the 1673 map. The plot to the south of No. 6a Brewer Street, together with the partially surviving plot to the rear of No. 7 are the only plots which survive in this area. There are a number of areas of Oxford where larger, more coherent areas of tenement boundaries survive such as around St. Michael's Street and Holywell. Apart from the boundary walls there also survives sections of wall from two buildings of some interest. These include the rear and east gable walls of property No. 6 which appear to survive from a significant, heavily rebuilt building which may have been of 17th or 18th century date. This structure warrants further investigation and recording prior to its possible demolition to determine whether the roof or any internal walls survive from the older building. The rebuilt brick gable in the east wall would suggest that the roof was probably reconstructed in the 19th or 20th century. Also of interest were surviving stone fragments from a former malthouse along the southern boundary of the site and further recording of this (possibly during its demolition/dismantling) would be of value. It was not considered that any of the walls were of such significance as to require their preservation in situ in the project development although it would be desirable to retain some of the older fragments where they can be practically incorporated into the new design. There is probably greatest scope for this along the edge of the site and particularly the corner of the former malthouse. In addition if the condition of the wall dictates that it must be taken down then it could be rebuilt on the same alignment re-using some stones such as the larger blocks which form the quoin. The interest of these surviving fragments from the malthouse was increased due the historic use of the area by Breweries and by the name Brewer Street. Two sections of the potentially old stone boundary walls were also located along the edge of the development boundary (Walls 1 and 4) so these property divisions would remain. [Au(abr)]

The redevelopment involved internal alterations to both houses in order to convert them into a hotel. Buckingham House had significant historical associations, being the location of the

assassination of the Duke of Buckingham in 1628. The oldest part was at the north end of the street front. It had taken a basic form in 1627. The surviving structure had a timber framed core that may have been earlier. There was originally a further block to the north but that was demolished in 1760. A second block, in brick, probably was also in existence by 1627, appeared to have been built on to the timber framed block. A new block was added to the south in about 1760 in a neo-classical style. Felton House was a simple townhouse of 18th century date, a new range was built to the rear in the mid-19th century. [Au(abr)]

### **LEITH HILL HOME BARNS, LEITH HILL**

#### ***Interpretative Historic Building Survey of Leith Hill Home Barns, Leith Hill, Surrey***

CgMs London : CgMs, 2008, 1p

*Work undertaken by:* CgMs

The Leith Hill Place home farm yard and barns were examined and recorded in 2008, in order to provide a clear understanding of the buildings' fabric, form, construction and development, creating a record of the buildings and to informing decisions for their future use and adaptation by the National Trust. The buildings recorded ranged in date from the 17th or 18th centuries to the early 20th century. The estate was established in the early to mid-17th century, with the main house gardens and farm set out. Title deeds from 1664 listed the holdings. Within the farm yard Building 1, a fully timber framed barn, and perhaps parts of Building 4 were constructed. In the later 17th century, the lower parts of the barn were replaced in brick and stone. By the later 17th to early-mid-18th century, Building 1 was constructed against the southern side of Building 2. Its form at this time was not fully understood because of the extent of later alterations. In the mid-18th and throughout the 19th century, Building 1 was enlarged and raised to a full two storeys, the roof and floor structure possibly having been re-used from an earlier building. Other buildings were constructed within the farm yard, including a building on the site of the existing dairy to the north of Building 2. A small extension was added north of the porch to Building 2. By the mid-20th century, Building 3, the dairy, was constructed, replacing earlier structures. In the later 20th century small structures within and on the edges of the farm yard were removed. In 1993 the National Trust took occupation of the barns as their estate management centre and office. [Sec(adp)]

The gardens on the site were Grade II Listed in the English Heritage Register of Parks and Gardens, and lay within the St. Peter's Conservation Area. They contained a number of Grade II Listed features and structures, including the 17th century riverside garden pavilion [gazebo], the 17th century causeway, the early to mid-19th century screen wall along the north-east boundary, the 17th/18th century retaining walls of the axial east-west terrace walk, the 17th century stables and the 18th century retaining wall of St. Peter's Churchyard and the Church of St. Peter [the Crinkle-Crankle Wall]. Recording of these structures took place as the first part of a phased programme of archaeological investigation, and recorded many phases of repair and alteration. [Au(adp)]

Wilson, N Milton Keynes : Archaeological Services & Consultancy Ltd., Report: 1064  
2008, 23pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Services & Consultancy Ltd.

During October 2008, a structural record was made of the Bone Mill Sluice on the canalised section of the Kennet and Avon Navigation immediately below Newbury in the Ham Marsh district. The recording work was undertaken prior to the demolition and replacement of the sluice. Though extensively rebuilt in 1966, much of the earlier timber structure, probably dating from a 1930s rebuild of the sluice using recycled railway sleepers was apparent. The three original guillotine gates and their operating mechanism, probably of 19th century date, also survived. [Au(abr)]

Rous, M Salisbury : Wessex Archaeology, Report: 69070.01 2008, 25pp, colour pls, figs, tabs, refs

*Work undertaken by:* Wessex Archaeology

The assessment discovered that despite documentary and mapping evidence showing that the site appeared to have been occupied since at least 1773, the extant property dated from 1877 following an earlier fire that removed all traces of former occupation. The building comprised a single phase of construction with later amendments and additions. Additional stores capacity was added between 1900-1912 with the construction of a lean-to, with two small storage sheds to the southern end of the west wing. The final phase of development included the addition of an outside toilet sometime in the mid-20th century. The building was considered to be of some importance, reflected in its status as Grade II Listed. [Au(abr)]

Earley, J & Millbank, D Reading : Thames Valley Archaeological Services, Report: 07/135 2008, 22pp, colour pls, figs, tabs, refs

*Work undertaken by:* Thames Valley Archaeological Services

Building recording showed two pillboxes differed considerably in plan, although the construction appeared to be broadly similar. Although only pillbox [A ]conformed to one of the numbered types (F W 3/24), both were fairly typical of the pillboxes constructed in 1940 and 1941. They were of a combination of brick and concrete slab construction, with reinforced concrete likely to be used for the roofs. Fieldworks of type F W 3/24 (also called a 'Hexagonal Bren and Rifle Emplacement') were designed to house five light machine guns (Bren guns) and two rifles. Together with a third pillbox, pillbox C [ not part of the building recording] the three pillboxes were positioned between the eastern end of the Portsmouth stop-line and the coastal defences at the sea front at Bognor. Taken together, this group of three pillboxes appeared to be built primarily to defend from the inland side, to the north, north-east and east. This suggested that although the slop-line protecting Portsmouth from attack did not continue to Bognor Regis itself, these pillboxes were placed to ensure that if defences on the south coast were bypassed, invading troops would be prevented from threatening the coast from the rear. Overall, these pillboxes represented a small but important part of Britain's defences during the Second World War. Defences such as these are an integral part of Britain's military history. Williamson, A Portslade : Archaeology South-East, Report: 2008133 2008, 102pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

Historic building survey of the Grade II Listed Dower House, Slindon, was carried out. The building was acquired by the National Trust as part of the Slindon Estate in 1950, although at the time of survey was occupied by tenants. The building was likely to have originated in the late 18th century as a relatively modest L-plan house which was considerably altered and extended in several phases, predominantly in the first half of the 19th century. The house retained a wealth of fixtures and fittings relating to these phases of alteration. Documentary sources suggested that there may have been a pre-existing dwelling on the site, although at the time of the survey there was no substantive evidence apparent to suggest that this formed an element of the existing house. Henderson M, Short, J & Russell, J Portslade : Archaeology South-East, Report: 2847 2008, 96pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

An historic building survey of the Woodyard buildings at Petworth House was conducted in June 2007. A second phase of work was carried out in June 2008 to make a drawn record of the structures. The Woodyard, Listed as Grade I (as it fell within the curtilage of the Mansion), was situated to the east of the domestic range which ran parallel to Petworth House. Seven buildings were surveyed of which five were housed within a long linear range of buildings

orientated east -west, which abutted the domestic range at the western extent. There was an additional building at the eastern extent of the range which followed the line of the road and utilised the boundary wall as its eastern elevation and a small stand-alone structure at the north-western end of the remainder of the yard wall. The rear wall of the Woodyard was a revetment wall set into the graveyard of the adjacent church. The buildings were constructed in coursed stone rubble with red brick quoins and trim. The roof was slate and the result of a single 20th century roofing event, incorporating the earlier roof constructions of several of the buildings. The perimeter wall of the Woodyard represented the earliest surviving phase of construction. A structure situated adjacent to the eastern perimeter wall was in situ by 1610, the original function of which was unknown. The much-modified building occupying this location may have incorporated some of the fabric of the earlier structure. The second phase of construction comprised buildings 2/3 and 5, both east-west oriented and constructed against the churchyard wall and were linked together at a later date [by 1706] by the construction of building 4. Building 2/3 was later found to have been constructed as a purpose-built Conduit House storing water piped from the Park. Building 1 was added to the western end of the range and the complex of structures altered to provide laundry facilities to serve Petworth House. The construction of building 6 in the second half of the 19th century represented the ongoing use and development of the laundry facilities. [Au(abr)]

Hughes, A F Chichester : West Sussex County Council, Report: 07-014 2007, 6pp, figs  
*Work undertaken by:* A.F Hughes

The building was originally a fully timber-framed three-bay building, with first floor and usable attic space, the roof gabled at each end. The relative dimensions of the bays, the cut rafters within the roof and mortice evidence on the underside of the mid-ties, indicated there was originally a central chimney stack,' with the front access onto the side of the stack (baffle-entry) and the original access to first floor at the rear of the stack. There was access to the attic rooms, and circulation beside the chimney stack within the spaces at each side. The weathering on the outer faces of the end ties suggested that when the building was first constructed, there were either no abutting buildings, or their roof lines were lower. As so much of the building was faced or plastered, It was impossible to discover evidence for original fenestration. It was characteristic of a dropped-tie building. It was possible there were attic windows in the gable ends. There may also have been first floor hearths, the surrounds of which (or evidence) may survive behind plastering. All the diagnostic evidence of proportions, plan, roof type and relative sizes of scantling pointed towards a build date of c. 1620. The visible principal framing of the building from first floor upwards was in good condition, in spite of the application of black paint. However, there was no indication of what subsidiary wall-framing survived behind the plastering, although it was clear that at ground floor, at least, brickwork and modern supports had been substituted for most of the framing. It was recommended that any building work should proceed with caution, in case hidden details could be recovered. [Au(abr)]

Williamson, A Portslade : Archaeology South-East, Report: 2008093 2008, 56pp, colour pls, figs refs

*Work undertaken by:* Archaeology South-East

A survey found the building reflected several phases of construction and refurbishment. It was essentially a house of mid-19th century date with substantial additions having been made. Several additional smaller phases of refurbishment and alterations were reflected in the surviving fixtures and fittings. It seemed likely that the building was preceded by an earlier structure, of which only traces survived. Comprehensive rebuilding and modification of the building made interpretation of this probable preceding structure difficult. [Au(abr)]

**NYETIMBER, WEST CHILTINGTON*****Nyetimber, West Chiltington, West Sussex. Historic Building Survey***

Henderson, M Portslade : Archaeology South-East, Report: 2008103 2008, 44pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

A supplementary historic building survey of the 20th century extensions to the main house, and a building survey of the Hovel and the Round House at Nyetimber Vineyard, West Chiltington was carried out. A substantial programme of additions to and alterations of Nyetimber House were conducted between 1919 and 1949. A long two-storey, east-west orientated range was added to the western side of the north cross-wing of the house, and reduction of the floor level in the south wing of the house in order to add a first-floor gallery was undertaken. Throughout the alterations, actual fixtures were imported of medieval provenance for use within the building. In addition, the interior works were carried out to emulate the fabric of the existing structure and to create work of a medieval style. The carpentry was of a high standard and a substantial knowledge of medieval layout and interior design contributed to an interesting building, it was difficult to distinguish historic features from those created in the first half of the 20th century. The Hovel was a long, low range, situated just north of the house. An existing boundary wall of 17th or 18th century date was incorporated as the rear [west] wall of this structure. The first phase of construction in creating the Hovel was the addition of a timber-built open-fronted shelter shed, the eastern wall of which survived in situ behind a modern weatherboard-clad exterior. Later developments included several phases of additions and alterations to the southern end of the structure incorporating part of an additional boundary wall. The final phase in the construction was the addition of an extension to the east at the southern end of the range in the late-20th century. The survey included an appraisal of the "Round Room", which as its name suggested, was a circular structure. The building was situated to the north of the property and comprised two phases of construction. The lower parts of the construction were built of stone rubble with an oversailing ledge over which a later timber-framed upper wall was built. The whole structure, including the roof, was clad in modern horizontal weatherboards. The Round Room was built between the closing years of the 19th century and the first decade of the 20th century. The function of the structure had not been ascertained, but was possibly intended for storage or to house a press. [Au(abr)]

*Work undertaken by:* Archaeology South-East

Despite the external appearance, the earliest part of the house dated from the late-14th century and comprised two bays and the fragment of a third of an originally four-bay timber-framed structure. The principal period remains were embedded within the middle part of the eastern range, with the eastern wall of a third bay extending through to the present main northern facade. The surviving section formed the two-bay hall and parlour of the medieval house. A primitive heating system was installed in the 16th century, which was later modified in the 17th and 18th centuries to incorporate a chimney flue and fireplace. Further later alterations were also noted. [Au(abr)]

Etheridge, D Kingswood : Avon Archaeological Unit, Report: 2007/101 2008, 25pp, colour pls, figs, refs

*Work undertaken by:* Avon Archaeological Unit

The standing building survey was undertaken prior to partial demolition and redevelopment of the study area. Notes and digital colour photographs were made of all accessible external areas. Recording of the late-20th century features was intended to characterize rather than create a detailed record. Detailed photographic recording was undertaken on the exterior and interior of the 19th century structures. Particular attention was paid to the original ceiling of the Hall, where visible. The ceiling was characterised by a geometric design in high relief executed in sawn timber on a lath and plaster base. It was found that the external walls of the hall had been constructed with load-bearing round arches, which were then filled in with either non-load bearing masonry or windows. [Au(abr)]

***Wacker Quay Engine Shed, Antony, Nr. Plymouth, Cornwall. Historic Building Recording***

Davis, R          Salisbury : WA Heritage, 2008, 14pp, colour pls, figs, tabs, refs

*Work undertaken by:* WA Heritage

The engine shed was once part of the Tregantle Military Railway, a standard gauge line built to serve the defensive forts of Scraesdon and Tregantle in the late-19th century. The engine shed was one of the few remaining features from this site, a prefabricated type of building that became common in the late-19th century. The shed was to be dismantled and rebuilt at another location as part of the refurbishment of Wacker Quay. At the time of the survey the building was structurally complete in much of the form that it was originally built. [Au(adp)]

*Land at The Farmer's House, Glynn, Bodmin, Cornwall: Photographic Survey*

King, D Swindon : Foundations Archaeology, 2008, 17pp, colour pls, figs, tabs, refs

*Work undertaken by:* Foundations Archaeology

A photographic survey was undertaken in April 2008. The required photographic survey involved the creation of graphic and visual records, in the form of written descriptions of the building and photography. The Photographic Survey was required on a redundant barn

adjacent to The Farmer's House prior to proposed conversion. Although the building was not of any particular architectural or historical merit, vernacular remains were becoming increasingly rare and were facing a high rate of loss through redundancy, demolition and conversion and therefore were worthy of recording prior to development. The barn was recorded on the 1880 Ordnance Survey plan and was at least 19th century in origin. It was originally built as a tack room and was probably a 19th century construction with mid-late-20th century additions. A more accurate construction date could not be given within the scope of the project, considering that the style of the building was fairly common. In the event that further works are undertaken within the complex it was recommended that a map regression exercise should be undertaken. In the 1970's the building was converted to a dairy and extensively remodelled internally. The roof structure and first floor were both modern replacements. [Au(abr)]

Tyler, REdgbaston : Birmingham Archaeology, Report: 1777 2008, 29pp, colour pls, figs, tabs, refs

*Work undertaken by:* Birmingham Archaeology

A photographic record of an agricultural outbuilding, representing a former cottage, at Shears Farm, Woodford, was undertaken in advance of conversion. The work was required to make an archive standard record of the buildings in advance of building works. The project allowed for a detailed photographic record of the former cottage to be made and, though the building had undergone radical alteration during the 1950s when it was converted from a two-storey domestic dwelling to a single-storey agricultural store, evidence was recorded relating to its former arrangements. Structural evidence was significantly enhanced by a series of historic photographs dating to the early part of the 20th century. [Au(abr)]

Berry, E Truro : Historic Environment Service Projects. Cornwall County Council, Report: 2008R038 2008, 38pp, colour pls, figs, tabs, refs

*Work undertaken by:* Historic Environment Service Projects. Cornwall County Council

The results of the survey demonstrated that the barn was a very individual example of its type and that it was the first planned building to be added to the existing farmstead. It was also clear that the horse-engine house was added to the barn soon after its construction and also that an open-fronted lean-to was added to the rear of the barn at about the same time, both additions possibly coeval with the insertion of a partition towards the east end of the barn to create a more secure granary area. Shippon and other buildings [already converted to holiday accommodation] added to the west end of the barn and at right angles to the south appeared to have been a post-medieval replacement of a less regular range of farm buildings on approximately the same site. Close examination of the building revealed a number of interesting possible interpretations for a number of the features present. The high quality of the building for one that was not part of a planned group was notable, as well as the existence of a possible horse-engine, a logical addition to the building. There was uncertainty as to the function of the building at ground floor level, relating to a feature that was recorded there, and the discovery that the original barn was not designed as bank barn demonstrated an important lesson about making assumptions as the purpose of a building. *Work undertaken by:* Historic Environment Service Projects. Cornwall County Council

The East Cauldledown Mill pan-kiln was built in the early 20th century and continued in use until the 1970s. Originally, it was a traditional china clay kiln, with a furnace room and chimney at the opposing end, and six settling tanks to the rear. The kiln was historically significant because it was the first such structure to incorporate a rotary drier in the 1940s. It was heavily modified in the Second World War with the insertion of a milling machine for pulverising clay, the subdivision of granite tanks and the construction of two block work buildings to house filter presses. ***Archaeological Recording of a WWII Personnel Shelter. Devon County Council Historic Environment Record***

Passmore, A Exeter : Exeter Archaeology, Report: EA6445 2008, 1p, colour pls, figs  
*Work undertaken by:* Exeter Archaeology

A record of a WWII personnel shelter was made prior to its demolition and the construction of a new aircraft hanger at Dunkeswell Airfield. The brick shelter had been surrounded, but not covered, by an earthen blast mound, although this had been removed prior to the survey. Measurements taken on the ground of its approximate extent corresponded with that depicted on modern Ordnance Survey mapping. The mound had been approximately 2.50m wide on the east, west and south sides, but only 1.10m wide on the north side. The mound had been formed from local stiff mottled yellow clay with flint, with a thin covering of topsoil supporting vegetation. The main brick-built structure was broadly rectangular and measured a maximum of 6.60m long, 4.45m wide and 1.50m high. The entrance was at the north end facing away from nearby dispersed hard standings and was flanked by sloped masonry on the sides of the shelter. The entrance gave access to a 5.50m long corridor, which in turn led into two rectangular chambers, 2.65m long by 1.45m and 1.60m wide. The shelter was constructed of unmarked frogged coarse red bricks laid in English Bond, and bonded with cement. The upper course was set on edge. The shelter was constructed on a 0.15m thick concrete plinth. This plinth was not reinforced, and did not extend beyond the extent of the walls. There was no surviving roof, and there was no evidence to indicate that the shelter had a roof. (A loose piece of reinforced concrete present on top of the shelter prior to its clearance was not thought into be in situ.) Internally, there were no fixtures or fittings such as benches. There were traces of green and yellow paint in one of the chambers and in the corridor respectively, but neither represented original decoration. [Au(abr)]

#### **SHUTE BARTON**

***Historic Building Analysis and Archaeological Survey of Shute Barton, Devon***

Exeter Archaeology Exeter : Exeter Archaeology, 2008, 1p  
*Work undertaken by:* Exeter Archaeology

From the mid-15th century to its partial demolition in the 1780s, Shute was one of the major houses of the West Country. Built by the Bonville family in the late medieval period and acquired by William Pole in 1561, it remained in the hands of Pole's descendants until the 20th century. Since 1959 it had been the property of the National Trust. Only a fragment of the medieval house survived, and its earlier form was not well recorded. However research, together with a new examination of the fabric of the building and of the surface archaeology, provided fresh information about the late medieval and early post-medieval house, most notably a detailed written survey made in 1559, discovered in 1996 and transcribed and

analysed here, provided a rare opportunity to reconstruct how the house was laid out and functioned. [Au(abr)]

**FARM BUILDINGS AT VENMORE FARM, WOODBURY**

***Archaeological Recording of the Farm Buildings at Venmore Farm, Woodbury, Devon***

Passmore, A Exeter : Exeter Archaeology, Report: 08.34 (6541) 2008, 20pp, colour pls, figs, tabs

*Work undertaken by:* Exeter Archaeology

The complex of historic buildings at Venmore Farm was constructed as a planned farmstead in the mid-19th century, which appeared to have replaced earlier buildings with a less formal layout than the 19th century buildings. The listing descriptions for both the farmhouse and farm buildings give the date of this rebuilding as being in the 1840s. However, there was some evidence to indicate that farm was constructed at a later date, perhaps in the 1850s or 1860s. The whole complex was constructed in brick, and the use of bullnose brick was not common until the second half of the 19th century. In West Devon, it was shown that brick was used in the rebuilding of farmhouses on the Maristow Estate from the late-1850s, one reason given being the abolition of the brick tax in 1852. The listing description for the house suggested the farm was one of the first to be rebuilt by the Rolle Estate as part of their improvements in the 19th century. The architecture of Venmore Farm was comparable to the other late-19th century Rolle Estate farms. However, there were some differences, in the lack of corbels supporting the gable ends of roofs, and the taller design of the two storey ranges that negated the need for dormer windows and tall, projecting entrance ways. It was also noted that Venmore Farm was constructed entirely of brick, whereas stone was used in other farms. This may however, simply have reflected the lack of suitable building stone at Woodbury. The style of roof was also identical to other late-19th century estate farms on the Blackdown Hills. The layout of the farm was a classic example of a 19th century planned farm, and as such it may have formed the model for later rebuilding of the Rolle Estate farms in East Devon. The layout was typical of 19th century farm improvement with a small yard that made efficient use of space. Although most of the buildings had been heavily altered and very few historic internal and external fittings survived, the design of the buildings provided some information to their original uses. Barn 1 probably had a symmetrical appearance with a central open fronted cart shed flanked by stables, the latter characterised by windows on either side of the doors providing light to the stalls. The last agricultural use was as a shippon. Barn 2 was designed as a shippon, with most of the ground floor used as such. The west room of the range would have functioned as a root store where food for the cows was stored. Access into this room was via a large opening in the west elevation, tall and wide enough for carts to enter from the small yard. The door in the east elevation gave direct access to the shippon. The functions of the two rooms at the east end of the building were not identified. The first floor was a hay loft. The last agricultural use of the building was as a dairy and stores. The use of barn 3 an open fronted structure in the middle of the farmyard was not established. The building could have been a cart shed or a dung store. Barn 4 was also a shippon, although the ground floor was heavily altered. The first floor was a loft and this function remains in use today. Barn 5 may have had a variety of uses. In plan, the south range is similar to but smaller than barn 1. The central area may have been open fronted, but could have been infilled with timber framing and been used as pigsties. The presence of doors in the east room indicated a non-husbandry function, perhaps as a store. The door into barn 4 from the west range may indicate this room was used as a root store serving the shippon in the adjacent barn 4, although the room was quite large and could have been divided into two rooms. Barn 7 was designed as a threshing barn. Although its architectural

style was consistent with the rest of the planned farm the building displayed the distinctive large central loading doors associated with (earlier) threshing barns, the west door also originally having a canopy or porch. Barn 8 probably had several functions. The west room was open fronted to the north fronting allowing access for carts from the small yard. The hoist above indicated that the loft was used for storage. The function of the ground floor of the east building was uncertain. The building appeared to be too large for housing animals, although could have provided further stables. Another possible interpretation was that the building was a pound house containing an apple crusher. Such machinery could have been powered by a driveshaft evident in barn 7. Historic 20th century maps depicted orchard in several fields around the farm. [Au(abr)]

***Archaeological Recording at Lower King's Mill, Cullompton, Devon***

Passmore, A J Exeter : Exeter Archaeology, Report: 09.43 2008, 14pp, colour pls, figs, refs

*Work undertaken by:* Exeter Archaeology

A barn and a derelict house were recorded prior to partial demolition and repairs at the rear of the currently occupied Lower King's Mill House. An archaeological assessment of the proposed works was carried out in advance of the recording that identified the derelict house as containing fabric of 16th or 17th century date. The buildings formed part of a large former industrial and domestic complex. The site straddled the River Culm, whose flow was formerly harnessed to drive water-powered mills. [Au(abr)]

***Thorverton Mill, Thorverton, Devon. Historic Building Recording***

Watts, M Cullompton : Martin Watts, Report: THO 170/08 2008, 45pp, colour pls, figs, tabs, refs

*Work undertaken by:* Martin Watts

Thorverton Mill was built in about 1885. It superseded an earlier mill, of medieval origin, which was sited to the south-west of the present complex of buildings. The mill, which was set up as a roller mill by 1889, was destroyed by fire in July 1897. It was quickly rebuilt and enlarged, the building on the footprint of the 1885 mill contained the wheat cleaning and millstone plant and a new block, of similar construction and dimensions, housing a six-sack roller plant, for flour production, by Robinsons of Rochdale. The mill was driven by two water turbines, fed by a leat from the river Exe. "Granolithic" grain silos were incorporated in the rebuilding, and further grain storage silos and loading structures were added during the 20th century. The mill, which latterly produced stoneground wholemeal for Allied Mills Ltd., was closed in September 1989 and most of the milling plant removed. The buildings are currently empty

and disused. The weir across the Exe was breached in 1999 and the leat had become dry. [Au(abr)]

Watts, M Cullompton : Martin Watts, Report: 165/2008 2008, 27pp, colour pls, figs, tabs, refs, CD

*Work undertaken by:* Martin Watts

A small functional two-storey building at the rear of 4 Barrington Street, Tiverton, was surveyed and recorded prior to its conversion to domestic use. The building, which probably dated from the late 18th or early 19th century, appeared to have been purpose-built for light industrial use, and was possibly older than the house behind which it was located. It was in use as a smithy by c.1838 and continued in use as such until the late-1920s. Remains of two flues from forge hearths survived, and there was possible evidence that the building was once divided into two working units. [Au(abr)]

Passmore, A J Exeter : Exeter Archaeology, Report: 6572 2008, 6pp, figs

*Work undertaken by:* Exeter Archaeology

In general, the development work would not have a significant effect on the historic fabric of the building. However, the works would provide an opportunity to more fully understand the building and its development. In particular, a record of the roof of the east range should be prepared, including of any elements currently hidden above the dressing room. Removal of the external render may expose evidence of earlier fenestration as well as structural features. The internal alterations may have exposed elements of pre-1970s fabric. Monitoring of these elements, in the form of a watching brief, was scheduled to take place. [Au]

Cottam, S Chicklade : AC archaeology, Report: ACD05/2/0 2008, 35pp, colour pls, figs, tabs, refs

*Work undertaken by:* AC archaeology

A historic building recording survey was carried out at Portland House, a Grade II Listed Building and of two and a half storeys with a workshop and yard to the rear. The house originally dated to the early 19th century with the ornate frontage added in 1891. The rear outbuilding/workshop was formerly used by W. Young and Sons, stone masons. On the rear internal wall of this workshop there were 17 stone carvings thought to have been made by apprentices. A survey of all the structures on the site established that much of the complex survived in its original form. The two buildings to the south had originally been separate but were joined by an extension, probably during the 19th century. The rear workshop was originally a large, open workshop/storage area that was later enclosed. [Au(abr)]

**FALLAPIT HOUSE, EAST ALLINGTON*****Archaeological Building Recording at Fallapit House, East Allington, Devon***

Parker, R Exeter : Exeter Archaeology, Report: 08.73 2008, 60pp, colour pls, figs, refs

*Work undertaken by:* Exeter Archaeology

Fallapit House was undoubtedly a place of great interest as the site of an ancient manorial settlement, including an important mansion and gardens as well as for its historic associations with the Fortescue family. Unfortunately, evidence of the medieval and later house remained

elusive. The present mansion, though clearly full of anomalies which might have suggested the incorporation of earlier fabric, could not actually be proven to include any substantial remains predating the early 19th century. The construction of much of the house, with timber lacing throughout the masonry, was typical of the period, and all the earlier elements visible in the fabric could just as easily have been reset in their current positions. There seemed little doubt that the ancient house was entirely demolished during the construction of the present house. The only possible exceptions to this were, perhaps, the archway over the carriageway to the north of the main frontage and the anomalous turret on the south elevation, though even this was arguable. The early 19th century house appeared to have been a more modest structure than the present building, with a compact rectangular plan and no significant service areas. [Au(abr)]

***The Cider Barn, Dent House, Doddiscombeleigh, Devon. Results of a Desk-based Assessment and Historic Building Recording***

Green, T, Humphreys, C & Waterhouse, R South Molton : South West Archaeology, Report: 090212 2008, 35pp, colour pls, figs, tabs, refs

*Work undertaken by:* South West Archaeology

The barn stood beside the minor road leading south from the settlement of Doddiscombsleigh to Lower Ashton. The two-storey building was constructed in stone with cob to the upper floor below a hipped slate roof. Inside, the cider making apparatus was intact and apparently in working order. According to the English Heritage Listing document, Dent House was apparently of 16th century origin having undergone 17th and 18th century remodelling and alterations and having been considerably extended in the 1970s. The documentary evidence and the surviving machinery within Cider Barn both suggested that the present building was probably constructed and the machinery installed between c.1840 and 1860. This tied in with an expansion of the farm and expansion and adaptation of the farm buildings at that time, associated with a change in ownership. [Au(abr)]

***Archaeological Recording of a Barn at Upcott Cottage, Cookbury, Devon***

Passmore, A.J Exeter : Exeter Archaeology, Report: 08.76 2008, 13pp

*Work undertaken by:* Exeter Archaeology

The barn was a small structure associated with the farm at Upcott. It had been previously described as a lincay, due to its open front. However, there was no evidence that the roof space was floored over and that this was used as a hay loft. In addition, with the exception of the east end of the barn, the lack of drainage provision in the cobbled surface also precluded an interpretation where the building housed cattle stalls throughout its length. An alternative use, which was reinforced by its position facing north away from the sun, was a cart shed, perhaps with some stalls. The building was likely to be of early to mid-19th century date. The roof structure was typical of a 19th century building. The complete use of stone rather than bricks indicated an earlier rather than later date within this period. It was possible that an abundance of locally sourced stone was available, since at this date the use of brick, at least for quoins and window jambs, may have been expected. The barn had undergone a few changes, probably through the later 19th century into the 20th century. These included the addition of a buttress against the east elevation that obscured an existing window. A new window was probably inserted to replace this window at the same time. The stalls were upgraded, with the enclosing of the open front and the provision of a new manger. Elsewhere, the bays were subdivided, perhaps to form storage for materials rather than carts. Green, T & Humphreys, C South Molton : South West Archaeology, Report: 090312  
 2008, 30pp, colour pls, figs, tabs, refs

*Work undertaken by:* South West Archaeology

Some of the earliest development in Appledore took place in and around Market Street. Number 46 represented part of an earlier probable three-cell cross-passage house (subsequently sub-divided), the eastern part of the curtilage of which was taken for the construction of the Quay in 1845. The extension to the rear of No. 46 was added in the mid-19th century after which the original building was subdivided. No evidence for earlier occupation was found during this assessment. [Au(abr)]

***Archaeological Recording in the Tower of the Church of St. Margaret, Northam, Devon***

Passmore, A Exeter : Exeter Archaeology, Report: 09.04 (6712) 2008, 9pp, colour pls, figs, tabs, refs

*Work undertaken by:* Exeter Archaeology

The church of St. Margaret at Northam contained a working early 20th century Perkins HPHW system, albeit served by a modern boiler. Unusually, the boiler was fuelled by gas. The system replaced two earlier Gurney Stoves located in the north aisle. No firm date for its installation was identified although 1906-1907 was proposed as the most likely date. A faculty for the erection of the vestry was issued in 1906, and the room was completed the following year. The pipes in the tower were attached to wooden panelling that extended throughout the ground floor of the tower and into the vestry. This panelling was depicted on 1906 plans for the construction of the vestry. Adjacent to the coil heater was a gas light fitting, contemporary with the panelling. The investigation concentrated on the recording of the heating system within the tower, with only limited observations of the system elsewhere in the church. It was understood that proposed phase 2 works to the church would involve the removal of pews within the western section of the church [i.e. to the west of the existing entrance). To facilitate this, a significant proportion of the surviving Perkins HPHW system, which was attached to the pews and included a number of long sinuous coil heaters, would need to be removed. **BARN AT VIRWORTHY WHARF, SUTCOMBE*****Barn at Virworthy Wharf Sutcombe Devon: Results of an Archaeological Building Survey***

Laing-Trengove, D South Molton : South West Archaeology, Report: 080522 2008, 15pp, colour pls, figs, tabs, refs

*Work undertaken by:* South West Archaeology

The barn stood on a former wharf associated with the Alfardisworthy branch of the Bude Canal, which was opened in the 1820s in order to import large volumes of lime and sea sand into the agricultural hinterland of north Devon, and which closed in the late-1890s as a result of competition from the railway. This branch of the Bude canal was built as a navigable feeder. Its main purpose was to carry water from the reservoir constructed about quarter mile up the valley to the main Holsworthy line of the canal; but it was also large enough to be navigated by tub-boats. The wharf had here, for a few brief years a vitalising effect on the local economy. The sand was brought in by the tub-boats and collected by cart for distribution to nearby farms. Other heavy goods such as coal and timber also arrived by water. The wharf building was typical of those on the Bude canal. It was used for storing perishable or valuable goods. [Au(abr)]

Passmore, A Exeter : Exeter Archaeology, Report: 0916 2008, 13pp, colour pls, figs, refs

*Work undertaken by:* Exeter Archaeology

The deer barn was a highly unusual structure, which was unique in Devon and rare nationally. Information on such buildings was not therefore readily available. There appeared to be no standard design, although many did incorporate a first-floor loft. Surviving buildings are either enclosed, fully open, enclosed with wide openings on several elevations, or comprise two ranges with one enclosed and the other open. There is no standard size or shape although earlier examples tended to be larger than later barns, and built in architectural styles in keeping with designed parklands. The barns seem to have been used for feeding, although the enclosed examples may also have been used as shelters. The roof of the building had been re-used. Alterations probably indicated that the original roof was damaged. It was possible that the whole building was replaced, and the piers rebuilt, there was no evidence or known reason for this to have occurred. It was therefore probable that the roof originated from another building. It was known that the intermediate 'collars' were re-used from an earlier domestic structure, although these could have been added after the barn was constructed. There was no clear dating evidence for the deer barn at Stevenstone, the main dating feature being the re-used roof. Despite this, the carpentry evident in the resetting of the roof was of good quality, utilising cambered rather than straight collars, and likely to be of 17th-century date. The presence of brick at the top of the piers was puzzling, and may have indicated the piers had been partially rebuilt. However, if they were original then they were unlikely to date to before the mid-late-17th century. In the 19th century the building was converted into cattle stalls, and this use continued into (at least) the mid-20th century. The first floor was probably originally used as a loft, again a function that continued during the later life of the building. [Au(abr)]

**Archaeological Recording Exercise at Bracken Hill, North Road, Leigh Woods, North Somerset**

Avon Archaeological Unit Kingswood : Avon Archaeological Unit, 2008, 16pp, colour pls, figs, tabs, refs

*Work undertaken by:* Avon Archaeological Unit

The Bracken Hill estate was established in 1896 by Walter Melville Wills, the Bristol tobacco magnate, and much of the gardens created by James Pulham between 1907 and 1927. The estate was donated to the University of Bristol in 1947 and the University Botanical Gardens were established in 1959. In 2002 it was decided to move the Botanical Gardens to grounds closer to the university and the Bracken Hill site was sold. Documentary sources indicated that the earliest glasshouses had been constructed by 1903, with a further example built in 1916. The results of the recording exercise indicated that, of these four original structures, only one glasshouse was likely to remain largely in its original state, with three others having been significantly remodelled, or entirely replaced at a subsequent date. The remaining glasshouses appeared to post-date the bequeathing of the gardens to the university and were modern structures erected at various times after 1956. The series of rectangular planting beds recorded in the former vegetable garden were laid out some time between 1916 and 1946, whilst the masonry structures that formed the raised planting beds and associated sunken pits of the watergarden were relatively modern features associated with the Botanic Gardens and constructed between 1970 and 1975. Passmore, A J Exeter : Exeter Archaeology, Report: 08.56 2008, 8pp, colour pls, figs, refs

*Work undertaken by:* Exeter Archaeology

The air raid shelter at Montpelier School was one of a group constructed in the Second World War within the grounds of Plymouth schools. Two general designs were constructed in the city, square [using pre-cast concrete slabs] and arched. Other types were, however, known. The example at Montpelier School was of the arched type and L-shaped in plan, with interconnecting tunnels. Fixtures and fittings in the form of lights and bench leg bases were

observed, and were thought to be present throughout the structure. The structure was flooded and of poor structural quality, as was projected. [Au(adp)]

Hislop, M Edgbaston : Birmingham Archaeology, Report: 1737.1 2008, 29pp, colour pls, figs, refs

*Work undertaken by:* Birmingham Archaeology

A built heritage assessment was undertaken of standing remains within an area of proposed development amongst the back plots of Fore Street and Cornhill, part of a conservation area in Wellington. Twenty structures were assessed including former and existing boundary divisions. Seven structures were considered to have no special architectural or historic interest. The others had varying degrees of local interest including a number of structures that incorporate a local vernacular form of construction that utilised chert rubble. Several of these chert structures were the boundary walls that delineate the backplots, apparently derived from medieval burgage plots. Dating was problematic, but there was no obviously early material, and the technique was certainly in use up to the mid-19th century. While the proposed development would provide an opportunity for the revitalisation of what became an unused and derelict area, the proposals as they stood would have resulted in the demolition of a number of these structures of local interest. In the event mitigation was recommended in the form of preservation by record. [Au(abr)]

*Work undertaken by:* GSB Prospection

Following the successful earlier survey at Fairfield in 2007, a second phase of work was carried out in order to try to gain a better understanding of the remains surviving under the fields beyond the present-day gardens. The most exciting discovery of this phase of the work at Fairfield has been the identification and mapping of the boundary wall, previously known to exist only on early plans and paintings. While other results have proved more difficult to interpret, a number of potentially interesting targets were identified which were thought to be key to understanding the development and layout of the grounds. ***Inn on the Quay, Goodrington, Paignton, Devon. Architectural and Archaeological Assessment***

Rous, M Salisbury : WA Heritage, Report: 70010 2008, 88pp, colour pls, figs, tabs, refs

*Work undertaken by:* WA Heritage

The site comprised an L-shaped range of buildings of one to three storeys dating from the late-18th century onwards, a rare example of a Napoleonic field hospital. The assessment discovered that the earliest elements of the building were found in the west wing of the East-West Range, where an external gable and remains of a rounded chimney stack found in the roof may have represented the remains of a small post-medieval cottage or fisherman's hut that predated the construction of the mid-late-18th century house. There was thought to be a low potential for the discovery of remains predating the site's use by the Admiralty in the early 1800s, with documentary evidence 'thin on the ground'. However, due to the likelihood for remains from the post-medieval to modern periods, an evaluation was recommended. [Au(adp)]

The principal structure surviving on the site was the result of a main phase of construction in the late-17th or early 18th century. The building was substantially altered in the late-19th/early 20th century when it was partly clad with tile-hanging and re-fenestrated. The interior was thoroughly overhauled in the later 20th century, such that with the exception of the staircase, it was virtually devoid of early fixtures and fittings, which somewhat hindered refinement in terms of the date of the building's phases. *Work undertaken by:* Wardell Armstrong

Building recording at the site demonstrated that the building was a well-preserved example of World War II defensive architecture with the dual function of providing decontamination facilities in the event of gas attack and protection from bombs and incendiaries. Despite the absence of fixtures and fittings the function of the building was clearly reflected in the structural design and layout. Identification of the building's function demonstrated the gravity with which the threat of a perceived gas attack was regarded, and most importantly served to highlight the presence of specific structural and design features in a building which at first sight appeared relatively insignificant. This would serve to ensure further identification of other World War II decontamination units that may otherwise have gone unnoticed. [Au(abr)]

### **THE WHARF PH , STATION ROAD, OLD HILL, CRADLEY HEATH**

***The Wharf Public House, Station Road, Old Hill, Cradley Heath, West Midlands. Historic Building Record***

Tyler, REdgbaston : Birmingham Archaeology, Report: PN1740 2008, 54pp, colour pls, figs, tabs, refs, index

*Work undertaken by:* Birmingham Archaeology

A programme of historic building recording was undertaken in January 2008 at The Wharf Public House, in advance of the redevelopment of the site for residential purposes. The Wharf Public House was included on the Statutory List of Buildings of Special Architectural or Historical Interest as a Grade II Listed structure. The unfortunate destruction of much of the building by fire in February 2006 and the subsequent deterioration of the fabric had, however, significantly reduced the inherent historical interest of the buildings themselves. Under these circumstances, and within the limitations imposed by Health and Safety concerns resultant from the dangerous condition of the buildings, the project allowed for as full a record as possible to be made of the remaining buildings in their present state, in advance of demolition. The historic core of the Wharf originated as an isolated farmhouse, Slack Hillock Farmhouse, loosely dated to the middle years of the 18th century. Identifiable alterations made to the primary structure include the full rebuilding of the southern elevation and the strengthening of the block by the introduction of three tiers of iron tie rods extending around all four elevations, presumably in response to subsidence arising from the extensive mining activities in the area. Slack Hillock Farm was sold in 1852 and was converted to use as a hotel or inn, being first listed in the trade directories as "The Sportsman and Railway Hotel" in 1860. The change of use reflected the general reduction in traditional agricultural land-use as farming became increasingly incongruous within a rapidly developing industrial landscape. A series of single storey extensions to the east, north and west of the main block dated principally to the later years of the 20th century and were of no inherent architectural significance or merit. **BASTION MEWS*****Bastion Mews, Hereford: Historic Building Assessment***

Archaeological Investigations Ltd. Hereford : Archaeological Investigations Ltd., 2008, 38pp, pls, colour pls, figs, tabs, refs, index

*Work undertaken by:* Archaeological Investigations Ltd.

An historic building assessment was undertaken of properties at Bastion Mews. The site lay in the Hereford Area of Archaeological Importance close to the site of the medieval Byesters Gate. The line of the medieval city wall ran along the eastern side of the site. Four buildings were considered in detail, the remaining structures being recent or temporary in nature. These were Rowberry and Sons Butcher Shop (formerly no.1 Commercial Square, latterly No. 37 Commercial Square/Street), Cartridge world (13 Union Street), Papaya (18 Commercial Street) and Bastion House. No. 18 Union Street appeared to have been built between 1800 and 1836, and No. 13 was probably late-19th century in date. No. 37 Commercial Square was built just before 1848 and was the remaining terrace of a row of five, the other four demolished to make way for the Hereford inner ring road (Bath Street widening) in 1967, Bastion House was likely to be similar in date. Historically and architecturally the most significant of these appeared to be Bastion House, which was most probably built by Leonard Johnson from the demolished remains of the city prison, and as a 19th century ashlar stone-built structure was unusual in Hereford City. Leonard Johnson also built one of the other buildings studied at 37 Commercial Square, a sole surviving property from a row of 5 terraces (four demolished in 1967). However, this property was much altered both internally and externally from its original design. Both these buildings were built around 1848. The other two buildings studied, Nos. 13 and 18 Union Street, had also undergone major internal and external alteration. The first of these included structures spanning from the beginning of the 19th century into the late Victorian period, the second dating from the early 19th century. The latter (no. 18) did not appear to retain any visible original features in its façade. One other structure of significance was considered, the rebuilt line of the city wall, a Scheduled Ancient Monument. The above ground portion was of 19th century date, probably reconstructed around 1848 when the Bastion was demolished and this part of the city redeveloped. The Scheduling for this also encompassed the east end of Bastion House. [Au(abr)]

Morriss, R Bromlow : Richard K Morriss & Associates, Report: 377 2008, 59pp, pls, figs, refs

Work undertaken by: Richard K Morriss & Associates

The gatehouse and hall were probably begun in the mid-14th century. Work seemed to have recommenced in the mid-15th century. In the post-medieval period, the status of the site declined and the gatehouse was extended as the main dwelling and farmhouse, the hall was relegated to agricultural use. It was re-roofed in the 18th century and a new opening created, but the basic masonry survived. It consisted of a hall range containing the great hall and a floored service area beyond the former screen's passage at its low end, and a projected service wing. There was also a larger shelter shed and another building, which later became a garage. [Au(abr)]

Frost, P Pontesbury : Castlery Archaeology, 2008, 24pp, colour pls, figs, refs

*Work undertaken by:* Castlering Archaeology

The only dating evidence for the round house was its appearance for the first time on the 1929 OS map. This date was considered to be extremely rare for a structure of this type. The building material indicated a construction date no earlier than the 1890s period, to time when the Ruabon red brick used on the building became fashionable. There were several attributes that made the Round House a unique structure. The building was a particularly late example of a horse engine house, in an unusually isolated position for a horse engine. ***Vennington Farm, Vennington, Shropshire***

Castlering Archaeology Pontesbury : Castlering Archaeology, Report: 302 2008, 16pp, colour pls, figs, refs

*Work undertaken by:* Castlering Archaeology

A survey was made of the buildings at Vennington Farm. The main building of the complex was Vennington Farmhouse, designated as a Grade II Listed Building in 1986. To the west of the farmhouse, the complex included a two-storey barn and cart shed with loft above, a range of single-storey stabling with a two storey barn adjoining the east end and a barn originally of timber framed construction aligned north-south and fronting the roadside. These buildings were referred to as Buildings A, B and C throughout the Listed Building. [Au(abr)]

**HOB HILL COTTAGE, NEAR BRAMSHALL**

***Hob Hill Cottage, Near Bramshall, Staffordshire. Historic Building Recording***

Meeson, B & Henshaw, C Tamworth : Bob Meeson, Report: 08/14 2008, 9pp, colour pls, figs, refs

*Work undertaken by:* Bob Meeson

Prior to its demolition in October 2008, a historic building record was made of Hob Hill Cottage. The building comprised an early 19th century brick cottage with two rooms down and two rooms up, with later additions on each end and to the rear. As a result, a sequence of refurbishments, particularly in the middle of the 20th century, and again in or about 1970, the cottage contained few visible early fixtures or fittings. The most interesting extension was the former cow-house to the south, which, despite its conversion into a garage, retained evidence of internal alteration to meet the changing needs of the farmers. Poole, B Chester : L-P: Archaeology, Report: LP0771C-HBR-v1.2 2008, 122pp, pls, figs, refs

*Work undertaken by:* L-P: Archaeology

The building lay within a medieval monastic centre and rural village, later part of the 18th century industrial growth area. Tutbury Mill was a Grade II Listed structure, and both structures, the Mill and Mill House, lay within a Conservation Area. The mill dated to the late-18th century and 12 subsequent construction phases were identified. Only a number of features from the early mill survived, such as shaft bearing boxes on both the ground floor and third floors, as well as blocked up arches associated with the wheel pit and fixings. **WHITTINGTON BARRACKS, LICHFIELD*****Whittington Barracks, Lichfield, Staffordshire: Historic Building Record, October 2008***

Tyler, R Edgbaston : Birmingham Archaeology, Report: 1878 2008, 104pp, colour pls, figs, tabs, refs

*Work undertaken by:* Birmingham Archaeology

A programme of historic building recording was undertaken at the Whittington Barracks. The Whittington Barracks were one of 22 'localisation depots' constructed throughout Great Britain between 1872 and 1880, as a direct result of the 'Cardwell Reforms'. The barracks were constructed on Whittington Heath in the late-1870s, on land purchased from the Marquis of Anglesey, and were handed over to the Military in August 1880. The project recorded the details of a total of nine structures at the site, the majority of which dated to a radical programme of modernisation undertaken in c.1964 and were only of limited historical interest and of no inherent architectural merit. A single structure [The Training Wing] represented an original element of the barrack complex as designed in the 1870s and was of special interest. While maintaining to a great degree its original exterior appearance, it was evident that this building had undergone radical internal alteration with the removal of partition walls and primary stacks and the excavation of a semi-basement. Further, the building had been removed to a great degree from its historical context by the demolition of adjacent contemporary structures. Further buildings dated to the development and extension of facilities at the barracks in the years before and during the Second World War. [Au(abr)]

### **LCUK CAULDON WORKS**

***LCUK Caudon Works, Staffordshire. Proposed Extension to Limestone and Shale Quarries. Historic Building Recording of Field Barn and Topographic Survey of Historic Limekiln***

Davis, R          Salisbury : WA Heritage, Report: 63504.01 2008, 12pp, colour pls, figs, tabs, refs

*Work undertaken by:* WA Heritage

The survey identified that the field barn, although badly damaged by partial collapse, was a typical example of post-medieval agricultural exploitation of marginal land. Located as it was in small field pastures, it was constructed to shelter animals in harsh weather and to store hay gathered from close by. The limekiln appeared to have been built in the 18th century to exploit the natural outcropping of limestone, and was used to produce lime for a variety of purposes including agricultural soil improvement and for lime mortar construction. The associated quarry was also recorded. [Au(adp)]

### **BUILDINGS 18, 19, 20 & 21, CHATTERLEY WHITFIELD COLLIERY**

***Archaeological Building Recording of Buildings 18, 19, 20 & 21: Chatterley Whitfield Colliery***

***Stoke-on-Trent, Staffordshire***

Sutherland, Z    Hanley : Stoke-on-Trent Archaeology, Report: 244 2008, 64pp, colour pls, figs, tabs, refs

*Work undertaken by:* Stoke-on-Trent Archaeology

A building recording was carried out on buildings 18, 19, 20 and 21, Chatterley Whitfield Colliery. The building recording took place between the 4th and the 28th August 2008 and surveyed a complex of buildings comprising 18: Baths, 19: Canteen, 20: Medical Centre/Deployment Wing and 21: Rescue Station, built between 1937 and 1976. The Baths and the Canteen were built by the Miners Welfare Commission in 1937 and were indicative of improvements in miner's welfare made from the early 1900s onwards. The Baths in particular, retained many of the original furniture and fittings specific to such a building. As the colliery grew extra accommodation was added to the Canteen in the form of Building 21, built by 1951, and originally known as the feeding centre. Further changes were made following new standards introduced with nationalisation in 1947. In the mid-1950s Building 21 was altered to accommodate a dedicated rescue station, although little trace of this was identified within the structure. Building 21 was built in the mid-1960s as a Deployment Wing. Following the closure of the colliery in 1976 the internal layout of the buildings was significantly altered. In particular the ground floor of the Baths was subdivided by breeze-block and glazed timber

partitions. The insertion of additional doorways provided external access to many of the workshops. The Chatterley Whitfield Mining Museum took over many of the buildings from 1978 until closure in 1991. Under their occupation Building 19 remained in use as the Canteen, however, Building 21 was sub-divided. More recently the buildings had been unoccupied with the exception of Building 20 which was refurbished. [Au(abr)]

**OASIS DATABASE: CAPPER RATAUD BUILDING, CLOUGH STREET, STOKE-ON-TRENT**

***Former Capper Rataud Building, Stoke-on-Trent, Historic Building Recording***

Simons, E., Lilley, S. AOC Archaeology Group, Loanhead, Scotland : AOC Archaeology Group, 2008, A4, 71 pages, including 9 A3 fold-out pages. Text, photographs, plans and elevations. White spine, transparent plastic covers.

*Work undertaken by:* AOC Archaeology Group

"A programme of historic building recording was required as a condition of planning consent prior to the demolition of the Former Capper Rataud Building, Clough Street, Stoke-on-Trent. AOC Archaeology Group were commissioned by Pinnacle Consulting Engineers to undertake this work in November 2007. The former Capper Rataud works is a typical industrial complex within the Stoke area and is characterised as having a plain utilitarian style. The initial construction of the factory dates to the late 19th century with the erection of the Kensington Pottery on the western half of the site and a confectionary factory situated on the corner of Morley and Statham Streets. Both were built over the remains of a former unnamed Pottery, although the extent to which any earlier buildings were re-used is unclear due to later developments in the 20th century. Both works underwent expansion along Statham Street so that by the mid 20th century the two factories became united under a single continuous facade. Whilst the interior of the ground and second floors survived to include decorative brick corbels, brick pilasters and King and Queen post roof trusses, substantial fire damage to the first floor prevented much of the area from being accessed and its character understood. This report provides a synthesis of the results of the Level 3 recording undertaken on the former Capper Rataud works, which included archive research, a detailed photographic, written and drawn record of the building. It also includes the results of a Level 1 survey of the facades of several buildings running along the north side of Clough Street, many of which have late Art Deco or Modernist decorative schemes." **BUILDING 29: GEOLOGY OFFICE, CHATTERLEY WHITFIELD COLLIERY**  
***Archaeological Building Recording of Building 29. Geology Office, Chatterley Whitfield Colliery, Stoke-on-Trent, Staffordshire***

Sutherland, Z Hanley : Stoke-on-Trent Archaeology, Report: 226 2008, 22pp, colour pls, figs, tabs, refs

*Work undertaken by:* Stoke-on-Trent Archaeology

The building recording identified an early to mid-20th century building that had been utilised as a mix of office and workshop space. Its occupants had included the Colliery Manager, the National Coal Board's Western Area Geology Office and, most recently, a car repair business. The internal layout of the building was largely constructed with wooden partitions and displayed little evidence of change over time. A brick partition and supporting wall appeared to have been removed in room A and, later, a breeze block wall had been constructed to separate this room from the rest of the building. Some partitions had also been removed in rooms A and D, probably in order to increase the available workshop space. Further evidence of alteration may, however, have been lost in a recent fire which gutted the south-east end of the building. [Au(abr)]

Archaeological recording of the remains of a mill, located on the south bank of the River Severn was undertaken. Engineering works involved the implementation of stabilisation measures (including piling) on both sides of the River Severn. The recording was to take place prior to continuation of works in the area of the mill, once an important mining community and heavily populated with industries dealing in iron, brick and tile making. Though one of the tile factories was still in operation at Jackfield, all of the earlier industries had ceased in this part of the Gorge. The features recorded were of local significance. [Au(abr)]

A rapid record was made of the probable 18th century, unlisted barn in 2008 in advance of restoration. The building represented the ruinous north-eastern arm of a complex that was L-shaped with a yard to the south-east in 1839. The south-eastern end of the building contained accommodation with two ground floor rooms and a loft over. The larger south-western room had an external door and window to the south-west, an inserted brick fireplace and a tiled floor. The smaller north-eastern room had a window to the north-east and was paved with bricks. The next room to the north-west had facing doorways of different sizes, a cobbled floor and a loft over; it may have housed animals. The complex was partly demolished sometime after 1974. [Sec]

Palmer, N & Grieg, I     Warwick : Warwickshire Museum Field Services,   2008, 1p, colour pls, figs, tabs, refs

*Work undertaken by:* Warwickshire Museum Field Services

A rapid survey to inform redevelopment proposals for one of a pair of large, Grade II\* Listed, semi-detached town houses built c.1698 after the 1694 fire of Warwick was carried out. The survey revealed five main building phases, the original house of c.1698, extensions to the north-eastern and north-western parts of the house made between 1806 and 1851; a rebuilding of the rear service wing between 1851 and 1886; alterations carried out in the 1930s and conversion into the WCC Staff club in the 1960s. The garden contained the buried remains of medieval properties fronting Saltisford destroyed by the 1694 fire and an earlier fire of 1664 and unbuilt on since. Observation of five borehole starter pits to the rear of the house revealed a deep layer of topsoil, over natural clay in three pits, deeper in the other two. [Au(abr)]

**BELL HALL CHAPEL, BELL END, BELBROUGHTON**

**Bell Hall Chapel, Bell End, Belbroughton**

Pagett, T     Worcester : Tom Pagett,   2008, 12pp, colour pls, figs, tabs, refs

*Work undertaken by:* Tom Pagett

The purpose of the survey was to re-examine the building known as the Chapel at Bell End, which was first surveyed in 1991. This survey was undertaken in April and May 2008. The building of stone churches in Worcestershire appeared to occur in the period 1130-1200. The building was showing signs of wear and tear by the 15th-16th centuries. It was around this time that possibly the insertion of an inner shell with the addition of new windows occurred. The English Reformation in the mid-16th century may have had some bearing on the continued use of the building for ecclesiastical purposes and the general decline at that time. [Au(adp)]

Williams, P Worcester : Mercian Archaeology and Historic Buildings, Report: PJ225 2008, 22pp, colour pls, figs, tabs, refs

*Work undertaken by:* Mercian Archaeology and Historic Buildings

The assessment determined that the cottage was most likely built during the early decades of the 19th century for rent to a local worker. The site was then surrounded by larger farms, which by 1866 were all incorporated into the Bockleton Estate. The building itself was a two-up two-down cottage with an attached brick-built lean-to, probably made of bricks from the estate's own brick kilns. The evidence suggested that the structure was likely to have been of one phase, with only minor alterations over the next 200 years. [Au(adp)]

A barn on the site was recorded, and established to have been brick-built with a tile roof. It comprised three bays, the central one over the threshing floor. Stables were recorded on the eastern end, with a hayloft overhead. Small extensions on the north and south sides consisted of a probable tack room, tool store and dairy. [Au(abr)]

Recording took place of a number of buildings at the site. Lower End House was a Grade II Listed Building dating to the 16th or 17th century, and had undergone a very fine and sympathetic restoration programme to be converted into accommodation for a nearby cookery school. The barns comprised four structures all joined to each other, a threshing barn, stable, byre and a barn that was once open space but later became roofed storage. [Au(adp)]

Tyler, REdgbaston : Birmingham Archaeology, Report: 1856 2008, 67pp, colour pls, figs, tabs, refs

*Work undertaken by:* Birmingham Archaeology

A programme of historic building recording was undertaken at Hill Top Farm. Documentary sources did not allow for a precise date to be assigned for the construction of the outbuildings. Therefore, dating of the structural remains were based upon stylistic evidence of form and fabric alone. The outbuilding under consideration had to be evaluated together with the series of agricultural buildings to the west and north-west which, a cursory inspection suggested, were broadly contemporary and formed part of a conceptual whole, being laid out around three sides of a central yard. The surviving buildings on the western side of the yard comprised a brick-built barn and a four-bay cart house beneath a raised granary. The yard was originally closed to the north by a long, single-storey range, represented at the time of recording only by the ruinous, western stub. Such an arrangement seemed to represent a planned programme of building, reflecting the rationalisation of the farming process and a more scientific approach to agriculture, a pattern of development that became increasingly current during the second half of the 18th century and into the 19th century. In the absence of firm documentary evidence for the date of the buildings at Hill Top Farm, they should be set within this late-18th/early 19th century context, most probably representing an expansion or restructuring of the farm after the enclosure of the common in 1779. The building as recorded constituted an interesting and attractive, though unremarkable structure and formed part of a relatively complete complex of agricultural outbuildings dating to the later 18th or early 19th century. The visual completeness of the complex was masked, however, to a large extent by the intrusive, 20th-century metal framed structure covering the central yard. The study allowed for a full visual and interpretative record of the outbuildings to be made ahead of conversion, and can be seen to form the basis for a more complete record of the complex as a whole should further works be proposed in the future. Children, G Leominster : Border Archaeology, Report: BA0802PPWFH 2008, 41pp, colour pls, figs, tabs, refs

*Work undertaken by:* Border Archaeology

The standing building recording survey of the complex of outbuildings at Woodrow Farm, supplemented by documentary research, identified evidence of three major phases of construction and rebuilding. The site at Woodrow Farm had been occupied at least since the early 18th century and probably much earlier. A detailed plan of the manor of Hanbury dated 1731 showed a house occupying the site of the farm, however, no adjacent outbuildings were shown. The Ordnance Survey surveyors' drawing of 1813 and the Hanbury tithe map of 1838 showed that a complex of outbuildings had been erected to the south-east of the farmhouse, however, its layout bore little resemblance to the existing outbuildings, which appeared to have been constructed at some time between 1838 and 1884. This initial construction phase was represented by the northern range of Barn 3, Barn 4, the small L-shaped stable block immediately north of Barn 3, Barn 5, situated immediately adjacent to and west of Barn 3, the range of pigsties and adjacent swill house [Barn 6]. The consistent external detailing of this group of buildings confirmed that they were constructed at about the same time. A secondary phase was represented by the construction of Barn 2, lying adjacent to the east of Barn 3 and replacing an earlier structure, which, based on cartographic evidence, appeared to have been rebuilt at some time between 1884 and 1904. A small single-storey extension was added to the north of Barn 2 at some time between 1904 and 1928. The most recent phase of building activity, dating from the mid-late-1970s, was represented by the building of a brick extension to the north of Barn 2 to accommodate a workshop, together with the rebuilding of the southern range of Barn 3 and the extensive renewal of window-and door-openings in Barns 3 and 4. *Work undertaken by:* Martin Cook

A building appraisal determined that the building, although probably of early 19th century in date, had been significantly and substantially altered in the later 19th and 20th centuries. It no longer had any of its original windows, all having been replaced by modern, usually uPVC, items. There were no surviving internal features that would have made further recording of the building worthwhile. The building was clearly associated with a prosperous, early 19th century Evesham man. However, it lies at the end of a row of several such buildings on the road out of Evesham and it was not believed that this alone made it worthy of preservation or further recording. [Au(abr)]

Napthan, M Worcester : Mike Napthan Archaeology, Report: WSM 38550 2008, 24pp, colour pls, figs, tabs, refs

*Work undertaken by:* Mike Napthan Archaeology

A programme of archaeological building recording was undertaken in January 2008, prior to the rebuilding of the present farmhouse in an existing form. The farm house had a complex structural history, and only very fragmentary evidence survived of its earliest phase. The earliest element was the remains of a medieval cruck truss, consisting of two opposing cruck blades and the truncated remains of a collar. These were tree ring dated to 1439. There is a small amount of late-17th century brick visible within the building together with reused internal doors of late-17th early 18th century date. The vast majority of the surviving fabric is 18th and 19th century in date. The interior of the house was primarily the product of a major 19th century remodelling, broadly contemporary with the addition of the north wing [c.1850-1860] and then a later addition of a lean-to kitchen [c.1860-1870]. An extension was built in the [1960s-70s] on the southern elevation. This was later demolished. A more recent remodelling [1990s] involved alterations to the interior layout, which left little of the original character. [Au(abr)]

Gilbert, N Kidderminster : Historic Kidderminster Project, Report: 769 2008, 3pp, colour pls, figs, refs

*Work undertaken by:* Historic Kidderminster Project

This house was of particular interest because it was an example of a council house built for sale. This issue caused much political controversy in the inter-war period. Sometimes whole estates were erected by the Borough of Kidderminster with the intention of selling the houses to private buyers. The report was based upon the deeds held by the present owner. This house was part of a large estate created by the break up of the historic Sutton Farm. Sutton was named in Domesday of 1086. The most likely site of the medieval settlement was where the farm stood until demolition in the 1930s, at the junction of Woodward Rd and Brinton Crescent where they meet Tomkinson Drive. With Kidderminster expanding outwards and agriculture in the doldrums, Sutton Farm was ripe for sale and redevelopment. In 1881 much of the farmland was purchased by the Worcester Land and Investment Company. However, this company was unable to develop much of the land, and in 1902 its members resolved to wind up the business. In June 1903 the farm, which still operated under yearly tenants, was sold with 52 acres of land to a house furnisher of Kidderminster. The land still had to wait a considerable time for building to take place, and was to be used to build a large council

estate. However, the houses built by the council were all to be sold. This policy was vigorously opposed by the rising Labour Party, who favoured letting the properties. In October 1929 the Corporation sold the newly built house to a blacksmith of 10 Clensmore St, at the price of £290. A good sized garden of 400 sq yards was included. The deeds showed that the house was then rented out by private landlords until 1944. [Au(abr)]

The house was of particular interest, having been built in consequence of the activity of the Park Street Land Society, which extended the street down to the cemetery in the late-19th century. The basis of the report came from documents held by the present owner. The house carried a stone with its name, Eton Cottage. It fronted directly on to the pavement, as did all the houses built in Park Street at this time. It was semi-detached. Its neighbouring house, number 108, which occupied the other half of the lot, was a mirror image and must have been built at the same time. It too appeared on the 1885 OS map. It was named Alma Cottage. Presumably its builder co-operated with in the construction of the two houses. In the 1887 list it is owned by William Cave. The neighbouring house on the north side was also shown on the 1885 map and was one of the biggest houses in this development of Park Street. In 1887 it was owned and occupied by James France. Gilbert, N      Kidderminster : Historic Kidderminster Project, Report: 741 2008, 4pp, colour pls, figs

*Work undertaken by:* Historic Kidderminster Project

The house was of great interest as part of a significant development of a row of cottages along the west side of Sutton Road in Kidderminster Foreign. The land was taken from a field belonging to Sutton Farm. It seemed to have been a very early example of a private initiative to enable a number of individual owners to quickly build upon a line of plots. A sales notice from August 1918 briefly described the two properties, by then having their present numbers 192 and 193. Each house contained three bedrooms, parlour, kitchen and cellar, and at the rear which was approached by a party entry, there was a paved yard with two sculleries, WC and long plot of garden land. The side entry only served number 192 at the time of recording. It was likely to have been uncovered originally, with the first floor subsequently being extended over it. [Au(abr)]

This was an important house by virtue of its occupation of a site which was part of an extensive piece of land purchased in 1851 by the ambitious Kidderminster Freehold Land Society. Deeds held by the present owners provided evidence that the apparent aim of the society was to create working class home owners with the qualification to vote, this was not always achieved. It took a quarter of a century before this house was built by John Lane 1876-79. The Kidderminster Freehold Land Society was formed in 1849. By January 1851 it had collected £645 in contributions from members. It made various purchases of land, and its second purchase in 1851 was at the Borough boundary on the east side of Sutton Road, then usually described as Sutton Common, but sometimes as Blakebrook. The society laid out the streets, which were Hume Street, Holman Street, Talbot Street and Franchise Street. The last-named street referred to the aim of the society's promoters to create new voters, who they hoped as working men would vote for the Liberal party. In July 1851 it was reported that "the levelling at Blakebrook is completed and the whole fenced in with rustic paling in a strong and tasteful manner". The land society created and disposed of building plots and presumably it was quickly realised that more was needed to ensure homes were actually built and were affordable to working men. A second organisation was set up to build up a fund for lending to members the money to purchase their plot and house. This was the Kidderminster Freeholders Permanent Benefit Building Society established in September 1851. The plots had already been allocated by April 1851, a plan of the allocated plots survived and was held by Kidderminster Library. In following the analysis it was important to distinguish between the present numbering of the houses and the numbering of the plots on the 1851 plan. Number 46 Franchise Street was built on the north side of the plot allocated to William Thomas and numbered 49. [Au(abr)]

**RIFLE RANGE HALT, SEVERN VALLEY RAILWAY*****Historic Kidderminster Project Report No. 448. Rifle Range Halt, Severn Valley Railway***

Beddoes, K & Millward, B      Kidderminster : Historic Kidderminster Project, Report: 448 2008, 2pp, figs, refs

*Work undertaken by:* Historic Kidderminster Project

The building of Rifle Range Halt was authorised by Great Western Railway [GWR] on 12 April 1905 at a cost of £145. The plans show a timber platform 100 yards long 6' wide and 3' high and a waiting shelter 20' x 7' similar to that on Foley Park Halt. These shelters were commonly known as "Pagodas" because of their distinctive design. The Halt was situated next to the line adjoining the bridge over the cart track on the tunnel side. There was a footpath from the platform to the cart track. GWR inspected the Halt on 2 May 1905 and stated that the opening was to be in June ; but no official date was given or is known.

Although opened in conjunction with a Steam Rail Motor Service, as was Foley Park Halt the main purpose of Rifle Range Halt was to provide better access for the Local Volunteers (precursors to the Territorial Army) to the nearby Rifle Range which has since lent its name to much of the area. The Halt was closed to passengers on 4 Oct 1920 but remained in situ until the early 1930s for the occasional use by trains conveying military personnel on exercises. The 1884 OS Map above shows the position of Kidderminster Racecourse just a short distance away from the position of the Halt. The two never coexisted, the last meeting at the racecourse being held in 1885. When the 1902 OS map was published the Racecourse area had been renamed as the Rifle Range. [Au(abr)]

Cook, M Tardebigge : Martin Cook, 2008, 28pp, colour pls, figs, tabs, refs  
*Work undertaken by:* Martin Cook

Building recording of a former bake house was carried out. Phase 1 [early 18th century] of the building provided cooking and scullery facilities for the houses on the street frontage. This was extended to include a bakery [Phase 3 - 1879, perhaps as early as 1830] with a single oven with a storage area over. This storage area was subsequently converted to a shop in Phase 4 in the early 20th century. The building was characterized by the extensive re-use of building materials. This practice was carried to extraordinary lengths with bricks of different sizes being used indiscriminately and roof trusses of different heights and spans being employed. [Au(abr)]

Mercian Archaeology and Historic Buildings Worcester : Mercian Archaeology and Historic Buildings, Report: PJ228 2008, 14pp, colour pls, figs, tabs, refs  
*Work undertaken by:* Mercian Archaeology and Historic Buildings

The timber-frame of the Grade II Listed Old Coach House was probably constructed some time in the middle decades of the 17th century, and was probably originally a barn. At some time, most likely in the 19th century, most of the timber-frame was replaced by brick and the building appeared to have been converted to a coach house, with a cart bay at the north-western end and a stable at the other end, below a hayloft. The function of an opening and a air of oval recesses in the south-eastern gable could not be determined and it may have been that there was a further intermediate use for the structure. [Au(abr)]

**VAGRANTS RECEPTION AND BOARD ROOM, KIDDERMINSTER WORKHOUSE,  
SUTTON ROAD*****Building Report. Vagrants Reception and Board Room, Kidderminster Workhouse,  
Sutton Road***Shaw, K & Gilbert, N Kidderminster : Historic Kidderminster project, Report: 601 2008,  
5pp, colour pls, figs, refs*Work undertaken by:* Historic Kidderminster Project

This was an important building in Kidderminster's history, being all that remained of the workhouse, an institution hated and feared by the poor. A Borough workhouse existed in Kidderminster in Vicar Street in the mid-18th century. Around 1784 a larger one was built in the nearby Vicarage meadow, approximately where Oxford Street is today. A further expansion was needed and a new workhouse was erected in Hornes's Field (now Broad Street) in 1816. The workhouse was built to house 150, but by 1881 accommodated 323 inmates. Further expansion was completed in 1885 to include two hospitals, one with 66 beds for men and a second with 50 beds for women. Other buildings included a bakery, brewery, laundry and a boiler house together with a school for 120 children. These changes took the workhouse capacity up to 420. In 1889 the public house called the Tap House was purchased by the Guardians, who demolished it and added the ground to the workhouse site. From 1915 it was forbidden to keep children in workhouses and the Guardians leased "Sunnyside" in Franche Road as a home for the children. There was no record of further work before the Workhouse buildings were integrated into the National Health Service and formed part of Kidderminster General Hospital. This was erected in 1874 to a design by the local architect J. T. Meredith. The ground floor of the surviving building served as an administration block where prospective inmates were initially interviewed. It also provided accommodation for staff including a waiting area, porter's day room with adjacent bedroom, bread room and overseers' room. Stairs led to the Guardians' Board Room on the first floor with a clerk's room and retiring room for the use of the Guardians. They had a separate entrance, which led directly to a staircase to the Boardroom. Also erected at the rear were vagrant wards, mostly for men. These have been demolished, apart from one room connected to the surviving main block which was a bathroom. The original plan shows a double room and three single rooms for women. There were ten men's wards [each some 10 feet by 3 feet 4 inches] and ten labour cells across a passage [the Local Government Board required some minor changes and a revised plan showed only nine male rooms which were slightly wider at 4 feet each]. The labour cells had an aperture through which stones to be broken had to pass, and the tramps were kept in until the stones were small enough to pass through. Outside these cells was a stone yard. Provision was made on the plans also for drying ground, a coach house and stable, and a yard with a broken stone store and an unbroken stone store. Inmates broke stone as a condition of their accommodation and were detained until their task was completed. The surviving reception building with boardroom and offices still remain with modifications. In recent years until 2007 it was in use as offices, but it was later empty. The original main entrance doorway had been partly bricked-up converting it into a window, the Guardians' entrance has been completely bricked up, entrance later being gained by a new doorway, probably converted from a window. **HARVINGTON HALL MALTHOUSE**  
***Harvington Hall Malthouse***

Pagett, T Worcester : Tom Pagett, 2008, 8pp, colour pls, figs, tabs

*Work undertaken by:* Tom Pagett

Prior to work being undertaken on the three storey post-medieval building, which was previously used as a malt house, a building survey was undertaken. Many modifications had been carried out over the last three/four centuries and it was uncertain about the use of the building over the time. The hall in its present form was thought to have been started c. 1580, superficially the building appeared to be contemporary with the hall with a mix of building elements used over time. [Au(adp)]

**8 RODEN AVENUE, KIDDERMINSTER**

***Building Report. 8 Roden Avenue, Kidderminster***

Gilbert, N Kidderminster : Historic Kidderminster Project, Report: 774 2008, 4pp, colour pls, figs, refs

*Work undertaken by:* Historic Kidderminster Project

This house was of great interest, being on land developed by the Avenue Road Land Society. The involvement with this society of one of the town's most eminent physicians, Dr. William Roden, provided added interest. There were many attractive well-built Victorian houses in this road, and No. 8 was one of them. It was built c.1880 with its adjoining house, No. 10 Roden Avenue. This was a well-built red-brick semi, with ample frontage as required by rules of the society. The main access was through a side porch, which seemed to be as originally built, and it was unaffected by a modern extension to its rear. No. 10 was its mirror image, sharing a tall chimney, although the symmetry had been reduced by both houses having their own extensions. One curiosity was that each house had an initialled stone near to its entrance. In the case of No. 10, it clearly referred to James Coates who built the house and was still living there at the 1901 census. However, the similar stone at No. 8 provided a mystery as it had the inscription "W.H.D." This could not even be the initials of Thomas' widow who was Selina Maria. [Au(abr)]

**7 & 8 MILL ST., KIDDERMINSTER, ONCE THE COACH & HORSES*****7 & 8 Mill St, Kidderminster, Once The Coach & Horses***

Millward, B Kidderminster : Historic Kidderminster Project, Report: 471 2008, 5pp, colour pls, figs, refs

*Work undertaken by:* Historic Kidderminster Project

The Paradise Balti House was listed as No. 7 Mill Street. Clearly, the Balti House had been formed by an amalgamation of two properties 7 and 8. The merger of the two properties into one was after 1902 and probably, but not certainly, before 1910. There was some evidence to suggest that the building had traces of timber framing. Previous to the property becoming the Paradise Balti House it had, for many years, been a public house called the Coach & Horses. Initially, the Coach & Horses only occupied No. 8; this was shown clearly on the 1885 OS map and, less clearly, on the 1902 OS map. Nevertheless, a photograph of Lower Mill St. for c1910 seems to indicate that, by that date, the two properties had been merged. The ornate bay windowed entrance still exists at the front of No. 8. By 1957. this entrance had been restructured and the main entrance moved to the left-hand building of the property. Although the Paradise Balti House was numbered as No. 7, the Coach & Horses was always referred to in Trade Directories as No. 8, at least up to 1962. The last entry for the Coach & Horses in the Register of Electors is 1985 which suggested that it ceased trading as a public house in 1985/1986, or thereabouts. Photographs dated 1987 and 1990 show the building, prior to becoming the Paradise Balti House, was being used as a dining room and delicatessen. A conveyance of 1805 reveals information dating back to the late-1770's. The conveyance refers (without dates) to former names by which the property had previously been known. The earliest reference is to the "Old Post Office", then the "Boars Head" and then the "Shears" before the style "Chaise & Horses" was adopted. Before this property merged with number 8 next door to form an enlarged 'Coach & Horses', it had been long associated with the Boot & Shoe trade. [Au(abr)]

Taft, G & Onslow, G Kidderminster : Historic Kidderminster Project, Report: 731 2008, 15pp, colour pls, figs, refs

*Work undertaken by:* Historic Kidderminster Project

According to the 1891 census there was no listing for Church Walk. The first houses appeared on the east side of the street between 1891 and 1901. Probably the first ones to be built were Nos. 14-18, Cedar Place. This was a terrace of 5 houses which were built in 1898 according to the plaque. They were built in the former grounds of The Cedars on Mason Road and named after that house accordingly. The number of houses on the east side of Church Walk was listed as 10 on this census. With the exception of No 12, all the cottages had named plaques [Au(abr)]

Dudley Street at the height of its development in the 1800s had about 90 dwelling houses fronting the street, a further 50 or so houses in courts and yards behind, as well as the Dissenting Meeting House Chapel, 6 public houses, several brew houses, 2 bake houses, loom shops, wheelwright's workshops, a coachbuilder's, coal yards, slaughterhouse, warehouses and a mineral water factory. The report included description, functions, maps and photographs covering approximately 170 former Dudley Street buildings on 23 different plots between Churchfields and the rear of Blackwell Street from the late-18th century to their gradual demolition in the 1960s and 1970s. Millward, B Kidderminster : Historic Kidderminster Project, Report: 461 2008, 4pp, colour pls, figs, refs

*Work undertaken by:* Historic Kidderminster Project

Elderfield Lodge was at the top of Coventry Street next to the property 'Elderfield'. It was part of an elegant row of eight houses under the collective name of 'Elderfield Gardens. At the front of the house, yellow facing brick was decorated with contrasting 'terracotta' styled moulded and plain brick string courses, with matching pediments, lintels, eared architraves and parapet to the false roof balcony. The roofing was slate and there was a full dormer window over this elevation. The side and rear of the property were plainer than the front, although the standard red brick construction was alleviated by the use of yellow bricks for over window segmental lintels. A plain dormer projecting from the slated roof provided a view out to the rear from the second floor. The single storey outhouse facilities were original to the property. At some time in its history the house was converted into flats but was re-converted to a family residence. The first record related to this property was a Conveyance dated 26th May 1883. [Au(abr)]

**YEW TREE HOUSE 45 LORNE STREET, KIDDERMINSTER*****Building Record and Historical Research on Yew Tree House, 45 Lorne Street, Kidderminster***

Owen, A Kidderminster : Historic Kidderminster Project, Report: 493 2008, 6pp, figs, refs

*Work undertaken by:* Historic Kidderminster Project

Aerial photographs (1969 and 1972) and the OS Maps of 1885 and later showed the house to have occupied a large plot behind 33 to 44 Lorne Street. The house appeared from photographs to have an L- shaped floor plan, was two- storied and had no dormer windows. The drive was the current entry to Lorne Grove. Part of the plot was on land originally proposed for development in 1830s and now mostly under the railway line. On an aerial

photograph, what was assumed to be the original western boundary line of the development was visible beyond the railway. Its position in the plot, almost up against its eastern boundary. it was built after the railway went through or perhaps was a rebuild like No. 44 Lorne Street. The house was demolished between 1972 and 1988. [Au(abr)]

**25 FARFIELD**

***Building Report: 25 Farfield***

Griffiths, N Kidderminster : Historic Kidderminster project, Report: 327 2008, 4pp, colour pls, figs, refs

*Work undertaken by:* Historic Kidderminster Project

No. 25 Fairfield was the second in a terrace of three brick houses built between 1841 and 1851. The original slate roof had been replaced with cement tiles. The chimney served both Nos. 25 and 26. It retained its original height but had lost the original chimney pots. Recent work to the interior revealed that the house had been built up against the side wall of No. 24, which must have been built first with an external chimney stack, as traces of the brickwork and soot could still be seen on the wall which formed an internal wall to No. 25. Only one brick to the front of No. 25 had been tied into the front wall of No. 24. Originally the six-foot high, wooden, six-panelled front door had wooden pilasters on either side and ogee brackets supporting a ledge above. The pilasters, door, brackets and ledge had been removed and replaced with a uPVC surround and moulded door. The original six paned sashes to the ground floor and the window with six panes to the lower sash and three panes to the upper sash to the first floor had also been replaced with modern uPVC windows. The stone sills to both windows and the flat arch decorated with five panels above the ground floor window remained. Originally the front boundary would have had a low wall with iron railings. The railings to all the houses in Farfield were removed during World War II and the low wall had also been removed All windows to the rear had been replaced and original doorways moved. There was originally a single storey extension containing the brewhouse at the rear but this had been extended, new windows and doors inserted, and given a new flat roof and a second outer skin of brick. The extension to the rear of No. 26 appeared largely unaltered and this had a slate tiled shed roof. There was also a privy beyond the brewhouse on the boundary with No. 26. The rear brickwork was tied into the brickwork of both No. 24 and No. 26. The front door opened directly into the front parlour. This room originally had a fireplace on the left hand wall adjoining No. 26 with a cupboard beside it. It also had a quarry-tiled floor. A door led into the back room but these two rooms were knocked into one. The stairs were originally enclosed and a door opened from the rear room onto the stairs. Another door under the stairs opened onto stairs descending towards the rear of the house into the cellar under the rear room, which had been filled in. The rear room originally had a chimney across the corner between the room dividing it from the front parlour and the left hand wall adjoining No. 26. A door led out into the brewhouse. The steep narrow stairs led to two bedrooms above the front parlour and the rear room. [Au(abr)]

***Building Report: 26 Farfield***

Griffiths, N Kidderminster : Historic Kidderminster project, Report: 328 2008, 4pp, colour pls, figs, refs

*Work undertaken by:* Historic Kidderminster Project

Third in a terrace of three brick houses built between 1841 and 1851. The original slate roof had been retiled with cement tiles. The chimney served both Nos. 25 and 26. It retained its original height but had lost the original chimneypots. The six-panelled front door had wooden pilasters on either side and ogee brackets supporting a ledge above. The original six paned sashes to the ground floor and the window with six panes to the lower sash and three panes to the upper sash to the first floor have been replaced with modern uPVC windows. The stone sills to both windows and the flat arch decorated with five panels above the ground floor window remained. Originally the front boundary had a low wall with iron railings. The railings to all the houses in Farfield were removed during World War II but the low brick wall remained. All windows to the rear had been replaced and doorways moved. There was originally a single storey extension across part of the width of the house containing the brew house at the rear. This had been modified although it appeared to retain the slate tiled shed roof. Originally there was a gap between Nos. 26 and 27. At some point late in the 19th century or early in the 20th both Nos. 26 and 27 were extended on the first floor to create a covered passage between the two houses. The extension did not appear on the Ordnance Survey map of 1885 but did on that of 1921. The roof of this extension was at the level of the roof on No. 26, slightly lower than the roof of No. 27. The rear room formed a third bedroom to No 26 that extended slightly over the ground floor of No 27, while the front room was part of No. 27. The front door opened directly into the front parlour. This room had a fireplace on the right hand wall adjoining No. 25 with a cupboard beside it. There was a 1930s tiled fireplace but the outline of an opening big enough to take a range could still be determined. There was a quarry-tiled floor. A door in the far wall led into a very small back room with a window to the rear elevation. This room had a chimney across the right hand corner by the door. On the left two doors led to steps down to the cellar and the staircase to the bedrooms on the first floor. A door in the far wall led out into the kitchen/bathroom extension. [Au(abr)]

**5 WOODWARD ROAD, SUTTON FARM, KIDDERMINSTER**

***Building Report: 5 Woodward Road, Sutton Farm, Kidderminster***

Gilbert, N Kidderminster : Historic Kidderminster Project., Report: 770 2008, 4pp, colour pls, figs, refs

*Work undertaken by:* Historic Kidderminster Project

It seemed that both No. 5 and No. 6 Woodward Road were farm labourer's cottages dating to Elizabethan times. The present owner had completely renewed the cottage and extended it. The exterior was rendered and it was not possible to see the original brickwork, which (allegedly) consisted of the smaller type brick from a previous era. The report was primarily based on deeds held by the current owner, since purchasing No. 5 in 1970. The building had been considerably extended, so it was unrecognisable as a small cottage. In its original state from front to back it would have been little more than 12 feet and there was no staircases in it (a ladder was used). By the time of the purchase of No. 5 there was 'rickety staircases'. There was a toilet in No. 5 Prior to that the occupier of No. 5 had the right to 'access to and egress from' toilets and wash house behind No. 6, which were still there in 1998 but subsequently had been demolished. Number 5 had a ceiling timber in the front room taken from Oldington Farm, which was being demolished in 1970. The whole cottage was built with small bricks, possibly Elizabethan, all now concealed by rendering. [Au(abr)]

Coombe, J Kidderminster : Historic Kidderminster Project, Report: 105 2008, 3pp, pls, figs

*Work undertaken by:* Historic Kidderminster Project

Claremont was one of a pair of semi-detached Victorian villas on the west side of Chester Road South. It was built in about 1858 by John Thompson a builder who bought the land in April 1858 from William Boycott. He, in turn, had acquired a parcel of land in 1840, part of a larger plot called Farfield which had originally been owned by Lord Foley and his wife Cecilia Olivia Foley. John Thompson died in 1866, William Thompson and Henry Willis lived at Claremont until it was sold in July 1867. It was sold by auction to William Coley. William Coley died in 1892 leaving the house to his sister Grace Coley-Power to live in until her death in 1954. It was sold once again at auction in 1955, then resold in 2006. The house had five bedrooms and large gardens with stabling and outbuildings at the rear. Since then it had been converted into flats. [Au(abr)]

**EYMORE FARMHOUSE [DEMOLISHED]*****Building Recording and Historical Research, Eymore Farmhouse [Demolished]***

Gammond, C Kidderminster : Historic Kidderminster Project, Report: 215 2008, 3pp, pls, figs, refs

*Work undertaken by:* Historic Kidderminster Project

The reputed Manor of Eymore originated in Edward Burnel's gift c. 1312 to the Prior and Convent of Worcester. Burnel had bought Eymore Wood in 1301, along with the estate of Trimpey. In 1542 Eymore was bestowed upon the Dean and Chapter of Worcester until the abolition of the Chapter when the old Mansion House at Eymore was bought and occupied in 1649 by John Corbyn. The Dean and Chapter recovered their lands at the Restoration and Eymore remained in their possession until 1861. At what date the original house was replaced

was unclear. During World War II the Home Guard were based at Eymore Farm. Nearby there were trench positions for guarding Victoria Bridge and the remains of railway line defences could be found discarded at the eastern end of the bridge. Tenants occupied Eymore Farm between 1952 and 1964. In 1964 the Birmingham Corporation Water Dept. began construction of Trimley Reservoir and Treatment Works and Eymore Farmhouse was demolished to make way for a terrace of 4 houses. [Au(abr)]

**THE LAKES, FRANCHE ROAD**

***Building Report. The Lakes, Franche Road***

Gilbert, N Kidderminster : Historic Kidderminster Project, Report: 277 2008, 4pp, pls, figs, refs

*Work undertaken by:* Historic Kidderminster Project

The Lakes was an early example of the great houses built by carpet manufacturers, in this case John Lea. The Lea family was of immense importance in Kidderminster's early manufacturing history. The Lakes was a good indication of the fortunes being made by industrialists in the town. It is also a further example of a mansion which went into decline and was demolished with no recognition of its former glory. No record of its demolition had been discovered and no photograph had been found. Sales particulars from 1919 offered an insight into the nature of this house. It was set in grounds extending to about five acres. Half of this was "rich old turf land". Pleasure grounds were tastefully laid out to include a tennis lawn and rose garden. They were well planted with shrubs and trees. The house was approached by a good carriage drive. A portico led to an entrance hall 25ft by 8ft and a back hall 14ft by 9ft. There was a morning room 17ft by 15ft, drawing room 21ft by 17ft, dining room 25ft by 18ft, with semi-circular end and entrance from lawn. Other ground floor rooms comprised a library 16ft by 12ft, china pantry, kitchen 22ft by 15ft, back kitchen and other outbuildings. There were extensive cellars under the whole house, with a coke stove by which the whole house was heated. On the first floor a large landing gave access to eight bedrooms, bathroom, box room, store room, linen room and servants' room. Outbuildings were around a yard with two coach houses, stabling for four horses, harness room, dog kennel, corn room and hay loft. The glass houses included a vinery with ten vines, tomato house and stove. [Au(abr)]

Mercian Archaeology and Historic Buildings Worcester : Mercian Archaeology and Historic Buildings, Report: PJ125 2008, 28pp, colour pls, figs, tabs, refs

*Work undertaken by:* Mercian Archaeology and Historic Buildings

Analysis of the site suggested that the earliest visible structure on site dated from sometime in the 18th century, although there was a suggestion that it was built on the site of the 13th century manor house. During the first two decades of the 18th century, the house was overhauled and modernised, with a "modern" symmetrical Georgian appearance to the fenestration with the 17th century fabric unaltered at the rear. During the following 130 years, the building was further extended and modernised, resulting in the piecemeal architectural patchwork that was later noted. A stable block and coach house to the rear of the building had undergone a similar pattern of modernisation. [Au(adp)]

**THE RAILWAY STATION INN, FARFIELD**

***Building Report. The Railway Station Inn, Farfield***

Griffiths, N Kidderminster : Historic Kidderminster project, Report: 326 2008, 5pp, colour pls, figs, tabs

*Work undertaken by:* Historic Kidderminster Project

The Railway Station Inn was a brick built, double fronted building with an arched passageway leading to the rear. There was a gabled roof tiled with a modern replacement for the original Welsh slates. There was a chimney at each gable end, with only one original chimney pot remaining. The different pitch to the roof indicated that it was built separately from the adjoining terrace although it shares the same dentil decoration under the eaves. The brickwork had been painted over. The two windows to the first floor at the front were replacements under the original square arches and with the original stone sills. To the round floor is a pair of canted bay windows each with four original sashes with stained glass to each bottom sash. There was dentil wooden decoration to the top of the window frame of each bay. The window locks inside appear to be original. The central front door had a wooden pilaster to either side and a pediment over with matching dentil decoration. To the southern end of the façade was an arched passageway with a ledged and braced door that led to a small courtyard and the original stable block. This courtyard had later been covered over as an outside smoking area. There were originally three houses adjoining at the southern end but these were demolished around the middle of the last century to provide a car park. To the rear was a two storey extension with a shed roof with a single chimney stack. The alleyway between the rear extension and the shed roofed stable block had been covered over creating a lean-to. The windows to the first storey of the extension were all replacements. However the ground floor windows that later opened onto the covered passageway appeared to be original. Beyond the two storey extension was a further flat roofed extension, possibly of later date than the main building, containing toilets. A lean-to conservatory had been added to the south side so that the toilets could be accessed without going outdoors. It was only possible to examine the public rooms of the building. At the time of survey, the front door opened into a tiny vestibule with a modern, glass panelled inner door. The side walls of this vestibule appeared to be original but it is not clear whether this was once a longer hallway. Originally there were two rooms either side of the front door, each with its own fireplace. The chimney breasts remained but the fireplaces have been replaced with a gas fire to the room to the left and a reproduction fireplace with open fire to the room to the right. The two rooms had later been made into an open area together with the room originally behind the left hand front room. This room also had a chimney breast, later fitted with a gas fire, and a window overlooking the courtyard. A modern, glass panelled door from this room opened into a passageway. On the right hand side of this passage a door opened onto the stairs to the first floor. Beyond it a second door, which would originally have been an external door from the small courtyard, opened into the first room in the rear extension. This room had a chimneybreast with original fire surround fitted with a gas fire. There was tongue and grooved panelling to the lower part of the walls but it could not be determined if this was original but

thought unlikely to be. Next to the door were two original sash windows that would have overlooked the courtyard but later looked onto the covered and glazed passageway. A door at the far end of this room led to the kitchen that also had a door and two windows onto the area between the stables and the extension, now roofed and glazed to make a conservatory area. The glazed lean-to giving access to the toilet extension led off the far end of this conservatory area next to a modern glazed door leading into the garden. The area beneath the stairs leading to the first floor has been used to make a servery with a bar to the room in the extension and another bar that extends out into the right hand front room. This servery area also contained the door beneath the stairs that led to the cellar. [Au(abr)]

**25 CHURCH WALK, ARELEY KINGS**

***Archaeological Recording at 25 Church Walk, Areley Kings, Worcestershire***

Mercian Archaeology Worcester : Mercian Archaeology and Historic Buildings, Report: PJ 210 2008, 18pp, colour pls, figs, tabs, refs

*Work undertaken by:* Mercian Archaeology and Historic Buildings

The results of the archaeological recording demonstrated that the structure recorded at 25 Church Walk was the base of a Victorian glasshouse from within the kitchen garden of Areley Court. The glasshouse was one of a pair shown on early mapping and referred to in sales particulars of 1923. Local residents confirmed the presence of a former ice house on the site, although the entrance to the structure remained unlocated. The depth of soil over the suggested area of the entrance suggested that the development would not affect any remains of the building that may have survived. [Au(abr)]

*Work undertaken by:* Historic Kidderminster Project

There had been a small lock-up shop on the site for over a century, the last business recorded was a General Store with specialisation in farm produce. The premises were demolished in 2007 after a compulsory purchase order was approved by a planning inquiry inspector in September 2001. The centrally located Horsefair shop was often, erroneously, known by local residents as the "tin shop" because the corrugated steel boundary fence adjoining the footpath in Broad Street gave it a superficial appearance. The main entrance to the shop led into the retail area which included a counter and stock for sale. An interior doorway led into storage areas and other backroom facilities. The 1902 OS map and the equivalent 1885 OS map showed the property in precisely the same profile as did a "bird's eye" aerial map shortly before demolition. Therefore it seemed most likely that the building was there since at least 1885. [Au(abr)]

Number 17 was a semi-detached house built in red-brick with a slate roof. It was part of a row of four pairs of houses which appeared to be identical and to have been built together. Four of these houses, numbered 9, 11, 13 and 15, were owned by Thomas Hall Garlick in the 1887 list, although it was J. Garlick who appears in the list of members among the 1873 papers. Clearly William Arnold and the Garlick family co-operated in the construction of these houses. [Au]

Leek, P Kidderminster : Historic Kidderminster Project, Report: 396 2008, 5pp, colour pls, figs, refs

*Work undertaken by:* Historic Kidderminster Project

The house was a substantial double fronted early Victorian [1851] red brick building with sash windows and an attractive ornate front porch. Inside, the hall floor still boasted the original tiles, later covered with carpet. Downstairs were two large front drawing rooms and a smaller room to the back which was the original kitchen. To the back of one of the drawing rooms was a bricked up doorway which was the tradesman's entrance. Hidden away in the wall at the base of the sash windows were very unusual wooden sash shutters, which would have been able to secure the front windows from the inside. To the left, the most recent owners had installed a new kitchen and to the right was a large brick built conservatory. When the present owners were constructing a water feature in the garden near to the new kitchen, it was obvious that some sort of structure had previously been there, and the plans of the house mentioned a "freezer room" situated here. In the rear garden there were mature trees and shrubs and to the right a two storey brick built stable, which was built at the same time as the house. Originally a driveway would have led to this stable from the road outside, and, although most of this driveway was later covered over by the garden, part of the original paving could still be seen near to the stable. Gilbert, N Kidderminster : Historic Kidderminster Project, Report: 763 2008, 3pp, colour pls, figs, refs

*Work undertaken by:* Historic Kidderminster Project

This group of four terraced houses was an example of a small development undertaken by an independent builder at a time of widespread construction in Kidderminster. He built the four houses now numbered 346-349 Hurcott Road. The pair of houses now numbered 348 and 349 was built on the first plot. It is likely he used the money raised from the sale of these two houses to finance the building of the pair of houses now numbered 346 and 347 Hurcott Road. The 1891 Census provided clear evidence that four houses had been built by then. These were numbered 45 to 49 Hurcott Road. [Au(adp)]

**Building Report: 99 Stourbridge Road, Kidderminster**

Gilbert, N Kidderminster : Historic Kidderminster Project, Report: 762 2008, 3pp, colour pls, figs, refs

*Work undertaken by:* Historic Kidderminster Project

This was a house of some character, known as "Laurel Cottage", and was part of the development of the north side of Stourbridge Road during the latter half of the 18th century. It was believed that it was undertaken by a land society, though little evidence was available to prove this. A series of plots was successfully built upon, with one exception, to form Nos. 85 to 103 Stourbridge Road. The only 20th century house in this row was number 99. This was a nicely proportioned red brick detached house. Like its neighbouring properties on either side, which were built on plots from the same piece of land, it had an extremely long garden at the back. [Au(abr)]

**HALIFAX FARM, FRANCHE**

***Building Report. Halifax Farm, Franche***

Weale, G C Kidderminster : Historic Kidderminster Project, Report: 856 2008, 7pp, pls, colour pls, figs, refs

*Work undertaken by:* Historic Kidderminster Project

Halifax Farm sat along side other areas in Franche as being significant in its connection to market gardening, which became a specific industry during the 19th century and up to the close of the Second World War. Reference was made to a cottage which may well have been amongst that cluster of farm buildings where Halifax Farm became established. Over the years the total area of the farm had changed from 35 acres in 1871 to 24 acres in 1947. Lying in a ring fence, and having a valuable building frontage to the main road from Franche to Bewdley, and another approach from Habberley Road. Interestingly the real access to Halifax Farm seemed to have been for some time off the Franche Road, even though it was a long way, along the side of The White Wickets Estate. The House was substantially built and had a small hall, living room, sitting room, kitchen, back kitchen, dairy, pantry, washhouse, cellar with rolling way, store with entrance from outside, spacious landing, three bedrooms and a garden. The house had a south-east aspect with extensive views and was in excellent structural and decorative repair. The outbuildings were situated well away from the house and included a stable for two with loft over, loose box or store (formerly cow shed) with loft over, another stable for two, two pigsties with corrugated iron extension over yards. Adjoining this building was a wood and corrugated iron lean-to shed, detached wood and corrugated iron open-fronted three bay cart shed, two-bay wood and corrugated iron open shed, boiling and mixing house with corrugated iron roof, and well of water with semi-rotary pump. A range of three wood and corrugated iron pigsties, detached wood and corrugated iron pigsty and concrete pig yard. In the orchard there was two detached wood and corrugated iron pig cots and runs with concrete floors. [Au(abr)]

**HALL STREET**

***Building Recording and Historical Research. Hall Street, Kidderminster Now Part of St. Mary's Ringway***

Shuttes, A Kidderminster : Historic Kidderminster Project, Report: 663 2008, 53pp, colour pls, figs, refs

*Work undertaken by:* Historic Kidderminster Project

Hall Street was named after the "Old Hall" which stood on the site and was believed to be part of the old manor house buildings. This manorial land was developed into a new street of houses in the late-18th century by the owner, Lord Foley of Witley Court, Baron of Kidderminster. Almost all the buildings were demolished in the 1960s and replaced by St. Mary's Ringway, part of Kidderminster's ring road. The site was adjacent to St. Mary and All Saints Church with its origins dating back at least to the 12th century. The Historic Kidderminster Project also initiated an archaeological radar survey which took place in 2006 next to the church to investigate the possibility of an earlier Saxon church or monastery. The site was close to the town centre, the canal, the river and to former carpet factory sites. Hall Street, at its height of building development in the 1800s, had 34 properties fronting the street and a further 24 houses behind in Courts 1-4. In addition to the weavers' houses, it included the classical style house belonging to the Price and Chambers families, used also for a school and then the Savings Bank, the Royal George Public House, some shops, the "Old Hall" building, an alehouse, a bakehouse, two small carpet factories, an almshouse and a pig sty. The last house on the "South side" butted up to the stable building on the plot of 22 Church Street, which was the only original building still standing on what was Hall Street and was used for commercial offices accessed from Church Street. Gilbert, N & Coombe, J Kidderminster : Historic Kidderminster Project, Report: 757 2008, 10pp, pls, colour pls, figs, refs

*Work undertaken by:* Historic Kidderminster Project

In January 1968 the demolition began of Harvey's wine vaults, It marked the end of at least 148 years of occupation of the premises by wine merchants in Kidderminster. For most of that time the famous firm of Harvey's were there. Remembered as a Bristol company, their important link with Kidderminster had been largely forgotten. The fine extensive cellars, were now filled in (or destroyed) and buried beneath the Swan Centre. Legends abounded regarding these cellars, including that they once led by underground passages to both St. Mary's Church and to Caldwell Tower. Another idea was that they once contained a Saxon chapel. Doubt remained, but probably the best opinion was that they were the undercrofts of medieval merchants. [Au(abr)]

**SPRING BANK HOUSE, 28 LESWELL LANE**

***Historic Kidderminster Project Ref 457. Spring Bank House, 28 Leswell Lane***

Millward, B Kidderminster : Historic Kidderminster Project, Report: 457 2008, 4pp, colour pls, refs, figs

*Work undertaken by:* Historic Kidderminster Project

This property sat at the top of Leswell Lane overlooking Coventry Street and St. George's church and once possessed an elevated panoramic view over the town. Initially a family home in the late-18th century, Spring Bank House later provided accommodation for private and Diocesan educational purposes, before reverting to residential use. In the 1960s/1970s, its appearance change dramatically to the present "warehouse" look after conversion into flats, and its garden was transformed into housing. Before conversion into flats this building had a gabled roof and period windows which overlooked the town. The sloping garden stretched westwards down the lane and there was a gated stepped access to it from Coventry Street [the bricked gateway could still be discerned]. The door and remains of a foot scraper near the main entrance are rare original external features of the property. Within living memory a name plate proclaiming "Spring Bank House" was near this doorway. There was no direct access to inside the building but an ex-inhabitant of the downstairs flat thought that the original main staircase remained in situ, but hidden from view behind a walled up stairwell. ***Building Report. The Malthouse, Bridgnorth Road***

Gilbert, N Kidderminster : Historic Kidderminster Project, Report: 276 2008, 6pp, pls, colour pls, figs, refs

*Work undertaken by:* Historic Kidderminster Project

The house was much changed and it is was not possible to pick out the original structure with any certainty within the current building with its many extensions. The double bay frontage with its gabled roof may have been original, and the top could just be seen on a painting by Miss Edith Thomas of how she remembered the district to be in 1898. However, the front door at the centre of this frontage had later been removed. The high malthouse, from which the dwelling house later took its name, is shown in the painting in all its glory. The base of this structure still remained. Next to it, closely abutting the Bridgnorth Road was the stable building which has acquired a new roof. This stable is not shown on the 1885 edition of the OS map, and its construction may have been part of improvements made in 1895. [Au(abr)]

Gilbert, N Kidderminster : Historic Kidderminster Project., Report: 772 2008, 4pp, colour pls, figs, refs

*Work undertaken by:* Historic Kidderminster Project

This house was of great interest, being built on a site within the land at Greenhill purchased by the Kidderminster Freehold Land Society at the end of 1850. It was a small detached house, a rare example of the Society achieving its stated aim of enabling working men to become home owners. The plots for Greenhill were allocated by ballot at a meeting of

members and friends of the Freehold Land Society in the Plough Inn on 22nd January 1851. Plots were allocated in Hurcott Road, Turton Street and Batham Street. The plot consisted of 572 square yards with a 10 yard frontage on the west side of an "intended new street to be called Turton Street". The house was given its current name in 1928, when it was described as "The Nook", 4 Turton Street. [Au(abr)]

Leek, P Kidderminster : Historic Kidderminster Project, Report: 397 2008, 3pp, colour pls, figs  
*Work undertaken by:* Historic Kidderminster Project

The house was invisible from the road and was accessed by a long drive from Franche Road. It was a substantial white painted, double fronted property standing in its own large grounds with sash windows and an ornate porch The garden had many mature trees and shrubs. Inside a hallway runs front to back with original tiles. There were three large reception rooms and a newly furbished kitchen, also a large cellar. There was a theory that the house was originally divided into two-the roof was thought to have two gabled sections running east-west, encompassing two smaller houses [possibly for the coachmen of Whitville House], but when work was done on the house and the roof was, in fact, shown to be run north-south, making the two houses theory to be much less feasible, also the Court map of c.1840 gave no indication of a divide. **15 FLEMINGATE, BEVERLEY**

***15 Flemingate, Beverley, East Yorkshire, Preliminary Architectural Appraisal***

Richardson, S & Neave, S & Dennison, E Beverley : Ed Dennison Archaeological Services Ltd., Report: 008/334.R01 2008, 32pp, pls, figs,refs

*Work undertaken by:* Ed Dennison Archaeological Services Ltd.

A preliminary architectural appraisal of premises at No. 15 Flemingate, Beverley, was undertaken. Flemingate probably took its name from the Flemish merchants trading in Beverley in the 12th century. It may have been the street in which some of them lived, and so it was possible that the site of No.15 was occupied from an early date. During the 14th century a house belonging to Thomas Harpham was located on north side of Flemingate. The details of a 1318 lease of land to Harpham by the burgesses of Beverley suggested that the site of No.15 may have been included in the lease, perhaps situated on the western edge of the land taken by Harpham, or possibly just beyond it, however, it was not certain if there was any occupation at this date. The earliest surviving parts of the existing building comprised a timber-framed domestic structure of probable late-15th century date. The form and detailing

of the roof trusses in particular was similar to a small number of surviving examples from this period within Beverley and also others within the Yorkshire region, for example in York and Scarborough. The quality of one of the trusses indicated a building of some status. On the basis of the surviving structural evidence, it was proposed that No.15 may have comprised a house set at an approximate right angle to the street frontage, with a gabled jettied end facing onto Flemingate (and possibly also onto a lane to the east) and a hall to the rear. Although a number of such houses dating to the 15th century and after survived in York, it was believed that this was the first time that the surviving structural evidence for such a layout had been considered in detail in Beverley. If the proposal was correct, then it could have wider implications for Flemingate and the medieval townscape as a whole, as it was unlikely to have been the only example of such a building within the town. Documentary evidence indicated that Nos.13 and 15 Flemingate were considered as a single property by c.1700, and it appeared that both underwent extensive alteration after being sold to a local tanner in 1725, including removal of parts of the timber-framing to No 15. The first clear documentary evidence for the use of Nos. 13 to 15 as an inn dated from 1809. No.15 appeared to have formed a dwelling separated from the inn (although in the same ownership) by 1815, and to have continued as such throughout the 19th century. By the late-20th century, it was in poor condition and in 1984 it was refurbished for use as offices. [Au(abr)]

***Penistone Market, Penistone, South Yorkshire. Photographic Building Survey***

Savage, S A Saxilby : Pre-Construct Archaeology (Lincoln), Report: 08-484 2008, 51pp, colour pls, figs, refs

*Work undertaken by:* Pre-Construct Archaeology (Lincoln)

Documentary and cartographic research undertaken for this report demonstrated that some of these buildings were already in existence by the early 1850s. The buildings fell into two groups, those in the market place itself, and most recently used as its offices, and those lying to the north, most recently part of an abattoir associated with the cattle market. The market buildings appeared to have originated as outbuildings to the rear of the 19th century Rose and Crown Inn, later used as agricultural buildings following the demolition of the Inn, and converted for market use in 1910. The northern group of buildings probably originated similarly to the rear of the Old Crown Inn. The survey also included the façade of the 19th century town lockup, now incorporated into a retaining wall on the northern edge of the proposed development area. [Au(abr)]

*Netherfield Annexe, Penistone Grammar School, Penistone, South Yorkshire. An  
Archaeological Building Record***

Scurfield, C Barnsley : CS Archaeology, Report: 27 2008, 144pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* CS Archaeology

A building recording was undertaken prior to the demolition of the Netherfield Annexe. The annexe consisted of a series of Victorian residential, administrative and hospital buildings. These functioned as the Penistone Union Workhouse, which was designed by the Bradford architects Lockwood and Mawson [c.1859] and based on Sampson Kempthorne's "cruciform or square" plan. Later buildings included an infirmary [c.1895], a mortuary and isolation hospital [early 20th century]. Some original and subsequent buildings had, during the late-20th century, been demolished but overall the building complex survived relatively unaltered. A few areas were either inaccessible or subject to extensive remodeling and would require further recording work. [Au(abr)]

***8-9 Hall Gate, Doncaster, South Yorkshire. An Archaeological Building Appraisal***

Scurfield, C Barnsley : CS Archaeology, Report: 24 2008, 54pp, colour pls, figs, tabs, refs  
*Work undertaken by:* CS Archaeology

The proposed development area featured two building phases. Phase 1 consisted of two 19th century brick buildings, each with a pitched roof. The exact original function of these buildings was unknown, but probably related to manufacture (Building A) and administration (Building B). Phase 2 buildings represented an extensive late-20th century flat roofed extension. Although the Phase 1 buildings were of some historical and archaeological interest they had been modified and retained a few original features, their loss was therefore considered to be of significance. This report therefore proposed further mitigation should take place in the form of an archaeological watching brief. [Au(abr)]

**DONCASTER COLLEGE, WATERDALE, DONCASTER*****Archaeological Buildings Recording at Doncaster College, Waterdale, Doncaster, South Yorkshire (2 Vols)***

Upson-Smith, T &amp; Wolfram-Murray, Y Northampton : Northamptonshire Archaeology, 2008, 78pp, colour pls, figs, tabs, refs

*Work undertaken by:* Northamptonshire Archaeology

The survey consisted of general and detailed photographs showing original features and the development of the buildings. At the time of the survey all of the buildings had been empty for some time and had suffered to varying degrees from vandalism, leaks etc. The Chequer Road Boys elementary school was built to a central hall design so that pupils could gather for special occasions. Around this time, there was a change in thinking to a more hygienic ventilated style of building, the Pavilion style, which the 1926 Girls and Infants school partially adopted. The 1910 High School for Girls was, as a grammar school, able to pick elements of the new thinking whilst being able to have a more ornate façade. The 1958 Technical College was built to cater for those born during the Second World War and to serve the growing mining and engineering industries which were located in and around Doncaster at the time. **SUNNYSIDE COTTAGE, LINDRICK, TICKHILL*****Archaeological Building Recording of Sunnyside Cottage, Lindrick, Tickhill, South Yorkshire***

Thompson, J Sheffield : ARCUS, Report: 887d.1(1) 2008, 51pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* ARCUS

A scheme of archaeological building recording was undertaken on Sunnyside Cottage, Lindrick, Tickhill. The recording was undertaken to meet the terms of an archaeological condition which was placed on the consent for development. Recording comprised floor plans, cross section, and photography. The building lay on a roughly level site, orientated north-west to south-east, with its southern boundary defined by Lindrick. The footprint of the building occupied an area of 55m<sup>2</sup>. It was a rectangular two storey limestone structure with a single storey lean-to against the south-eastern gable. Sunnyside Cottage was a good surviving example of a small post-medieval agricultural building dating to the early mid-18th century. Although the structure had been converted several times within its lifetime, sufficient evidence remained to indicate it had originally been a cattle-shed, particularly the survival of a brick manger. **MANOR FARMSTEAD, CHURCH STREET, GREASBROUGH*****Manor Farmstead, Church Street, Greasbrough, South Yorkshire, Archaeological Assessment and Building Appraisal***

Ware, P &amp; Hunter, K Malton : MAP Archaeological Consultancy Ltd., 2008, 90pp, colour pls, figs, tabs, refs

*Work undertaken by:* MAP Archaeological Consultancy Ltd.

The buildings within the Development Area included an 18th century barn with 17th century timbers with an attached 19th century horse engine house, the farmhouse (possibly 18th century in date), two 19th century barns and cart sheds and three modern farm buildings, pig sties and outbuildings. The site of the development was derelict and overgrown and the buildings in a state of disrepair with visible signs of vandalism and arson. The site bordered to the north onto the Wentworth Woodhouse Registered Park and Garden (GD2167 Grade II\*). [Au(abr)]

**DENBY STREET NURSERY, DENBY STREET*****Archaeological Photographic Survey of the Denby Street Nursery, Denby Street, Sheffield***

Barnes, J Sheffield : ARCUS, Report: 973b.1(1) 2008, 37pp, colour pls, figs, tabs, refs

*Work undertaken by:* ARCUS

This report described a programme of photographic survey at the Denby Street Nursery school fronting Denby Street. A photographic record was required to record the buildings on the site. However, access to the site was not achieved and photography for the report was undertaken by a third party, restricting the scope of the report. The site consisted of six buildings which fell into three main phases of construction taking place from the 1930s up to the 1980s. All of the buildings studied were specifically built to function as a school apart from the caretaker's house which was purpose built as a dwelling. A previous desk -based assessment in 2006 revealed that prior to construction of the site the area had previously been used as allotment and formal gardens, and following this the Corporation Depot No.12, a municipal authority store. The only remains extant from this period of the sites history was the western external boundary wall. [Au(abr)]

**SHARROW LANE INFANTS SCHOOL*****Archaeological Buildings Appraisal of Sharrow Lane Infants School, Sheffield***

May, R, Jessop, O &amp; Thomson, J Sheffield : ARCUS, Report: 1206.1(1) 2008, 70pp, pls, figs, tabs, refs

*Work undertaken by:* ARCUS

A building survey showed that the earliest phase of the Infant School was typical of Sheffield Board School structures of the late-19th century, with subsequent modernisation of pupil and staff facilities within and around this core. The layout of the 19th century school remained

essentially intact despite these changes, although the original intended circulation was impeded by the expansion of class rooms within the existing framework. Desk-based research indicated that there were no known structures on the site from at least the late-18th century until the construction of the school. The site was part of a field or close associated with the adjacent 17th century Priory Grange house, which was demolished in the 1880s. It has been suggested that this building stood on the site of a medieval monastic grange and tithe barn affiliated with Worksop Priory, but no supporting information, other than place-names, was found during the assessment. Geotechnical investigation indicated that there was the potential for the survival of archaeological deposits at the site, some of which may predate ground-levelling activities for the construction of the school. Thomson, J Sheffield : ARCUS, Report: 1190 2008, 21pp, pls, figs, tabs, refs  
*Work undertaken by:* ARCUS  
The site comprised an 1803 dry house, with alterations including the removal of the western town in the later 19th and 20th centuries. The building was three storeys with open floors divided by modern partitioning. Nothing remained of the original timber frame, although there

was ephemeral evidence from later alterations that survived behind modern studwork and plaster coverings. The Coach and Horses Inn was built prior to 1802 to serve the Halifax to Bradford via Queens Head turnpike. It comprised a two storey cellared building, with living arrangements upstairs and a public house on the ground floor, with adjoining cottages to the south that predated the inn and possessed evidence for domestic and industrial use. McComish, J M York : York Archaeological Trust, Report: 2008/45 2008, 15pp, colour pls, figs

*Work undertaken by:* York Archaeological Trust

A number of features of interest were noted. Some striated tooling was present on the walling, though the surface in other areas, notably the window sills, had eroded. The window in the south passage contained a window in a wooden frame, while the window in the eastern passage lacked a wooden frame, though a slot for one was clearly visible. Four small wooden pegs and one slightly larger wood peg were visible at the southern end of the west facing elevation of the eastern passageway. In addition several infilled put-log holes were present, three in the west facing elevation of the east passage, one in the east facing elevation of the east passage and one in the north-facing elevation of the south passage. The wooden beams visible at the base of the east passage east-facing elevation were badly cracked along their entire length. Two iron rods, presumably tie-bars, were present across the northern end of the eastern passageway. [Au(adp)]

#### ***The Grapes Inn, Ebberston, North Yorkshire. Preliminary Architectural Appraisal***

Dennisin, E & Richardson, S Beverley : Ed Dennison Archaeological Services Ltd., Report: 2008/323R.01 2008, 42pp, pls, figs, tabs, refs

*Work undertaken by:* Ed Dennison Archaeological Services Ltd.

A preliminary architectural appraisal of The Grapes Inn described the architectural structure and character of building, and provided an understanding of the architectural and historical development of the complex. Based on the surviving structural evidence, and comparison with other sites, a sequence of development was proposed for The Grapes. There was a single storey house present on the site during the 17th century, but the structural evidence for its original form was conflicting. It may have been a three-cell hearth-passage house that was substantially altered during the 18th century, or a two-cell house in the hearth passage tradition but with a gable entry, or an uncommon example in this area of a much altered two cell lobby entry house. On balance, it was considered that it was a two-cell house in the hearth passage tradition with a gable entry. This 17th century house could have been altered during the early or mid-18th century, but the existing structural evidence suggested that the main phase of works took place in the late-18th century. The house was re-fronted and raised to two storeys at this time, and a stable / byre was added to the east end. It may be that it first became an inn at this date, to take advantage of increased coach traffic to Scarborough which took place in the second half of the 18th century. Further additions, both internal and external, were made in the mid to late-19th century. A cellar was created in the latter part of the 20th century, along with several additions to the rear of the inn. [Au(abr)]

### **ST. MARY'S PRIORY CHURCH, OLD MALTON**

#### ***St. Mary's Priory Church, Old Malton, North Yorkshire Archaeological Desk-top Assessment of Proposed WC Extension***

Dennison, E Beverley : Ed Dennison Archaeological Services Ltd., Report: 2008/324.R01 2008, 21pp, pls, figs, tabs

*Work undertaken by:* Ed Dennison Archaeological Services Ltd.

A desk-based assessment was undertaken at St. Mary's Priory Church. The remains of St. Mary's Church, consisting of a chancel and nave in one range, were formed from the six western bays of a former Gilbertine priory church. The north aisle was demolished in the late-15th century and the south aisle was destroyed by fire sometime after that. The surviving three stage south-west tower represented one of the two towers formerly positioned at either end of the west front. The priory cloisters and claustral complex formerly lay to the south of the church, and a crypt or undercroft survived within the adjacent 17th century Abbey House.

It was recommended that archaeological work should be undertaken to mitigate any disturbance to below-ground deposits or structures. [Au(abr)]

An area was surveyed in advance of the proposed construction of an egg production unit and associated access works. The most obvious anomalies in the magnetic data were the isolated positive/negative [dipolar] responses which were common across the site. These responses were caused by ferrous material on the ground surface and in the topsoil, not normally archaeologically significant. However, it could be seen that a weak arc of these responses may have corresponded with the projected line of former field boundary through the study area. Elsewhere, within the area surveyed there was no evidence for buried archaeological features. [Au(abr)]

Adcock, J Thornton : GSB Prospection, Report: 08/10 2008, 12pp, colour pls, figs, tabs, refs

*Work undertaken by:* GSB Prospection

The combined techniques of magnetic and resistance survey painted a comprehensive picture of the archaeological remains in the Orchard Field, Sibbertoft. The footprint of the former "Mansion House" was identified as well as what appeared to be the remains of ancillary buildings to the north, all apparently constructed, at least partially, of brick. Associated garden features including a lake and waterways were recorded along with more ephemeral responses perhaps indicating walled or formal gardens. The line of the original medieval road was confirmed and, adjacent to it, relatively undisturbed medieval tenement plots were apparent. Within these plots there was evidence of possible dwellings and other potentially archaeological anomalies. The project produced an interesting dataset which spanned features from the medieval [tenement plots and road], through to the modern day [ferrous responses from recently planted, fenced-off trees] and corroborated the 1782 drawing

by Joseph Sturgis, until now, the only available evidence for the location of the "Mansion House". [Au(abr)]

The "lost" chapel was visible in both the magnetic data, as an area of increased magnetic response, and in the resistance results, as an apparent single-celled building. The magnetic survey also identified a rectilinear enclosure, which was initially thought to be associated with the chapel. However, excavation demonstrated that it was most likely Roman in date and another much smaller ditched feature proved to be of Iron Age date. Other features of archaeological interest detected in the magnetic data included a burnt down wattle and daub building of medieval date, a causeway ditch that linked Chapel Field to a settlement in fields to the north-west and several short ditch lengths and pits of unknown date and function. A number of old field boundaries were also detected. [Au(abr)]

While both of the Romano-British temples and the adjacent circular shrine were visible in the resistance data, the results were not as clear as the cropmark evidence. However, the resistance survey identified a third temple to the east. By contrast, the magnetic data simply identified these features as areas of increased magnetic response, without showing any particular detail. Both geophysical techniques had detected [parts of] the triple ditch system and the enclosure ditch around the temple complex. In the resistance data the enclosing ditch showed as a series of low responses, which may have suggested post pits. Both techniques identified areas of natural soil and geological variations which confused the interpretations. [Au(abr)]

*Work undertaken by:* GSB Prospection

The survey at Hitchin recorded a number of anomalies of archaeological interest. These included a ring ditch, potential ring ditches, trackways, ditches and former field divisions. Pit type anomalies and trends were noted throughout the survey areas and may also have had an archaeological origin. Ridge and furrow cultivation along with modern ploughing trends were evident in the results, as too were bands of natural responses. Extensive magnetic disturbance from a disused railway was visible in the data. Ferrous responses were caused by metal pylons, fences, pipes and the railway line. [Au(abr)]

Railton, M Alston : North Pennines Archaeology Ltd., Report: CP637 2008, 16pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

In June 2008 geophysical surveys of land to the north of Springfield were undertaken. In July 2007, Acle High School discovered a number of Roman artefacts at the site, as well as a barbed and tanged arrowhead, dating to the Bronze Age. The Springfield site would have been on a prominent piece of high ground in the Roman period, and it was believed that this area could have been site of an important Roman trading port. The results of the geophysical survey were to be used to inform the location of a series of archaeological test pits, which were planned to be excavated by Acle High School. Potential features were found to be concentrated on the north side of the survey area, which was consistent with the topography of the site. These comprised a series of possible pits or ditches and a number of broad features, interpreted as soil-filled hollows, or geological features. The exact nature of the features was uncertain, but it was evident that they probably continued outside of the survey area to the north, in the area occupied by houses and gardens. In addition, a small number of possible soil-filled ditches or land drains were detected, possibly associated with the former agricultural use of the site. It was recommended that the features detected were investigated further through the excavation of a series of test pits or trenches, as part of the planned investigation of the site. [Au(abr)]

Railton, M Alston : North Pennines Archaeology Ltd., Report: CP730 2008, 16pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

Geophysical surveys were undertaken on land on the north side of Great Melton Road. The site was situated in a single arable field to the north of Great Melton Road in an area considered to have high archaeological potential. Of particular significance were a probable Roman villa complex that has been identified in fields to the north of the proposed development area. A possible early Saxon cemetery was also identified in fields to the north of Hethersett. Medieval building remains were believed to survive to the west of the site. Modern agricultural features were detected over the majority of the survey area. Two service pipes were detected on the east side of the site. No definite archaeological anomalies were detected within the study area, suggesting that the area may have remained agricultural land throughout the Roman and later periods. Given the results of the survey, no further geophysical survey was recommended at the site. [Au(abr)]

Armstrong, K Bournemouth : Armstrong, K, 2008, 35pp, colour pls, figs, tabs, refs

*Work undertaken by:* Kayt Armstrong

The geophysical surveys revealed features related to the medieval and later exploitation of the peat soils. A field boundary system was revealed some of which was not visible on the surface. On the same alignment as this, the gradiometer survey detected a ploughing trend running across this area, another set of linear trends were discovered underlying both. This was different in character; it was highly regular and on a different alignment to the others detected. As this did not reflect archaeologically understood ploughing regimes, it was suggested that perhaps this represented the remains of hand-cut peat workings. None of the geophysical techniques detected the timbers of the post alignment, or any related features. It was also possible to make general observations of patterns of relative drying on the site; surveys showed considerable drying in the centre of the surveyed area. This seemed to roughly match up with different vegetation management; with the drying corresponding to areas more actively managed. [Au(abr)]

Three techniques detected the continuation of a wall extending from the Dovecote tower in Area A. The resistance survey identified several other responses which may have been of archaeological interest, located in Areas A, C and D, and included possible wall lines and building rubble that may have been associated with the tower. Additionally, two anomalies were highlighted that had the same dimensions as the tower and could have represented similar features. Interpretation of many of the responses was complicated by the potential effects of modern land use [landscaping, trees, garden features]. Modern factors had produced widespread ferrous disturbance in the magnetic data, effectively masking any weaker responses, and very few anomalies of possible interest were identified. The ground penetrating radar survey over the tennis courts also proved disappointing, with most of the recorded responses attributed to material used in construction of the courts. It was not clear whether the lack of archaeological anomalies indicated an absence of surviving remains or was due to a masking effect of the modern overburden. [Au(abr)]

While the geophysical results from the Paddock failed to shed any further light on what survived in this area, elsewhere more positive findings were revealed. A small [presumably Romano-British] enclosure was identified along with a few pits or other features of archaeological interest. While there was no evidence for a substantial villa building, possible interpretations included a small farmstead or, given the large number of metal-working artefacts that have been recovered [and relatively small quantities of pottery], it may have indicated a temple or shrine. Resistance survey adjacent to the house may have detected early foundations of the Hall. [Au(abr)]

Conditions for survey were not ideal surrounding the ruins, and this impacted on all survey techniques. Magnetic data was collected to the north of the priory remains. A number of large pit-like responses were located along with a possible former monastic boundary. Unfortunately, due to the topography and past landscaping of the site, interpretation of the resistance data proved difficult. However, some high resistance anomalies indicated possible rubble spreads and features which may have been associated with the priory nave and cloister. The ground penetrating radar data also proved difficult to interpret. However, it was possible to identify the eastern continuation of the nave and areas of increased response which related directly to the priory buildings. [Au(abr)]

*Work undertaken by:* GSB Propection

The concentration of ferrous metal within the survey area severely influenced the results. It was not possible, with any confidence, to comment on the findings with regards to subtle archaeological anomalies. However, in the few locations where the background levels are were low, there were no anomalies which could represent a moat or ditch. Surface features [manhole covers, anchorage points and fences] may have accounted for most of the strong ferrous responses. Some of the responses had no obvious visible source but were presumed to be similar artefacts or scrap metal. An interpretation diagram of these "unknowns" was included in the hope that it would assist in the investigation of the site. [Au(abr)]

Plouviez, J Aldeburgh : Sutton Hoo Society, 2008, 6pp, colour pls, figs

*Work undertaken by:* L-P: Archaeology, Sutton Hoo Society

The plotting of cropmarks from air photos, geophysical and topographic survey was carried out on accessible areas during early October 2008; preliminary assessment showed that magnetometry was producing good results. Metal detecting survey was showing that the new area was extremely productive. The main cropmark ring ditch was identifiable and intersected with an irregular, roughly D-shaped enclosure. In places there seemed to be redefinition or two ditches defining this enclosure. Within it the second ring ditch was less clear, but adjoined/overlapped an oval feature. To the east a second possible curvilinear enclosure appeared to be related as it respected the east side of the D-shaped enclosure. To the west were various linear features, the longest of which appeared to be nearly parallel to the modern field boundaries. A rapid inspection of the field under crop showed that there were handmade pottery sherds of probable Anglo-Saxon date, and it was decided to incorporate this area into the project. Unfortunately the field was looted in the two days between cultivation and survey detecting, but finds did include a mid 8th-century silver sceat and Anglo-Saxon copper-alloy ornate harness mount and small buckle. For this reason a further two days detecting on this field was carried out, following rolling and planting, and further

Anglo-Saxon coins and copper-alloy objects recovered. A very preliminary assessment of this evidence suggested that this might be a "productive" site comparable to the Anglo-Saxon sites known at Coddendam and Barham in the Gipping valley. The Anglo-Saxon presence here was confirmed and extended, making the identification with the villa region even more plausible. The positive results from the magnetometry suggested that it would be productive to extend the survey and that targeted small-scale excavation would be a viable research project in the future. *Work undertaken by:* Allen Archaeological Associates, Grid Nine Geophysics

A geophysical survey was undertaken on land at the Langley Park School for Boys. The site was being used as a sports field for the school. Existing sports equipment [e.g. Rugby goalposts], service/drain covers and boundaries caused some distortion to the dataset, however, the survey revealed a number of anomalies, the majority of which could be attributed to known boundaries and features, as shown on historical maps and aerial photographs. These included a former track, the remains of a demolished nursery, and former boundaries. Two curvilinear anomalies may have been of archaeological significance as they did not appear on any known mapping and did not conform to existing or known former boundaries. There were many dipolar responses which were likely to have been caused by modern ferrous detritus. [Au(abr)]

Wilkins, E Thornton : GSB Prospection, Report: 08/53 2008, 8pp, colour pls, figs, tabs, refs

*Work undertaken by:* GSB Prospection

A few responses, predominantly pit-like, were classified as potential archaeology although the isolated nature of these anomalies made further interpretation difficult. Ridge and furrow was evident in both fields. In the southern area, trends orientated east-west were thought to run towards the adjacent stream, and as such they may have been field drains. A suspected old field boundary bisected the site, although this was a tentative suggestion and the response may have been due to variation in agricultural practice. There was no discernible pattern in the distribution of ferrous responses, although the overall concentration is higher than might be expected for a green field site. [Au(abr)]

*Work undertaken by:* GSB Prospection

Survey in Area 1 was conducted over extant ridge and furrow cultivation with the aim of identifying any underlying, earlier settlement features, but the results simply reflected the medieval plough lines. Work within the Deserted Medieval Settlement, Area 2, produced magnetic and resistance results which largely reflected the standing earthworks. They did not add significantly to the interpretation of the archaeology. The results from Area 3, to the east of the site, failed to identify any continuation of the settlement remains. [Au(abr)]

Wilkins, I Thornton : GSB Prospection, Report: 08/16 2008, 11pp, colour pls, figs, tabs, refs

*Work undertaken by:* GSB Prospection

A few potential archaeological responses were identified within the survey area. Suspected rectilinear anomalies occurred close to a demolished farm and the existing residential property. A few pit-like responses were also indicated but these were tentative interpretations given their isolated nature. Extensive ridge and furrow could be identified within the data and was visible within the landscape. There were numerous trends, some of which could have been past field boundaries. An area of increased magnetic response is thought to be an in-filled pond or hollow. However, given the extensive mining in this region it could have an industrial origin. Two ferrous pipes have been identified together with strong magnetic responses from fencing, manhole covers and borehole/ground investigation activity. This combined with the strong ridge and furrow response could mask any weaker anomalies if present. [Au(abr)]

*Work undertaken by:* GSB Prospection

Large scale ferrous disturbance, assumed to be modern in origin, dominated the data. This made the reliable identification of potential archaeological anomalies extremely difficult. A number of pit-type anomalies were recorded, but the majority lay within the bulk of the ferrous responses and, as such, any archaeological interpretation was highly tentative. It had not been possible to investigate whether anomalies of archaeological interest identified in the earlier geophysical survey extended into the present area due to modern disturbance. Trends were noted throughout the data some speculated, to have formed part of a small rectilinear enclosure. One curving trend aligned with linear anomalies from the former survey, but its origins remained unclear. [Au(abr)]

*Work undertaken by:* University of Durham, Archaeological Services

Surveys were undertaken to establish former planting schemes for fruit trees. The different techniques detected different features in different parts of the garden, enabling interpretation of much of the former garden. GPR proved to be the most successful technique at detecting anomalies which were likely to reflect the buried platforms that once underlay fruit trees. The other techniques detected parts of former paths and other possible platforms. The composite interpretation plan of anomalies detected by each technique corresponded well with the depiction of the garden on the first edition Ordnance Survey published in 1857. [Au(abr)]

*Work undertaken by:* GSB Prospection

Widespread ridge and furrow, not visible at the surface, was recorded across the application area and could have masked subtler anomalies, if present, pertaining to earlier phases of activity. In certain areas, the ridge and furrow response levels were elevated, possibly indicating the presence of disturbed deposits pre-dating these cultivation practices. However, natural variation in the soil or modern intervention could also have caused this, certainly with regard elevated response levels in the south. Pipework, fencing and recent ground work had all resulted in magnetic interference. [Au(abr)]

Hale, D Durham : University of Durham, Archaeological Services, Report: 2100 2008, 18pp, figs, refs

*Work undertaken by:* University of Durham, Archaeological Services

Possible traces of ridge and furrow cultivation, or other former ploughing, were evident across much of the detailed survey areas. In Area 1, the survey detected the probable remains of two

ditched enclosures and a large number of probable pits, some on an apparent alignment, some in a cluster and others spread over a large area. A former field boundary was also detected. The survey of Area 2 detected the probable remains of some ditch and pit features. The magnetic susceptibility survey identified areas which may have reflected past human activity. It was likely the ridge and furrow traces had a medieval/post-medieval origin and that the former field boundary in Area 1 was post-medieval. The ditched enclosures in Area 1 were possibly of late prehistoric/Romano-British date. [Au(abr)]

Healey, C Lancaster : Oxford Archaeology North, Report: L9968 2008, 51pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology North

A programme of archaeological investigation was undertaken in advance of the development. The planning application covered two fields with a total area of 4.2ha, although only the central 1.7ha would be developed under existing proposals. An archaeological appraisal of the development area was conducted in January 2008 and comprised three phases: a review of the available aerial photographs of the site, a site visit, and a geophysical survey. Three putative cropmarks of potential archaeological origin were identified on several photographs, and a further two cropmarks appeared just once. None of these features could be defined as extant earthworks by the walkover survey, although one additional feature, a slightly raised earthwork platform, was identified. The clearest of these cropmarks lay within the part of the site which was to be developed for static caravans. Two lay within an area that had already been developed, whilst the remainder fell to the east on sloping ground which would not be developed as part of the proposals. Despite severe magnetic disturbance over a large part of the site, the geophysical survey successfully identified several anomalies of archaeological

potential, including a ring ditch clearly visible on aerial photographs. In addition, there were suggestions of a possible adjacent small rectilinear enclosure and a potential concentration of archaeological features in the western extremity of the survey area, the latter of which presently fell outside of that part of the site which will be developed. However, any interpretation was tempered by the extent of magnetic from services and modern features in the area. The proposed development was likely to have a major effect on these putative features, and it was recommended that a trial trench evaluation was undertaken prior to development. [Au(abr)]

Wilkins Thornton : GSB Prospection, Report: 08/49 2008, 12pp, colour pls, figs, tabs, refs  
*Work undertaken by:* GSB Prospection

The results of magnetic survey identified few anomalies of potential archaeology. The majority of these were either isolated or formed no clear pattern and as such their interpretation was tentative. In one location a linear response with apparent branches could have indicated an old field system, but the anomalies may have represented field drains. Other responses of possible interest were scattered across the survey areas, but they tended to lack any specific shape or form that would indicate definite buried archaeology. Ridge and furrow and modern ploughing trends were visible in the data from the fields which were under pasture, but apart from these linears there were few other anomalies of interest. Background levels of magnetic noise were noticeably higher in the arable fields in comparison to the pasture fields. This may have been due to the natural variations in the soil, or changes in the geology, and showed more prominently due to recent agricultural practices; the presence of spoil from mining activity was an alternative explanation. One large ferrous response was likely to be modern although a capped mine shaft was a possible explanation. [Au(abr)]

***Todd Hill Wind Farm, Morpeth, Northumberland, Geophysical Surveys***

Villis, R & Hale, D Durham : University of Durham, Archaeological Services, Report: 2108 2008, 16pp, figs, tabs, refs

*Work undertaken by:* University of Durham, Archaeological Services

Seven hectares of geomagnetic survey were undertaken at Todd Hill, near Morpeth, prior to the proposed construction of a wind farm. Probable ring ditches, which could indicate the presence of roundhouses, and enclosure ditches were identified in Area 5. Anomalies within the possible roundhouses could reflect hearths and pits or post holes. Traces of former ridge and furrow cultivation were identified in Areas 2, 3, 4 and 5. Possible soil-filled pits and ditch features may have been detected in Areas 3, 4, 5 and 6. [Au(abr)]

Hale, D Durham : Archaeological Services Durham University, Report: 2117 2008, 19pp, figs, tabs, refs

*Work undertaken by:* University of Durham, Archaeological Services

A geophysical survey was undertaken at the Todd Hill windfarm in Northumberland. Probable ring-ditches, which could have indicated the presence of roundhouses, and possible enclosure ditches were identified in Area 5/5a, on a small plateau. Anomalies within the possible roundhouses could have reflected hearths and pits or post holes. These features may have comprised a small late prehistoric settlement of the type often investigated by Jobey in the last century. Traces of former ridge and furrow cultivation were identified in Areas 2/2a, 3, 4 and 5/5a. Possible soil-filled pit and ditch features may also have been detected in Areas 3, 4, 5/5a and 6. Burnham, B London : Society for the Promotion of Roman Studies, Report: 39 2008, 6pp, figs, refs

*Work undertaken by:* TimeScape Surveys

During late-2007 and early 2008 an extensive magnetometer survey examined over 4.2ha including the stone fort area directly to the north and elements of the vicus to the west

complementing that undertaken over 4.4ha north of the Stanegate in 2000. The survey of the fort indicated a complex palimpsest of features and differential degrees of stone robbing. The western section of the via principalis was visible as far as the principia as well as a double granary west of the latter, each part of which measured c. 25m by 8m. The layout of buildings might have supported the theory that the population of the vicus moved into the fort and redeveloped the internal layout either after c. AD 270-360. A group of larger than typical barrack or granary buildings may represent later development. Evidence was found for post-military occupation which overlaid multi-phase military buildings, some of which had been robbed of stone. [Sec(adp)]

*Work undertaken by:* North Pennines Archaeology Ltd.

Geomagnetic surveys were conducted over ten separate areas within the study area along the route of a proposed access road. All of the archaeological features detected were associated with the former agricultural use of the site, including ridge and furrow earthworks of possible medieval or post-medieval date, a former post-medieval field boundary and a possible series of later land drains. A modern service pipe was also detected which was believed to be a high pressure gas pipe. [Au(abr)]

Railton, M Alston : North Pennines Archaeology Ltd., Report: CP712 2008, 21pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

Geophysical surveys of land to the north of Papcastle was undertaken. The Roman fort of Derventio (a Scheduled Ancient Monument) was situated to the west of the site, and two projected Roman roads, exiting the main east gate of the fort, were believed to have extended into the area of the proposed development. A previous desk-based assessment of the site had identified that the potential for sub-surface Roman and/or medieval remains in the area was high. The results of the geophysical survey, on the north side of the survey area, were dominated by the geological anomalies detected in this area. These anomalies were associated with a prominent ridge, which was probably formed by igneous extrusive basalt or spilite. Although these anomalies were filtered out of the geophysical data, the possibility

existed that the geological anomalies detected had masked less substantial features in this area. The majority of the features detected were associated with the medieval and post-medieval agricultural use of the site, including the remains of ridge and furrow cultivation, former field boundaries, and possible land drains. The westernmost field boundary was illustrated on the Tithe Apportionment map of 1829, but was removed in the early 20th century. These features reflected the former presence of medieval strip fields, which would once have surrounded Papcastle. No features of probable Roman date were detected by the geophysical survey, despite the close proximity of the proposed development area, to Derwentio Roman fort. It was possible that medieval and post-medieval cultivation may have truncated earlier features in this area. [Au(abr)]

 The magnetic survey identified concentrations of ferrous type responses which were presumed to be associated with buildings from Calgarth village. Additionally, former buried utilities were also recorded. As such, these results were exciting in that they suggested that

the village was not totally destroyed in the 1960s, but that some remnants had survived in situ. However, the geophysical results were perplexing because they did not always tie in with the old map evidence. More work, in the form of survey and excavation, would be required to verify the accuracy of the maps and to test the geophysical interpretations. [Au(abr)]

#### ***Bramall Hall Park, The Bowling Green & The Croquet Lawn: Geophysical Survey***

Grimsditch, B & Thompson, A Manchester : University of Manchester Archaeological Unit, 2008, 19pp, figs, tabs, refs

*Work undertaken by:* University of Manchester Archaeological Unit

A geophysical survey was undertaken on the grassed areas to the north-east and west of Bramall Hall. The survey indicated very little in the way of archaeological anomalies. Several high magnetic responses were detected though these were interpreted as modern metallic deposits. An area in the north eastern corner did indicate an ephemeral linear anomaly running approximately east to west but this appeared to follow the fall of slope that ran along the eastern side and could have had a geological cause. There was also a small area of high magnetic response located close to a timber and metal bench in the croquet lawn, the area surveyed showed a wide spread of high resistance readings possibly due to redeposited building material associated with landscaping. In the south-east of the grid there was low readings, possibly derived from an infilled pond or garden feature. [Au(abr)]

**LAND AT WORDEN PARK, LEYLAND*****Geophysical Surveys of Land at Worden Park, Leyland***

Railton, M Alston : North Pennines Archaeology Ltd., 2008, 150pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

Geophysical surveys of land at Worden Park were undertaken. The surveys were designed to target the site of the former Worden Hall (Area A), and a parterre garden to the south (Area B). Worden Park was Grade II Listed on the English Heritage Register of Parks and Gardens. Worden Hall (originally known as Shaw Hall) was the principal home of the Farington family between 1717 and 1946. During the 18th century the grounds were extensively landscaped, and included the creation of a formal garden. Worden Hall was extensively damaged by fire in April 1941, and was demolished in the 1960s. The objective of the geophysical surveys was to determine the presence/absence, nature and extent of any archaeological anomalies in the study area, and the presence/absence of any known modern anomalies within the study area, which may have affected the results. The results of the surveys were to be used to inform the creation of a ground plan to mark the site of the former Worden Hall, as part of a development plan for Worden Park. Earth resistance surveys were conducted over two areas within the park. The external walls of the former hall were detected in Area A. In addition surviving sub-surface features, possibly associated with the remains of interior walls or floors, were indicated by the geophysical survey. The remains of a smaller building were also detected on the north side of Area A, which corresponded to the location of a range of buildings shown on the 1st Edition Ordnance Survey map (surveyed 1844-1850). No certain formal garden features, or other archaeological remains were detected in Area B. [Au(abr)]

The site generally had very low magnetic background levels, giving a high confidence that potential archaeology would be identified if present. The scanning survey provided very few potential areas of interest. Subsequent detailed survey confirmed the absence of anomalies with the exception of ridge and furrow which was evident in the data and, in some cases, visible as earthworks. In one location a potential headland for the ridge and furrow was identified. Other weaker trends could also have been due to agricultural activity representing multiple phases of ploughing. Other pit-like anomalies fell into the category of "uncertain" since they were both weak and/or isolated. Most strong ferrous anomalies were thought to be modern in origin. An area of magnetic disturbance coincided with a knoll but the likelihood was that this was an accumulation of recent material. [Au(abr)]

**EARWIG CORNER*****Earwig Corner – Ground Penetrating Radar Test Survey***

Archer, T Eastbourne : Arrow Geophysics, 2008, 6pp, figs

*Work undertaken by:* Arrow Geophysics

Ground penetrating radar appeared to have imaged a shallow earth-cut grave within the area that was surveyed. It was not clear why this feature was found in isolation. Earwig Corner was a road junction on the outskirts of Lewes. It was also the site of a Scheduled Monument (ES7185), which consisted of a large high status Anglo-Saxon cemetery first rediscovered in 1830. A rescue excavation of five graves had taken place in 2001. It was not known whether other graves existed within the vicinity. A novel deployment of ground penetrating radar was tested at the site, namely the use of a high centre frequency antenna more usually employed for detailed mapping of concrete structures. It was hoped that the greatly increased spatial resolution of this antenna might delineate graves that could not be imaged by more conventional GPR survey. The possible earth-cut grave was imaged on several successive depth slices, and showed better definition in both plan and profile than in the corresponding 500 MHz dataset. It was recommended that further testing be carried out over earth cut graves of which the precise location was already known. [Au(abr)]

*Work undertaken by:* GSB Propection

Unfortunately, the magnetic data had been badly affected by severe magnetic disturbance which covered a major part of the site. The presence of metal goal posts, a metal perimeter fence, a small transformer [just outside the site], a number of metal road signs and buried services had all resulted in strong magnetic fields which will have masked any buried archaeology. Similarly a c.15m wide strip of ground, corresponding to where caravans were believed to have stood in the 1950s, was totally disturbed. This probably reflected landscaping as there was a distinct variation in the turf colour that coincided with this strip. In such circumstances it was impossible to say whether any buried archaeology was present or whether it had been damaged by the later disturbances. [Au(abr)]

*Work undertaken by:* English Heritage

A geophysical survey including magnetic, earth resistance and ground penetrating radar (GPR) surveys were used, although every technique was in part hampered by the physical restrictions of the site. Linear anomalies possibly associated with historic drainage features and former building remains were revealed by the earth resistance survey and these were partially corroborated by the GPR data. Comparison with historic mapping suggested some anomalies were comparatively recent and more significant remains may well, perhaps, have been obscured to geophysical techniques. [Sec(abr)]

***A Review of Results for Mr Michael Deeley on a GPR Survey carried out in December 2003 at Manor Farm, Launton***

Stowe, S Upton-upon-Severn : Stratascan, Report: 1822 2003, 6pp, figs

*Work undertaken by: Stratascan*

A survey was undertaken to locate the entrance to a conjectured tunnel that was believed to run from Manor Farm to a rectory approximately 150m away. Local residents claimed to have seen the entrance to this tunnel in the living room of the farmhouse, with a set of stairs next to the fireplace leading to the entrance of the tunnel. However, no entrance was found when the current owners investigated the fireplace. The purpose of the survey was to attempt to locate this reputed entrance. The survey located two areas within the farmhouse that displayed evidence that may have been associated with the tunnel. Anomalies discovered under the living room may have been associated with the entrance to the tunnel. However, the rooms to the south contained responses which may also be associated with the tunnel. Further investigation was recommended to fully understand what these anomalies related to. [Au(abr)]

Haskins, N Chichester : Chichester District Archaeology Society, 2008, 6pp, colour pls, figs, tabs, refs

*Work undertaken by:* Chichester District Archaeology Society

A survey was carried out in a car park adjacent to the Chichester Marina. The objective was to confirm the position of any remains of the Casher bridge, which was dismantled during WWII but whose remains were believed to have been left near the original site of the bridge. Oral tradition had it that the bridge remains were left following damage caused by work after the war. The abutments of the original bridge were visible immediately to the south of the car park. Results showed a large object was buried beneath the rough ground alongside the car park. [Au(abr)]

Wood, E Thornton : GSB Prospection, Report: 08/45 2008, 5pp, colour pls, figs, refs

*Work undertaken by:* GSB Prospection

The magnetic results were, in this instance, inconclusive. A hectare sample block was positioned to cover an old field boundary marked on a map of 1775 and the tithe map of 1839. While the data indicated a feint negative trend located along the predicted 1775 boundary, it was uncertain whether this trend was connected with the old field boundary or due to modern ploughing. The absence of responses associated with the old boundary may have been the result of the boundary being totally ploughed out or due to a lack of any magnetically enhanced material [unless ditches were associated with an old boundary there was no reason why a removed boundary should result in a magnetic signature]. A number of anomalies of a

sporadic nature have been detected within the data and were likely to be caused by natural variations within the soil. The hectare block was scattered with small ferrous responses which were assumed to be of a modern origin and comprised iron debris within the topsoil or on the surface. [Au(abr)]

Stratascan Upton-upon-Severn : Stratascan, 1995, 16pp, figs

*Work undertaken by:* Stratascan

It was thought that an area of higher resistance was an area of rubble from the demolition of abbey buildings. Several larger rooms were identified the most north-west being the conjectural day room south of the chapter house. It was felt that there were several smaller rooms within the centre of the area which may have been a part of the living quarters or a kitchen range. It was possible that some magnetic anomalies were flues or hearth sites. A strong linear feature was thought to be the precinct wall of the abbey with three features cutting at right angles and may have been part of an entrance from the east. It was also suggested that there was a shallow ditch to the west of the precinct wall and an apron beyond the ditch. [Au(adp)]

Wilkins, I Thornton : GSB Prospection, Report: 08/56 2008, 7pp, colour pls, figs, tabs, refs

*Work undertaken by:* GSB Prospection

The site had very high magnetic background levels, attributed to the local geology, and although these may have masked weaker responses, it was still possible to identify potential archaeological features in the data. A strong linear response, bisecting the field east-west, was thought to be a field boundary, although it might have represented part of a former enclosure ditch. Other strong linear responses in the southern, upland half of the field may also have archaeological potential. However, in the absence of a definitive pattern, interpretation was difficult. A combination of the steep slope, former ploughing and natural

variations within the soil are likely to account for many of the responses identified within the data. Most strong ferrous anomalies are thought to be modern in origin. [Au(abr)]

Adcock, J Thornton : GSB Prospection, Report: 08/51 2008, 9pp, colour pls, figs, tabs, refs

*Work undertaken by:* GSB Prospection

The survey revealed a set of three enclosures ranging from approximately 20m up to a maximum of 60m across, two of which [in the east of the application area] were intersecting, and therefore indicative of different phases of construction. Whilst all three enclosures had internal features, there was some question as to the antiquity of those within the easternmost example. The two intersecting enclosure ditches lay just east of a diffuse "edge", which demarcated a shift to a zone of diminished magnetic response running through the centre of the field. In places, this appeared to be associated with lines of small pit-like anomalies. The largest enclosure [at the western end of the application area] was adjacent to a zone of increased response within which lay a number of pit and ditch-like anomalies, though they did not form any clear patterns. Presumed ploughing trends were also visible in the data here. A known former field boundary had been clearly mapped, along with numerous small, isolated pit-like anomalies and trends. [Au(abr)]

Adcock, J Thornton : GSB Prospection, Report: 08/71 2008, 11pp, colour pls, figs, tabs, refs

*Work undertaken by:* GSB Prospection

The results of the survey were affected by modern disturbances associated with the existing school buildings and paraphernalia on and around the playing fields. In addition, the near surface bedrock added to the background magnetic noise. Despite these complications, a series of old boundaries and field systems was identified. There were numerous linear and curvilinear ditches and one possible small enclosure. A number of pits and other features of archaeological interest were also recorded. Given the high levels of noise, more ephemeral features may well have been missed. There is one area of enhanced magnetic readings which is difficult to interpret. It could have indicated a concentration of archaeological features, but it seemed more likely to be associated with landscaping, or perhaps former mining activity. A possible old mineshaft was highlighted in the data along with some other responses likely to be associated with a soakaway and possible mine-working, though an archaeological origin could not be ignored. *Work undertaken by:* South West Archaeology

Four sets of anomalies were recorded that indicated potential archaeological features. These potential features were provisionally identified as a ditch forming a partial circle with a projected diameter of 12.5-metres, a curving series of possible pits, another ditch and a linear feature, possibly another ditch or an earthen bank. *Work undertaken by:* Stratascan

A gradiometer survey was carried out on arable land to the north-west of Topsham. The survey identified a number of anomalies that may have been archaeological in origin. Positive anomalies were identified as filled-in cut features such as ditches, and negative anomalies were interpreted as ploughed-out banks or earthworks. Many of these anomalies could be

attributed to former field boundaries. A quantity of magnetic disturbance and debris was thought to have been caused by modern activity and interference. [Au(abr)]

*Work undertaken by:* University of Durham, Archaeological Services

Geophysical survey was undertaken at Hanson Town Farm. The surveys of Areas A and B may have detected evidence for iron-working in the form of possible smelting furnaces, like those detected previously to the west, and areas of associated waste such as slag. Such features, if proven, might have been considered to be of regional significance. Possible traces of ridge and furrow cultivation and former field boundaries were detected across parts of the area, some of which may have been medieval. These features would be of local significance. Occasional magnetic anomalies throughout the study area could reflect the remains of ditch and gully features of unknown date, though a number of the longer anomalies corresponded to grassed tracks evident on the ground and on recent aerial photographs. *Work undertaken by:* Bristol University

The SMR entry for Mine Field was created due to aerial photographic evidence that showed a large rectangular enclosure in the south eastern area of the field. It was thought that the crop mark may have been the remains of a Roman fort. Field investigation of the site in 1982 concluded that the site was not a suitable position for a Roman fort. This did not, however, satisfactorily explain what the enclosure could have represented and so the site was chosen for this study to see if any further knowledge and the archaeological activity represented by the crop mark could be gained. The geophysical survey data did not show a rectangular enclosure but the results instead added to the picture of the agricultural history of the site. [Au(abr)]

***Archaeological Geophysical Survey in Peatland Environments: Case Study Survey at Yellowmead Multiple Stone Circles and an Adjacent Cairn, Yellowmead Down, Sheepstor, Dartmoor: Interim Report***

Armstrong, K Bournemouth : Armstrong, K, 2008, 31pp, colour pls, figs, tabs, refs

*Work undertaken by:* Kayt Armstrong

Geophysical surveys were conducted over Yellowmead Stone Circles and an adjacent cairn, as part of ongoing research into archaeological geophysical prospection in peat land environments. The objectives were to test four different geophysical techniques in this environment, to establish the reliability of the antiquarian reconstruction of the monuments, to look for a suggested stone row to the west of the circles and to examine the relationship between the cairn and the circles. The surveys revealed several targets of archaeological interest, and resolved some of the questions about the site. New potentially archaeological features were identified below the line of the leat in line with the stone rows, and adjacent to the small cairn to the north of the main circles. The larger stones of the circles were visible in both the radar and resistivity surveys and the leat and its bank showed up well in both. The radar results suggested an area with buried small stones covering the inner area of the circles, lending weight to the argument that this was originally some sort of encircled cairn monument, rather than four free standing concentric rings. The conductivity, magnetic

susceptibility and gradiometer survey all showed some response to the stone circles, again more specifically to the larger stone settings. None of the surveys revealed anything at odds with the 1920's reconstruction of the site, nor any definitive evidence for stone rows extending down slope of the circles. The surveys also showed non-archaeological features, with the footpaths showing up. The resistivity and radar in particular, showed that the character of the soil down slope of the leat appeared to be quite different to the rest of the site. Overall, the radar proved the most informative technique, giving a greater level of detail of the stone circles and a greater number of potential targets than the other techniques. Additional features near to the cairn were located by the GPR which would require further investigation to determine their nature and where they fit in the chronology of the site. There is a possibility that the GPR survey detected a continuation of the stone row to the west of the leat but due to the character of the response in this area, ground truthing was required to state this with any certainty. Wilkins, I Thornton : GSB Prospection, Report: 08/24 2008, 14pp, colour pls, figs, tabs, refs

*Work undertaken by:* GSB Prospection

The gradiometer survey was hampered by strong magnetic responses from both playground equipment within the survey grids and from adjacent buildings. Together these masked a large area and the end result was low levels of confidence in the interpretation. One large ferrous response was recorded but this was a suspected pipe. The GPR survey produced more promising results with two anomalies suggestive of voids, although in both instances the responses could easily have originated from utilities or the ground make-up. Other responses, although not classified as voids, could have been of interest. These included six shallow responses and two deeper anomalies, but in all cases alternative explanations could be applied. The north-east corner of the playground had groups of responses that could be the result of past structural remains, although alternative explanations included redundant utilities or foundations for adjacent walls. Given the concentration of responses in this corner the presence of munitions or explosives could not be ruled out. [Au(abr)]

Adcock, J Thornton : GSB Prospection, Report: 08/25 2008, 12pp, colour pls, figs, tabs, refs

*Work undertaken by:* GSB Prospection

The scanning and subsequent detailed survey revealed an unusual pattern of response across the application area. This was characterised by a series of very strong ditch type

anomalies that clearly had archaeological potential. However, they were difficult to correlate with each other, given the lack of a wider context, but their similar response characteristics certainly suggested that they were related. The most interesting examples were an isolated 80m length of ditch, with a distinct curve at the eastern end, and a rectilinear ditch forming two sides of what could have been an enclosure. Both terminated very abruptly with no geophysical evidence of a continuation and, in the case of the former, very few other associated archaeological anomalies. The partial enclosure appeared to have an "entranceway" on the southern side, and immediately to the north were a series of strong pits potentially containing burnt or fired material. Weaker linear anomalies were also recorded which were likely to be of archaeological interest, although in some cases the potential for drains or former field boundaries could not be ruled out. A number of faint pit-like anomalies of indistinct origin (there was little evidence to suggest either an anthropogenic or natural source) were detected across the site. [Au(abr)]

Adcock, J      Thornton : GSB Prospection, Report: 08/68 2008, 10pp, colour pls, figs, tabs, refs

*Work undertaken by:* GSB Prospection

Very little of clear archaeological significance was detected across the majority of the survey areas. The one possible exception was Area 3, where strong ferrous anomalies may not have been modern ] as is usually assumed] but, in fact, related to former metal working. Possible slag deposits were seen on the surface during data collection. That said, this area was shown as a "Rifle Range" on 1889/1890 OS mapping and this may have accounted for some of the responses. A linear anomaly in Area 6 may have been a former field boundary although there was no map evidence to corroborate this. The remaining areas were characterised by responses from the surrounding fences, small-scale ferrous debris, and weak trends. [Au(abr)]

Stowe, S      Upton-upon-Severn : Stratascan, Report: J1916 2004, 30pp, figs

*Work undertaken by:* Stratascan

The survey of the canal bank showed several anomalies at different depths. Shallower high conductivity and magnetic susceptibility anomalies were probably caused by the boat which was found buried on the site. A deep low conductivity anomaly flanked by high conductivity anomalies may have been caused by pooling of fresh water from the culvert below 3m depth. No indication of the line of the culvert was discovered in the electromagnetic data. The magnetometry survey carried out over the bank of the canal also did not locate the position of the culvert, due to the large response generated by the steel piling at the side of the canal. Further west from the canal a large anomaly was picked up which was probably associated with buried ferrous material at depth. The magnetometry survey carried out down the centreline of the canal produced a relatively high amplitude anomaly. This confirmed that the section of the culvert running beneath the canal is likely to be made of cast iron. The GPR failed to produce any meaningful results on the bank of the canal, probably due to the clay used in the construction of the canal. On the traverses collected across the surface of the canal the edges of the canal were clearly imaged, although the signal from the antenna dropped out at a shallower depth than would be expected for the conditions. *Work undertaken by:* Bartlett-Clark Consultancy

The survey produced a strong magnetic response as expected, with findings which included two distinct ditch-lime features. These may have represented boundaries associated with the ridge and furrow cultivation which was detected across much of the site, or could perhaps be of a different date. It was thought possible that there was once a track across the field, the road metalling evidenced. Various negative linear features, could have represented hollows or furrows in the topsoil and further magnetic anomalies could have represented pits, indicative of settlement activity. [Au(adp)]

*Work undertaken by:* University of Durham, Archaeological Services

Geomagnetic surveys were undertaken over land at the Down Ampney Estate, straddling both Gloucestershire and Wiltshire, prior to proposed gravel extraction. The technique proved very effective over the soils and gravels at the site, detecting a range of both features and materials. Features that were typically detected across the study area included soil filled ditches (some defining enclosures and trackways, roundhouses and barrows), traces of former ridge and furrow cultivation, old field boundaries, drains and palaeochannels (particularly in the east near the River Thames ). Some of the detected features corresponded to cropmarks recorded on aerial photographs but many were previously unknown and have provided added value to existing knowledge. Concentrations of probable archaeological features which might be regarded as being of more than local significance, were detected in Phase 5 Area B, Phase 6 Area B, Phase 7 Areas A and E, and Phase 9 Areas A and B. *Work undertaken by:* Archaeological Surveys

A magnetometer survey was conducted in an area crossing the Wiltshire/Gloucestershire border. In the eastern part of the site, a cluster of ring ditch features were likely related to roundhouses forming a prehistoric or early Romano-British settlement. There was evidence of the intercutting of ring ditches or the addition of ditch like features to the roundhouses, possibly indicating development and settlement of the site over a long period. Linear and curvilinear anomalies in the vicinity of the north-eastern corner of the site could not be confidently interpreted but correlated approximately with a scatter of early post-medieval

pottery sherds noted during the fieldwork phase. A small number of Roman potsherds and worked flints were also noted in this area. A number of positive linear anomalies possibly representing post-medieval land division were noted. Discrete positive anomalies were widespread across the site. [Au(abr)]

*Work undertaken by:* Archaeological Surveys

A magnetometer survey was carried out prior to an extension of a housing development. It located a number of positive linear and discrete anomalies that related to cut features such as ditches and pits. The location of prehistoric features, during previous survey and excavation on land immediately to the north of the survey area, tended to indicate a high archaeological potential for these anomalies. A number of anomalies could not be confidently interrupted but may have represented features with archaeological potential. Two buried services crossed the survey area and created zones of severe magnetic disturbance. [Au(abr)]

The results of the survey were magnetically very quiet. The enclosure ditch resulted in a highly variable magnetic response. In places, there were strong anomalies, elsewhere the feature was barely detectable. This was likely to be a result of partial infilling of the ditch in recent times, as opposed to any other archaeological origins. Within the enclosure were a few anomalies of potential interest, in particular a zone of increased responses close to the cable trench, where bodies were recorded. However, there was no evidence in the data of any settlement type responses. [Au(abr)]

***Henfield Farm, Westerleigh, South Gloucestershire. Magnetic Susceptibility and Magnetometer Survey***

Sabin, D & Donaldson, K Chippenham : Archaeological Surveys, Report: 238 2008, 53pp, figs, refs

*Work undertaken by:* Archaeological Surveys

Magnetic susceptibility survey located moderate enhancement across parts of the western half of the site with some well-defined areas of high magnitude enhancement within the eastern half. The latter appeared associated with ferrous slag, stone and post-medieval pottery on the field surface. Magnetometry survey was targeted across enhanced zones where practicable. Severe magnetic disturbance associated with buried pipelines restricted magnetometry to half of the site. Magnetometry within many of the target areas produced linear and discrete anomalies that could not be confidently interpreted. Magnetometry survey within the vicinity of zones of enhanced magnetic susceptibility associated with iron slag, did not provide supporting evidence of industrial features. To the north of a former coal mine shaft the survey produced evidence of rectilinear features of archaeological potential, possibly indicating structures associated with the mine shaft. [Au(abr)]

Johnson, A Noke : Oxford Archaeotechnics, 2008, 16pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeotechnics

The survey recorded the presence of extensive areas of magnetic "clutter" across the site, caused by probable modern building debris. However, more subtle areas may have indicated infilled hollows or possible pitting of unknown date. Former brick footings may have been noted. Linear anomalies identified within the south-western part of the main survey area were probably of modern origin and may have been associated with the sports field. [Au(adp)]

Attwood, G Durham : Archaeological Services Durham University, Report: 1746 2008, 22pp, figs, tabs, refs

*Work undertaken by:* University of Durham, Archaeological Services

This report presented the results of further geomagnetic surveys conducted in advance of the proposed development of land east of Swindon. The first phase comprised surveys of 16 areas undertaken in 2005. The current Phase 2 and Phase 3 works comprised a further 18 geomagnetic surveys totalling approximately 37ha. Soil-filled features including ditches, enclosures, pits and gullies were identified across the surveyed areas, roughly divided into five foci. A large multi-phased area of occupation possibly of late prehistoric/Roman date had been identified around South Marston Farm. Trackways and enclosures had also been identified in Phase 3 Area 3A to the east of South Marston Farm. These may have been related to the much larger area of occupation to the west. An area of probable occupation identified during the Phase 1 surveys south of Marston Farm was found to extend beyond the original survey. Possible stone walls and ditch features were identified across the survey extension. A probable prehistoric enclosure and three possible prehistoric roundhouses were identified. Traces of probable medieval ridge and furrow cultivation were also identified. [Au(abr)]

Sabin, D & Donaldson, K Castle Combe : Archaeological Surveys, Report: 226 2008, 41pp, colour pls, pls, figs, tabs, refs

*Work undertaken by:* Archaeological Surveys

Magnetometry survey was carried out within a single field, the north part of which contained the Scheduled area of the villa site. The response to Roman walls was clearer than expected, possibly due to the clearance of structural debris during the 19th century excavations at the site. Negative evidence of anomalies correlated well with the mid-19th century plan of the excavations. Some plough disturbance was noted. Evidence for a large ditch to the west and south of the villa was noted, and possibly indicated a substantial defensive work that may have dated to the late Roman period. Weak curvilinear features were recorded to the south of the enclosure ditch and may have been indicative of early Roman or late prehistoric features. Crossing the central part of the surveyed area, a ditch located by magnetometry lay immediately north of a low extant bank, and could have been the northern part of a naturally defended promontory. Ditch-like anomalies at the southern tip indicated an enclosure, with suspected prehistoric origins. A possible Roman road was also recorded. The site had a high potential for archaeological remains. Lafuente, M & Roseveare, M Hereford : ArchaeoPhysica Ltd., Report: LEI071 2008, 15pp, colour pls, tabs, refs

*Work undertaken by:* ArchaeoPhysica

A geophysical and topographic survey was undertaken in Dark Lane, Leintwardine, in advance of development. The survey was intended to provide information on surface and subsurface features of likely archaeological interest and, therefore, to inform on the potential archaeological remains, in advance of a programme of trial trenching. The study area had potential to contain Roman settlement and cemetery remains given that it lay adjacent to a Roman road and close to the Roman town of Branogenium. The use of a magnetic technique permitted the location of enhanced areas that could be identified with old field boundaries aligned with the existing boundaries in the field to the east of Dark Lane, and other magnetic single anomalies which could have an archaeological origin (pits, fires), as well as a modern origin (debris, brick). The post survey excavation revealed the existence of a kiln that had not generated a clear magnetic anomaly. Subsequent investigation revealed that this had been obscured by coincident ferrous debris, probably associated with the site of a removed telegraph pole. There were grounds for suspecting similar structures within the evaluated area. The digital terrain model of the study area suggested the existence of two lynchets in the southern half of the field, one of them aligned with the field boundary in the field to the east of Dark Lane and other slight earthworks which may not have an archaeological origin. Engineering Archaeological Services (EAS) Ltd Blaenau Ffestiniog : Engineering Archaeological Services (EAS) Ltd, 2008, 1p

*Work undertaken by:* Engineering Archaeological Services (EAS) Ltd

An extensive number of anomalies had been recorded, from both the resistivity and fluxgate gradiometer surveys that were carried out. These suggested a significant level of activity within the survey area, probably from several periods of activity. The resistivity survey in particular appeared to document three possible buildings, in addition to the probable location of the dovecote, together with possible roads/trackways and features probably representing a series of paths associated with the Orchard Slip. The Fluxgate Gradiometer survey was less successful. There was a degree of correspondence between the anomalies recorded by the two techniques adopted. There was also a degree of correspondence between the samples taken for magnetic susceptibility and the other techniques used. [Au(adp)]

*Work undertaken by:* GSB Prospection

The scanned area and pre-defined detailed survey blocks displayed varying levels of magnetic disturbance. Where the ground was ploughed dense concentrations of brickwork, machine parts, wire and scrap metal were all visible. This material clearly contributed to the elevated magnetic levels. Where the magnetic disturbance was particularly strong [and well defined] the assumption was made that aircraft remains could be present. Thus five potential aircraft dumps were identified [four within the pre-defined blocks and one outside], together with three locations where ferrous material appeared more concentrated. The numerous ferrous responses will have masked any archaeological remains if present. [Au(abr)]

Roseveare, M J Hereford : ArchaeoPhysica Ltd., 2008, 12pp, pls, figs, tabs, refs

*Work undertaken by:* ArchaeoPhysica

The survey revealed at least two phases of settlement at the site. Roundhouses dating from the Bronze Age/Early Iron Age were recorded, some with significant internal detail including hearths. It was thought that what had started out as an unenclosed Bronze Age settlement, populated quite densely with roundhouses and probably reached by a track, was replaced by a later enclosed settlement. The latter settlement was interpreted to have a rectangular field system running back onto the plateau perpendicular to the western slope. Survival was thought to be particularly good, however, this was related to the ploughing regime and may have changed had the site been ploughed deeper. [Au(adp)]

**COUGHTON COURT*****Geophysical Survey at Coughton Court***

Archaeophysica Harewood End : Archaeophysica, 2008, 1p

*Work undertaken by:* ArchaeoPhysica

Magnetic and electrical resistance surveys were undertaken at Coughton Court. The area was known, from maps of 1695 and 1746, to have had ranges of buildings including stables and associated ancillary structures for the house. The survey was successful in

demonstrating the existence of the remains of these structures, sufficient to reveal their approximate form and location with good correlation with some elements of the 1746 mapping. The existence of what appeared to be a stew pond immediately adjacent or even contiguous with the north-west corner of the moat was also discovered. This had implications for understanding the setting of the house during the medieval period. What appeared to be a former line of the southern drive, different from any known alignment (deviating from the pre-1746 course) was also discovered. Some evidence was found for the width of the moat. When viewed in conjunction with the stew pond it was suggested that perhaps the medieval house stood on a low island or promontory within the confluence of the Cain Brook and River Arrow. Further work would be needed to examine this possibility further, however, some support for this idea was provided by the electrical resistance data which appeared to show this drier ground continuing westwards beneath the site of the stables and other structures. No definitive archaeological anomalies, suggesting enclosures or barrow ditches, were detected by the survey. Hints of a single circular anomaly were identified, but the poor definition of the responses made an archaeological interpretation highly cautious. Two groups of linear anomalies formed patterns that suggested an anthropogenic origin. One group may have reflected ridge and furrow cultivation, while the nature and function of the other remained uncertain. Weak small scale "pit-type" anomalies and faint trends were present in all the survey blocks. They were generally isolated and formed no obvious patterns. While an archaeological origin for any one of these could not be entirely discounted, natural, modern or agricultural origins were equally, if not more likely. [Au(abr)]

A gradiometer survey was conducted over an area to the south east of Beverley. The survey identified a number of anomalies which may have been of archaeological origin, including two curvilinear enclosures in Areas 4 and 5. Possible former field boundaries and an area of distinct ploughing activity had also been identified in areas of intense crop marks. There was a lot of metallic debris across the site, notably in the north-east and this may have indicated mixed or dug earth or made-up modern ground. There was a lot of magnetic disturbance observed running along the perimeter of the survey area caused by metal fencing and modern interferences. [Au]

Cropmark evidence suggested that features were present where the soil was sandy, however, fewer existed where clay was dominant. For this reason, survey was concentrated on the clay and the sandy areas were to be evaluated by non-geophysical means. The survey revealed sufficient to suggest that the field system found north of Holme Wood Lane did continue into the site and that there may have been related features. However, it was also clear that many features had been truncated by ploughing as their anomalies were indistinct and discontinuous. [Au(abr)]

Wilkins, I Thornton : GSB Prospection, Report: 08/07 2008, 14pp, colour pls, figs, tabs, refs

*Work undertaken by:* GSB Prospection

Very few locations within the offices were identified as potential voids. In most cases the disturbed ground seemed to relate to the past usage of the site and most areas of "movement" were changes in floor construction not actual subsidence. However, consideration should be given to the Canteen and Workshop [design office], where some potential problems were identified. Outside the buildings a more complex interpretation arose. Near Borehole 9, five locations showing concentrations of disturbed ground were identified with one containing potential voids and another showing potential for subsidence. Around Borehole 10 one potential void was identified but this was an unusual response and could have related to some past usage of the site. Disturbed ground rather than voids accounted for the anomalies identified close to Borehole 11. Within in the car park area two potential voids were identified near Borehole 12, but they lay close to suspected service trenches which complicated the interpretation. Although no distinct voids were identified in the survey area around Borehole 13, one location did show evidence of subsidence and there were four areas of disturbed ground. In a few locations the response from the radar was variable in terms of depth of penetration. In the case of the Canteen this may have been due to the type or condition of the flooring while in some of the outside locations, such as around Borehole 10 and 13, the reinforced concrete had effectively masked the underlying deposits. It was therefore not possible to comment, with any certainty, on the conditions below these anomalies. [Au(abr)]

The results from East Riddlesden Maze Field were slightly disappointing, in that they did not really help resolve the matter of the Roman road. However, they pinpointed high resistance readings that would seem to coincide with parch marks which had been seen in the recent past. Unfortunately, modern disturbance had affected the quality of the data and may have masked some of the underlying features. [Au(abr)]

*Work undertaken by:* GSB Prospection

The majority of the anomalies detected during the survey related to either old field boundaries or former agricultural practices. Some of the boundaries detected were marked on early maps, while other potential boundaries were unrecorded. Both ridge and furrow cultivation and modern ploughing effects were visible in the data. Only a few anomalies of archaeological potential were identified. These included ditches associated with an earthwork bank and a possible ditched enclosure. A few tentative rings were noted, but the responses were often nothing more than trends in the data. A potential archaeological interpretation was presented simply due to the existence of a Bronze Age carved stone on the site. [Au(abr)]

Geophysical survey indicated the presence of an essentially rural landscape of probable late prehistoric/Roman trackways, field enclosures and possible sub enclosures formed by archaeological ditches. It was not possible to determine whether any of the enclosures contained occupational features due to the varied background magnetism and effects of the agricultural anomalies. Several of the linear anomalies were discontinuous but it was not certain whether this was due to an intermittent lasting effect from ploughing, truncation of features or possible segmentation of the features. Noel, M J Maughold : GeoQuest Associates, 2008, 14pp, figs, tabs, refs

*Work undertaken by:* GeoQuest Associates

The survey established that the site was found to be characterised by extremely weak geomagnetic anomalies, indicative of very low soil susceptibilities, a fact confirmed by the fact

confirmed by the absence of any anomalies over the sites of backfilled trial pits or topographic features. However, the general absence of contamination by surface ferrous litter aided the detection of weak geomagnetic anomalies of potential archaeological interest. The presence of a trackway seen as a cropmark on aerial photographs, and further ditches possibly indicative of enclosures and additional tracks were located. The confidence level assigned to many of the features was low, and as a result further archaeological work was advised. [Au(adp)]

*Work undertaken by:* The Landscape Research Centre

Geophysical survey was undertaken on Cleave Dyke and the promontory fort. The survey supported the view that Cleave Dyke terminated at some distance to the south-west of the fort, where it appeared to have originally been dug as a pit alignment. A series of other linear features some 50-60m to the west may have formed part of a more elaborate arrangement of earthworks to the south of the fort, this would become clearer once survey around the fort itself was completed. The magnetic response of the site was reasonable although contrast

was not particularly strong, as would be expected with a non-domestic prehistoric boundary ; 37 features of potential archaeological origin were detected. [Au(abr)]

*Work undertaken by:* GSB Propection

Ridge and furrow, with an associated headland, was detected across the application area as well as a possible former ditch or boundary running through the southern half of the data. A number of potential pits were highlighted and a zone of increased magnetic response may have indicated earlier archaeological phases cut by the ridge and furrow. Their distribution was too disturbed by the latter cultivation to determine this for certain. Magnetic disturbance, broad ferrous anomalies and trends were detected throughout the survey area along with a band of magnetic disturbance following the line of the ridge and furrow. These were thought to be of modern origin relating to services, debris and land management practices. [Au(abr)]

Wilkins, I Thornton : GSB Propection, Report: 08/30 2008, 8pp, colour pls, figs, tabs, refs

*Work undertaken by:* GSB Propection

The extended survey area helped to clarify the nature of the anomalies identified in the earlier work and to place the results in their wider archaeological context. There would appear to be at least two elements to the site, firstly, anomalies associated with the medieval ridge and furrow and secondly, those that seemed to respect the line of the presumed Roman road that crossed the field. A number of enclosures and possibly associated features were identified, and correlated partially with the earthworks, but it was difficult to assign the responses to any specific period of antiquity. Stowe, S Upton-upon-Severn : Stratascan, Report: 1818 2004, 17pp, figs

*Work undertaken by:* Stratascan

The survey area comprised of the concrete apron on the eastern side of the weir. The survey located large areas of strong complex returns. These fell into two broad categories. The first type exhibited discrete boundaries in terms of both depth and extent, and represented strong evidence of voiding or ground movement associated with voiding. The second type of anomaly was a more general complex return, starting near the surface and extending to depth, but without clearly defined boundaries. This was indicative of significant ground movement or disturbance. These areas of anomalies were surrounded by weaker complex returns that may be minor evidence of voiding and ground movement. Adcock, J Thornton : GSB Prospection, Report: 08/74 2008, 7pp, colour pls, figs, tabs, refs

*Work undertaken by:* GSB Prospection

Evidence of badger activity was interpreted as extending to at least 4.0m [laterally] beneath the sloped section of the bank, although, at this distance, the anomalies were difficult to interpret since they were at the limits of effective penetration [1.5m – 2.0m]. Over the lowest sections of the bank and associated toe, individual tunnels were tentatively identified, however, higher up the bank it could not be guaranteed that the sett did not extend further underneath. A geophysical survey was undertaken. All the anomalies detected in the survey almost certainly reflected ferrous and/or fired materials, some incorporated within a man made bank and others comprising near surface litter. No evidence for the former mill was identified in the survey. Concentrations of intense anomalies in the north-eastern part of the survey could possibly mask the presence of weaker anomalies associated with mill remains, or indeed the mill could lie outside the surveyed area, under existing gardens or to the south between the survey area and the railway line. High resistance anomalies clearly marked the two rows of pillars in the western nave. They showed interesting variations that could have indicated remains beyond the conventional interpretations. It was suggested that the earth resistance survey be compared to the eastern nave, where pillars were still visible, to better understand the responses obtained from the buried foundations. Test excavations at pillar 6 (North) would help to provide information why no foundation was detected at this location. [Au(adp)]

**AGGREGATE DREDGING LICENCE, AREA 480*****Aggregate Dredging Licence, Area 480. Archaeological Assessment of Marine Geophysical Data, Pre-dredging Monitoring Report***

Serra, C Salisbury : Wessex Archaeology, Report: 69890.02 2008, 18pp, colour pls, figs, tabs, refs, CD

*Work undertaken by:* Wessex Archaeology

An archaeological assessment of marine geophysical data in view of a pre-dredging monitoring heritage review for aggregate dredging Licence Area 480 was carried out. The marine geophysical survey area consisted of 21.89km<sup>2</sup> irregular polygon, orientated south-west to north-east and located 21km off the east coast of Lincolnshire. The marine geophysical data consisted of sidescan sonar and bathymetry data acquired in 2008 in addition to sub-bottom profiler data acquired in 2000 and 2002. This report reviewed the sites highlighted during a 2003 desk-based assessment, and suggested modifications, highlighted new archaeological sites identified within the limits of the aggregate dredging Licence Area 480 and suggested mitigating measures. Only one anomaly reported during the 2003 desk-based assessment lay within the limits of the aggregate dredging Licence Area 480. This anomaly was not re-identified during the assessment of 2008 marine geophysical data reviewed during this assessment. This was likely to be a combination of improved data quality aiding interpretations, and sediment possibly covering the anomaly when the 2008 data were acquired. The assessment of 2008 sidescan sonar data resulted in the identification of six new sites of possible archaeological interest. The archaeological assessment of 2000 and 2002 sub-bottom profiler data indicated a sequence of early, mid and late Devensian formations [glacial till and outwash] deposited over Cretaceous Chalk. Artefacts dating to Palaeolithic and Early Mesolithic periods were unlikely but the existence of derived artefacts in secondary context cannot be precluded. On the basis of the likely archaeological resource of the region and the sites identified in the sidescan sonar data, mitigation measures were suggested. [Au(abr)]

Hamel, A Salisbury : Wessex Archaeology, Report: 66896.5051.01 2008, 21pp, colour pls, figs, tabs, refs, CD

*Work undertaken by:* Wessex Archaeology

In-water archaeological observation and recording was conducted for Wreck 5051 [Unknown]. This work was undertaken as part of the archaeological mitigation strategy for the DP World London Gateway container terminal development. The wreck was located 1.2 kilometres south-west of Canvey Island, and north of Blyth Sands. It lay 100 metres inside the dredged channel. Recent fieldwork for this project was summarised, and the evidence from the wreck structure and artefacts was discussed. The exposed site was approximately 18 metres long by 4.5 metres wide, and the remains indicated a wooden hulled vessel. Over 180 artefacts were raised from two locations on the wreck. From the southern section, a large volume of flint was recovered, as well as the contents of a locker or chest. The vast majority of finds were located in the north section of the wreck and included wooden tools, a shoe upper and pieces of a boot. From the artefacts recovered, it was thought that the vessel dated to the late-19th century, and could have been a local vessel that traded along the coast. [Au(abr)]

Hamel, A Salisbury : Wessex Archaeology, Report: 66896.5204.01 2008, 27pp, colour pls, figs, tabs, refs, CD

*Work undertaken by: Wessex Archaeology*

In-water archaeological observation and recording was carried out for Wreck 5204 [Pottery Wreck]. This work was undertaken as part of the archaeological mitigation strategy for the DP World London Gateway container terminal development. The wreck was located east of Sea Reach No.3, only six metres from the southern edge of the existing dredged channel. This report provided a brief overview of previous fieldwork. Details of the methodology employed in carrying out in-water observation and recording, and the recording of recovered timbers, were also included. Fieldwork took place in two phases. The first phase of the diving operation was undertaken between the 11th and 13th of June 2008. Two dives were conducted, with an average dive time of 80 minutes. An airlift was used to remove sediment overburden from within and around the wreck. Major structural elements were identified, and a mixed assemblage of artefacts was recovered. The second phase was undertaken between the 22nd and 24th of June 2008. Three dives were undertaken with an average dive time of 86 minutes. The removal of sediment overburden continued, and elements of the hull structure were raised for further study. The recovered structural elements were recorded at the PLA's passive storage facility at Denton Wharf, between June 25th and 26th. The timbers were identified, assessed, photographed, measured and drawn in order to develop an understanding of the vessel's size, construction and date. Finds from the wreck were transported for specialist analysis. Approximately 282 finds were recovered during the June fieldwork, including coal, ceramics, glass, bricks, metal, wood, bone and leather. Wreck 5204 (Pottery Wreck) was thought to be a Thames Bawley, a local fishing vessel of the type that operated in the Thames and along the east coast, fishing for prawns and small fish. The vessel probably sunk in the later part of the 19th century, based on the artefacts that were recovered. [Au(abr)]

#### ***Marchwood Seawall Flood Defence Scheme. Archaeological Watching Brief***

Forster, D Salisbury : Wessex Archaeology, Report: 69620.02 2008, 14pp, colour pls, figs, tabs, refs, CD

*Work undertaken by:* Wessex Archaeology

An archaeological watching brief investigation for a seawall flood defence scheme trenching operation at Marchwood was carried out. The trenching work was undertaken rapidly in order to ensure that the cement for the wall could be laid before it was submerged by the rising tide. The seawall flood defence scheme comprised of two sea walls on the foreshore, referred to as the Upper Flood Wall and the Lower Flood Wall. The Upper and Lower Flood Wall trenches varied notably in depth. Access to the trenches was possible at points where the depth of the trench was less than 1.2m, enabling a series of short sections to be recorded. The location of these sections was positioned using a handheld GPS device loaded with Pocket GIS software which had OS mapping loaded as background mapping. The Ordnance Datum (OD) height of all recorded sections was calculated and the section drawings were annotated with OD heights. Where the trench exceeded 1.2m in depth, it was not possible to enter. Furthermore, the trench sides were generally very unstable, and frequently collapsed. As such, no samples were taken throughout the watching brief. During the watching brief, two archaeological features were observed. Feature 2006, thought to be a ditch cut, was observed on the north facing section of the Lower Flood Wall trench. The ditch section was recorded and its position was captured using the handheld GPS device. In alignment with this, a further feature 2008 was apparent in the north facing section of the Upper Flood Wall trench, comprising a number of large stone boulders in a somewhat coherent arrangement. Unfortunately due to the depth of the trench at this point, this section could not be recorded. These features each ran in alignment with the previous early 19th century walkway which extended from part of the former Ordnance Depot known as "Magazine A" to the foreshore. They were thus presumably associated with the foundations of the walkway, which would have had to be fairly robust enabling the transport of large quantities of gunpowder from "Magazine A" which was loaded on to vessels. No further archaeological features were noted throughout the course of the watching brief. [Au(abr)]

Astill, M Salisbury : Wessex Archaeology, Report: 60078.01 2008, 12pp, colour pls, figs, tabs, refs, CD

*Work undertaken by:* Wessex Archaeology

An archaeological diver assessment of a seabed anomaly which was identified by archaeological assessment of marine geophysical data as part of pre-development monitoring was carried out. The main objective of diver assessment was to determine whether the anomaly in question was of archaeological significance. Archaeological diving operations were carried out during August 2008. Tracked diver searches were conducted in the vicinity of the anomaly. No substantial features were recorded during these searches. The two small iron objects, a length of electrical cable and evidence for trawl gear suggested that the geophysical anomaly was created by trawling activity in the vicinity of the wreck site at the centre of Exclusion Zone 7069 and that there were no significant archaeological remains to the south of the main wreck site. It further suggested that the wreck was likely to be 20th or 21st century in date. Based on these findings a reduction in the southern extent of the exclusion zone was proposed. [Au(abr)]

**RIVER HAMBLE*****Recording Archaeological Remains on the River Hamble. Final Report***

Hampshire & Wight Trust for Maritime Archaeology Southampton : Hampshire & Wight Trust for Maritime Archaeology, 2008, 80pp, colour pls, figs, tabs, refs

*Work undertaken by:* Hampshire & Wight Trust for Maritime Archaeology

The Hamble River Project was a programme of maritime research and field work along the Hamble River estuary. It was an innovative and unique maritime landscape study. The Hamble River had a long tradition of shipbuilding and maritime activity. This has left a legacy of "hulked" vessels abandoned around the margins of the waterway. These were largely wooden vessels that probably dated from between 1800 and 1940, although some earlier examples existed. Adjacent to many of these hulks were the remains of docks, wharves and landing places. Initial archaeological investigations by the HWTMA had recorded the position of a number of sites, however, they deserved detailed survey and investigation to create an archive of information on them before they were further affected through human or natural processes. During the project it was possible to survey twenty three sites these had been selected as suitable for further investigation. After field survey had been conducted desk-based research added to information gathering. The results of these investigations were placed within individual site assessment reports. [Au(abr)]

**AIRCRAFT CRASH SITES AT SEA*****Aircraft Crash Sites at Sea. A Scoping Study***

Scott, G            Salisbury : Wessex Archaeology, Report: 66641.02 2008, 162pp, colour pls, figs, tabs, refs, CD

*Work undertaken by:* Wessex Archaeology

A scoping study to identify current gaps in data and understanding relating to aircraft crash sites at sea was carried out. The study arose partly out of the discovery of aircraft parts and associated human remains as a result of marine aggregate dredging. Thousands of aircraft were likely to have been lost in UK territorial and near-territorial waters during the 20th century. A high proportion of these losses were likely to be combat losses or accidental losses of military aircraft that occurred during WWII. The potential resource was therefore very large. The number of known aircraft crash sites previously recorded was relatively small. The known resource was therefore relatively small. Notwithstanding issues concerning survival, the potential existed for the presence of a very large number of currently unknown crash sites on the seabed and, to some extent, in the inter-tidal zone. Recent discoveries of previously unknown aircraft crash sites in licensed marine aggregate dredging areas suggested that there was a need for urgent national and local record enhancement in areas of seabed likely to be impacted by human activities. The discrepancy between the known resource and the potential resource could be addressed by research of both primary and secondary material. However, there was a huge amount of this material and it was not complete. There was also likely to be a lack of good quality data concerning the positions of losses. Enhancing existing databases was likely to be very time consuming and therefore could most effectively be achieved by harnessing the information and expertise of existing aviation researchers, both in the UK and abroad. Much of the work undertaken by these researchers was not geographically orientated and may have required further work in this respect. In addition much of it was unpublished and therefore vulnerable to loss. Seabed and inter-tidal environments, particularly those that resulted in burial or other favourable preservation environments, offered the potential for much more intact survival than most terrestrial sites. This could be seen in the case studies examined as part of this project. However, locating well preserved sites was problematic and largely a matter of chance. Management and research considerations were dominated by the application of the Protection of Military Remains Act 1986 to most of the sites that constituted the resource. They were also complicated by the possible presence of human remains from what were, archaeologically speaking, recent casualties and by various international interests. English Heritage devised a method of assessing the importance of aircraft crash sites through research conducted for the Monuments Protection Programme. The approach suggested appeared to be simple and effective, although lists of "extinct" and otherwise important aircraft needed updating. Through the same research a basic research agenda that could have been applied to aircraft crash sites on the seabed was suggested. This required more detail and input from all stakeholders to ensure that it became a truly workable strategy. An agreed means of risk assessing known aircraft crash sites was not currently available. The question of preservation in situ needed further consideration and consultation. A preservation in situ policy had been advanced by English Heritage in relation to archaeological sites on the seabed in the last few years. However, guidelines for managing aircraft crash sites did not envisage the preservation in situ of most aircraft remains and control of the licensing process was not directly in the hands of English Heritage. Aircraft crash sites appeared to be of widespread interest to the general public and to special interest groups. Numerous potential stakeholders had been identified, some of whom, such as aircraft recovery groups, may not have research agendas that sat entirely comfortably with heritage management thinking. This needed to be addressed further. Draft interim guidance for the marine aggregate industry on dealing with aircraft crash sites at sea was produced. This built on the existing industry protocol for reporting finds of archaeological interest. [Au(abr)]

**WEYMOUTH PAVILION MARINA*****Weymouth Pavilion Marina. Archaeological Assessment of Geophysical Data***

Baggaley, P & Russell, J Salisbury : Wessex Archaeology, Report: 69000.01 2008, 17pp, colour pls, figs, tabs, refs, CD

*Work undertaken by:* Wessex Archaeology

An archaeological assessment was carried out of geophysical data as part of evaluation works for the proposed development of Weymouth Pavilion marina. The data consisted of sidescan sonar, sub-bottom profiler, magnetometer and multibeam echosounder data. This assessment focussed on the potential for remnant terrestrial landscapes that may have contained terrestrial archaeological material dating to time of lower sea level, and the potential for the remains of maritime craft or aircraft of cultural heritage importance within the area that may have been impacted upon by the proposed scheme. From the assessment of the borehole logs it appeared that the scheme would not pose a threat to palaeo-landscapes which had been inundated by marine transgression, as these deposits in the area lay below the proposed dredge depth of the scheme. Four sites of archaeological interest were identified from the geophysical data, one of which was a small wreck site while the remaining three were thought to be debris which may have proved to be relatively modern in origin. A further 34 sites were identified from the geophysical data although these are likely to be modern debris. The majority of these sites were magnetic anomalies for which no corresponding features could be identified in the sidescan sonar data and were therefore likely to be buried objects. [Au(abr)]

Gloucestershire County Council Archaeology Service Gloucester : Gloucestershire County Council Archaeology Service, 2008, 129pp, figs, tabs, refs

*Work undertaken by:* Gloucestershire County Council Archaeology Service

The archaeological resource in the Severn Estuary was under threat from various natural processes such as coastal erosion, exacerbated by the high tidal range and strong currents within the estuary. The area around Woodspring Bay, Blackstone rock and Walns Hill were under particularly high threat due to coastal change. In Avonmouth, there were a high number of fish traps under threat. These were from medieval and post-medieval fisheries. Although the fish house at Collow Pill was a Grade II Listed Building, the location of those at Hawkins Pill were unknown and may have benefited from survey work. [Au(adp)]

Serra, C Salisbury : Wessex Archaeology, Report: 69900.02 2008, 15pp, colour pls, figs, tabs, refs, CD

*Work undertaken by:* Wessex Archaeology

An archaeological assessment of marine geophysical data in view of a pre-dredging monitoring heritage review for aggregate dredging Licence Area 472 and for five corridors intended for sediment monitoring outside the aggregate dredging Licence Area was carried out. The assessed marine geophysical data consisted of 2008 sidescan sonar data covering the aggregate dredging Licence Area 472 in full and the seven sediment monitoring corridors. The report reviewed the sites highlighted during a 2003 desk-based assessment, suggested modifications, highlighted new archaeological sites identified within the limits of the aggregate dredging Licence Area 472 and suggested mitigating measures. A total of eleven sites identified during the 2003 desk-based assessment lay within the limits of the current aggregate dredging Licence Area 472. None of these sites were re-identified in the 2008 dataset due to improved data quality, which aided interpretations, and sediment dynamics, possibly covering some of the anomalies identified in 2003. The assessment of 2008 sidescan sonar resulted in the identification of fifteen new sites of possible archaeological interest, eight within the limits of the licence dredging area and seven along the corridors of sediment monitoring, which extended beyond the licence area and will not be subject to dredging. **LINCS. OWF EXPORT CABLE ROUTE*****Lincs. OWF Export Cable Route. Review of Archaeological Exclusion Zones***

Baggaley, P Salisbury : Wessex Archaeology, Report: 66033.02 2008, 67pp, colour pls, figs, tabs, refs, CD

*Work undertaken by:* Wessex Archaeology

Recently collected geophysical data was assessed over 28 sites subject to further investigation. The sites selected for review were located along proposed export cable routes and alternatives that may have been required following engineering assessments of the seabed character. Six of the 28 sites were removed from the list of those requiring further investigation as a result of this review. Of these, four sites were sidescan sonar anomalies for which no corresponding anomalies had been identified in the current data set. However, given the quality of the 2008 sidescan sonar data, problems with positioning and the nature of the mobile sediments within the area it may have been prudent to provide a watching brief for these sites during construction. The Exclusion Zone around site 4012 was merged with another site [3037] to create a new Exclusion Zone. It was recommended to remove the Exclusion Zone around site 6304 based on interpretation. This feature was interpreted as a possible anchor scar or fishing gear. As a result of this assessment two sites, 3037 and 6600, have had Exclusion Zones established. [Au(abr)]
