## Introduction

---

This publication represents the nineteenth in a series of Gazetteers that aim to provide an easily accessible annual listing of information about the nature and extent of archaeological investigations carried out in England. The series was developed from *The Assessment Gazetteer 1982-1991*, which was issued as as *British Archaeological Bibliography Supplement* (no.1) in October 1994. It was quickly realised that *The Assessment Gazetteer 1982-91* was very limited in scope, it only dealt with Archaeological investigations directly related to the Town and Country Planning system in England, i.e. desk-based assessments, field evaluations, and environmental assessments. The present series is more ambitious, by encompassing other kinds of intervention types that involve some degree of ground disturbance which results in the recording and, in consequence, the destruction of archaeological deposits. As the project has progressed other forms of archaeological investigations have also been included in its remit; this not only expanded the criteria for how archaeology was undertaken, but included more detail of why archaeological recording was carried out i.e. as part of a building recording or estate management plan.

This latest Gazetteer has been compiled as the principal output of the *Archaeological Investigations Project (AIP)*, carried out in the School of Conservation Sciences at Bournemouth University for English Heritage between April 2009 and March 2010. An analysis of the main trends in the pattern of archaeological activity in England will be published as a separate report in due course. Information about *AIP* and its background can be found on the World Wide Web at the following address:

<http://csweb.bournemouth.ac.uk/aip/aipintro.htm>

## Background: The listing of archaeological investigations

The publication of systematic annual gazetteers of archaeological investigations in England is neither new nor innovatory, but long overdue. In the early years of the present century the Earthworks Committee of the Congress of Archaeological Societies included within its annual report listings of "record and discovery" and "excavation" events. These reports were published for the years from 1903 down to 1939 (from 1931 to 1939 as the Research Committee) and contain much valuable information. Nothing similar was produced in the years immediately following the Second World War, however in 1961 the Ministry of Public Building and Works began publication of *Excavations: Annual Report*, a practice continued by its successor the Department of the Environment, down to 1976. The Council for British Archaeology published an annual review under the title *Archaeology in Britain* between 1967 and 1992, although its coverage focused on, and was structured around, the work of member organisations and institutions rather than sites and projects.

Some of the major "period" societies also began publishing annual listings of work falling within their particular academic areas of interest. *Medieval Archaeology* has since 1957 carried a section dealing with recent work; *Post-Medieval Archaeology* since its first publication in 1968; and *Britannia* since its first publication in 1970, building on a precedent established for Roman studies and published in the *Journal of Roman Studies* between 1921 and 1969. Nothing so comprehensive ever emerged for prehistoric archaeology, although the *Proceedings of the Prehistoric Society* carried a section containing summary excavation reports for most years between 1977 and 1985.

In recent years, a number of county archaeological journals have begun carrying listings of discoveries and summaries of projects within their geographical areas of interest. At a broader scale, many of the Council for British Archaeology's regional groups publish lists of recent work in their newsletters/annual reviews.

All of these summaries and reviews provide invaluable sources of information about projects and discoveries. They are important both for the time at which they are published and in a retrospective or historical context. Indeed, for a variety of reasons, some of these summaries are all that is known about investigations that have never been adequately published. The reality, however, is that since 1939 there has been no comprehensive summary of completed and ongoing archaeological work for England. Trying to stitch together what does exist in piecemeal summary listing is not easy and in any case does not give a complete picture. This situation contrasts with that in Scotland and Wales, where comprehensive annual summaries have been published by the Council for Scottish Archaeology since 1955 and the Council for British Archaeology Group 2/Wales since 1961.

The need for a summary account of work in England is made still more necessary by the sheer pace and scale of archaeological activity, and the common interest shared by all archaeologists in wishing to know what has happened where and when, so as to better inform their work and alert them to the implications of their findings. In the case of minor investigations with limited positive results, the publication of a statement in an annual summary, together with an appropriate report to the relevant Sites and Monuments Record may satisfy professional obligations to publish and make available the results of work undertaken.

## **Content, scope, sources and format**

A wide range of archaeological investigations were considered by *AIP*, and these investigations can be broadly classified according to the nature of the work itself. Eight main groups are recognised, and in this classification use is made of definitions and guidance contained in planning guidance (DoE 1990) and the series of "standards" issued by the Institute of Field Archaeologists.

- I **Desk-Based Assessments (Database Code B):** Assessments of the known or potential archaeological resource within a specified area or site (land-based, inter-tidal or underwater), consisting of a collation of existing written and graphic information in order to identify the likely character, extent, quality and worth of the known or potential archaeological resource in a local, regional or national context as appropriate (IFA 1994a, 1; and see DoE 1990, para. 20).
- II **Field Evaluations (Database Code C):** A limited programme of non-intrusive and/or intrusive fieldwork which determines the presence or absence of archaeological features, structures, deposits, artefacts or ecofacts within a specified area or site (land-based, inter-tidal or underwater). If archaeological remains are present, field evaluation defines their character and extent, and relative quality; and it enables an assessment of their worth in a local, regional, national or international context as appropriate (IFA 1994b, 1; and see DoE 1990, para. 21).
- III **Environmental Assessments (Database Code D):** These are programmes of work carried out under the terms of the European Directive 85/337/EEC and council directive 97/11/EC (implemented in the UK as *Town and Country Planning (Assessment of Environmental Effects) Regulations 1988* (SI 1199) and *The Town and Country Planning (Environmental Impact Assessment) Regulations 1999* (SI No.29), respectively), and often combine desk-based assessment and field evaluation.
- IV **Other Investigations (Database Code E):** This embraces a wide range of archaeological investigation types, which mainly fall into two groups in terms of their rationale. First are "post-determination" events such as open-area excavations, watching briefs, recorded observations and building surveys that are carried out under the terms of a planning condition or agreement of some kind in advance of development; this work is sometimes collectively referred to as "rescue archaeology". Second are excavations and surveys of various sorts that are undertaken outwith the requirements of the Town and Country Planning system; investigations falling within this second group are sometimes referred to as "research" excavations, but this is a misnomer since all archaeological investigations are pieces of research.
- V **Estate Management Surveys (Database Code F):** These will be similar in nature to a desk-based assessment for development purposes, but relates instead to the production of a defined-purpose management plan. Such work is likely to include documentary research, inspection of existing records, walkover inspection surveys and perhaps some limited fieldwalking or geophysical surveys.
- VI **Building Recording (Database Code G):** Archaeological Building Investigation and Recording is defined as a programme of work

intended to establish the character, history, dating, form and archaeological development of a specified building, or structure, or complex and its setting, including its buried components, on land or under water (IFA 1996, 1).

**VII Geophysical investigations (Database event signifier H):** To include the following types of archaeological investigation: Electromagnetic survey, Ground penetrating radar, Magnetic susceptibility, Magnetometer, Microgravity, Resistivity, Resistivity depth sounding, Resistivity profile, Seismic Refraction

**VIII Maritime investigations (Database event signifier M):** Archaeological maritime investigations for the most part, use broadly similar land-based archaeological techniques that have been adapted for use underwater (The marine archaeological resource, IFA 2000). As well as intrusive archaeological techniques and visual surveys Geophysical and other remote techniques have also developed for use in an underwater environment. Areas of estuary and intertidal areas have been included under this designation.

Apart from desk-based assessments forming part of the development control process, or archaeological building recording other kinds of non-interventional survey have been omitted, unless they are reported alongside interventional events. One obvious example of this split is with geophysical surveys which are sometimes carried out as discrete events while in other cases as part of multi-method study. A further listing of geophysical surveys was compiled by English Heritage, and is available on the World Wide Web at: <http://sdb2.eng-h.gov.uk/>

Three main sources were used in identifying and tracking down information about completed and ongoing projects. First, and by far the most important source, were reports and records inspected during visits to archaeological contractors and curators in every county. Second were published listings and summaries of projects undertaken. And third were completed returns of *pro forma* report sheets circulated to local societies, University departments, and organisations which could not be visited by research staff from the AIP. Throughout this work the emphasis has been on archaeological projects that have been completed during the year, no matter how large or small they may have been. In the case of long term projects spanning several years, the archaeological works actually carried out in the year covered by the particular Gazetteer are listed.

Most of the reports summarised here are circulated typescript or loose-bound volumes prepared on a desk-top publishing system. Few of them have ISBN

numbers, and their circulation is typically restricted. Within the sphere of commercial archaeology at least, most were produced for clients in support of planning applications, as background papers for public consultation, or in fulfilment of planning conditions or agreements. No details of availability or cost are provided, but the name of the issuing authority is given wherever possible. Neither English Heritage nor the originators of this Gazetteer are able to supply copies or extracts of any of these reports (except those for which they are themselves the issuing authority), and any enquiries about the reports listed should be addressed directly to the relevant issuing authority.

The details given are as full as may be permitted from scrutiny of the reports themselves or from information supplied by authors, issuing authorities, or, exceptionally, summary sources. Wherever given, the site name is as set out in the report, as are National Grid References. The bibliographic reference follows the style established by the *British and Irish Archaeological Bibliography*. Where no specific author is identified on the report's title page (or elsewhere in the report) the term "Anon" or the name of the relevant investigating body is used in place of the author's name. Where no exact title for a report has been supplied by the issuing authority a substitute title enclosed in square brackets has been given (e.g. [Report on an evaluation at Windcott Hill]).

Wherever possible the author's own summary has been used in whole or in part, but where this is not available a short abstract of the report has been prepared by a member of the *AIP* team. These abstracts should be regarded as general statements of what the referenced report contains. While every effort has been made to check details of sources and the content of summaries, the Gazetteer originators accept absolutely no responsibility for errors or inaccuracies in the material presented. **The listings are intended as fair guides to what is available rather than a set of definitive statements. Accordingly, the original documentation should always be checked if it is to be referred to in publications or discussion.**

Where possible, SMR reference numbers have been included in the entries, but at the time of the visits made to collect data many reports had yet to be entered into the relevant SMR system and so had not in consequence had a number assigned to them. The format of the entries is detailed further in the section below entitled "Anatomy of a typical Gazetteer entry: guidance notes for users".

## **List of English Heritage Regions comprising constituent Counties, Districts, Metropolitan Boroughs and Unitary Authorities**

## **EAST MIDLANDS**

### **Derby**

#### **Derbyshire**

*Districts:* Amber Valley, Bolsover, Chesterfield, Derbyshire Dales, Erewash, High Peak, North East Derbyshire, South Derbyshire

### **Leicester**

#### **Leicestershire**

*Districts:* Blaby, Charnwood, Harborough, Hinckley & Bosworth, Melton, North West Leicestershire, Oadby & Wigston

### **Lincolnshire**

*Districts:* Boston, East Lindsey, Lincoln, North Kesteven, South Holland, South Kesteven, West Lindsey

### **North East Lincolnshire**

### **North Lincolnshire**

### **Northamptonshire**

*Districts:* Corby, Daventry, East Northamptonshire, Kettering, Northampton, South Northamptonshire, Wellingborough

### **Nottingham**

#### **Nottinghamshire**

*Districts:* Ashfield, Bassetlaw, Broxtowe, Gedling, Mansfield, Newark & Sherwood, Rushcliffe

### **Rutland**

## **EASTERN REGION**

### **Bedfordshire**

*Districts:* Bedford, Mid Bedfordshire, South Bedfordshire

### **Cambridgeshire**

*Districts:* Cambridge, East Cambridgeshire, Fenland, Huntingdonshire, South Cambridgeshire

### **Essex**

*Districts:* Basildon, Braintree, Brentwood, Castle Point, Chelmsford, Colchester, Epping Forest, Harlow, Maldon, Rochford, Tendring, Uttlesford

**Hertfordshire**

*Districts:* Broxbourne, Dacorum, East Hertfordshire, Hertsmere, North Hertfordshire, St Albans, Stevenage, Three Rivers, Watford, Welwyn Hatfield

**Luton****Milton Keynes****Norfolk**

*Districts:* Breckland, Broadland, Great Yarmouth, King's Lynn & West Norfolk, North Norfolk, Norwich, South Norfolk

**Peterborough****Southend-on-Sea****Suffolk**

*Districts:* Babergh, Forest Heath, Ipswich, Mid Suffolk, St Edmundsbury, Suffolk Coastal, Waveney

**Thurrock****GREATER LONDON**

*London Boroughs:* City of Westminster, Barking & Dagenham, Barnet, Bexley, Brent, Bromley, Camden, City of London, Croydon, Ealing, Enfield, Greenwich, Hackney, Hammersmith & Fulham, Haringey, Harrow, Havering, Hillingdon, Hounslow, Islington, Kensington & Chelsea (Royal Borough), Kingston upon Thames (Royal Borough), Lambeth, Lewisham, Merton, Newham, Redbridge, Richmond upon Thames, Southwark, Sutton, Tower Hamlets, Waltham Forest, Wandsworth

**NORTH EAST****Darlington****Durham**

*Districts:* Chester-le-Street, Derwentside, Durham, Easington, Sedgefield, Teesdale, Wear Valley

**Former County of Tyne & Wear**

*Metropolitan Boroughs:* Gateshead, Newcastle upon Tyne, North Tyneside, South Tyneside, Sunderland

**Hartlepool**

## **Middlesbrough**

### **Northumberland**

*Districts:* Alnwick, Berwick-upon-Tweed, Blyth Valley, Castle Morpeth, Tynedale, Wansbeck

### **Redcar & Cleveland**

### **Stockton-on-Tees**

## **NORTH WEST**

### **Blackburn with Darwen**

### **Blackpool**

### **Cheshire**

*Districts:* Chester, Congleton, Crewe & Nantwich, Ellesmere Port & Neston, Macclesfield, Vale Royal

### **Cumbria**

*Districts:* Allerdale, Barrow-in-Furness, Carlisle, Copeland, Eden, South Lakeland

### **Greater Manchester Area**

*Metropolitan Boroughs:* Bolton, Bury, Manchester, Oldham, Rochdale, Salford, Stockport, Tameside, Trafford, Wigan

### **Halton**

### **Lancashire**

*Districts:* Burnley, Chorley, Fylde, Hyndburn, Lancaster, Pendle, Preston, Ribble Valley, Rossendale, South Ribble, West Lancashire, Wyre

### **Merseyside**

*Metropolitan Boroughs:* Knowsley, Liverpool, St Helens, Sefton, Wirral

### **Warrington**

## **SOUTH EAST**

### **Bracknell Forest**

### **Brighton & Hove**

## **Buckinghamshire**

*Districts:* Aylesbury Vale, Chiltern, South Buckinghamshire, Wycombe

## **East Sussex**

*Districts:* Eastbourne, Hastings, Lewes, Rother, Wealden

## **Hampshire**

*Districts:* Basingstoke & Deane, East Hampshire, Eastleigh, Fareham, Gosport, Hart, Havant, New Forest, Rushmoor, Test Valley, Winchester

## **Isle of Wight**

## **Kent**

*Districts:* Ashford, Canterbury, Dartford, Dover, Gravesham, Maidstone, Sevenoaks, Shepway, Swale, Thanet, Tonbridge & Malling, Tunbridge Wells

## **Medway Towns**

## **Oxfordshire**

*Districts:* Cherwell, Oxford, South Oxfordshire, Vale of White Horse, West Oxfordshire

## **Portsmouth**

## **Reading**

## **Slough**

## **Southampton**

## **Surrey**

*Districts:* Elmbridge, Epsom & Ewell, Guildford, Mole Valley, Reigate & Banstead, Runnymede, Spelthorne, Surrey Heath, Tandridge, Waverley, Woking

## **West Berkshire**

## **West Sussex**

*Districts:* Adur, Arun, Chichester, Crawley, Horsham, Mid Sussex, Worthing

## **Windsor & Maidenhead**

## **Wokingham**

**SOUTH WEST**

## **Bath and North East Somerset**

### **Bournemouth**

### **Bristol**

### **Cornwall**

*Districts:* Caradon, Carrick, Kerrier, North Cornwall, Penwith, Restormel

### **Devon**

*Districts:* East Devon, Exeter, Mid Devon, North Devon, South Hams, Teignbridge, Torridge, West Devon

### **Dorset**

*Districts:* Christchurch, East Dorset, North Dorset, Purbeck, West Dorset, Weymouth & Portland

### **Gloucestershire**

*Districts:* Cheltenham, Cotswold, Forest of Dean, Gloucester, Stroud, Tewkesbury

### **North Somerset**

### **Plymouth**

### **Poole**

### **Somerset**

*Districts:* Mendip, Sedgemoor, South Somerset, Taunton Deane, West Somerset

### **South Gloucestershire**

### **Swindon**

### **Torbay**

### **Wiltshire**

*Districts:* Kennet, North Wiltshire, Salisbury, West Wiltshire

## **WEST MIDLANDS**

### **Birmingham Area**

*Metropolitan Boroughs:* Birmingham, Coventry, Dudley, Sandwell, Solihull, Walsall, Wolverhampton

## **Herefordshire**

### **Shropshire**

*Districts:* Bridgnorth, North Shropshire, Oswestry, Shrewsbury & Atcham, South Shropshire

### **Staffordshire**

*Districts:* Cannock Chase, East Staffordshire, Lichfield, Newcastle-under-Lyme, South Staffordshire, Stafford, Staffordshire Moorlands, Tamworth

## **Stoke-on-Trent**

## **Telford & Wrekin**

### **Warwickshire**

*Districts:* North Warwickshire, Nuneaton & Bedworth, Rugby, Stratford-on-Avon, Warwick

### **Worcestershire**

*Districts:* Bromsgrove, Malvern Hills, Redditch, Worcester, Wychavon, Wyre Forest

## **YORKSHIRE & HUMBERSIDE**

### **East Riding of Yorkshire**

### **Former County of South Yorkshire**

*Metropolitan Boroughs:* Barnsley, Doncaster, Rotherham, Sheffield

### **Former County of West Yorkshire**

*Metropolitan Boroughs:* Bradford, Calderdale, Kirklees, Leeds, Wakefield

## **Kingston Upon Hull**

### **North Yorkshire**

## **York**

## Anatomy of a gazetteer entry - notes for users

- 1/189□(B.90.0047) . □ST65934559
- **TB PICNIC SITE, NUTWOOD**
- ***Archaeological Field Evaluation: TB Picnic Site, Nutwood (NAFG Report No. 12/2001)***
- Bear, R T Nutwood: Nutwood Archaeological Fieldwork Group, 1999, 15pp, colour pls, figs, refs
- The area proposed for development was, in the 18th century, part of Nutwood Common. The site was semi-wooded and was used for hunting from the 16th century. The common was enclosed by Act of Parliament in 1780. By 1920 the area had become a partially landscaped garden for Appleton House, a purpose-built Rest Home. The arrangement of the grounds was designed for psychotherapeutic reasons, permitting walking, games and picnicking. As well as the remains of the modern landscape garden features, cartographic sources indicated remnants of medieval ridge and furrow. No areas of certain ancient woodland were identified.
  - [AIP.]□ *SMR Primary Record Numbers: 2630*

☞ *Archaeological periods represented: MD, PM, MO, UD*

*er er er*

- Gazetteer entry number for investigation: Each investigation entry for the 1999 Gazetteer volume has a unique individual number with two elements: the Gazetteer Section Number in which the investigation record is contained and a serial number. These numbers should be used to enable the location of each investigation within the volume using the author, investigator and period/dating indexes provided at the end of the Gazetteer volume.
- *Archaeological Investigation Project* database reference number for the relevant investigation record (for internal *AIP* use only)
- National Grid Reference: An eight figure grid reference prefixed by the relevant National Grid letters has been recorded where provided in the reports, etc. accessed.
- Site/project name and location: The name of the site or development project, giving some indication of its location, is given.
- Report title : The full title of the report relating to the investigation is given.; in the case of an "unpublished" monograph-type report of the kind illustrated this may include an internal report number, if recorded. Square brackets are used to indicate either that the title has been "made-up" by a member of the project team because the document referenced lacked a formal title, or that a document with the title given (or something closely approximating to it) is known to exist but was not actually inspected by a member of the project team.
- Other publication details: Normally comprises the name of the organisation/individual responsible for authoring or editing the report, followed by the place of issue/publication, the name of the organisation

responsible for issue/publication, the year of issue/publication and a description of the physical format of the document including the total number of pages, and the presence of figures, tables, plates etc. (see abbreviations for codes used). Occasionally, where the report represents an article in a published monograph or serial, or where a summary abstract has been obtained from a 'secondary source' and the original report has not been seen, the name of the originator of the article, monograph, or summary note will be given followed by a 'Source Number', the relevant page, and a description of the content of the article/summary note (presence of figures, plates, tables etc.). The 1999 project did not encounter any instances of this.

- Summary of investigation.
- Summary authorship attribution code: See relevant list of abbreviations/codes used for further information.
- SMR Primary Record Numbers*: Relevant Sites and Monuments Record reference numbers.
- ☞ *Archaeological periods represented*: The broad dating of the archaeological remains identified during the course of the investigation (please refer to relevant list of abbreviations/codes used for further information).

## Other annotations

Square brackets are used in Gazetteer entries to indicate either that information was not available or recorded for the relevant part of the Gazetteer entry, or that due to the nature of the source material, a significant degree of interpretation and inference was necessary in compiling the digest entry.

## Acknowledgements

The *Archaeological Investigations Project* was funded by English Heritage

In carrying out the *Archaeological Investigations Project* and compiling this Gazetteer the project team would like to thank all those who have contributed information, facilitated access to archives and libraries, and responded to enquiries, especially all the County Archaeological Officers, SMR Officers, the National Trust, the English Heritage Signposting team and staff of archaeological contracting units and consultancies around the country. Many local archaeological societies are now also regular contributors to the project as well as University departments involved in fieldwork, so thanks to them also.

**LAND AT SIDDALS ROAD AND COPELAND STREET, DERBY*****Archaeological Desk-based Assessment of Land at Siddals Road and Copeland Street, Derby***

May, R Sheffield : ARCUS, Report: 1204.2(1) 2008, 42pp, pls, figs, tabs, refs  
*Work undertaken by:* ARCUS

The site and its immediate environs appeared to have been developed between 1835 and 1852. The development included terraced housing, shops and public houses, a brass foundry and a timber yard, a Methodist chapel, a gasometer and two schools, the gasometer was replaced in 1879. The site was partially redeveloped in the 1930s with a new road laid out along the western boundary. The 1840s buildings were all demolished by 1968 with the 1879 school having been demolished after 1987. Geotechnical investigations suggested that there was the potential for the survival of 19th century archaeological remains in Area 1, whereas Area 2 contained substantial areas of made ground. May, R Sheffield : ARCUS, Report: 1249.1(1) 2008, 29pp, colour pls, figs, refs  
*Work undertaken by:* ARCUS

The site lay adjacent to a postulated 1st century AD Roman road. A Roman coin was found in the park in the 1970s and a large number of coins were recorded to be found in the parish in the 17th century. The site was likely to have been under agricultural use in the 17th century. The park may have been established in the early 17th century. A long series of fishponds were constructed in the park by 1792 and part of a fishpond ran through the proposed development area. There was the potential for the remains of this fishpond and an associated weir within the development area as well as associated remains from the Chaddesden Brook. [Au(abr)]

*Archaeological Desk-based Assessment The Former Sixt Kenning Depot, Cathedral Road, Derby*

May, R Sheffield : ARCUS, Report: 1158.1(1) 2008, 59pp, colour pls, figs, tabs, refs

*Work undertaken by:* ARCUS

There was a good potential for the survival of archaeological remains associated with medieval industrial use. A medieval church was probably located to the east of the site. Geotechnical data indicated made ground and 19th century housing. Medieval remains may survive beneath the made ground. The proposed development would have pile foundations, to avoid disturbing the ground, which was contaminated with fuel and oil residues due to its use as a garage and filling station in the second half of the 20th century. Clay, P N & George, S Leicester : University of Leicester Archaeological Services, Report: 2008-079 2008, 31pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Leicester Archaeological Services

The assessment concluded that the site lay in an area of archaeological interest, particularly relating to remains from the Roman period. In addition, the development area was identified as the site of the Union Iron Foundry, a locally Listed post-medieval industrial site. Any archaeological deposits found were likely to have been disturbed by the construction of the modern building on the site, although there was potential for remains to exist in certain areas. **THE CHAPEL OF ST. MARGARET, ALDERWASLEY*****An Archaeological Desk-based Study of The Chapel of St. Margaret, Alderwasley, Derbyshire***

Sheppard, R Nottingham : Trent &amp; Peak Archaeological Unit, 2008, 33pp, colour pls, figs, tabs, refs, CD

*Work undertaken by:* Trent & Peak Archaeological Unit

The chapel was both a Grade II Listed Building and a Scheduled Ancient Monument. It was stone-built of coursed gritstone masonry and had a pitched stone slate roof. It was built on a slope some distance from the local hall in an isolated position. Alderwasley was a chapel to Wirksworth and St. Margaret's was probably a chapel of ease for local parishioners and the families who owned Alderwasley Hall. The building was listed as being of early 16th century date, largely on account of the late Perpendicular style of its windows, doorways and ceiling structure. However, a chapel was recorded at Alderwasley in 1504 and an indenture, probably dating to the 1520s, recorded that the existing chapel was then "repaired and made new" by the parishioners, money and cattle were made available to finance a priest. The structure provided evidence of alterations. The building had a northern extension and a possible bell-tower, both supposedly added at some point but then removed in the mid-19th century. A large patch of brickwork in the north wall corresponded with where the north extension [a possible vestry] once stood. A distinct building line showed along the western end of the building, below the eaves level, with smaller and lighter stonework used above the line. The line corresponded with a long timber set into the east end wall. This may have been explained as a retained tie-beam, indicative of a lower roof level, and the building was perhaps raised in the early 16th century. Suggesting that most of the present-day structure may have been of medieval date. Although the architectural detailing may generally have been later, there was some evidence for the re-setting and replacement of windows, a re-set doorhead, and the reuse of decorative stones bearing heads and designs, both outside and inside the building. At the south-west corner there was a carved stone, possibly a Sheela-na-gig figure of medieval date. This appeared to be in situ at the building line and the size and appearance of the stone was consistent with the surrounding stonework below the suggested raising of the roof-line. Proposed alterations to the building involved relatively minor structural disturbance and some external excavations outside the west end. An archaeological watching brief would be required during the works. [Au(abr)]

Hunt, L Leicester : University of Leicester Archaeological Services, Report: 2008-089 2008, 26pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Leicester Archaeological Services

The assessment determined that the site lay adjacent to HM Prison Foston Hall, dating to the 18th century. The site was once part of its estate, but was later used for arable farming. Cropmarks had been recorded in the area, which, although undated, were likely to have been associated with prehistoric burial areas and prehistoric or Roman settlement or field systems. There were also several neighbouring fields that showed signs of cropmarks, and a prehistoric hand axe had been recorded close to the site. There was thought to be a high potential for archaeological remains to be present, that may have been impacted by any subsequent groundworks on the site. [Au(adp)]

Gnanaratnam, A K Leicester : University of Leicester Archaeological Services, Report: 2008-187 2008, 29pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Leicester Archaeological Services

The site lay within the historic core of the village of Humberstone. To the south-west of the site lay the remains of medieval religious house, discovered in the 1970s. A precursor to the 18th century "manor house" may also have been located nearby. Map evidence indicated buildings in the vicinity of the development area in the early 19th century, although these were cleared by 1887. To the north of the site were the remains of an extensive late prehistoric settlement site, whose limits had not yet been defined. The development itself would seriously compromise any archaeological remains that had survived on the site. [Au(adp)]

***An Archaeological Desk-based Assessment of Land at Six Hills Lane, Six Hills, Broughton and Old Dalby, Leicestershire***

Gnanaratnam, A K      Leicester : University of Leicester Archaeological Services, Report:  
2008-170 2008, 21pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Leicester Archaeological Services

The site lay near to the junction of the Fosse Way and the Saltway, leading from Six Hills to Grantham. A findspot was located close by that produced undated pottery and a Roman tile fragment, and also undated mounds. The overall potential for the recovery of archaeological deposits was low to moderate. [Au(adp)]

**39 WEST END, LONG CLAWSON**

***An Archaeological Desk-based Assessment for 39 West End, Long Clawson, Leicestershire***

Gnanaratnam, A K      Leicester : University of Leicester Archaeological Services, Report:  
2008-138 2008, 16pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Leicester Archaeological Services

The assessment established that although the site was located on the edge of the village, it appeared to have been within the village core since at least the late-18th century. The 1779 Enclosure plan showed a building on the West End frontage, although it was not clear whether this would extend into the development area due to changes in plot boundaries. The rear of the plot showed no evidence for truncation, or later disturbance. [Au(adp)]

**LAND AT BESCABY PARK*****An Archaeological Desk-based Assessment for Land at Bescaby Park, Bescaby, Sproxton, Leicestershire***

Hunt, L Leicester : University of Leicester Archaeological Services, Report: 2008-128 2008, 35pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Leicester Archaeological Services

The assessment determined that the site was located in an area of archaeological potential, laying as it did adjacent to Bescaby Deserted Medieval Settlement, a Scheduled Ancient Monument. The development work was thought to be limited to the alteration of buildings within the farm itself, at least in the early stages, and should not impact significantly on the surrounding archaeology. However, there was some potential for the discovery of archaeological remains, and some of the buildings on the site may have been in need of an appraisal prior to any alteration. [Au(adp)]

Hunt, L Leicester : University of Leicester Archaeological Services, Report: 2008-113 2008, 28pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Leicester Archaeological Services

The site was made up of farmland, and may have remained so since at least the medieval period. It was found to have contained several findspots, including a leaf arrowhead of likely Late Neolithic date, a scatter of material possibly of Neolithic/Bronze Age date and further medieval material. The remains of a post-medieval mineral railway were known to have existed on the site, and there were further Neolithic and Roman sites located close to the assessment area. There was thought to be a moderate to high potential for Neolithic and Bronze Age remains, as well as medieval and post-medieval remains. In the absence of systematic survey there was unknown potential for the discovery of archaeological remains from other periods. [Au(adp)]

Hunt, L Leicester : University of Leicester Archaeological Services, Report: 2008-036 2008, 44pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Leicester Archaeological Services

Minorca colliery was opened during WWI and continued to produce coal through deep mining until the late-1980s. The application area contained remnants of the former mine workings including pit heads, spoil heaps and quarried areas. Around 102ha of the 136ha site remained untouched by the mining activities, and contained arable fields. The Leicestershire and Rutland HER showed that there were two archaeological sites within the application area itself, comprising cropmarks relating to a Bronze Age pit alignment, as well as Roman pottery. The site was assessed as having low archaeological potential for the areas containing the mine workings, moderate potential for the arable fields to the south and east of the workings and high potential for the fields to the east and west of Measham Fields Farm. [Au(adp)]

Rowe, M Saxilby : Pre-Construct Archaeology (Lincoln), Report: 433 2008, 18pp, colour pls, figs, tabs, refs

*Work undertaken by:* Pre-Construct Archaeology (Lincoln)

The assessment found that there was no existing information suggesting that settlement or other activity took place during the prehistoric or Roman period. However, the evidence for medieval agriculture was apparent over most of the site, surviving as characteristic ridge and furrow, and preserving with it a fragment of parish boundary, apparently in its unadulterated medieval state. The results of the assessment suggested that the archaeological potential of the site was low. [Au(adp)]

Brown, J Nottingham : Trent & Peak Archaeological Unit, 2008, 30pp, colour pls, figs, tabs, refs

*Work undertaken by:* Trent & Peak Archaeological Unit

The assessment was carried out as part of a proposal to redevelop the site. There was slight potential for Roman and prehistoric remains, as well as medieval ridge and furrow to exist on the site. Two mine shafts were thought to be located within or immediately adjacent to the study area. A limekiln was in operation just to the east of the study area in the mid-19th century. A waggonway may also have run through the proposal site. A steam engine was located immediately outside the development area. Boundary stones marking a probable mid-19th century boundary between Woolaton and Radford were thought to have survived near the north-east and south-east corners of the study area. The 1950s Regional Seat of Government building, known locally as the Kremlin, existed in the southern portion of the centre of the study area. [Au(adp)]

Brown, J & Sheppard, R Nottingham : Trent & Peak Archaeological Unit, 2008, 41pp, colour pls, figs, tabs, refs

*Work undertaken by:* Trent & Peak Archaeological Unit

There was no reason to expect evidence for prehistoric activity within the study area. There was good evidence for Roman activity in the general area, this was at some distance from the study area, and there was no reason to expect evidence for Roman activity within the study area itself. There was little reason to expect evidence for Anglo-Saxon or medieval settlement, or for significant activity in the area before the later medieval period when coal

mining spread into the area. Records indicated that mining at Wollaton was likely to have started sometime after 1450, and the first pits were probably in the low lying northern area of the Old Park of Wollaton, including the vicinity of the study area. Although there was no documented evidence of mining taking place within the study area, scatters of pits, particularly the bell pits and small shafts employed in early mining, were recorded in some quantities in the vicinity. Although only one bell pit had been mapped within the study area, the aerial photographic coverage of the site before William Sharp School was built was not of sufficient clarity to rule out the existence of others having been present. The site was deemed to be of medium-high risk of retaining archaeological evidence of early post-medieval coal mining. [Au(abr)]

Roberts, J Durham : University of Durham, Archaeological Services, Report: 2115 2008, 23pp, colour pls, figs, refs

*Work undertaken by:* University of Durham, Archaeological Services

There were no historic or statutorily protected buildings on the site. The structures on the site were of 20th century date. There were two Listed Buildings in the vicinity, at Chaul End, to the north-east, and Zouche's Farm, to the west. There were no Scheduled Ancient Monuments in

the vicinity. Where topsoil was stripped in advance of soil build up, this had the potential to reveal archaeological remains or artefacts. This included flint artefacts dating from the Palaeolithic and later periods and archaeological remains relating to the later prehistoric, Romano-British, medieval and post-medieval periods. Other localised groundworks would take place across the site, primarily the excavation of drains, ponds and irrigation pipelines, the removal and planting of trees, and earthworks associated with greens, tees and bunkers. Timberlake, S Cambridge : Cambridge Archaeological Unit, Report: 830 2008, 40pp, colour pls, figs, tabs, refs

*Work undertaken by:* Cambridge Archaeological Unit

The assessment concluded that if any archaeological remains were to be present on the site, the most interesting would relate to the medieval Dominican Priory. The presence of College buildings and grounds which covered the whole of the former priory site would have helped to preserve any remains that existed. However, this lack of disturbance will also have limited the chance for investigation. There was thought to be a low chance for the discovery of pre-Priory remains. [Au(adp)]

Abrams, J Bedford : Albion Archaeology, Report: 2008/97 2008, 32pp, figs, tabs, refs

*Work undertaken by:* Albion Archaeology

The projected route of a Roman road crossed the proposed development. The remains of undated [likely Iron Age] field systems had been identified in the centre of the proposed development area. The subsurface remains of medieval field systems may have been present and the extant remains of the post-medieval and modern landscapes were visible within the development area. The study area contained the remains of prehistoric to modern activity. If archaeological remains were present, they were most likely to be preserved in the southern part of the development area, although even in the more developed/landscaped northern and central parts there were pockets of land which would preserve subsurface remains. These would be detectable through a field-based archaeological evaluation that would include non-intrusive [geophysical survey] and intrusive trial trenching. The south-east quadrant of the site was of particular interest in this regard. The data available at this time did not suggest that either sub-surface archaeological remains or built heritage will preclude development. Several land parcels in the area had already been given permission for development. These included Cambridge Biomedical Campus, Medical Research Council, Clay Farm, Glebe Farm, Bell School and Trumpington Meadows. [Au(abr)]

Philips, T Bar Hill : Cambridgeshire Archaeology Archaeological Field Unit, Report: 1006 2008, 38pp, colour pls, figs, tabs, refs

*Work undertaken by:* Cambridgeshire Archaeology

A desk-top assessment was undertaken to examine the available historical and archaeological resources relating to Jesus Green. Jesus Green was a public recreation space in Cambridge, bounded to the east by Victoria Avenue, to the north by the river Cam and to the south by Jesus College. Prior to the 19th century Jesus Green lay outside the town of Cambridge, part of common land situated between the built up area of the town to the west and arable land to the east. After the construction of Victoria Avenue in 1890 the use of the

Green gradually changed to recreation ground. Possible buried archaeological remains on Jesus Green include the town's Civil War defences and World War Two air raid shelters. A small excavation carried out within the grounds of Jesus College to the south, approximately 50m from Jesus Green, revealed a high density of archaeological features with five phases of activity dating between the Neolithic and post-medieval periods and thus prehistoric archaeology may be found in Jesus Green. In addition there were several Grade II Listed Buildings and structures including the lock keeper's house, the lock itself and the footbridge over the lock. Any future conservation or maintenance work on Jesus Green, such as the planting of new trees, the laying of new paths or the building of new structures should include some form of archaeological monitoring if the work would be likely to affect possible buried remains. ***Archaeological Desk-Based Assessment of land at Gaul Road, March, Cambridgeshire***

Hall, R. Heckington, Lincolnshire : Archaeological Project Services, Report: 146/07 2008, A4 Comb bound

*Work undertaken by:* Archaeological Project Services

"A programme of desk-based assessment was undertaken to determine the archaeological implications of proposed development on land north of Gaul Road, March, Cambridgeshire. An assessment area of 500m radius from the centre of the proposed development site was examined. The location of the proposed development site is of topographical and archaeological significance. Geological and soil mapping of the area has suggested that during the prehistoric periods the site lay on the edge of March 'island', with a small extension of the surrounding fen protruding into the site. Early use of the site is attested to by the presence of Mesolithic and Neolithic flint scatters in the northwestern and southwestern corners of the site. A further scatter of flints was indentified in the southwestern part of the site

during recent fieldwalking (report forthcoming). These scatters may represent the remains of small transient groups moving across the landscape rather than more permanent settlement. Several prehistoric settlement sites have been recorded on March 'island' and in the surrounding area. There is no indication of any later activity at the site. In the northern and western parts of the site remains could be buried beneath alluvium associated with either the realignment of the River Nene or the deposition of sands and silts during phases of marine incursion during the Neolithic period. Cartographic evidence suggests that the development site has been agriculture/pastoral land since at least 1680." [OASIS]

Roberts, J Durham : University of Durham, Archaeological Services, Report: 2129 2008, 22pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Durham, Archaeological Services

The structures on the site were of 20th century date. There was one Scheduled Ancient Monument in the vicinity of the site. There was no direct evidence that the proposed development area was occupied during the prehistoric or Romano-British periods, but significant evidence had been discovered in the surrounding area and an as yet unidentified resource had the potential to exist. Any resource may also have been waterlogged and hence in a good state of preservation. During the medieval and post-medieval periods the area was outside the area of settlement; and was not occupied until the 19th century. Evidence of agricultural activity and fen drainage may have occurred on the site, but evidence for settlement from these periods was unlikely. The proposed development had the potential to impact upon any archaeological resource that was present through demolition, drainage and the construction of foundations and associated services. No archaeological deposits were identified which required preservation in situ. The development would not impact upon any statutorily protected or historic buildings. [Au(abr)]

**103 TRINITY LANE, WALTHAM CROSS**

***103 Trinity Lane, Waltham Cross. Historic Buildings Research***

MacQuarrie, H Twickenham : AOC Archaeology Group, 2008, 50pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* AOC Archaeology Group

An assessment was carried out at the site, and found that 103 Trinity Lane was demolished without the progression of the archaeological building recording. As a result it was requested that historic building research be conducted to satisfy the requirements of a previous planning condition. The application site was located on the north side of Trinity Lane. The site was located to the north-west of the core of Waltham Cross, in an area which was dominated by the Royal Nurseries, until post war urbanisation of the area. Historically the site fell within part of Cheshunt Parish. 103 Trinity Lane was built between 1872 and 1896. Cartographic sources indicated that No. 103 and the neighbouring property [No. 101] were built at the same time and it did not appear that 103 underwent substantial architectural changes to the original design and layout of the building. It was the lack of alteration to the building or layout that gave it historic interest. The response from local residents provided an insight into how 103 Trinity Lane integrated with the 21st landscape, prior to its demolition. Trinity Lane appeared to have a strong sense of community and many generations seemed to remain in the area. This sense of community and history appeared to have been focused on Maurice Maxfield, not only as he owned many of the properties on Trinity Lane, but also given that some of the local men were employed by his building company, including John White who occupied the building prior to demolition. While 103 Trinity Lane was a decent example of late Victorian, high status architecture, it was the connection this building had to the Maxfield family that appeared to have heightened its historic value in the wider community. **CEDARS PARK, CHESHUNT*****Cedars Park, Cheshunt. Archaeological Investigation and Recording of Structural Remains***

Croxson, N Oxford : Oxford Archaeology, Report: 3775 2008, 92pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology

Cedars Park was a 30 acre popular, well maintained park with two distinct facets. It was an important local resource which was well used and was popular for its facilities, open space, varied habitats, and developing event programme, and it was also the site of a 16th-century manor house, later to become a Royal palace known as Theobalds. Theobalds Palace was originally built by Sir William Cecil between 1564 and 1585, and it was frequently used by Elizabeth I until her death in 1603. In 1607 it became a Royal Palace proper when James I decided to exchange it with Cecil's son Robert for the nearby Royal Manor of Hatfield. James died at Theobalds in 1625 and Charles I owned the palace until his execution in 1649. At this time Theobalds was listed amongst other royal properties for disposal by the Commonwealth and by 1650 was partly or largely demolished. Due to these close links with Royalty, Theobalds Palace was of great historical significance. It was also of archaeological significance in that it was believed by Sir John Summerson [one of the leading architectural historians of the 20th century] to have been one of the most important architectural achievements of the Elizabethan period. The 2008 investigation comprised three main elements: historical desk based research, geophysical survey, and building assessment/recording. This work largely confirmed the understanding of the former layout of Theobalds Palace. However, it was also possible to outline the various phases of occupation on the site now encompassed by Cedars Park. There was little in the way of above ground archaeological remains, particularly from the primary palace structure, however, there was potential for buried remains. A geophysics survey provided some insight into sub-surface features, although it was of limited value in confirming which, if any, of the original palace walls survived below ground. Further geophysics however, using alternative techniques, could be targeted on specific areas which held some potential for good results. In addition to this, it was worth noting that certain areas held high potential for trial trenching, evaluation, and research excavations should this be approved. It was recommended that due to the potential presence of below ground archaeology in certain areas of the park, that any future intrusive ground works be archaeologically monitored. [Au(abr)]

*Work undertaken by:* CgMs

The study site was shown to have a low to very low archaeological potential for the Palaeolithic, Mesolithic, Neolithic, Bronze Age, Iron Age, Anglo-Saxon, medieval, post-medieval and modern periods. The site's archaeological potential for the Roman period was thought to be moderate as Roman tile had been recovered from the immediate vicinity of the site in 1900. Past post-depositional impact at the study site could be characterised as severe. [Au(abr)]

Winter, M & Ashworth, H      Letchworth : Heritage Network, Report: 476 2008, 48pp, figs, tabs, refs

*Work undertaken by:* Heritage Network

Research demonstrated that there was a moderate probability of encountering features or finds of early prehistoric, late prehistoric and Iron Age date during the development on the present site. The risk rose to high for the Roman, Saxon, medieval, post-medieval and modern periods. Although the area had been subject to several phases of redevelopment since the 19th century, most recently being use as a London Transport garage, it was thought possible that deep features, such as pits and ditches, may have survived in pockets across the site. Fitzpatrick-Matthews, K J Letchworth Garden City : North Herefordshire District Council Museums Service, Report: 35 2008, 30pp, pls, colour pls, figs, tabs, refs  
*Work undertaken by:* North Herefordshire District Council

The archaeological potential of the site lay in a number of areas. The known archaeology of the surrounding area indicated that nearby prehistoric activity dating to the Neolithic was likely to extend at least onto the southern part of the site. There was also the possibility of Bronze Age or Iron Age discoveries, although a Bronze Age date was perhaps more likely, given the geology of the site, which lay in an area of former wetlands, which were often a focus for Late Bronze Age [c.1140-750 BC] activity. Similarly, the extensive Romano-British activity attested across the Garden City meant that there was a strong possibility of Roman period remains on the site, although its low-lying character suggested that it was unlikely to be domestic. The likelihood of discovering human remains on the site was high. If they were of early medieval date, they would represent a rare class of monument in North Hertfordshire. Other forms of archaeological remains may have existed and have simply not been recorded through the discovery of diagnostic datable material. In particular, the likelihood that nearby Romano-British occupation was preceded by Iron Age occupation of identical character was noted. The deposits underlying the topsoil were part of the floodplain of the Pix Brook and may well have been waterlogged. Such deposits were a focal point for Late Bronze Age activity, but they were also likely to favour the preservation of organic materials that usually decay on dry land archaeological sites. Finally, the archaeology of the Garden City as a monument in its own right should not be overlooked. While remains of recent date were not generally considered in developments of this nature, the international significance of Letchworth Garden City made the careful recording of remains from its early years an important element in preserving the archaeology of the site, if only by record. The impact of redevelopment of the site would impact on the archaeological remains in a number of ways, the size of the impact being dependent on the scale and nature of the redevelopment. Some potential impacts may be mitigated in the design of the works, while others were unavoidable. In the latter category were the human burials in the vicinity of the paddling pool in Howard Park. Any landscaping or other work involving ground penetration in this area had a significant likelihood of disturbing human remains. Any ground disturbance may have destroyed otherwise irreplaceable archaeological remains and an opportunity should be afforded for the recording [and salvage excavation, if necessary] of any remains exposed in this way. Penn, KNorwich : NAU Archaeology, Report: 1375 2008, 21pp, colour pls, figs, tabs, refs

*Work undertaken by:* NAU Archaeology

A desk-based assessment was undertaken of land at Attlebridge, Taverham and Spixworth, where four borrow pits [Areas 1-4 in Study Areas 1 and 2] were proposed. There was some evidence for significant archaeological remains in both Study Areas 1 and 2. In Study Area 1 [around Areas 1 and 2] there were records of prehistoric monuments, but little of significance

for later periods. In Study Area 2 [around Areas 3 and 4], besides evidence of prehistoric activity [flints], a Roman temporary camp, a cremation Roman burial and other evidence of a Roman presence was recorded. What may be an early Saxon occupation site was also recorded. There were also several records of surface finds, doubtless casual losses and not related to contemporary occupation. The results of this assessment indicated that a scheme or programme of archaeological mitigation would be required in the footprints of the four borrow pits and associated compounds. [Au(abr)]

Watkins, P J Norwich : NAU Archaeology, Report: 1843 2008, 98pp, figs, tabs, refs

*Work undertaken by:* NAU Archaeology

Overall, the evidence suggested that this area was one of reasonably high archaeological potential, having clearly been occupied and utilised throughout most periods. Two prehistoric round-barrows, both Scheduled Monuments, represented the most obvious constraints to future development. A medieval moated site and two medieval hollow ways were the only other archaeologically significant sites represented by visible remains. Artefactual material recovered during fieldwalking led to the identification of several further sites where significant archaeological remains were likely to survive. These sites included a probable Roman villa complex, a possible early Saxon cemetery and several potentially significant medieval and post-medieval structures. Cartographic sources also identified locations where further post-medieval structures once stood, although these were of limited significance. It was highly likely that archaeological remains were present elsewhere within the potential development areas. The available evidence suggested that prehistoric remains may well be present in the various valleys that bisected this area. There were a number of areas, close to Hetherset itself, where Anglo-Saxon and medieval remains were more likely to be present. It was also highly probably that Roman features would be present in many locations, particularly in the environs of the probable villa site. The research conducted in the desk-based assessment strongly suggested that this topographically varied and heavily divided landscape retained

much of its 18th and 19th century character. The most important survival was the reasonably well preserved early 19th-century park which surrounded Thickthorn Hall. The broader arrangement of this landscape was likely largely of medieval origin. It did not appear that any standing buildings or structures of architectural or historical significance would be directly threatened by development of these areas, although the setting of one Grade II\* and several Grade II Listed structures would be affected. [Au(abr)]

#### **OLD COAL YARD AND EXHIBITION CENTRE, RAILWORLD SITE**

***A Proposed Housing Development at the Old Coal Yard and Exhibition Centre Redevelopment at the Railworld Site, Peterborough. Desktop Assessment***

Punchard, W Bar Hill : Cambridgeshire Archaeology Archaeological Field Unit, Report: 1021 2008, 60pp, colour pls, figs, tabs, refs

*Work undertaken by:* Cambridgeshire Archaeology

A desk-based assessment was carried out in advance of the proposed residential and commercial development over the two Railworld sites. The first site, referred to as RW1, was located on the southern bank of the River Nene and the second site, referred to as RW2, was located on the northern bank. The study attempted to define any possible archaeological potential of the land at the two sites. The first development area (RW1) was a railway museum and exhibition centre called Railworld. Prior to this the land was the site of the former Woodston locomotive shed and also used as railway sidings. Nationalisation of the railway network in 1948 saw the line enter the hands of British Rail, however steady decline led to closure in 1972. The locomotive shed was demolished around 1965 and all of the sidings removed. The land at the RW1 site has been subject to several episodes of ground make-up associated with the railway construction. This may have sealed archaeological remains. The second development area (RW2) was open scrubland and being used for storage of materials by the adjacent railway. A coal yard was constructed in the south-eastern corner of the site c.1948, however, this was demolished in the late-1970s. Prior to this there was little evidence of the site having any development or structures upon it. It was likely that this land was part of the flood plain for the River Nene and was waterlogged during certain times of the year. Nearby archaeological activity has revealed evidence from a wide range of historical periods mainly consisting of waterside related activities. 500m to the east of RW2, also on northern bank of the Nene, a complete Iron Age canoe was discovered. A possible boat-landing place called "Wodehithe" was located in the south-eastern corner of RW2 and evidence of water channelling was present on the early pre-OS maps of the area. These could possibly be leats for a nearby watermill/windmill or boat hythes for access. Also there was the potential to uncover further, undocumented, railway features at both sites. [Au(abr)]

Barber, K      Salisbury : WA Heritage, Report: 68340.02 2008, 21pp, colour pls, figs, tabs, refs

*Work undertaken by:* WA Heritage

The assessment determined that the site lay close to, but outside, the known extent of the Saxon, medieval and post-medieval town defences, in an area that historically comprised a wetland area until the 20th century. Due to the waterlogged nature, the site was thought to have been at the periphery of any settlement activity, and flood remediation programmes may have compromised any archaeological remains that did exist. Given the nature and conditions of the site, there was thought to be a moderate archaeological potential for the site in general, and low to moderate for the area within the proposed development's footprint. [Au(adp)]

OASIS ID: no

*Work undertaken by:* Museum of London Archaeology Service

The assessment found that the proposed cable route had a high potential to contain later medieval remains. It lay in the immediate vicinity of the medieval manor houses of Porters and Parsloes, the exact location of which was uncertain. Excavation of the cable trench would partially or completely remove any archaeological remains, and for this reason, further work was suggested in the form of an intermittent watching brief. Thompson, G Brockley : Pre-Construct Archaeology Ltd., 2008, 54pp, colour pls, figs, tabs, refs

*Work undertaken by:* Pre-Construct Archaeology Ltd.

The application site was found to have a high potential for Roman and post-medieval remains, a moderate to high potential for Saxon and medieval remains, a moderate potential for Bronze Age remains and a low potential for all other periods. Archaeological evidence indicated that settlement developed in the nearby vicinity during the 1st and 2nd centuries AD. The existing building on the site had re-used the foundations of its late-19th century predecessor, which extended to cover the entire footprint of the proposed development. Any basements attached to buildings on the site would have likely removed any and all archaeological remains that otherwise may have been present. [Au(adp)]

*Work undertaken by:* CgMs

The site was thought to be in an area of archaeological potential, in particular an area of Roman and medieval occupation. However, the potential for archaeological survival was low as a result of 19th century basementing across the site. As a result, all archaeological remains at this level would have been removed. Where excavations relating to the development were thought to exceed the depth of the existing basements, archaeological monitoring was recommended in order to record any deposits that may be encountered. [Au(adp)]

King, R Swindon : Foundations Archaeology, 2008, 41pp, colour pls, figs, tabs, refs

*Work undertaken by:* Foundations Archaeology

A desk-based assessment was undertaken on land at 437 Uxbridge Road. The assessment highlighted that the site was of moderate to high archaeological potential for the recovery of prehistoric finds and of low potential for remains from the Roman through to the post-medieval period. The site appeared to have been agricultural land throughout the medieval and early post-medieval periods. It remained undeveloped until c.1935, when the tennis courts were constructed, followed by the public house c. 1956. A number of garages/short lived structures were subsequently constructed within the site, close to the southern boundary. The foundations for these earlier structures were likely to lay beneath the present industrial buildings and may only have survived in a fragmentary form. The main archaeological potential of the site was for the presence of Mesolithic finds. It was noted, however, that construction of the tennis grounds and the public house may have caused an impact on any archaeological deposits that may have been present. Features of Mesolithic date are likely to have been insubstantial and easily destroyed. However, with the exception of two garage blocks, the level of disturbance in the southern part of the site, which was of the highest potential, may have been relatively light. Preservation of Mesolithic archaeological finds and features in this area may, therefore, be considered possible. [Au(abr)]

*Work undertaken by:* CgMs

The site was shown to have a low archaeological potential for the Roman through to the post-medieval periods, with a low to moderate potential for Mesolithic to Iron Age periods and a moderate to good potential for the Palaeolithic periods. The cumulative effects of post depositional impacts was not considered to be great, as the site had been utilised as meadowland from the medieval period onwards. A watching brief during groundworks was thought to form an appropriate mitigation exercise. [Au(abr)]

Francis, A London : Isambard Archaeology, 2008, 28pp, colour pls, figs, tabs, refs

*Work undertaken by:* Isambard Archaeology

The site was found to have a rich archaeological heritage, with the importance of the maritime and chemical industries and the later high density residential area. The site had been developed since 1623, prior to which it lay on the floodplain of the Ravensbourne, and when the river was drained and revetted, open or agricultural fields. There was thought to be a low potential for the recovery of prehistoric, Saxon or Roman remains, a moderate potential for medieval remains and a high potential for post-medieval remains. [Au(abr)]

***Thistle Hotel Project. Archaeological Desk-based Assessment***

Featherby, R London : Museum of London Archaeology Service, 2008, 42pp, colour pls, figs, tabs, refs

*Work undertaken by: Museum of London Archaeology Service*

The assessment found that there was a variable potential for the recovery of archaeological remains. Ground reduction across the northern three-quarters of the site would have removed all but the deepest archaeological remains, and survival here was anticipated to be poor. The southern portion of the site, which had not been subjected to such severe reduction, had a high potential for prehistoric and Roman remains. The site lay on the edge of a prehistoric ritual landscape. Other prehistoric remains were present within the vicinity of the site. [Au(adp)]

Archaeological Desk-based Assessment**

Phillipots, C London : Museum of London Archaeology Service, 2008, 24pp, colour pls, figs, tabs, refs

*Work undertaken by:* Museum of London Archaeology Service

The assessment established that there was no evidence to suggest that the site was occupied during the prehistoric, Roman and early medieval periods. A monastic grange was established immediately adjacent to the site in the 13th century, and ancillary buildings, enclosures and fishponds may have lain within the area of the site itself. The foundations of the proposed new college blocks and housing were likely to have removed any surviving archaeological remains within their footprints, where these had not already been truncated by 20th century terracing. Given the archaeological potential of the site, a field evaluation was thought to be appropriate mitigation against any archaeological remains. [Au(adp)]

*Work undertaken by:* CgMs

The site was considered to have a generally low potential, except for the post-medieval period which was considered as moderate. Past post-depositional impacts were severe and cumulative as a result of 19th and 20th century development within the study area. Substantial quantities of made ground extended down to the natural river terrace gravels, indicating a severe impact on the original surface and sub-surface deposits, probably at the time of the canalisation of the Ravensbourne. The proposed development was thought likely to have a negligible archaeological impact. [Au(adp)]

*Work undertaken by: Halcrow Group Ltd.*

The assessment identified one statutory designation within the proposed development area. medieval finds had been recorded in the area. It was thought that extensive remains of the Victorian street plan and adjacent houses may have been present across the area of the scheme, however, the extent of their survival could not be determined at this stage. The scheme would only generally involve shallow construction, and would be unlikely to impact archaeological remains. It was possible that Victorian street frontages may be exposed, and it was recommended that some form of mitigation should be carried out for this reason. [Au(abr)]

Carter, N Twickenham : AOC Archaeology Group, 2008, 54pp, pls, figs, tabs, refs

*Work undertaken by: AOC Archaeology Group*

The assessment indicated that the site was not developed until the late-19th/early 20th century. Prior to this, cartographic evidence showed the site laying within the boundary of a large lake feature, first shown on Chapman and Andre's map of 1777. It was thought the area was most likely agricultural land before this. There was thought to be a low archaeological potential for all periods. [Au(abr)]

Platell, A      Durham : University of Durham, Archaeological Services, Report: 1821 2008, 20pp, colour pls, figs, refs

*Work undertaken by:* University of Durham, Archaeological Services

Two possible prehistoric sites were known from crop marks within the study area, with a third just outside. None of these had been investigated archaeologically. Several other similar sites had been recorded, although all these were of more doubtful authenticity. There were no reliable records of Roman or Saxon activity in the study area. Medieval remains survived at Croxdale Church and at Low Butterby, in both cases being scheduled sites. Slight traces of ridge and furrow agriculture were identified in some parts of the study area. The remains of three post-medieval mills were present along Croxdale Beck. Two of these were used for the paper making industry, for which County Durham was a centre in the 18th and 19th centuries. Croxdale paper mill in particular was the oldest known such mill in the county. The gardens were altered repeatedly during the 18th and 19th centuries, and the visible remains included elements from all these changes. Little significant change had taken place through the 20th century. [Au(abr)]

Strickland, J Alston : North Pennines Archaeology Ltd., Report: CP/781/08 2008, 27pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

A desk-based assessment was undertaken. The site lay within 250 metres of the Registered Historic Battlefield of Neville's Cross, which was designated as a site of archaeological importance. The assessment was required in order to appraise the potential for the survival of archaeological deposits on site and what impact construction work associated with the proposed development would have on those deposits. The assessment revealed that the proposed development area had been occupied since the 19th century, with little changes being made to the buildings throughout their history. Fernhill first appeared on maps dating from 1898 as Crofton Holmes. The present day name appeared on the Third Edition Ordnance Survey map of 1923. Prior to the development of the houses on this site, the area was open fields. Given the close proximity of the site to the Historic Battlefield of Neville's Cross it was possible that archaeological deposits of this period survived within the proposed development area. There was the possibility, however, that any early archaeological deposits that once existed within the site may have since been truncated by post-medieval or modern developments in the area. It was recommended that a metal detection survey took place, followed by an archaeological watching brief while groundwork was carried out. It may also be recommended that a Level II Building Recording be undertaken in order to record the Victorian two-storey sandstone built lodge that was proposed for demolition. [Au(abr)]

University of Durham, Archaeological Services Durham : University of Durham, Archaeological Services, Report: 1857 2008, 31pp, colour pls, figs, refs

*Work undertaken by:* University of Durham, Archaeological Services

Existing evidence indicated that the study area was occupied and exploited in prehistory. An extensive probable Iron Age or Roman settlement was present to the east of the proposed development area. Ridge and furrow, resulting from ploughing during the medieval period, survived as upstanding earthworks in Area C. It was probable that the remainder of the site was exploited for agricultural purposes during the medieval and post-medieval periods. A farm had existed in Area D since the early 1800s, and a building also existed in Area G from the mid-19th century or earlier (demolished by 1960). A programme of field evaluation was recommended, comprising geophysical survey followed by trial trenching. It was recommended that the farm buildings and the air-raid shelter in Area D should be subject to building recording. [Au(abr)]

Peters, C Alston : North Pennines Archaeology Ltd., Report: CP 697/08 2008, 37pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

An archaeological assessment was undertaken of land adjacent to No.4 High Bondgate in advance of proposed redevelopment. The study area had remained within the core of the settlement of Bishop Auckland during the medieval and post-medieval periods. The results of the assessment suggested that the study area was occupied from at least the mid-18th century onwards and probably before, within the northern part of the site, except the observatory and boundary wall, remaining gardens and back plots for the frontage. Archaeological deposits relating to the medieval settlement and the post-medieval town were highly likely to survive within the south-eastern part of the site, with further potential for boundary features, perhaps even of medieval origin, within the northern part. A boundary wall, likely to be that first seen on First Edition Ordnance Survey mapping of 1856 but possibly of much earlier origin, and the gazebo, or observatory, which was Listed Grade II, were known to have existed on the site. The observatory was in a poor state of repair, which prevented a full inspection of the building. It was recommended that archaeological building recording was undertaken prior to the restoration of the observatory. This could be extended to record the boundary wall, which from initial inspection, appeared to incorporate some interesting architectural features. [Au(abr)]

Peters, C Alston : North Pennines Archaeology Ltd., 2008, 28pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

A desk-based assessment and visual site inspection was carried out. The site was located on the south side of the Market Place at the centre of Bishop Auckland. Evidence suggested that the area around Bishop Auckland had been exploited in prehistoric and Roman periods, although no direct evidence for this was found within the study area. The desk-based assessment indicated that the study area was located within the medieval core of the town, and the post-medieval town, with structures of the post-medieval era extant within the proposed development site. The site visit found that features survived within the site boundary. These included a post-medieval boundary wall and outbuildings, the latter to be demolished, and perhaps the boundary wall also. It may be necessary for an archaeological building recording to be undertaken, prior to the demolition of these features, to further inform of their construction and date, and to assess whether these were part of the mid-18th century No. 4 Market Place build. Buried archaeological deposits relating to the medieval and post-medieval occupation of the site may have survived within the proposed development area. As foundation trenches and services were due to be excavated within the site as part of the proposed development, it was further recommended that a scheme of trial trenching was undertaken, in the areas due to be affected, to test the potential for medieval deposits relating

to the early history of Bishop Auckland, and also to record any post-medieval deposits in the area, which were likely to be destroyed by the groundworks. [Au(abr)]

Breslin, L Edinburgh : Headland Archaeology Ltd., 2008, 17pp, colour pls, figs, tabs, refs

*Work undertaken by:* Headland Archaeology Ltd.

A desk-based assessment and walkover survey was undertaken of the site of the former Warner Electric Site. The proposed development area contained the demolished remains of part of the St. Helens Colliery, dating from the 19th and early 20th century. There was no significant potential for other, unrecorded cultural heritage features within the development area. Ground breaking works during construction of the proposed development would disturb any surviving sub-surface remains of the colliery. This was considered to be an impact of no more than minor significance. No cultural heritage features in the surrounding area would be subject to significant adverse impacts on their setting as a result of the construction and operation of the proposed new mixed-use development. Scott, J & Strickland, J South Shields : Tyne & Wears Museum Archaeology Department, Report: 824 2008, 43pp, colour pls, figs, refs

*Work undertaken by:* Tyne & Wears Museum Archaeology Department

Documentary sources did not indicate the presence of significant archaeological remains on the site. Long Benton and Little Benton villages were settled during the medieval period though the settlements did not extend as far as the site boundary. This was evidenced by historic map regression illustrating that prior to the construction of the campus buildings which occupied the majority of the site the area was open fields. The other building that occupied the site consisted of Rose cottage which was built in the early 20th century. Extensive ground disturbance during the construction of the Coach Line Campus and the Northumbria University building in the 1960s meant that the potential for the survival of archaeological and cultural heritage features was low. Oakey, N Gosforth : Entec UK Ltd., 2008, 68pp, figs, tabs, refs  
 Work undertaken by: Entec UK Ltd.

A desk-based study and walkover survey found that the study area was predominately agricultural in nature with some former industrial sites recorded, including five collieries, four quarries, three tile works [one a Listed Building], and brick and firebrick works. These tended to be concentrated towards the southern end of the route as did the wagonways, railways and other 19th century features. However, watermills and related features [races, leat ponds etc.] were more extensive in their distribution [more than 13]. Defensive features from World War Two included four pillboxes [one survived and was Listed, the remainder demolished], the sites of two searchlight emplacements and four roadblocks and anti-glider or anti-aircraft ditches. A 'Prisoner of War' camp was located on the eastern edge of Wooler and a Royal Observer Corps underground monitoring post may have been associated with the Cold War as well as earlier episodes. **HAWKS ROAD, GATESHEAD****Proposed Development at Off Hawks Road, Gateshead, Tyne and Wear. Archaeological Desk-based Assessment**

Hunter, D Leeds : Under Construction Archaeology, 2008, 33pp, figs, refs  
 Work undertaken by: Under Construction Archaeology

The site was used as a crane depot and comprised a yard and warehouses. The site was located on high ground above the River Tyne in an area developed since the 1740s as part of an iron works. There was cartographic evidence for the development of these works between 1770s to the 1890s. Since closure at the end of the 19th century, the site had been undeveloped or used for storage, distribution and transport. The cartographic evidence suggested that the site was not part of the early works although an 18th century dam, used to power metalworking machinery via a waterwheel, may have lain below much of the site. During the 19th century parts of a foundry and other industrial buildings and some cottages were present within the site. [Au(abr)]

Northern Archaeological Associates Barnard Castle : Northern Archaeological Associates, Report: 08/56 2008, 37pp, colour pls, figs, tabs, refs

*Work undertaken by:* Northern Archaeological Associates

The assessment identified eighty three archaeological and other historic sites within a 1km radius of the site, including twenty one Listed Buildings. The college buildings with associated paths and services were likely to have truncated any remains that existed within the northern part of the site. The southern part of the site was likely to have been the subject of limited landscaping in the creation of the sports field, but may have had a limited impact on the area. The nature of the proposed redevelopment of the site was unclear, which did not permit detailed recommendations for further work. However, if the development affected the grassed sports area, further archaeological work was suggested. [Au(adp)]

***Archaeological Desk-Based Assessment of Land at Brewery Bank, Swalwell, Gateshead Tyne and Wear***

Strickland, J Alston : North Pennines Archaeology Ltd., Report: CP/771/08 2008, 30pp, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

A desk-based assessment was carried out of the site, which lay within the presumed extent of Swalwell medieval village, designated as an area of potential archaeological importance. The assessment revealed that the proposed development area had been occupied since the 19th century. Brewery Bank itself is shown on maps dating from the end of the 19th century. Within the boundary of the proposed development area, the site was densely packed with terraced housing until the 1940s when the terraced housing was replaced with a social club and a two-storey brick-built house that still survived on the site. Given the close proximity of the site to the medieval centre of Swalwell, it was possible that archaeological deposits of this period survived. There was also the possibility, however, that any such early deposits may have since been truncated by post-medieval or modern developments in the area. Subsurface remains relating to post-medieval and modern activity were likely to survive within the proposed development area. These were likely to consist of the foundations of terraced housing, dating from the mid-19th century and later. It was recommended that two archaeological evaluation trenches be excavated across the site in order to ascertain the survival of any sub-surface features or deposits associated with medieval or post-medieval Swalwell. *Work undertaken by:* Entec UK

"Archaeological desk-based assessment of the GAP Hire yard at St Lawrence, Newcastle upon Tyne. Review of previous archaeological fieldwork and existing documentary and cartographic records suggested that the site occupied the former site of the fifteenth-century High Glass Houses at St Lawrence. This site was later occupied by the north-eastern end of the St Lawrence Ropery. Previous SI work and archaeological evaluation of the adjacent plot suggested the presence of deep deposits of glass-making waste used to make up a building platform for the ropery on the bank side." Late 19th century housing was cleared to allow for the existing offices and yard. It was thought likely that survival and character of archaeological features would be complex and varied, largely dependant on the underlying topography of the site. Depths of made ground were uncertain. The depth of these deposits and the relatively insubstantial nature of the overlying ropery buildings may, in places, have protected the underlying remains of earlier glass houses. [Au(adp)]

Mabbitt, J Gosforth : Entec UK Ltd., 2008, 31pp, colour pls, figs, tabs, refs

*Work undertaken by:* Entec UK Ltd.

The use of the site before the medieval period was unknown. It was possible that the Vallum, part of Hadrian's Wall, ran through or near the George Street strip, but its line in this area was never confirmed. The site appeared to have been farmland during the medieval period, though it was possible that some coal mining took place here. There was also evidence for small scale extractive industry in the form of clay pits within the study area during the 18th century. Given the intensity and extent of cellaring and terracing that occurred during the 19th century and subsequent development of the site any archaeology would have been significantly disturbed. Pre-Construct Archaeology Ltd. Durham : Pre-Construct Archaeology Ltd., 2008, 62pp, colour pls, figs, tabs, refs

*Work undertaken by:* Pre-Construct Archaeology Ltd.

In the development proposals, the majority of the existing school was to be demolished with a new build in the north-eastern part of the site. Although the site was located c.400m from Hadrian's Wall, mid-19th century maps showed it lay immediately adjacent to a colliery and coal pit. The potential at the study site for archaeological remains of all prehistoric eras and the Roman, Anglo-Saxon and medieval periods was considered low. The area of the former Dene was considered to have low to moderate potential for palaeoenvironmental remains. There was a low potential for non-industrial post-medieval and early modern remains, while there was a high potential for industrial remains. [Au(abr)]

Pre-Construct Archaeology Ltd. Durham : Pre-Construct Archaeology Ltd., Report: 2008/16  
 2008, 45pp, pls, figs, tabs, refs

*Work undertaken by:* Pre-Construct Archaeology Ltd.

The study site comprised an irregular shaped piece of land, which was formerly occupied by the 19th century settlement of Holywell, developed in association with the West Holywell Colliery. The site was effectively divided into three distinct portions by the route of the Backworth to Earsdon Road. The potential for earlier prehistoric archaeological remains was low, but was high for the later prehistoric and Romano-British periods. The potential for medieval and post-medieval remains was moderate and the archaeological significance of any such remains would be moderate to low. The potential for early modern and industrial era remains was high. [Au(abr)]

*Work undertaken by:* Scott Wilson

The site was used as agricultural fields from the medieval period until the Second World War. A flask mine [coal mining bell pit] dating to the 17th or 18th century may have been located in the north-eastern corner of the site. From 1939 to 1944 the north-eastern part of the site formed the RAF No 33 Groups No 15 Balloon Centre. Buildings within this part of the site comprised barrack blocks, the NAAFI sitting room and changing room blocks, and part of an air raid shelter. No Second World War buildings survived within the development site. The site had been levelled and subsequently built up with made ground imported from land to the south which was formerly the refuse heap of the Balloon Centre. [Au(abr)]

Five historic environment issues were identified. These comprised the presence of an 18/19th century Cockpit on the site, a degraded hedgerow that crossed the site of Canal Farm, a planned 19th century estate farm demolished in the late-20th century located within the depot area, the presence of a major prehistoric site at Humbledon Hill a few hundred metres away and the canalisation of the Barnes Burn and the presence of a later backfilled pond or small mere immediately north of the proposed area. Much was known about the formation of the Hetton Coal Company in 1820 which sank the Blossom and the Minor Pits of Hetton Lyons colliery and by 1822 extracted coal that was transported to the River Wear. The first phase of the proposed development was the demolition of the modern workshops which allowed for an unobstructed view of the engine house. The proposed fabrication assembly shops were in keeping with the general commercial nature of the Hetton Lyons Industrial Estate. [Au(abr)]

Carey, C Gateshead : Archaeological Research Services, Report: 2008/5 2008, 21pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Research Services

An assessment was carried out for the site, originally thought to have been used to protect cattle from Scottish raids, although no solid evidence could be found to support this. The building was then thought to have been converted into a windmill, with an initial construction date of sometime in the 17th century. The roof was missing, leaving the interior open to the elements, with the main beams of the internal potence [a revolving ladder system used to access the nest boxes] surviving, but under threat due to their exposed state. The dovecote was thought to be of regional significance, and action needed to be taken to ensure the site did not fall into further decay. [Au(adp)]

*Work undertaken by:* The Archaeological Practice Ltd.

The assessment established that the site had been used for agricultural purposes until the 19th century, when the original school was constructed. There was no evidence that any archaeological remains prior to this would be encountered, although the possibility could not be dismissed entirely. Part of the school itself dated to the second-half of the 19th century, and the chapel dated to 1902 and was an attractive building of some local significance. It was recommended that the school buildings should be recorded. [Au(adp)]

*Work undertaken by:* Fiona Green Garden Historian

An assessment was carried out of the site in advance of the construction of a new golf course, modelled in the style of Harry Colt, whose approach was to incorporate features of the site and make use of existing topography rather than extensively remodelling the landform. Close House Estate was characteristic of similar estates built along the Tyne Valley in the 18th century, with plantations, rides and an undulating landscape planted with clumps of trees which framed or directed views to the distant prospect. Alterations were made to the house at the beginning of the 19th century, and the layout of the grounds appeared to have been consolidated from previous plans. [Au(adp)]

*Work undertaken by:* Archaeological Services WYAS

An assessment was carried out in response to proposals for a wind farm to be constructed on the site. The study area was formerly part of the Butterwell Opencast mine, which had been re-landscaped and reinstated as farmland and woodland. It was predicted that due to the site's former land use, any archaeological remains would have been destroyed. However, aerial photograph analysis demonstrated that a small area on the south-western corner of the proposed development site may have remained unaffected, and may have had the potential to contain Iron Age or Roman deposits, based on the site's proximity to the extensive settlement of this period at Pegswood Moor Farm. Further work was recommended. [Au(adp)]

Scott, J & Strickland, J South Shields : Tyne & Wears Museum Archaeology Department, Report: 651 2008, 48pp, colour pls, figs, tabs, refs

*Work undertaken by:* Tyne & Wears Museum Archaeology Department

The assessment established the main archaeological issues within the area of the site. The Roman road known as the Devil's Causeway ran north-south through the two areas that constituted the site. The core of the deserted medieval village of Todburn lay between the two portions of the site, with some of the outlying fields, once associated with the village, located within the site boundaries. Seven potential prehistoric sites were identified from aerial photographs. The Roman road, medieval settlement and possible prehistoric sites were all assessed to have been of high archaeological potential. Other features, of moderate and low potential, were also highlighted, and were used as mitigating factors in the placement of

turbines, at some point, an access track would have to cross the Roman road, and in this case it was agreed that preservation by record would be the most suitable method of mitigation. In the wider landscape of the development, several sites needed to be assessed with regard to the potential impact of the development on the setting of important archaeological sites and historic buildings. Pollington, M Morley : Archaeological Services WYAS, Report: 1871 2008, 21pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Services WYAS

It was probable that the site had remained in use as mixed agricultural land since at least the medieval period. The extant field pattern within the site was a product of post-medieval enclosure, although the curvilinear alignment of the field boundaries probably reflected the influence of earlier medieval land divisions. Apart from agricultural activity and minor quarrying, there was no evidence for archaeological activity on the site, however no archaeological survey or excavation had taken place on the site and it was possible that deposits predating the medieval period could be present. Further archaeological work was suggested. [Au(abr)]

Scott, J & Strickland, J South Shields : Tyne & Wears Museum Archaeology Department, Report: 729 2008, 16pp, colour pls, figs, tabs, refs

*Work undertaken by:* Tyne & Wears Museum Archaeology Department

An assessment was carried out in response to proposals to extend the Delhi remainder opencast site. A watching brief immediately to the south-west of the extension area in 2005 uncovered a series of partially collapsed mines c .12.5m below the current ground surface, and extending 40m into the area of opencast mining. There was no evidence of surviving wagonways, wooden tubs, or pit props. The size and shape of the pillar and stall workings were consistent with those galleries being of 19th century date. A series of tunnels infilled with rubble would extend into the area of the proposed extension. There could be evidence for surviving wagonways, though it was likely that these would be removed, although stone or concrete sleeper blocks could be present. A watching brief was suggested. Peters, C Alston : North Pennines Archaeology Ltd., Report: CP/703/08 2008, 41pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

The desk-based assessment located a total of 305 sites from the various sources consulted during the research within 2.5km of the development site. This highlighted the potential for prehistoric, medieval and post-medieval archaeology in the area. A total of 60 of these 305 sites lay within the site boundary itself showing the strong possibility for subsurface deposits to survive on-site, and as the area had never undergone archaeological investigation, this potential had yet to be tested. As the proposed sewage requisition scheme was likely to require a linear cut across the landscape within the site boundary, which would have a direct and irreversible impact on any archaeological features it encountered, it was likely that further archaeological work would be required. **THORNGREEN LIMEKILN, ALLENHEADS*****Archaeological Assessment and Recording of Thorngreen Limekiln, Allenheads, Northumberland***

Wooler, F Alston : North Pennines Archaeology Ltd., Report: CP/711/08 2008, 53pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

An archaeological desk-top assessment and rectified photographic survey was undertaken of Thorngreen Limekiln, prior to the consolidation and interpretation of the Grade II Listed structure. A desk-top assessment was undertaken prior to the building recording project, and this revealed that there has been a limekiln at Thorngreen since at least 1849, although this particular kiln was located on the triangular piece of land just to the west of the property "Thorn Green". The limekiln that was the subject of the present survey appeared to have been constructed as a replacement at some point between c.1865 and 1899. The building survey revealed that Thorngreen Limekiln was a nice example of a later 19th century, presumed commercial, kiln which has some architectural detail, despite its utilitarian function. The kiln has double-pots, one of which has been used in the 20th century as shown by the brick lining, remains of modern brick walls on the top of the kiln, and surviving burnt lime within the drawing eyes of the eastern arch. The kiln has clearly suffered some structural failure, but it appeared that this was not a recent occurrence as the cracks were shown on elevation drawings dating to 1976. [Au(abr)]

Whilst early prehistoric settlement and land-use on the site could be assumed, the well-preserved remains of a sub rectangular Iron Age or Romano-British enclosure, possibly associated with ancillary features, may have been the earliest direct evidence for settlement on or adjacent to the site. The area continued to be farmed in the medieval period, when it bordered a deer park, part of the boundary of which later lay within the site. Coal mining may also have been practiced on a small-scale in the medieval period or earlier but became the dominant economic activity there in the second half of the 18th century onward. [Au(abr)]

Johnson, P G Barnard Castle : Northern Archaeological Associates, Report: NAA08/04 2008, 41pp, colour pls, figs, tabs, refs

*Work undertaken by:* Northern Archaeological Associates

The assessment identified a total of 28 archaeological and historical sites within, and just beyond, a 1km radius of the proposed development area. Six of these were Listed Buildings, two of which lay immediately east of the development site. The development proposals would not have an impact on any of these, however. There was no evidence for activity on the site prior to the post-medieval period. The remains of the former West Lodge and Burn House were built in 1890 as part of later phases of development within the Prudhoe Hall Estate. The nature of the development necessitated the demolition of all buildings on the site with the exception of Burn House, and the nature of the site meant that it was unexpected for any archaeological remains to have survived. Davies, E Durham : University of Durham, Archaeological Services, Report: 1820 2008, 30pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Durham, Archaeological Services

Three historic or statutorily protected buildings were in the vicinity of the site. The structures were of 18th, 19th and 20th century date. There were no Scheduled Ancient Monuments in the vicinity. The area was occupied during the medieval period, and Cambois was mentioned in several historic texts. A chapel was said to have stood in the northern part of the site, near Cambois Farm. The area remained occupied throughout the modern period, despite a decrease in industrial activity and shipping. The area was further developed during this period, to include defensive military features and a power station. Archaeology relating to the prehistoric or Romano-British periods had the potential to survive in the undisturbed area of ground west of the foundry, and a programme of archaeological evaluation, comprising geophysical survey and trial trenching, was recommended in this area. ***The Old School, Church Lane, Bedlington. Archaeological Desk-based Assessment***

Scott, J & Strickland, J South Shields : Tyne & Wears Museum Archaeology Department, Report: 802 2008, 29pp, colour pls, figs, tabs, refs

*Work undertaken by:* Tyne & Wears Museum Archaeology Department

The assessment established that the site occupied an area of land held by St. Cuthbert's Church. Documentary sources suggested that the Bishop's Hall and a medieval leper hospital were located here. During the post-medieval period, the area was occupied by a series of terraced houses known as Church Row, which were demolished prior to 1898 when the Infants School [later the Church Hall] was built. It was possible that the area contained foundations for these buildings, and a small possibility for prehistoric remains. No further mitigation was recommended for the eastern half of the site, as this comprised a building that

was to be retained. Further archaeological work was strongly suggested for the western side, as this area was thought to have the potential to contain archaeological remains. [Au(adp)]

Ridings, C Lancaster : Oxford Archaeology North, Report: 2008-9/855 2008, 17pp, colour pls, figs, refs

*Work undertaken by:* Oxford Archaeology North

A proposed scheme of improvements to the reservoir may yet include the demolition of the fisherman's hut, research there concluded that the hut was of limited value only. Cartographic sources demonstrated that it was not of great antiquity and was only built during the late 19th century or early 20th century. The building appeared to be the housing for the valve shaft of the overflow system, and also probably functioned at some point as an office for maintenance staff. [Au(abr)]

Ridings, C Lancaster : Oxford Archaeology North, 2008, 87pp, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology North

In total, 139 sites of archaeological interest were identified within the study area, all had been previously recorded in either the Cheshire or Greater Manchester HER. One site, a motte and bailey fortification, was designated a Scheduled Monument, whilst 42 listed buildings were also identified within the study area, though these were not included within the gazetteer. The 139 identified sites included both potential Palaeolithic and Neolithic sites, and eight confirmed Bronze Age sites, comprising six ring ditches, a findspot and a cremation burial. In addition, there were five Roman sites, of which four were associated with the route of the Chester to Manchester Road, whilst the fifth was the findspot of an amphora handle. The medieval period was well represented with 13 sites, the most significant being the Scheduled Monument at Watch Hill; a motte and bailey fortification reputedly dating to the baronial rebellion against Henry II in 1173. The post-medieval period had 68 sites, which were predominantly former historic fields or cottages and farms, whilst the industrial period was more varied, featuring 35 sites, including boundaries, woodland management, and a Wesleyan Chapel with attached graveyard. Three modern sites were encountered, a Royal Observer Corps Monitoring Post, a Second World War US Army base which later became a German POW Camp and a water tower. A further five sites were not ascribed a period due to insufficient data. A walkover survey was undertaken in September 2008 to compliment the desk-based assessment, no additional sites were identified. If the pipeline remained within the confines of the proposed route, then thirty-four of the sites in the study area had the potential to be affected by the groundworks. If the pipeline followed the course of the main roads in the area, it was unlikely to have any significant effect on archaeology, as these would have already been disturbed by the road scheme itself. However, if the pipeline was laid in the fields adjacent to the road, then there was potential for damage to the identified sites or hitherto unknown sites. Therefore, it was recommended that a watching brief should be maintained during all ground disturbing activities. In addition, a historic field and former farmhouse would require evaluation. Peters, C Alston : North Pennines Archaeology Ltd., Report: CP/656/08 2008, 196pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

A desk-based assessment and walkover survey of land at The Cottage Hospital, Isel Road, Cockermouth, was carried out. The research showed that an early medieval settlement may have existed in the vicinity of the proposed development site, in the eastern part of Cockermouth, demonstrated by the medieval motte of Tute Hill. In addition, the motte's replacement, Cockermouth Castle, lay just to the west of the site. It was known that from at least 1259 a park was associated with the castle, and from at least the early 16th century, and probably earlier, the proposed development site was a part of this. Ditched boundaries associated with the park may have survived in the area as sub-surface archaeological features. This potential for medieval deposits surviving within the site was of particular relevance in terms of surviving medieval landscape features. It may be considered necessary for the site to undergo a form of archaeological mitigation prior to construction work on-site. This was likely to take the form of an archaeological evaluation. Peters, C.G. Nenthead : North Pennines Archaeology Ltd, Report: CP603/08 2008, A 30-page A4 page report

*Work undertaken by:* North Pennines Archaeology Ltd

"The desk-based assessment located a total of 7 sites from the SMR within 1 km to the development site. This highlighted the potential for prehistoric and medieval archaeology in the vicinity of the development site. A further potential for early medieval activity in the vicinity was highlighted by cartographic sources. Despite this, no traces of surviving archaeology were visible during the walkover survey. This does not rule out the possibility that sub-surface deposits could survive on-site, and as the area has never undergone archaeological investigation, this potential has yet to be tested. This is of particular relevance in terms of the potential for surviving medieval landscape features, as the Regional Research Framework for the North West has shown that, for the Pennine Fringe. **LAND AT SILVER STREET, CROSBY RAVENSWORTH, PENRITH*****Archaeological Desk-based Assessment of Land at Silver Street, Crosby Ravensworth, Penrith, Cumbria***

Strickland, J   Alston : North Pennines Archaeology Ltd., Report: CP/838/08 2008, 25pp, colour pls, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

An archaeological desk-based assessment was undertaken. The site was close to the centre of Crosby Ravensworth and to the south-east of the 12th century Church of St. Lawrence. The site of the 16th century Crosby Hall was also known to have existed in the area. Earthworks were also present in the village that were indicative of medieval and post-medieval occupation. There was the potential that archaeological remains dating to the medieval or post-medieval periods may have survived below ground. Documentary evidence revealed that Crosby Ravensworth had been an area of settlement since at least the medieval period. Silver Street, originally Post Office Lane prior to the mid-1800s, was a side street located off of the main thoroughfare in the village. On the south side of Silver Street lay the now derelict Cumbria Stone Works, opened in the middle of the last century by the Parkin family. During the site visit, it was noted that to the west of the site boundary, the course of the old mill race, noted on the Ordnance Survey map of 1859, was still visible. Prior to the stone works, the remainder of this area of land appeared to have been undeveloped. Given the close proximity of the site to the medieval St. Lawrence Church and being within the vicinity of the medieval village, it was possible that archaeological deposits of this period survived sub-surface within the proposed development area. There was also the possibility, however, that any early archaeological deposits that once existed within the site area may have since been truncated by post-medieval or modern developments within the area. Subsurface remains relating to post-medieval and modern activity were likely to survive within the proposed development area. These included the course of the mill race that was associated with the corn mill dating to at least the mid-19th century, appearing on the First Edition Ordnance Survey map, which ran along the western boundary of the site. Given the potential for the survival of medieval or post-medieval deposits within the proposed development area, it was possible that it would be recommended that a series of trial trenches be excavated in order to establish the nature and extent of potential archaeological deposits across the site. *Work undertaken by:* Oxford Archaeology North

Nine sites of archaeological interest were identified in a desk-based assessment, including a Neolithic axe, a Roman temporary camp, the medieval origins of Langwathby village, a Grade II Listed post-medieval farmhouse and barn, a post-medieval milestone, a post-medieval quarry and gravel pit and a modern mill. An area of undated cropmarks was also identified within the study area. A walkover survey found a further seven sites. These comprised an oxbow lake, undated but possibly fairly recent earthworks, post-medieval agrarian features, such as ridge and furrow and clearance cairns. [Au(abr)]

Virtually all of the present site proposed for redevelopment had, to a greater or lesser extent, been subjected to opencast quarrying for either limestone or gravel extraction over the course of the last two hundred years. With the exception of two small quarries and an associated limekiln near to the centre of the site, there were no sites of interest. [Au(abr)]

Strickland, J Alston : North Pennines Archaeology Ltd., Report: CP/835/08 2008, 31pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

An archaeological desk-based assessment was undertaken. This site lay in the centre of historic Penrith. Due to the location of the site, there was the potential for subsurface archaeological remains dating to the medieval or post-medieval periods to survive below ground. Subsurface remains relating to medieval and post-medieval activity were likely to survive within the development area. These were likely to consist of tenement houses, yards and shops. Given the potential for the survival of medieval or post-medieval deposits within the development area, it was recommended that a watching brief be undertaken during the ground works of the site to establish the survival of any archaeological deposits that survived subsurface and to investigate the depth of disturbance from previous structures. [Au(abr)]

 2008, 31pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology North

In total ten sites of archaeological interest were identified. Five new sites were identified during the documentary research. The sites included a possible platform, one Listed Building, an historic farmhouse, a railway embankment and an historic parish boundary. The walkover survey identified a further five sites, two of which were post-medieval drainage systems. The remaining three sites were likely to have related to the medieval fortified house that was identified in the documentary research at Nether Levens. These sites were a D-shaped earthwork of indeterminate function, the remains of ridge and furrow ploughing and a platform that had several earthworks on it. The walkover also confirmed the presence of the furness Railway embankment. [Au(abr)]

*Work undertaken by:* Pre-Construct Archaeology Ltd.

The assessment identified that a number of 19th century buildings of archaeological interest may have survived as archaeology on the site, beneath the current car parks and buildings, and a number of standing buildings of low heritage value. The impact of the proposed development on the nearest Conservation Areas and Listed Buildings, was considered to be low, and in some cases, beneficial. Impacts on the 19th century archaeological resource were considered to be high throughout the site. Recommended mitigation measures comprised

evaluation trial trenching, and a programme of building recording for those buildings and hard landscaping of heritage value which were to be demolished. [Au(abr)]

**PROPOSED QUARRY EXTENSION AT PILKINGTON QUARRY, HORWICH (NEAR BOLTON)**

***An Archaeological Desk-based Assessment of a Proposed Quarry Extension at Pilkington Quarry, Horwich [near Bolton], Greater Manchester***

Harthen, D, Cowell, R & Adams, M Liverpool : Liverpool Museum Field Archaeology Unit, 2008, 77pp, colour pls, figs, tabs, refs

*Work undertaken by:* Liverpool Museum Field Archaeology Unit

A desk-based assessment was undertaken of land at Pilkington Quarry, Horwich. There was no direct evidence for prehistoric settlement from within the site, though topographically it was similar to other areas which have produced evidence for Mesolithic activity. There was some evidence for Bronze Age activity in the form of a Bronze Age Round Cairn situated to the north of the present quarry. This site is a Scheduled Ancient Monument, but was not affected by the proposed extension. However, it did provide evidence of contemporary settlement in the wider area and potential land-use in the study area. There was little evidence for later prehistoric, Roman or medieval settlement within the proposed extension. The present landscape was largely a product of the early 19th century and 20th century quarrying. The construction of the drystone walls which crossed the area could be dated to 1819-1820. However, the farms and cottages in the area appeared to be slightly earlier, possibly late-18th century. There were ten Listed Buildings within the study area ranging in date from the 17th to the 19th century. [Au(adp)]

Arrowsmith, P Manchester : University of Manchester Archaeological Unit, 2008, 28pp, colour pls, figs, refs

*Work undertaken by:* University of Manchester Archaeological Unit

An archaeological assessment was carried out. The local place name Castle Hill suggested that this locality may have been the site of a late prehistoric to Romano-British settlement. However, the antiquity of this name was uncertain. Prior to enclosure in 1818 the study area formed part of the common land of Tonge Moor. In c. 1934 a cinema building, still standing, was erected on the western side of the study area. At about the same date housing was erected on the eastern side, but this had been demolished. Any prehistoric/Romano-British remains could be considered to be of regional significance. The former cinema building was only of moderate local significance. Any below-ground remains within the study area could be damaged or destroyed by groundworks for the proposed development. In view of this, it was recommended that prior to redevelopment the study area was evaluated. [Au(abr)]

***Aldi Foodstore, Railway Street, Ramsbottom. An Archaeological Desk-Based Assessment and Building Survey***

University of Manchester Archaeological Unit Manchester : University of Manchester Archaeological Unit, 2008, 49pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Manchester Archaeological Unit

During the mid-19th century, three cotton mills were constructed in the study area. The earliest of these mills was Meadow Mill, which was constructed between 1851 and 1854-5. Between 1856 and 1858 Crow Mill was constructed, followed by the construction of Orchard Mill between 1869 and 1871. All of the mills were extant into the latter part of the 20th century. At the time of survey only one mill building was extant and this formed the subject of the building survey. The survey, along with the desk-top sources, suggested that it probably functioned as a warehouse associated with Meadow Mill. During the assessment, no potential below ground remains were identified, which were considered to be of national or regional importance. However, the study area contained potential remains of local significance, the remains of power systems associated with the three 19th century cotton mills. The location of some of these remains might be found within the footprints of the two proposed commercial units. It was therefore recommended that prior to redevelopment evaluation was first undertaken within the footprint of these buildings. The remains of the power systems of the mills might also have been found within the proposed car park. Depending on the depth to which current ground levels would be reduced during the construction of the car park and during the insertion of associated services, and based on the results of evaluation and excavation, a watching brief may be required across this area. Fletcher, M Stretford : Matrix Archaeology, Report: 2008-04 2008, 32pp, figs, refs

*Work undertaken by:* Matrix Archaeology

Documentary research revealed that the study area was within the boundary of land granted to the monks of Monk Bretton priory during the late medieval period, and lay in very close proximity to the site of a manorial corn mill first mentioned in 1246. A bleach works was established at the site in the early 19th century, and was successively enlarged during the late-19th century, and again in the early 20th century. The walkover revealed structural remains of the bleach works buildings, as well as a tunnel related to a short-lived brickworks. Building recording and trial trenching were recommended prior to site redevelopment, as well as permanent historical signage being erected at the site entrance. [Au(abr)]

Arrowsmith, P Manchester : University of Manchester Archaeological Unit, 2008, 27pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Manchester Archaeological Unit

The assessment found the standing building at 51 Hilton Street was built between 1808 and 1819. The surrounding study area was also first developed during that period, with the earliest buildings being a pair of workers houses on Brewer Street and other adjoining structures of unknown function. Between 1831 and 1845 a machine manufactory building, 8 and 10 Brewer Street, was erected in the south-east of the study area. Adjoining this on the north and to the rear of 51 Hilton Street was an engine house and boiler house range, built between 1848 and 1888 and possibly between 1869 and 1874. The power system served a factory which operated on the first and second floors of 51 Hilton Street and 8 and 10 Brewer Street, and in the 1870s was used by a cloth cap manufacturer and in the 1890s by a hat block manufacturer. No potential below-ground of national importance were identified within the study area, however, it may have contained below-ground remains of local significance, comprising the remains of early 19th century workers houses, the 1831-45 machine manufactory and the later 19th century engine and boiler house. **SMITHFIELD NORTHERN QUARTER PHASE 5**

***Smithfield Northern Quarter Phase 5, Manchester: An Archaeological Desk-based Assessment***

Gregory, R & Arrowsmith, P Manchester : University of Manchester Archaeological Unit, 2008, 28pp, figs, tabs, refs

*Work undertaken by:* University of Manchester Archaeological Unit

A desk-based assessment was undertaken at the proposed Smithfield Northern Quarter phase 5 development. Evidence indicated that during the medieval and post-medieval period the study area lay within agricultural land, which was converted to allotments by the late-18th century. It was likely that deposits associated with land use of this type, such as relict ploughsoils and garden soils, contained artefacts of these periods which were incorporated into these soils during manuring. In the early 19th century the area became the site of Smithfield Market, with the study area being given over to market stalls, which were covered by a glass and wrought iron roof in the mid-19th century. None of the likely and potential remains within the study area were considered to be of national importance. However, the study area was likely to contain remains of local significance. It may also contain remains of regional significance, relict plough/garden soils containing medieval and/or post-medieval artefacts. It was recommended that prior to redevelopment the study area should be evaluated through trial trenching. [Au(abr)]

**CHANCELLOR PLACE, ARDWICK**

***Chancellor Lane, Ardwick, Manchester. An Archaeological Desk-Based Assessment***

Gregory, R Manchester : University of Manchester Archaeological Unit, 2008, 65pp, figs, tabs, refs

*Work undertaken by:* University of Manchester Archaeological Unit

Based upon favourable geological and topographical conditions, there was thought to be a possibility for evidence of prehistoric activity being contained to the west of the River Medlock. The earliest identified sites within the study area, dated to the post-medieval period and included houses/cottages. In the late-18th century, further dwellings were constructed. In the 19th century three mills were established, along with a brewery, a starch and gum works, a church and large areas of workers' housing. Further industrial expansion took place in the later 19th century. Of these sites, a mineral works was still extant. During the 20th century the late-18th and 19th century buildings were largely demolished and replaced by a series of industrial units and warehouses. The current redevelopment of the area would entail the demolition of the 19th century public houses and water works, and potential below ground remains would be damaged, or destroyed. There were no known sites within the study area which were considered to be of national importance. However, there were potentially below ground remains of regional and high local significance. These included any remains relating to prehistoric activity, remains relating to the power systems of the early to mid-19th century mills, the remains of post-medieval buildings and the remains of late-18th century and early 19th century workers' housing. It was recommended archaeological evaluations be carried out in potentially affected areas. Trial trenching was also recommended over the site of the Church of St. Silas in order to confirm the presence or absence of any burials at this site and enable the removal of any burials if found. It was also recommended that prior to demolition survey should be undertaken of buildings. [Au(adp)]

Laing O Rourke Manchester : Laing O Rourke, Report: MPT3A-EMO~OOERP-60 2009, 63pp, colour pls, figs, refs

*Work undertaken by:* Faber Maunsell

The route of the East Manchester Metrolink tram line passed through an area that had seen considerable development in the post-medieval and industrial period. Out of a total of 181 recorded sites within the study area, 154 were dated to the post-medieval period. The area was dominated by the canals and transport links that heralded the building of industrial mills and associated buildings such as workers housing. The main road network predated the canals and railways within the region. Ashton New Road and Great Ancoats Street were depicted on late-18th century maps whilst Store Street and Cemetery Road followed the course of the old Roman road running between Manchester and Castleshaw. Many of the structures that were Listed comprised canal locks and associated structures and industrial buildings. Clayton Hall, the only Scheduled Monument within the study area, and Phitips Park, a Grade II registered park and garden, also date to the post-medieval period. Impacts were predicted to be limited to the areas identified as requiring further archaeological monitoring or field work. Building recording was required for those buildings proposed for demolition. The overall impact of the project was considered to have been moderately adverse. [Au(abr)]

### **CROOK HILL WIND FARM**

#### ***Crook Hill Wind Farm, Environmental Statement. Archaeological Assessment***

AOC Archaeology Group Leeds : AOC Archaeology Group, 2008, 102pp, figs, tabs, refs

*Work undertaken by:* AOC Archaeology Group

Archaeological assessment was carried out on a proposed wind farm site at Crook Hill. A total of 105 known sites of potential archaeological sensitivity were recorded within the proposed development area. Four of these sites, a post-medieval structure, two 19th century boundary stones and a length of stone walling, of low significance were likely to be directly affected. It was advised that the visible remains of the boundary stones and wall were recorded to ensure their preservation by record. It was further advised that boundary stones located in close proximity to the proposed access track and Turbine 4 were fenced off to ensure that site work avoided them. Apart from seventy three late post-medieval Listed Buildings within 3 km of the proposed wind farm, the majority of cultural heritage remains in the immediate vicinity of the site derived from post-medieval coal mining, quarrying and farming. Flint finds and a Bronze Age barrow provided evidence for prehistoric activity from the Mesolithic onwards. There was a low probability that unknown archaeological remains of a similar nature or date might be concealed beneath the current ground at Crook Hill. However, It was advised that a watching brief may be required on the site during work. Any disturbance of the post-medieval remains were likely to require archaeological intervention. The significance of visual effects on the Conservation Areas, Listed Park and Garden and Listed Buildings in the vicinity ranged between none, negligible, low and moderate, particularly as topography and urban structures combine to limited views of the wind farm from these sites. [Au(abr)]

### **SPOTLAND BRIDGE NEW MILL, ROCHDALE**

#### ***Historic Building Assessment Spotland Bridge New Mill, Rochdale***

CgMs Birmingham : CgMs, Report: GB110373 2008, 76pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* CgMs

The site comprised two substantial brick buildings located on the junction of Bridgefold Road. The mill originally had two entrances off Mellor Road to the north and south of the present East Mill. The northern entrance survived as did the gate and the original cobbled lane with its distinctive revetment wall created with the massive stone slabs. The two buildings, referred to as the West Mill and East Mill were positioned on a near north/south alignment. The western building was the original 1833 mill, whilst the eastern building was described as the 'early 20th century extension'. The latter was linked to the earlier mill by a small enclosed walkway at first floor level spanning across the gap between the two buildings. The development of the mills is shown on the O.S map series from the earliest c.1851 edition up to the 1989 edition .

The yard between the two buildings was now enclosed and covered to provide additional space as a joiners workshop. The infill was of no architectural or historic merit. [Au(abr)]

### **CHARLESTOWN DEVELOPMENT AREA, SALFORD**

***Charlestown Development Area, Salford, Desk-Based Assessment [Extract from Environmental Impact Assessment]***

University of Manchester Archaeological Unit Manchester : University of Manchester Archaeological Unit, 2008, 27pp, figs, tabs, refs  
*Work undertaken by:* WSP Environmental Ltd.

No archaeological sites of prehistoric date were known within or in the vicinity of the site area, however the location of the site within the floodplain of the River Irwell may have been prohibitive for settlement. No Roman activity was known within the vicinity of the development area. The line of the Manchester to Rimester Roman Road lay c. 1km to the north-east of the site area, which was the closest known site of this date. No known post-Roman/ Anglo-Saxon activity was known in the vicinity of the site, although place name evidence suggested that settlement may have been present in the general area. Later development of the site would have impacted upon any earlier remains that may have been present, the potential for unknown archaeological remains of prehistoric, Roman or Anglo-Saxon date to survive was seen as negligible. A water mill was recorded at Pendleton in the early 13th century, which was possibly located on the same site as the Pendleton Corn Mill, recorded in the 18th century, which lay within the site boundary. Remains of the medieval mill may survive within the site and could be exposed, damaged or destroyed by the development proposals. Pendleton Old Hall was a 16th century building that may have had earlier origins. The building was demolished after 1918 and the area had not been redeveloped. There was a good potential for buried remains of the building to survive within the site boundary that would be impacted upon by the development. The site of the 18th century Pendleton Com Mill lay within the north-eastern part of the site area. Buried archaeological remains of the different phases of development of the mill were likely to be present within the site area, which was considered to be of archaeological importance. Other 18th century industrial sites of importance in the development area included Pendleton Colliery, which was unlikely to be significantly affected and the former site of Britannia Mills, which would be affected. Three Listed Buildings were present within the vicinity of the site which were unlikely to be adversely affected, although potential negative impacts could emerge during the construction phases. The development proposals aimed to enhance the setting of the Grade II St. George Church tower which lay to the south-east of the site. The two other Listed Buildings lay to the east and were screened from the proposed development by terraced housing (which would not be affected). Initial archaeological evaluation was required over the identified sites of archaeological importance. The site of Pendleton Colliery was unlikely to be affected by the development, although an archaeological watching brief was recommended. [Au(abr)]

### **THE EXCHANGE, GREENGATE, SALFORD**

***The Exchange, Greengate, Salford. Greater Manchester. Archaeological Desk-based Assessment***

Middleton, P Manchester : Archaeo-Environment Ltd, 2008, 94pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeo-Environment Ltd

The Exchange lay on the southern edge of a triangular area which formed the heart of Salford's historic core. A total of 47 cultural heritage sites were identified within the vicinity of the proposed development, of which 27 lay within the immediate boundary of the site. The construction of the railway station in the late 19th century may have potentially disturbed and eradicated much of the earlier archaeology in the area. Sites within the project area fell into five main brackets each associated with a particular aspect of the city's growth. These comprised the town's foundation, industrial activity, workers' housing, inns and pubs and the railway. Eleven medieval, or immediately post-medieval sites, were identified, including Greengate and Chapel Street themselves, which formed part of the original layout of the medieval town. Four industrial sites were identified and included the Barnes and Hardman Brewery (18th century), Greengate Cotton Mill and an associated dye works (19th century). A fourth site, an iron foundry (19th century) and later tool works. Workers' housing associated with these industries, and others in the area, were identified across the area from the 18th to 19th century. Of interest was an early example of a speculative housing development, The Hardy Buildings. The study also identified twelve inns and pubs within the project area. At platform level much of the railway station was demolished in the 1980s although a substantial network of railway arches were still preserved at street level. The archaeology of the Exchange, was assessed and was believed to be of regional significance. The construction of the Exchange Station, and various other phases of earlier development, may mean that archaeological preservation will vary considerably across the site, the best preserved areas being along Chapel Street. At the time of the report, the proposed Exchange development was only at the outline stage and final decisions regarding construction methods were dependant on the results of further surveys. Based on the available information the greatest impact upon any potential below ground archaeology was believed to be from piling and any additional supports and foundations for the proposed buildings. This would need to be assessed in more detail when further plans were available. [Au(abr)]

#### ***Hollands Mill, Shaw Heath, Stockport: Archaeological Desk-Based Assessment***

Owen, P Manchester : Gifford, Report: 14717.R01 2008, 74pp, colour pls. figs., Tabs, refs

*Work undertaken by:* Gifford

The area of the main mill block consisted of a relatively level area of compacted demolition debris. Wall footings were visible and indicated the survival of at least part of the subsurface remains of the mill. The north-western boundary of the site was formed by the roadway that separated the assessment site from the site of the former St. Thomas' Hospital. Two large stone blocks placed against the hospital boundary wall appeared to be remnants of the mills power generation or transmission system, possibly engine beds or drive shaft bases. A small two-storey brick structure located adjacent to the roadway appeared to be that shown on the 1875 Ordnance Survey map, albeit in modified form with obvious modern rebuilding and extension. The interior of this building was inspected, but no early fixtures or fittings of any kind survived. The mill extension that first appeared on the 1898 Ordnance Survey map survived as 'The Carpet Centre' and a number of former openings in the north-western wall demonstrated that there was an internal connection between the main mill and this extension, which may have functioned as a warehouse. Adjacent to 'The Carpet Centre' was the building that replaced numbers 61 and 63 Shaw Heath sometime between 1960 and 1992, now known as 'Nostalgia'. The architectural style of the frontage suggested that the building dated

to the 1960s. The rear of this and 'The Carpet Centre' were visible from the Junction Road boundary of the assessment site. A builder's yard formed the north-eastern boundary of the assessment site and occupied the area of the former mill reservoir. The archaeological potential of the site was summarised as being low to moderate. Areas of particular potential included evidence of the mill engine and boiler arrangements, details of which were unknown. As no details of the proposed development were available at the time of assessment, it was not possible to make detailed recommendations for mitigation. However, it was likely that an archaeological watching brief would be required on development groundwork within the area of the engine and boiler houses. [Au(abr)]

*Work undertaken by:* Faber Maunsell

A total of thirteen sites were identified within the study area. Of these, two were located within the site boundary, a saw mill and print works. These had been demolished for subsequent development and the impact upon them was considered to be neutral. There was a potential that previously unrecorded archaeological features may be found within the site boundary. However, this potential was considered to be low due to the paucity of known archaeological heritage within the area. The overall significance of impact of the proposed development was considered to be neutral. [Au(abr)]

Taylor, K Lancaster : Oxford Archaeology North, Report: 2009-9/848 2008, 55pp, colour pls, figs, refs

*Work undertaken by:* Oxford Archaeology North

An assessment encountered evidence of the site being used as a colliery in 1848 with later tramways on the site. In 1930, during levelling and draining of Cherryfold playing fields, the existence of the pit of Cherry Fold was uncovered. The shaft was said to be in an "excellent state of preservation" and was sealed up again. It was 75 feet deep and filled to within 15 feet of the top with water and was constructed from coarse rubble. The shaft was not filled as it was not on building land. It was covered with girders and supporting wrought iron plates, which were installed 55 years previously when a local farmer's cow fell into the shaft. This was known to be situated beneath the tennis courts for the school. [Au(abr)]

### **PEEL PARK, ACCRINGTON**

#### ***Peel Park, Accrington, Historic Environment Desk- based Assessment***

Newman, C Lancashire : Egerton Lea Consultancy Ltd., Report: 0118 2008, 20pp

*Work undertaken by:* Egerton Lea Consultancy Ltd.

Between January and February a desk based study of Peel Park was undertaken to inform a proposal for the restoration of the park. The land within the park and wider study area was part of the medieval vaccary of Riley, within Accrington chase. From the end of the medieval period, the land became part of the farm of Hillock Bank. Following the purchase of the Hillock Farm estate by the Peel family in the late-18th century, and the building of Accrington House, some of the farmland was taken into a landscape park. Around the same time, Plantation Mill, a fulling mill and later calico print works, was established on Pleck Brook on the southern edge of the study area. Plantation House and Owl Hall were built to house the owners of the mill, and nearby was Arden Hall. Only Owl Hall and ancillary buildings to Arden Hall still survived, just outside the study area. To the north of Peel Park, quarrying began in the 19th century, first with sandstone quarries supplying building stone, and later a large clay pit which supplied the Plastic Brick and Terracotta Works in Huncoat. The land was acquired by Accrington Corporation in the early part of the 20th century, and in 1909 Peel Park was opened, marked by the unveiling of a memorial on top of the Coppice. Although football pitches were established on the plateau at the top of the hill, the park remained largely

undeveloped. A shelter was added in 1911, but it was not until 1939 that the Bowling Green and some landscaping were added to the facilities on the lower part of the park. Two heavy guns presented to the park in 1910 were later melted down, and only the wooden mounting of one gun survives in the park. The park has been associated with the Accrington Pals battalion. Narrow, interrupted "H" trenches which can still be seen across the plateau, were almost certainly excavated as anti-glider trenches in the Second World War. [Au(abr)]

***Edge Hill, Liverpool. An Archaeological Desk-based Assessment***

Birmingham Archaeology Edgbaston : Birmingham Archaeology, 2008, 38pp, colour pls, figs, tabs, refs

*Work undertaken by:* Birmingham Archaeology

A desk-based assessment was carried out of part of Edge Hill, Liverpool in advance of the proposed clearance and regeneration of the area. A walkover of the study area was undertaken in order to assess its current character, the historical and architectural significance of existing buildings, and their settings. The study area was a predominantly residential area characterised by terraces of two storey Victorian houses, many of which were now vacant, derelict, or in a poor state of repair. The assessment revealed an area which was largely rural in character until the mid/late-19th century. Prior to this the general area was the home to the gentry and merchant princes of Liverpool, two houses of whom were located in the study area. The extension of the city and suburbs into the area from the mid-19th-century brought with it rows of brick terraced housing which characterised the area in the present day. This assessment provided a phased history and characterisation of the buildings in the study area, and provided recommendations for future archaeological mitigation. [Au(abr)]

**CROSBY WELL*****Crosby Well. Archaeological Desk-based Assessment***Hamel, A, Russell, J & Baggaley, P Salisbury : Wessex Archaeology, Report: 70310.02  
2008, 36pp, colour pls, figs, tabs, refs*Work undertaken by:* Wessex Archaeology

A desk-based assessment of the potential impact of the proposed Crosby Well upon archaeological remains was prepared. The exploratory well was to be located in Liverpool Bay, c.16km west of Southport, off the Lancashire coast. In order to provide archaeological context for the desk-based assessment a Study Area, consisting of a buffer zone with a two kilometre radius around the well site, was created. The resulting data was then filtered to focus on sites that lay within the Study Area. Any remaining data was used, along with the information from secondary sources, to inform a wider assessment of the archaeological potential of the area. This report set out the methodology employed in carrying out the study and an account of the policy and legal framework pertaining to archaeological sites and wrecks in the United Kingdom. The historic environment was discussed, and a baseline of the archaeological evidence of the area from the Palaeolithic to the modern period was included. In summary, the known and potential archaeology within the Study Area around Crosby Well consisted of one wreck and four obstructions charted by the United Kingdom Hydrographic Office, five obstructions recorded in the National Monuments Record, six geophysical anomalies identified during and archaeological assessment of sidescan data, documented losses [for which there were no known seabed remains] that may have lain within the Study Area, unknown and undocumented wrecks from various periods, possibly dating back to the Mesolithic, stray finds of ship-borne debris from various periods, and the potential for the presence of submerged prehistoric finds and prehistoric land surfaces. The archaeological potential of the Study Area was considered to be generally low. There was potential for prehistoric exploitation of landscapes that later became submerged. In addition, the area was part of an important trade route along the coast that had been in use from at least the Iron Age to the present, therefore the discovery of further wrecks was possible. Potential impacts of the development were discussed and measures for mitigation of these impacts were suggested. [Au(abr)]

**SUTTON MILL, COPPULL LANE, WIGAN*****Sutton Mill, Coppull Lane, Wigan. Documentary Research***

Blythe, K & Miller, I Manchester : University of Manchester Archaeological Unit, Report: L10067 2008, 30pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology North

Documentary research was carried out of the site of Sutton Mill. The study was required to inform design proposals for improvements to the River Douglas, which flows immediately to the east of the site. The origins of Sutton Mill were unclear, and whilst the possibility that the site was occupied by a fulling mill during the medieval period cannot be discounted, firm evidence was lacking. Sutton Mill was first depicted on a plan of c. 1712, and on William Yates' Survey of the County Palatine of Lancaster, which was published in 1786. Later, more detailed mapping, shows it as a rectangular structure with two additional out buildings, and an associated weir across the River Douglas. References to a corn mill on Coppull Lane in 19th century trade directories occur from 1828 onwards. In trade directories from 1881 and 1887, and an almanac from 1889, Thomas Charlson was listed as the miller at Sunon Mill. Charlson was the leading corn dealer in Wigan at this time and, by 1889, owned at least three mills in the area. However, although his business continued into the early 1900s, Sutton Mill is not mentioned in trade directories after 1889. By 1909, the mill had been converted for use as a farm. The farm was occupied by the Leather family in the late-1920s, when it formed part of the Bottling Wood Unhealthy Area, outlined for clearance by the Insanitary Houses and Conversions Committee of Wigan Borough Council. In total, 64 properties were demolished as part of this clearance scheme. Most of the old houses in the designated Unhealthy Area, including Sutton Mill, were demolished in 1927-8, although the last property, the Woodman Inn, remained until 1932. There was no surviving above ground remains of the mill, although it was likely that elements of the water-management system, including the waterwheel pit, may survive as buried structures. **THE RECTORY, WIGAN*****The Rectory, Wigan, Lancashire. An Archaeological Desk-based Assessment***

Walter, E Wigan : Wigan Archaeological Society, 2008, 12pp, figs, tabs

*Work undertaken by:* Wigan Archaeological Society

Despite recorded archaeological evidence for prehistoric activity within Wigan and its environs there was no evidence from this period at the Rectory site. Important evidence of Roman occupation had been discovered in central Wigan, the most significant as recently as 2005, although evidence from the site was limited to one bronze coin. The potential for the discovery of deposits from these periods was considered low. Little was known of Wigan during the early medieval period. No material remains were known to exist and evidence of occupation was limited only to place-name evidence. Similarly, the potential for the discovery of remains and deposits at the site was low. There was evidence of occupation in central Wigan during the later medieval period although no archaeological excavation had been undertaken at the site or adjacent areas. Maps dating from the early 19th century which showed the extent of the glebe land, various footprints made by a pre-1875 building and the present building, the outbuildings and the several locations of water. Written records provided a seemingly accurate description, with measurements, of the various buildings extant in 1814. Much of the original glebe land had been lost to encroaching development but the potential that such remains existed in the remaining grounds was high since the majority of the site,

apart from minor landscaping, had remained undeveloped. Two resistivity surveys had been completed of the lawn which seemed to indicate that archaeology was present. [Au(abr)]

**WIGAN HALL AND LODGE**

***Wigan Hall and Lodge. An Archaeological Desk-based Assessment***

Arrowsmith, P Manchester : University of Manchester Archaeological Unit, 2008, 51pp, pls, colour pls, figs, refs

*Work undertaken by:* University of Manchester Archaeological Unit

An assessment of Wigan Hall, the Lodge and attached boundary wall and the stepped terraces to the west of the Hall noted they were all Grade II Listed Buildings. Since the medieval period the study area contained the site of Wigan's manorial hall (possibly moated) which was also its rectory. By the early 17th century the site included a gatehouse and outbuildings. The Hall was improved and enlarged in the early 17th century and a new wing was added in 1695. Further additions were made in the 18th century and again in the mid-19th century. In 1873-5 the old Hall was mostly demolished and replaced. A Lodge was erected at the new entrance to the grounds on New Market Street. The former office wing was demolished in c.1956, when a new wing was built at the north end of the Hall. With regard to non-Listed remains (below-ground remains, earthworks, buildings), on the available evidence the study area contained known and potential remains of regional and local significance, which would require preservation by record should these be threatened by development. The remains of regional significance included those of the Roman and medieval periods. Post-medieval remains might also be of regional significance, dependent upon their form, extent and condition. Remains relating to 19th century alterations at the site were considered to be of more local significance. [Au(abr)]

**WIGAN JOINT SERVICES CENTRE**

***Wigan Joint Services Centre Environmental Statement-Volume II: Chapter 8: Built Heritage and Archaeology***

Scott Wilson Leeds : Scott Wilson, 2008, 38pp, figs

*Work undertaken by:* Scott Wilson

During the construction phase of the proposed development there would be direct impacts to archaeological deposits at the northern end of the development area. These included potential Roman settlement remains, medieval back yard deposits and burgage plot boundaries and early 19th century workers housing and yard services. These were identified in previous evaluation trenches as well as excavation areas undertaken during the 1980s. It was anticipated that archaeological remains would be preserved in situ beneath a new landscaped piazza, whilst those deposits situated close to the Municipal Building would be impacted by the construction of the new development. As much of this area had already been extensively truncated by previous archaeological excavations, mine stabilisation works, 19th and 20th century buildings, modern utilities and an electricity substation, the archaeology was fragmentary between major intrusions and therefore considered of low importance. The impact of the new development upon the remaining archaeological deposits in this area was assessed as Major without mitigation. After mitigation, no further residual impacts were

anticipated during the operation of the development scheme. Slight/ moderate adverse and neutral to slight adverse effects were assessed on seven archaeology receptors of low value within the development area. The scheme would not have an impact upon built heritage receptors after mitigation, the majority would experience a slight adverse effect arising from the development, principally reflecting likely changes to the streetscape setting of Library Street and Mill gate. Changes to the streetscape setting would have an overall slight adverse effect upon the Wigan Town Centre Conservation Plan, but the conservation area was already characterised by a number of modern buildings interspersed with older structures. Although the Wigan Town Centre Conservation Area included a number of buildings of local historic interest, only one such building was identified as experiencing a direct impact, from the scheme. This was 17-19 The Mend, which was to be demolished as part of the development. A further building would experience a neutral to slight adverse effect arising from the development. The Municipal Building, Hewlett Street, would experience a moderate to large adverse effect as much of the building would be demolished and a new structure erected behind the retained principal facades. ***Stockley Hill Surface Mine. Archaeological Assessment***

Kendall, G      Headingly : WYG Archaeology and Heritage, 2008, 83pp, figs, tabs, refs  
*Work undertaken by:* WYG Archaeology and Heritage

A desk- based assessment was undertaken for the proposed development of open cast mining between the parishes of Standish and Shevington, Lancashire: Historically, mining had disturbed, disrupted and destroyed much of any archaeology that lay in areas 1-8. Secondly Standish Hall had been removed from the site at Standish Hall Farm, and this removal suggested little remained for practical archaeological study. However, Areas A to E did represent large land takes that although expanded upon historic areas of mining, would impact potential archaeology within the areas earmarked for coal extraction despite the negligible possibility that substantive archaeology would be found. It was also found that the higher ground to the east of the site was potentially archaeologically sensitive and may have contained deposits relating to the prehistoric period or later. This area was, however, not immediately affected by development .It was recommended that zones that were suitable for survey within Areas A to E were subject to geophysical assessment in order to ascertain that no potential and hitherto unknown archaeology would be impacted by additional mining activity, such a survey would exclude areas of historic mining. It was also recommended that a community led project be developed, encouraging local schools to participate in the understanding and research of Standish Hall. Also, recommendation that any building of historical note that would be destroyed or removed was subject to an acceptable level of building survey. A final recommendation was that a photographic record was made of the farms in their present setting. [Au(abr)]

Fletcher, M      Manchester : Matrix Archaeology, Report: 2008-05 2008, 30pp, figs, refs

*Work undertaken by:* Matrix Archaeology

Documentary and cartographic research revealed that there appeared to be three main phases of development at the site. The standing remains of Storeton Hall, comprising a stone built solar block and part of the great hall, were probably erected in c.1370. The house appeared to have been abandoned as a residence in the early Tudor period. Probably in the 17th century, the farmhouse was erected and a farm building attached to the earlier medieval house. During the 19th and 20th centuries a number of other farm buildings were erected at the site, including a large brick-built barn. [Au(abr)]

Healey, C      Lancaster : Oxford Archaeology North, 2008, 55pp, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology North

In total, 102 sites identified within the Hazard Area or easement of the pipeline route would be directly impacted upon by the proposed pipeline. These sites dated from the prehistoric to the modern period, and comprised find spots, a single burial site, agricultural systems, settlements, industrial sites and complexes, and infrastructure sites. The study area encompassed parts of the Greater Manchester area, and also the Lancashire coalfields, and industrial coal-mining complexes and related sites were therefore prevalent. The sites were assessed individually based on the available evidence, and assessments were made of the impact of the pipeline. Proposals for mitigation of any impact were then considered, and were presented as recommendations based on current legislative guidelines. [Au(abr)]

Fletcher, M      Manchester : Matrix Archaeology, Report: 2008-08 2008, 37pp, pls, figs, refs

*Work undertaken by:* Matrix Archaeology

Documentary evidence suggested that a sub-manorial house was probably established at Barrow Old Hall sometime during the 14th century. By the 16th century, the house was occupied by members of the Bold family of nearby Bold Hall, apparently as a dower house. By the 18th century, the house was occupied by tenants and in 1860 sold off as part of the greater estate sale. The hall was demolished in 1924, leaving the moated site visible as an earthwork, which was later a Scheduled Monument. Since 1981, a number of archaeological investigations have occurred with and around the moated site. The evidence from the moated platform, although clearly archaeological, was considered to be of limited value in informing future management decisions. It was recommended that trial pits should be excavated. [Au(abr)]

Featherby, R      London : Museum of London Archaeology Service, 2008, 50pp, colour pls, figs, tabs, refs

*Work undertaken by:* Museum of London Archaeology Service

A desk-based assessment was carried out of a proposed cable route from Telscombe to Woodingdean. The development proposal included the construction of five new substations. The proposed route passed through two Archaeologically Sensitive Areas. A possible Iron Age settlement site and field systems, the medieval settlement of Telscombe and Bronze Age to Roman field systems. The assessment found that the proposed cable route had a high potential for the discovery of later prehistoric and Roman remains along sections of the route. The entire route had a low potential for the discovery of medieval and post-medieval remains. The area was used as agricultural land throughout both these periods with little development until the post-war period. The removal of topsoil within the working width and the subsequent movement of vehicles could partially or completely remove any archaeological remains present. It was recommended that a watching brief should be undertaken, for the whole of the proposed route, which passed through sites of prehistoric and Roman date and fields systems of prehistoric to medieval date, other than 842m of the proposed route which lay within Saltdean, which should be subject to On-call Observation and Recording. [Au(abr)]

***Desk-Based Assessment. Manor Hospital, Aylesbury, Buckinghamshire***

Hunn, J Milton Keynes : Archaeological Services & Consultancy Ltd., 2008, 42pp, pls, colour pls, figs, tabs, refs

*Work undertaken by: Archaeological Services & Consultancy Ltd.*

The assessment revealed that a Roman brooch had been found on the site and that a number of artefacts had been recorded in the surrounding area. A post mill was present in the north part of the site during the 18th and early 19th centuries, but the site probably largely comprised open ground until the construction of the manor house in the late-19th century. The development of the existing hospital during the 20th century probably destroyed or severely truncated any archaeological remains in the central part of the site, but remains may have survived, in less disturbed areas, on the periphery. Overall the site was considered to offer low to moderate archaeological potential. [Au(abr)]

Conway, M Salisbury : WA Heritage, Report: 69150.04 2008, 17pp, colour pls, figs, tabs, refs

*Work undertaken by:* WA Heritage

The Manor House was located within Stoke Park, which was designated a Grade II Registered Park and a Conservation Area. The house itself was Grade I Listed, and as such was considered to be of national importance. The house was reduced to its assessed extent around 1800 when it was abandoned as the main house within the park in favour of the newly constructed Stoke Park House. A house was known to have existed at or near the site since the 14th century. The potential of survival of remains from the medieval and post-medieval periods was thought to be moderate to high, with a perceived, although lower, potential for further Bronze Age features in the area, given by the presence of a round barrow of this period in the vicinity. Despite the study of available sources, the precise layout of the 16th century manor house remained unclear, and further work was recommended to establish this. [Au(adp)]

Featherby, R London : Museum of London Archaeology Service, 2008, 38pp, colour pls, figs, tabs, refs

*Work undertaken by:* Museum of London Archaeology Service

An assessment of a proposed cable route at Bullock Down Farm was undertaken. The western edge of the proposed route and the proposed western substation lay adjacent to the Scheduled Ancient Monument of Bullock Down, which encompassed an area of visible field systems of prehistoric and Roman date. A section at the western end of the route lay within an Archaeological Sensitive Area, covering the area of Bullock Down, a landscape of surviving prehistoric, Roman and medieval habitation sites and field systems. The assessment found that the proposed route had a high potential for the discovery of prehistoric and Roman remains. The entire route had a low potential for the discovery of medieval and post-medieval remains, as the area was used as agricultural land throughout both these periods. The excavation of a trench for the cable, and a square raft for concrete pad foundations for the proposed substations could partially or completely remove archaeological remains. It was recommended a watching brief should be undertaken. [Au(abr)]

### **ALL SAINTS CHURCH, ALL SAINTS STREET, HASTINGS**

***An Archaeological Desk-based Assessment for All Saints Church, All Saints Street, Hastings, East Sussex***

Dunkin, D & Greatorex, C Polegate : C.G. Archaeology, Report: 08/03 2008, 44pp, colour pls, figs, tabs, refs

*Work undertaken by:* C.G. Archaeology

A desk-based assessment concluded that there was only a low potential for prehistoric and Romano-British remains being exposed by any groundwork within All Saints Church cemetery. However, it was noted that Middle Bronze Age, Late Iron Age and Romano-British deposits were uncovered unexpectedly during building work at St. Thomas-A-Becket Church in Pagham, the possibility of similar types of discoveries being made at All Saints Church could not be discounted. The proposed toilet and kitchen facilities at the church were to be constructed at or on the current floor level. However, it was possible that the limited opening up of the floor for drainage connection in the corner of the aisle would reveal archaeological features related to a postulated earlier Saxon and/ or Norman church at the site. More likely though, was the discovery of previously unrecorded structural features, funerary monuments, human remains, other cut features, layers and artefacts associated with the 15th century building. It was worthy of note that two 15th century windows located within the north aisle would not be impacted upon directly by the intended redevelopment. Evidence suggested three to ten 19th century interments commemorated by wall plaques, could lie within the footprint of the proposed internal reordering. The precise location, depth and character of these burials had not been ascertained. It was possible that they were associated with significant in-situ funerary structures such as vaults/tombs. However, given the limited impact of the redevelopment upon the aisle floor level, the potential of the internal works to uncover structural features, funerary monuments, human remains, other cut features, layers and artefacts relating to the post-medieval history of the church was moderate. It was not known if the commemorative plaques located on the north aisle wall would remain in their current positions if the redevelopment scheme was to go ahead. The pews proposed for removal were likely of 19th century origin and of no obvious significant architectural or historic value. The extent of trench excavation within the churchyard was yet to be determined. The route of the cutting would avoid all visible/documented headstones and other funerary monuments. Nevertheless, these groundworks had the potential to reveal buried funerary monuments, unmarked articulated and disarticulated human remains, other cut features, deposits and artefacts spanning the Anglo-Saxon to post-medieval periods. **THE STADE, HASTINGS*****A Desk-based Assessment on The Stade, Hastings, East Sussex***

Butler, C Polegate : Chris Butler Archaeological Services, 2008, 52pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Chris Butler Archaeological Services

A desk-based assessment was carried out the Stade, Hastings. The proposed development of the Stade and Jerwood Gallery was located on the Pink Stade, an area of former beach, south of Hastings Old Town and outside the original town wall. Traditionally in medieval and post-medieval times, it had been the centre of the Hastings fishing industry, and also the location of ship building and other associated industries. The assessment established that due to the storm damage during the later 19th century it was unlikely that any earlier archaeology would have survived on the Stade, apart from remains that may have been buried below the gravel shingle beach. Remains of earlier harbours were previously revealed nearby therefore it was likely that any deep excavation would disturb buried archaeological features. It was very likely that remains of late-19th and early 20th century date would be preserved below the existing tarmac and paved surfaces on the Stade, whilst other remains could be disturbed during work on the associated road system. **COLLEGE OF THE HOLY CHILD JESUS*****College of the Holy Child Jesus. Archaeological and Historic Building Desktop Study, February 2008: Volume 1: Draft Text***

ACTA Robertsbridge : ACTA, 2008, 54pp, colour pls, refs

*Work undertaken by:* ACTA

The significance of the principal buildings on the site, constructed between 1834 and early 1870s and comprising the convent, chapel, gatehouse, gateway and Training College, had been recognised by the recent revision of their Listing. They had architectural merit and group value and were associated with significant figures in the history of the Catholic Revival in England. They were associated with a terraced garden and boundary wall which added to the group value. Conservation of these buildings would be a significant benefit of the development. The buildings and additions dating from after c. 1870 were of very little architectural merit and detracted from the earlier ones. There was the potential for redevelopment of these areas to have a neutral or beneficial impact on the listed buildings. No direct evidence of pre-19th century features had been found. However, there was moderate potential for the Palaeolithic and late medieval periods. Any deposits of these or any other pre-19th-century phases were likely to have been disturbed by cultivation before the 1830s and the extensive terracing that had taken place since. It was recommended that the extent of the disturbance caused by the terracing be assessed and the need for any further archaeological investigation could then be discussed with the planning authority. [Au(abr)]

**BISHOPSTONE TO NORTON*****Proposed EDF Cable Route, Bishopstone to Norton, East Sussex. Archaeological Desk-based Assessment***

O'Gorman, L London : Museum of London Archaeology Service, 2008, 41pp, figs, tabs, refs

*Work undertaken by:* Museum of London Archaeology Service

A desk-based assessment was undertaken in advance of proposed development at Bishopstone and Norton. The main archaeological potential for the proposed cable route was for the discovery of remains dating to the early and later medieval periods. Previous investigations at Bishopstone had shown there was an extensive Saxon settlement here which continued into the later medieval period. There was also potential for field systems dated to these periods and evidence of later medieval settlement at Norton. The proposed route had a moderate potential for prehistoric and Roman remains. An excavation at Bishopstone had revealed evidence of Neolithic activity and Bronze Age barrows had been identified in the vicinity. Evidence of Bronze Age, Iron Age and possible Roman settlement had been recorded 400m to the west of the proposed area, whilst remnants of possible Iron Age, Roman [or later] field systems were identified c 50m to the north and might once have extended as far as the route. There was a low potential for the discovery of remains dating to the post-medieval period other than agricultural features. In light of the potential for the discovery of archaeological remains and the possible important nature of such remains, it was recommended that the excavation of the cable trench was subject to monitoring. [Au(abr)]

#### ***Archaeological Desk-based Assessment of Land at Down Road, Bexhill***

Richardson, L London : L-P: Archaeology, Report: LP0660L-DBA-v1.2 2008, 22pp, figs, tabs, refs

*Work undertaken by:* L-P: Archaeology

The site did not contain any Scheduled Monuments or Listed Buildings, nor did it fall within a council designated Conservation Area. The immediate vicinity of the site did not see extensive activity during the prehistoric or Roman periods. During the early medieval period a manorial complex was established in the hamlet of Bexhill, and a church was constructed by the early 12th century. Settlement remained small and scattered throughout the medieval and early post-medieval period. The town of Bexhill-on-Sea developed out of a collection of small hamlets, scattered farmsteads and the main village with extensive new construction during the late Victorian and Edwardian period. The site area remained as common land until the early 20th century, at which point housing and a church were constructed close to the Down Road site. Given the distance of the site from the established settlement centre at Old Town Bexhill and the maintenance of the area as common land, the potential for significant archaeological remains being present on the study site was considered low. ***Land to the Rear of Tower House, Hilders Cliff, Rye, East Sussex. An Archaeological Desk-based Assessment***

Hall, N West Wittering : Development Archaeology Services, 2008, 29pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Development Archaeology Services

The assessment established that the archaeological resource may have comprised medieval and/or early post-medieval tenements with associated rear activity such as pitting, and outbuildings as well as potential street surfaces. This area was also part of the lands granted to the Austin friars, so it was expected that structures and other activity associated with the friary complex could be encountered during development. The area of the assessment site was situated within an area of common land known as "Le Haltone", the extent of which was uncertain. It was also uncertain whether this may have predated or post-dated any medieval tenements and associated activity on the site. It would probably predate the construction of the Austin friary complex, which took place after AD 1378. Buried topsoil deposits associated with this area of common land may have existed. The results of a previous watching brief to the south of the assessment site in 1999 at the Rye Lodge Hotel site encountered substantial 19th century made ground deposits at depth. It was possible that a similar sequence and nature of deposits could be found on this site although to a lesser depth. [Au(adp)]

**JEVINGTON TO FRISTON**

***Jevington to Friston Proposed EDF Energy Cable Route, East Sussex. Archaeological Desk-based Assessment***

Featherby, R London : Museum of London Archaeology Service, 2008, 44pp, colour pls, figs, tabs, refs

*Work undertaken by:* Museum of London Archaeology Service

A desk-based assessment was undertaken of a proposed cable route from Jevington to Friston. The development proposal included the construction of a new substation. The proposed route would not have an impact upon any nationally designated sites, such as Scheduled Monuments, Listed Buildings or Registered Parks and Gardens. The route did not pass through any Archaeologically Sensitive Areas. The proposed route had a moderate potential for the discovery of finds dating to the prehistoric and Roman periods. A range of prehistoric artefacts had been recovered as chance finds and as the result of metal detecting. An archaeological investigation south-east of the proposed cable route, identified concentrations of Bronze Age flints, as well as Early/Late Iron Age and Roman pottery indicating two areas of habitation nearby the area, showing that the route was part of a much larger, relatively densely inhabited landscape. The potential for the early, later and post-medieval periods was low. Although Jevington and Friston were of early medieval date, the route lay between these two settlements in land that had been arable, pasture and managed

forest throughout these periods. The removal of topsoil within the working width and the subsequent movement of vehicles would partially or completely remove any archaeological remains present. The excavation of the trench for the cable and a square for concrete pad foundations for the proposed substation would partially or completely remove archaeological remains depending on the depth of the colluvial deposits. It was recommended that during the construction of the proposed substation foundations and during excavation of the proposed cable route, the work should be archaeologically monitored. [Au(adp)]

**EAST DEAN TO BIRLING GAP**

***East Dean to Birling Gap Proposed EDF Cable Route, East Sussex. Archaeological Desk-based Assessment***

Featherby, R London : Museum of London Archaeology Service, 2008, 38pp, figs, tabs, refs

*Work undertaken by:* Museum of London Archaeology Service

The proposed cable route had a high potential for the discovery of finds dating to the prehistoric, Roman, periods, largely identified through concentrations of artefacts revealed by a fieldwalking survey. The removal of topsoil within the working width and the subsequent movement of vehicles could partially or completely remove any archaeological remains present. The excavation for the cable trench itself and ground disturbance for the foundations of proposed substations could also partially or completely remove archaeological remains. In light of the archaeological potential of the area, it was recommended that, during the construction of the proposed substation foundations and during excavation of the proposed cable route, the work should be subject to a watching brief. This would ensure that there was a full record of any archaeological features that may be encountered. [Au(abr)]

Butler, C Polegate : Chris Butler Archaeological Services, 2008, 33pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Chris Butler Archaeological Services

A desk-based assessment was carried out on Glebe land adjacent to Church Lane. The assessment established that the field in which the proposed new school was to be built had not been the subject of any development or other land use during the 160 years since the Tithe map. There was significant archaeological activity in the surrounding area dating from the Mesolithic period through to the post-medieval period, and therefore it was likely that the proposed development would disturb or destroy any buried archaeology. **ASHDOWN FOREST*****An Archaeological Survey of Ashdown Forest, East Sussex***

Butler, C Polegate : Chris Butler Archaeological Services, 2008, 89pp, figs, tabs, refs

*Work undertaken by:* Chris Butler Archaeological Services

A survey of Ashdown Forest was undertaken during 2007 and 2008. Prior to this survey, there were only some 75 archaeological sites recorded within the boundaries of Ashdown Forest. The survey identified a further 498 sites ranging in date from the Bronze Age through to the Second World War. Considering that the survey was only able to sample some areas and other areas were not visited at all, there was a huge potential for further, as yet undiscovered, archaeological sites across the Forest, especially sites that had no above ground features. Rodenbuesch, I London : Museum of London Archaeology Service, 2008, 33pp, colour pls, figs, tabs, refs

*Work undertaken by:* Museum of London Archaeology Service

A desk-based assessment was undertaken in advance of a proposed cable trench from Wilmington to Folkington. The proposal included the construction of a new substation and a micro transformer. No designated archaeological resources would be affected by the proposed cable route. The lack of previous investigations in the area made it difficult to fully assess the archaeological potential and the known finds and features only provided a limited understanding of human activity along the route. The route had uncertain potential for prehistoric remains. Evidence was limited to a Bronze Age hoard suggesting some activity in the area during this period. There was a moderate potential for Roman remains. It was located immediately to the south of the probable Roman road to a Roman fort at Pevensy and some roadside activity might be present. There was a low potential for medieval and post-medieval remains. Although the route ran between two villages of early medieval origin, it lay outside the likely extents of these settlements and probably lay entirely within open

fields. Any archaeological features from these periods were likely to be agricultural. Due to the potential for Roman remains associated with a Roman road adjacent to the route it was recommended that during the works archaeological monitoring take place. [Au(adp)]

Birbeck, V & Coleman, L Salisbury : Wessex Archaeology, Report: 685501.01 2008, 22pp, colour pls, figs, tabs, refs

*Work undertaken by: Wessex Archaeology*

The assessment identified a moderate potential for the survival of the remains of prehistoric occupation of the ridge and Romano-British remains representing roadside settlement. Even if one, or both, of the Roman Roads did continue in use during the Saxon and medieval periods, it was unlikely that it was extensively maintained. Therefore it was considered that there was a low to moderate potential for the presence of significant archaeological remains surviving below the present road and pavement surfaces. If the road was utilised as a coach-road during the post-medieval period there was a low to moderate potential for the survival of features and deposits associated with the maintenance of the road. **RUSHLAKE GREEN**

***Southern Water First Time Sewage Scheme [FTSS], Rushlake Green. Cultural Heritage Assessment***

Atkins Heritage London : Atkins Heritage, 2008, 30pp, figs, tabs, refs

*Work undertaken by: Atkins Heritage*

The impacts of the proposed development on cultural heritage assets were assessed. It was concluded that the proposed works would result in a neutral effect on the built heritage and historic landscape. The works would not adversely affect the Conservation Area or any Listed Buildings. Although, no known or recorded buried archaeological remains lay within the footprint of the proposed pipeline, there was a high potential that works could disturb buried archaeological remains of low or negligible value, the magnitude of groundwork impacts was likely to be negligible or minor. To mitigate the effect of the scheme on potential archaeology during ground-intrusive operations an archaeological watching brief was recommended to be undertaken, which would cover all groundworks including the excavation of the trenches and the preparatory groundworks [topsoil stripping] in advance of creation of wastewater plant and pumping stations. *Work undertaken by:* Gifford

The area had been consistently used for agricultural purposes, prior to the construction of Oak Park Secondary School in 1958. In view of the discovery of Roman site at the east end of Lavant Drive and the proximity of the Roman Road the potential for further discoveries has been long recognised. The work south of Lavant Drive revealed, however, that the site comprised layers of modern material overlying the natural strata. This was understood to have been the result of relatively recent ground levelling, which was severe enough to have removed any archaeological layers that might have been present. [Au(adp)]

*Work undertaken by:* Thames Valley Archaeological Services

The site lay within close proximity of the medieval manor itself, as well as the church and village. Although no aerial photographs showed anything on the site, the surrounding area had produced a number of clear cropmarks. The site had never been developed, so any archaeological remains that were present should not have been disturbed to any great extent. Desk-based assessment suggested it would be necessary to provide further information about the potential of the site from field observations in order to draw up a scheme to mitigate the impact of development on any below-ground archaeological deposits if necessary. Trial trenching revealed a single, undated, gully, and a peat-filled channel, which suggested that the site had little or no archaeological potential. [Au(abr)]

Birbeck, V Salisbury : Wessex Archaeology, Report: 70130.01 2008, 29pp, pls, figs, tabs, refs

*Work undertaken by:* Wessex Archaeology

The site lay within an Area of High Archaeological Potential. There was only a low potential for the presence of in situ Palaeolithic or Mesolithic features and deposits to survive within the site. The nearby presence of a spring and the associated watercourse running through the site suggested a moderate potential for the presence of Neolithic, Bronze Age, Iron Age and Roman features and deposits within the site. The site appeared to have lain a short distance beyond the medieval and post-medieval core of Brading, which presumably was also the core of the Saxon settlement. There was therefore a low to moderate potential for settlement of

Saxon, medieval and post-medieval date, although it was possible that traces of "back yard" activities may have survived. [Au(abr)]

Short, J & Wenban-Smith, F Portslade : Archaeology South-East, Report: 2008006 2008, 79pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

A desk-based assessment was prepared for the Sweyne Junior School and surrounding land. A geoarchaeological assessment of the Pleistocene deposits and Palaeolithic archaeology of the site and the surrounding study area indicated that deposits of high potential for containing Palaeolithic flint artefacts were deeply buried beneath overlying deposits within the footprint of the proposed new school building. Palaeoenvironmental and faunal remains were also likely to be well preserved within these Pleistocene deposits. A review of other known archaeological evidence and historical sources suggested that the site had a high potential for containing archaeological deposits of Roman date, based on the proximity of excavated features located in the vicinity of the site. These included a section of Roman road which may have extended across the northern tip of the site. The site was considered to have a low potential for containing archaeological deposits of other periods, although the southern sector of the site was crossed by a historic hedgerow and the buried remains of other former field boundaries were likely to have survived. Moody, G Birchington : Trust for Thanet Archaeology, Report: TSM 08 2008, 7pp, figs, refs

*Work undertaken by:* Trust for Thanet Archaeology

The main impact on archaeological deposits on the site would likely come from the excavations for the formation of the pads and from cutting of trenches associated with the supply cables to the Tesco store. In the case of Pad 2, it was possible that the excavation could encounter part of the medieval enclosure ditch, assuming it survived the later construction of a small factory building. [Au(adp)]

Preston, S Reading : Thames Valley Archaeological Services, 2008, 29pp, figs, tabs, refs

*Work undertaken by:* Thames Valley Archaeological Services

The site lay just outside the medieval city walls, in a location likely to have been favoured for settlement from prehistoric times onwards. Saxon and medieval settlement remains had been found close by and a medieval grange barn was also considered probably to have been located nearby. A small area of the site to be developed was previously built upon but had most always been gardens within its recorded history. The site therefore had considerable general and specific archaeological potential. It will have been necessary to have provided more information from field observations in order to devise a scheme to mitigate the impact of the proposal on any archaeological remains that have been present. Ford, A Oxford : Oxford Archaeology, 2008, 25pp, figs, refs

*Work undertaken by:* Oxford Archaeology

An assessment concluded that the nursery school was in an area in which there was some potential for pre-medieval, and especially Romano-British deposits and/or features being present. It was thought possible that the water course that formed the eastern boundary of the site with the St. Bartholomew's enclosure formed part of the water supply for St. Bartholomew's Hospital but it was unlikely that built structures associated with the hospital extended to the west of this boundary. The exact location of a Holy Well associated with the water supply at St. Bartholomew's remains uncertain although it was likely to have lain on a natural spring line in the northern part of the enclosure. **MARY ROSE NEW MUSEUM, DRY DOCK NO. 3*****Mary Rose New Museum, Dry Dock No. 3***

Moore, H & Wheeler, R Southampton : Gifford, Report: 14879/GE/R04 2008, 90pp, colour pls, figs, tabs, refs

*Work undertaken by:*

In 1723, two slipways were added to the Great Basin, one to the east and the second to the south-east corner. The construction of the south-east slipway caused the removal of the collection of the Clerk of Cheques' House and neighbouring small buildings that had stood there previously. Dry dock number 3 was begun in 1799 and completed by 1803. This dock had a profile unique in the Portsmouth docks, with the steps at the head truncated so that the head was wider than the body of the dock. The known archaeological and historical importance of this area of the dockyard, which was likely to represent the core of the area of Henry VII's dockyard, as well the later 16th-18th century dockyards together with the international significance of the Dry Docks and associated structures, required that a robust archaeological mitigation strategy should be prepared in advance of and with regard to the known impacts of the new museum design. The area of Dry Dock number 3 was designated as a Scheduled Ancient Monument, and was also part of Conservation Area 22 designated as such by Portsmouth City Council. Consultation has been undertaken by the Mary Rose Trust and Design Team with English Heritage and Portsmouth City Council at all stages of the project with respect to cultural heritage matters. The production of this desk-based assessment was undertaken at the request of English Heritage and Portsmouth City Council in order to set the design and impact of the new museum into the archaeological and historical context of the historic dockyard. Wheeler, R Southampton : Gifford, Report: 15022/GE/ R01 2008, 63pp, colour pls, figs, refs

*Work undertaken by:*

Designations within the Search Area included 63 Grade II Listed buildings, 9 Locally-Listed , Oxford Street and Canute Road Conservation Areas, a local area of archaeological importance and an area of common land. The proposed development would involve the erection of a four-storey building within an existing void, behind the Oxford Brasserie and fronting on to John Street. The proposed building would be of a similar height to the surrounding buildings and the windows would be of a similar scale. Overall, there was a low to moderate potential for archaeological remains including human remains within the application site, with moderate potential for remains from previous building alignments and associated remains, from the post-medieval period. The 19th century buildings of the application site may have been cellared and therefore the majority of the below-ground remains predating the first phase of these buildings may have been destroyed. [Au(adp)]

Barber, K Salisbury : WA Heritage, Report: 68121.01 2008, 33pp, colour pls, figs, tabs, refs

*Work undertaken by:* WA Heritage

The assessment found evidence for use of the study area from the prehistoric to the present day. The site was peripheral to settlement development during the medieval period and lay between the estate foci from the post-medieval period onwards. A site visit recorded areas of make-up and levelling relating to the use of the site as a tennis court, and while ground reduction may have impacted upon the archaeological resource, the ground build-up may have served as a buffer to protect deposits. It was thought that if any remains existed they would be relatively well-preserved. [Au(adp)]

Cherrington, R Erdington : Benchmark Archaeology, 2008, 35pp, pls, figs, refs

*Work undertaken by:* Benchmark Archaeology

The assessment established the application site had been used as a quarry and lime works from at least the early 19th century, although quarrying on the site may have begun as early as the early/mid-18th century. Due to the fact that the quarry had been worked to the deepest levels of the underlying geology (up to c. 25m below the surrounding landscape), the potential for buried archaeological deposits predating the quarry workings was considered to negligible. A walk-over survey identified a lime kiln of archaeological merit along with other buildings outside of the footprint of the current proposals. [Au(abr)]

*Work undertaken by:* L-P: Archaeology

The immediate vicinity had seen moderate activity during the prehistoric period, particularly during the Bronze Age and Iron Age. Egham town continued to see activity during the medieval period when it was held by Chertsey Abbey. By the 19th century, the site was located in the periphery of commercial developments. It was first developed by the 19th century when a line of small buildings were constructed. These works were demolished at some point between 1934 and 2008 in preparation of the construction of a tarmac car park. The potential for archaeology was considered to be high. [Au(abr)]

*Work undertaken by:* WA Heritage

The assessment identified a moderate potential for the survival of archaeological remains on the site, particularly Mesolithic material, with quantities of worked flint from this period present in the vicinity. There was a low potential for remains from the Roman period, with a slightly higher potential for those of the Anglo-Saxon and medieval periods. It was clear that the site stood within the post-medieval core of the town, and there was therefore a high potential for the recovery of remains from this period, probably in the form of domestic or small-scale industrial features in the gardens or back-plots of these houses. Rodenbuesch, I London : Museum of London Archaeology Service, 2008, 43pp, figs, tabs, refs

*Work undertaken by:* Museum of London Archaeology Service

The construction of four new buildings was projected to remove any archaeological remains from their footprint. Additional proposed groundwork for the drains, services and new access roads and landscaping would potentially remove archaeological remains within the footprint of each construction. Alterations and refurbishments of the existing West Hall mansion could potentially affect original features, depending on the type of proposed works and methods of construction. In light of the uncertain archaeological potential of the site, in particular for the Bronze Age/Iron Age and Roman period, it was thought likely that further investigation would be required. Rous, M Salisbury : Wessex Archaeology, Report: 69930.01 2008, 101pp, colour pls, figs, tabs, refs

*Work undertaken by:* Wessex Archaeology

The assessment determined that the site had a generally low potential for finds of most prehistoric periods. However, there was high potential for Mesolithic evidence, in the form of worked flint and potentially waterlogged deposits, which were known to exist within 250m of the site. There was also a high potential to encounter remains relating to the medieval development of the town of Newbury from at least the 12th century, although any such deposits would only exist where the post-medieval and modern development of the town had not compromised the study area. The Bartholomew Street frontage had been continually built up since before the first maps of Newbury were drawn in the 18th century, and extensive cellaring was expected across the site. With regard to the built heritage, it was expected that most of the buildings on the site would be removed, as well as the loss of historic fabric from the roof space of No. 17. Appropriate building recording was recommended, along with a watching brief for the rest of the site. [Au(adp)]

***Manor Farm House, Marsh Benham, West Berkshire. Archaeological Assessment and Watching Brief***

Mayor, D Swindon : Foundations Archaeology, Report: 590 2008, 44pp, colour pls, figs, tabs, refs

*Work undertaken by:* Foundations Archaeology

A desk-based assessment was undertaken in 2008. The assessment report was undertaken after site works had begun in order to inform the results of the watching brief and in an attempt to partially mitigate the consequences of unmonitored works which had already taken place on the site. Demolition of a conservatory structure and an outbuilding on the north side of the farmhouse had already taken place prior to the notified commencement of the watching brief. The monitored groundworks comprised the reduction of the interior of the former outbuilding and the cutting of two new wall footings, Trenches A and B. The assessment indicated that there was a low potential for the recovery of finds or features predating the post-medieval period. The assessment further indicated that the present building complex around Manor Farm was of late 19th century date, rather than originating as utility buildings

associated with the 18th century construction of Benham Park, although the earlier buildings certainly predated the Park. The possible connection of the names Manor Farm and Manor House, suggested the earlier buildings of the complex were associated with the 17th century house in Marsh Benham village, not with the house and the park to the east of the study area. It was clear that the later 19th century buildings of the complex formed the kitchen gardens. It was not known if the earlier buildings, none of which appeared to have been retained when the 19th century kitchen gardens were constructed, had any connection to the function of the Park. The assessment highlighted the potential for the recovery of pre-19th century building remains predating the existing late-19th century building complex, as well as evidence for the use and construction of the kitchen gardens. Impact of the new development on the character of the park was considered low. The previous watching brief had not revealed any archaeologically significant finds, features or deposits predating the probable late-19th century construction of the kitchen gardens. No evidence pertaining to the existence of earlier structures was present. No artefactual or ecofactual evidence was present within the watched area. There was no clear evidence pertaining to the function of the structure observed during the watching brief. Although the sub soils across the site were not completely intact, they were only marginally truncated, demonstrating that the lack of archaeological deposits was most likely a true representation of the archaeological record within proposed development area. [Au(abr)]

*Work undertaken by:* Cotswold Archaeology

An assessment was carried out to examine the potential effects of a quarry extension upon the Devil's Ditch Scheduled Monument and its relationship with surrounding monuments. The Devil's Ditch ran along an east-west alignment to the north of the site, and the proposed mineral extraction would produce no physical impacts upon the monument. During extraction works the immediate agricultural setting of the monument would be disrupted, although

following restoration works the long-term effect would be very slight. The assessment found that there would be little long-term impact, as the inter-visibility of monuments in the area was slight, and not really intelligible. [Au(abr)]

West Sussex County Council Shrewsbury : West Sussex County Council, Report: 404-0404-00003-020 2008, 32pp, figs, tabs, refs

*Work undertaken by:* SLR Consulting Ltd.

A site survey was conducted in order to assess whether any features of historic interest might exist within an area adjacent to Kilwood House that has been described on a 1st edition OS map as parkland. Historic mapping was examined as well as the physical landscape. These forms of evidence failed to provide any evidence of an intention to create a designed parkscape at Kilwood. It was recommended that the historic parkscape ornament was removed from this area on the constraints map in the JAAP. The landscape and ecological merits of some features within the study area will be assessed during any environmental impact assessment of the development proposals. These features included a line of mature oaks, aligned with an old field boundary, which predate the house: areas of coppicing along the western boundary of the study area and west of the ancient track; and the western perimeter hedge, which occurs on all OS maps and is a significant component of the historic landscape. Darton, L London : CgMs, 2008, 41pp, figs, tabs, refs

*Work undertaken by: CgMs*

Due to the past post depositional impacts at the site in the later post-medieval and modern periods, the site was considered to have a low archaeological potential for all past periods predating the post-medieval. By the later 19th century a pottery works was established across the site. The fragmentary remains of buried wall footings from the 19th century pottery buildings may survive particularly in the south of the study site. Overall it would appear that the proposed development of this site would have a low archaeological impact periods predating the post-medieval period. The report concluded that an archaeological evaluation targeted at remains of pottery buildings would form an appropriate archaeological mitigation strategy. [Au(abr)]

**WILMINGTON WAY ESTATE, HAYWARDS HEATH*****An Archaeological Desk-top Assessment of Wilmington Way, Haywards Heath, West Sussex***

Sayer, K London : Pre-Construct Archaeology Ltd., 2008, 31pp, figs, tabs, refs

*Work undertaken by: Pre-Construct Archaeology Ltd.*

There was moderate potential for prehistoric remains. Although evidence for the prehistoric period was limited to a single Neolithic axe, the study site did include an area situated on alluvial deposits, potentially unaffected by the construction of the current estate. There was a low potential for Roman remains. No evidence for the Roman period was found within the study area. There was a low potential for medieval remains. All evidence for the medieval period within the study area suggested that activity was concentrated to the north-east and west of the site. There was a low potential for uncovering post-medieval remains. Although the cartographic evidence shows development within the area of the site during this period the site remained undeveloped until the 1940s. The existing buildings across the whole site and previous buildings to the south of the site will have had a localised but severe impact on underlying archaeological deposits, whilst more widespread landscaping of the site indicates that any shallow archaeological remains will have been disturbed. However, the north-west corner of the site, has the potential for the presence alluvial deposits associated with the Scrase Stream. As such it was recommended that whilst archaeological deposits are unlikely to survive across the majority of the site, an archaeological investigation in the existing playground should be undertaken prior to development in this area in order to assess and record the presence and extent of any deposits of archaeological and/or environmental interest. Davenport, P Cirencester : Cotswold Archaeology, Report: 08070 2008, 37pp, pls, figs, tabs, refs

*Work undertaken by:* Cotswold Archaeology

A desk-based assessment was carried out to determine the potential of the site prior to development. The site was occupied by a Georgian-style terrace house, built in 1951 to replace the house destroyed by enemy action in 1942. The site was located within the centre of Bath, and straddled the site of the medieval and possible Roman walls and moat. There was some potential for archaeological remains to be recovered. Roper, S Bristol : Bristol & Region Archaeological Services, Report: 1979 2008, 22pp, colour pls, figs, refs

*Work undertaken by:* Bristol & Region Archaeological Services

The evidence examined suggested that the current settlement in which the study area was located developed in the post-medieval period extending out from the city centre along the London Road. The existing Listed Buildings on the site were built in the early 19th century and were first identifiable on the 1841 tithe map. Various extensions were built on to the back of the main building and subsequently demolished throughout the 19th and 20th centuries. Archaeological deposits relating to the Roman and post-medieval periods were likely to be present on the site. [Au(abr)]

**THE ROMAN BATHS, BATH*****The Roman Baths, Bath, Lower Museum Area. Archaeological Desk-based Assessment***

Davenport, P Cirencester : Cotswold Archaeology, Report: 08080 2008, 38pp, colour pls, figs, tabs, refs

*Work undertaken by:* Cotswold Archaeology

An assessment was carried out to identify the nature and extent of the archaeological resource within the site to better understand its condition and research and display potential. The study showed that there were significant research questions to be addressed, and that certain areas could be better displayed and understood. The remains as a whole had varying levels of authenticity, but those in the Lower Museum were essentially original and had not suffered over-restoration. Important and informative archaeological work was carried out in the 1960s, however the full implications of this work had not yet been realised. It was thought that there were opportunities and justification for further intrusive and non-intrusive work. [Au(abr)]

*Work undertaken by:* Avon Archaeological Unit

The study area was located within the medieval parish of Batheaston, later located within the City of Bath, a World Heritage Site. The construction of Bailbrook House on the site in the 1790s represented a watershed in the development of the study area. There was thought to also have been significant human activity in the general environs of the site from the later prehistoric period onwards, including Roman and medieval activity. It was thought that the archaeological potential of the site varied depending upon the location and the type of archaeology suspected. [Au(abr)]

Corcos, N Bristol : Bristol & Region Archaeological Services, Report: 2002/2008 2008, 29pp, colour pls, figs, tabs, refs

*Work undertaken by:* Bristol & Region Archaeological Services

The study was carried out as part of a proposal for re-development of early Victorian villas and a later undertaker's shop on the site. The study found that the Listed element of No. 1 Alma Vale Road was built at the turn of the 20th century as an undertaker's premises, with the front garden of one of two Victorian villas constructed in the mid-19th century. Thereafter, a steady accretion of outhouses and workshops developed on the site, up to at least the mid-1920s. The structures erected after the main, highly ornate, buildings of 1899, were rather plain, unpretentious workshops which had been subjected to sometimes damaging later alteration. [Au(abr)]

**THE FORMER COLLIERY CHIMNEY, TROOPERS HILL ROAD, ST. GEORGE**  
***Archaeological Desk-based Assessment of the Former Colliery Chimney, Troopers Hill Road, St. George, Bristol***

Bryant, J Bristol : Bristol & Region Archaeological Services, Report: 1959/2008 2008, 21pp, pls, colour pls, figs, tabs, refs  
*Work undertaken by:* Bristol & Region Archaeological Services  
A desk-based assessment revealed that the site formerly lay in Kingswood Forest and the ancient parish of SS Philip & Jacob. In 1610 the hill was named Harris Hill, but before 1704 had become known as Truebody's Hill, a name that has since been corrupted to Troopers Hill. The area at the bottom of the hill was industrialised by the early 18th century, with involvement from local families such as the Eltons [of Clevedon Court]. Considerable quantities of coal were required by the local copper and brass industries, and the Swede Rheinhold Angerstein, visiting in 1754, recorded coal mining in the immediate area. Coal mining initially involved pits of limited depth with the product hauled to the surface by windlass. Deeper mines required engine houses both for winding purposes and for pumping water from the workings, sometimes accompanied by chimneys providing draughting for mine ventilation purposes. Two engine houses were erected for the Crews Hole Pit [alias troopers Hill Pit] in probably, the very early years of the 19th century. It is unclear whether Maule's map of 1803 recorded an engine house or a cottage on this site, although this certainly seemed to show the upper engine house. Similar in build, the two engine houses were not quite identical, their chimneys being positioned differently. The 1842 tithe map recorded what appeared to be a gin house [where a horse or donkey operated winding gear] on the north-west side of the lower engine house, although all trace had long since disappeared. Mining had ceased at this location by 1845. The engine house may have been derelict by the early

1880s. It was certainly roofless by the early 1900s, at which time the other structures close by had gone. In contrast, the upper engine house, a third of the way up Troopers Hill Road, continued to survive for some years after being converted into living accommodation. An aerial photograph taken about 1930 showed the building on the present site at the bottom of the hill as ruined though retaining all four walls in addition to the chimney. The first edition Ordnance Survey 1:1250 plan, surveyed in the late 1940s, recorded only the chimney and portions of two walls. Fortunately there had since been stabilisation of the remains, which were later Listed Grade II. [Au(abr)]

*Work undertaken by:* D Hardwick Chartered Surveyors

It was proposed to demolish the existing single-storey outbuilding to the right of the property and to extend the existing terrace. The property would be a three storey building with rear additions to match the existing to form self-contained flats. The study found no specific documentary evidence for the site but map evidence showed buildings on the site from at least the 18th century. The existence of a colliery pumping engine in the 18th century indicated that there was a relatively sizeable series of colliery workings in the area. The likelihood of finding undisturbed remains from the early period of the site history was remote. [Au(adp)]

Longman, T Bristol : Bristol & Region Archaeological Services, Report: 2087/2009 2008, 31pp, colour pls, figs, tabs, refs

*Work undertaken by:* Bristol & Region Archaeological Services

A desk-based assessment was carried out on the property, which was located within the historic area of Kingswood Chase and from at least 1803 an enclosed parcel of land

containing a dwelling. By 1842 it was known that the study area, on Swan Lane [now Hillburn Road], was occupied by a "House & Garden" owned by John Stibbs. By the early 1880s the site was partially quarried for clay pits and a number of buildings, including the house and a Pug Mill were shown on the site. The quarry was filled in by 1904. By 1944 the dwellings were named as "Nos. 1-2 South View, Stibbs Hill". Several outbuildings were also present within the study area. Sometime after 1973 the cottages were severely damaged by fire and became derelict. The ruins were finally demolished in the mid/late-1990s. [Au(abr)]

***Bristol General Hospital, Guinea Street, Bristol. Archaeological Desk-based Assessment***

Blackwell, R Cirencester : Cotswold Archaeology, Report: 0870 2008, 32pp, colour pls, figs, tabs, refs

*Work undertaken by:* Cotswold Archaeology

The baseline survey indicated very low potential for currently unrecorded prehistoric to Roman archaeological remains within the site. There was no evidence to suggest that the site was the focus of prehistoric or Roman activity. Medieval activity in the study area appeared to have been focused elsewhere to the north-east. There was, however, a low potential for in-situ medieval deposits. Redcliffe Caves, mined from the 15th to 16th century, were recorded to the north-east of the study area. Documentary evidence suggested that the caves extended south of Guinea Street, but their extent had not been mapped. From the early 19th century, now removed industrial buildings, a sugar house, iron foundry and a timber yard were established. Bristol Hospital was constructed in the 1850s and expanded until the 20th century. The site was situated in Redcliffe Conservation Area and included the Grade II Listed Buildings Bristol General Hospital, Lodge and attached piers and gates. [Au(abr)]

**H.H. WILLS PHYSICS LABORATORY, TYNDALL AVENUE, CLIFTON*****Archaeological Desk-based Assessment of Land at the H.H. Wills Physics Laboratory, Tyndall Avenue, Clifton, Bristol***

Townsend, A Bristol : Bristol &amp; Region Archaeological Services, Report: 1995/2008 2008, 44pp, colour pls, figs, tabs, refs

*Work undertaken by:* Bristol & Region Archaeological Services

The 20th century redevelopment of the area resulted in a number of post-medieval buildings undergoing demolition. A number of early 20th century houses on the southern side of Tyndall Avenue were also demolished when the laboratory was extended in the 1960s. The evidence examined suggested that there was part of a substantial building on the study area from the late-18th century which survived until the 20th century. A smaller building, probably a greenhouse, also existed on the study area during the 19th century. Further elements on the study area during the 18th and 19th centuries included boundary walls. It was thought possible that features and deposits of archaeological interest were present within the burial

environment. These possibly included the vestiges of buildings depicted on 18th and 19th century maps. [Au(abr)]

**SOMERSET HOUSE, NO. 42 ALFRED HILL, KINGSDOWN**

***Somerset House, No. 42 Alfred Hill, Kingsdown, Bristol. Archaeological Desk-based Assessment***

Etheridge, D Kingswood : Avon Archaeological Unit, 2008, 49pp, colour pls, figs, refs  
*Work undertaken by:* Avon Archaeological Unit

The study area comprised an L-shaped three-storey Grade II Listed house with an attached rubble wall and garden to the rear. It was concluded that the study area was probably laid out and the primary wing of the present house built around 1800 but certainly no later than 1828. the secondary wing was added before 1855. the building was one of a pair with adjoining Dorset House [demolished c.1905-1908]. Alfred Hill was formerly known as Prior Lane in the late-18th and early 19th centuries. The route appeared to have been one of the principal ways northward from the city during the Middle Ages but had been reduced to a farm track by the 17th century. During the 18th century, the route was reused as local access to the summerhouses of wealthy Bristol merchants. [Au(abr)]

**THE BELL PUBLIC HOUSE, NO. 7 PREWETT STREET, REDCLIFF**

***The Bell Public House, No. 7 Prewett Street, Redcliff, Bristol. Archaeological Desk-based Assessment***

Etheridge, D Kingswood : Avon Archaeological Unit, 2008, 42pp, colour pls, figs, refs  
*Work undertaken by:* Avon Archaeological Unit

The study area was formerly within the 12th century manor of Bedminster. The Bell Public House, Cathay, was first mentioned in a trade directory from 1752. Scale plans of 1874 and 1884 showed little change in the development of the study area and it surrounded from 1855. By that date a longer extension had replaced the short extension behind the main building of The Bell. This was described in an 1849 advertisement for a tenant as a brewery and skittles alley. On the west the study area was bounded by tenements known as Prewett Place, while one the east were tenements known as Harris's Cottages. Prewett Place was replaced c.1930 by the present building. This area of Redcliff was completely remodelled in the later 1950s and 60s following extensive aerial bombardment of Redcliff in 1940-1941. [Au(abr)]

Longman, T Bristol : Bristol & Region Archaeological Services, Report: 2064/2008 2008, 22pp, colour pls, figs, tabs, refs

*Work undertaken by:* Bristol & Region Archaeological Services

Several features of archaeological significance were observed within the study area, comprising a number of linear features in area units 2 and 3, suggesting a pre-enclosure origin. Whilst it was likely that some of the visible features represented footpaths and/or modern field drains, others may well have been "fossil" field boundaries associated with ancient farming. Ditches and other features of Roman and medieval date had been recorded both within the study area and in the general locality. However, when considering the possible antiquity of these features, it should be remembered that it was common practice both prior to and during the Second World War to create ditches and other obstacles in fields surrounding strategic locations such as airfields, in order to hinder possible airborne assaults. Indeed, during a watching brief on a site on the north side of Hengrove Park [the site of Whitchurch Airport between 1930 and 1957] in 1997 a "meandering negative feature" was recorded. This was interpreted as "some kind of defensive emplacement" dating from before 1938. [Au(abr)]

**PURDOWN STATIC HEAVY ANTI-AIRCRAFT BATTERY*****Archaeological Desk-based Assessment on Purdown Static Heavy Anti-Aircraft Battery, Bristol***

Glass, E Bristol : University of Bristol, 2008, 54pp, pls, figs, tabs, refs

*Work undertaken by:* Emily Glass

This desk-based assessment was undertaken as part of a MA module. During WWII, the Purdown battery was stationed on the high ground of Purdown ridge. The archaeological assessment identified a low presence of early prehistoric material along the Purdown Ridge, much of which was either residual or dispersed with no clear evidence of any settlement. There was firmer evidence for remains from the Iron Age to Romano-British periods and a potential settlement or farmstead identified on the grounds of the present day Heath House to the south-west of Purdown battery. The medieval period saw little change to the area around the battery which was mostly used for pasture and what remained of the forest. [Au(abr)]

Brown, C Twickenham : AOC Archaeology Group, 2008, 47pp, colour pls, figs, tabs, refs

*Work undertaken by:* AOC Archaeology Group

The assessment concluded that while there was a recorded presence of archaeological remains from the prehistoric to post-medieval periods in the wider area, cartographic and documentary evidence indicated that the site itself remained under fields from at least the mid-19th century. For this reason there was considered to be a low to medium potential for archaeological remains dating to the medieval and post-medieval period. There was a low potential for the recovery of significant archaeology of all other periods. [Au(abr)]

**WEST PRINCE OF WALES AND WHEAL BROTHERS MINE, HARROWBARROW*****West Prince of Wales and Wheal Brothers Mine, Harrowbarrow, Cornwall. Archaeological Assessment***

Buck, CTruro : Historic Environment Service Projects. Cornwall County Council, Report: 2008R057 2008, 59pp, colour pls, figs, tabs, refs

*Work undertaken by:* Historic Environment Service Projects. Cornwall County Council

The assessment found that Wheal Brothers had been worked from at least the 1760s, although the documented history started in the early years of the 18th century. The mine closed down by 1820 after all the famous silver "parcels" of ore had been found, but reopened in the 1830s with the advent of more efficient steam engines. However, this venture also failed, and the site was amalgamated with those nearby, with its final use as a copper and arsenic refinery in the 1870s. West Prince of Wales Mine had a very different history, with its parallel series of tin and copper deposits containing very little silver. The site operated intermittently until its closure in 1915, very late for a Cornish mine operation. [Au(adp)]

***Land Adjacent to No. 33 Tregony Hill, Tregony. Archaeological Assessment***

King, D Swindon : Foundations Archaeology, Report: 600 2008, 43pp, figs, tabs, refs

*Work undertaken by:* Foundations Archaeology

A desk-based assessment was undertaken on land adjacent to No. 33 Tregony Hill. The assessment highlighted that the site should have had some archaeological potential for finds and features of the medieval period, possibly related to settlement activity. It was probably a lath-makers yard during the late-18th century, an activity which would be unlikely to leave any substantial archaeological remains. No extant remains were present within the site, which had been terraced at some point in the past, probably as the result of small scale quarrying between 1841 and 1880. No archaeological deposits were likely to have survived this process. The archaeological potential of the site was therefore to be considered negligible. [Au(abr)]

**BONYTHON WIND FARM*****A Proposed Replacement Power Cable for the Bonython Wind Farm, From Penhale to Bonython, The Lizard Peninsula, Cornwall. Archaeology and Cultural Heritage Assessment***

Sims, R, Valentin, J &amp; Chandler, J Bradninch : AC archaeology, Report: ACD04/1/0 2008, 39pp, colour pls, figs, tabs, refs

*Work undertaken by:* AC archaeology

The proposed cable route extended over a distance of approximately 3km and was located on Goonhilly Downs, with this heathland area forming part of The Lizard Peninsula Area of Great Historic Value. This landscape contained well-preserved remains relating to prehistoric settlement, field systems and funerary monuments, including numerous well-preserved Bronze Age barrows, some of which lay close to the proposed cable route. Other sites within the landscape included medieval field and ridge and furrow systems, parts of which might have been crossed by the scheme. Evidence indicated that there was the potential for remains relating to medieval or earlier settlement to be exposed during groundwork associated with construction. The assessment set out the possible impacts of the scheme on known and potential archaeological remains and proposed a programme of mitigation, which meant that the overall effects of construction on archaeological and historical remains would be minimised. Parkes, C Truro : Historic Environment Service Projects. Cornwall County Council, Report: 2008R126 2008, 33pp, colour pls, figs, refs

*Work undertaken by:* Historic Environment Service Projects. Cornwall County Council

In the study area, a total of 16 archaeological features or potential sites were recorded. Of these, 15 could be directly affected by the pipeline construction, but none were thought to be nationally important. Most related to post-medieval mining, and of outlying features associated with the airfield. [Au(abr)]

**SKY-TIPS IN THE ST. AUSTELL CHINA CLAY DISTRICT*****Sky-Tips in the St. Austell China Clay District. An Archaeological Assessment***

Smith, J R Truro : Historic Environment Service Projects. Cornwall County Council, Report: 2008R041 2008, 45pp, colour pls, figs, tabs, refs

*Work undertaken by:* Historic Environment Service Projects. Cornwall County Council

An assessment was carried out of the historical and archaeological significance of spoil heaps in the St. Austell china clay district, some of which may have been subject to removal for further aggregate of mineral extraction. Of particular concern were the removal of "sky-tips" or conical dumps. It was debatable whether some sky-tips should be conserved in the landscape as monuments to the china clay industry. [Au(adp)]

Chandler J, Nobles G, Stanier P & Valentin, J Bradninch : AC archaeology, Report: ACD03/1/1 2008, 67pp, colour pls, figs, tabs, refs

*Work undertaken by:* AC archaeology

An assessment was carried out as part of a wider Environmental Impact Assessment relating to the regeneration of six areas of former china clay extraction. The landscape of all six areas had been radically altered by the china clay industry and, particularly for the pre-industrial sites, it was therefore difficult to determine whether features survived beneath massively industrialised areas and associated waste tips. It was clearly easier to determine when quarrying will have removed early sites, with these more likely to survive where they were located within areas of surviving landscape, such as those within the historic field remnants at Blackpool and Baal. It was often the case that the structures and features associated with the china clay industry had become archaeological sites themselves. Prior to the exploitation of tin in the late medieval period, the St. Austell china clay area was essentially a rural landscape. There was little evidence for archaeological activity predating the Bronze Age, with this period mainly represented by ritual and funerary monuments such as barrows and stone rows. Unfortunately later industrial activity had destroyed many of these sites within the six areas, although some had been investigated by formal archaeological excavation. There

were a few late Iron Age/Romano-British rounds with the study areas, although the main one, Trethurgy, had been subjected to detailed archaeological excavation prior to being covered by a waste tip. Field name evidence indicated that other round sites might also have been present. It was known from excavation that many round sites continued in use into the early medieval period. Into the later medieval period the area was characterised by small farmsteads and hamlets surrounded by fields. Many such sites have been identified by this study, although it was known that a number had been destroyed by china clay working, while for others the survival of associated buried remains was uncertain. Recommendations were made for mitigating measures to be carried out, however, it was not possible to fully assess the potential of all the sites, as where china clay extraction had not occurred, there was still the potential for hitherto unrecorded archaeological remains from any period to be present. Bashford, D Beckley : John Samuels Archaeological Consultants, 2008, 52pp, colour pls, figs, tabs, refs

*Work undertaken by:* John Samuels Archaeological Consultants

The distribution of archaeological remains indicated that the site was densely occupied during prehistory. Although there were ephemeral traces of Mesolithic activity, the main concentration of activity spanned the 4000 years between the beginning of the Neolithic and end of the Iron Age. The establishment of the legionary fort at Exeter within ten years of the Claudian invasion and the subsequent development of the Roman town also left its mark on the area, as well as the later Saxon and medieval occupations. Use of the land shifted towards mainly agricultural during the Late Saxon and medieval periods. There was good reason to suppose that a complex range of potential archaeological features could have survived on the proposed development site, albeit in truncated condition. [Au(adp)]

*Work undertaken by:* Context One Archaeological Services

The assessment concluded that little could be said with any certainty about the early history of the site or its archaeological potential, but this was in the main due to the lack of past investigation. Notwithstanding this, a large site located centrally, close to the harbour and possibly containing a former rope walk, clearly had the potential for shedding light on the

formative history of the town. Any such remains were unlikely to have been more than of local importance, but nonetheless significant in planning terms. [Au(adp)]

### **BEACH ROAD, LUNDY**

***Beach Road, Lundy. Archaeology and Cultural Heritage***

Passmore, A      Exeter : Exeter Archaeology, 2008, 28pp, colour pls, figs, refs

*Work undertaken by:* Exeter Archaeology

The assessment identified some archaeological sites within the study area not previously recorded. A wreck, "Mary", a brigantine of 219 tons stranded between Rat Island and Lundy on 16 December 1870, was revealed. Another wreck ship, "Hannah More", was wrecked off Landing Beach on 24 January 1866. A flight of six concrete steps were also recorded. The upper steps were destroyed during the construction of the road to the jetty in 1989–1990. A building was depicted at this location on the Ordnance Survey's first and second edition 1:2500 maps. The building was destroyed in a landslip in 1954 and there was no visible evidence of the structure. At the south end of the terrace was the site of a building, formerly 4m long, only the rear wall survived, to a full height of 1.40m. This wall was constructed of slate bonded in hard white slightly gritty lime mortar, and incorporated a projecting plinth of standard red brick and tile for a roof truss. There was a series of hooks and nails in the wall. The floor was not visible. The remainder of the terrace to the north of the building had a concrete surface. The building was depicted on the Ordnance Survey's 1st and 2nd edition 1:2500 maps, and appeared to have survived until at least the mid-20th century. Above the boathouse there were two main lengths of retaining wall on the upper side of the Beach Road. The north end of this wall truncated an earlier curving slate retaining wall. To the north of this platform the next stretch of the retaining wall was rebuilt in concrete in the 1960s, although a small patch of earlier stone masonry survived. Further north, there was a small patch of masonry, constructed in shale, overlaid by a later rebuild that extended for some 25m along the road. This was constructed generally of larger blocks of slate than the wall it replaced, and was bonded in a hard slightly granitic lime mortar. The wall incorporated a plinth at its northern end, four courses below road level. It was recommended that no further mitigation

was undertaken on the three affected sites, since an adequate record had already been prepared. A drawn record was prepared as part of the assessment along with a detailed photographic and written record. It was deemed unlikely that further recording would add any useful information to the understanding of the sites. [Au(abr)]

Valentin, J Bradninch : AC archaeology, Report: ACD20/1/0 2008, 19pp, colour pls, figs, tabs, refs

*Work undertaken by:* AC archaeology

An archaeology and cultural heritage assessment was carried out. There was no previously recorded evidence for archaeological remains on the site itself, although it did occupy part of one of a series of medieval burgage plots to the rear of mainly 16th and 17th-century properties that fronted onto the main street through the village. The buildings and the burgage plots were separated by Back Lane, which would have previously provided access into the plots from their south side. Historic maps and documentary sources indicated that the site had remained largely unchanged since at least 1843, with the present boundaries still in the same positions. The western and northern boundaries were stone-revetted banks and were likely to date to the medieval period, while the walls and hedges on the eastern and southern sides appeared to be more recent additions. In the mid-19th century the site was called "Part of Steddaford's Holmes", with the land-use described as pasture. The burgage plot two along to the west was named "Crocker's Acre" at this time, perhaps indicating early manufacture of pottery or other ceramics. Burgage plots often contained remains associated with small-scale industry such as ceramics production, and it was possible that evidence for this or some other manufacturing process might have been present on this site. Tyler, REdgbaston : Birmingham Archaeology, 2008, 31pp, colour pls, figs, tabs, refs

*Work undertaken by:* Birmingham Archaeology

A desk-based assessment was undertaken on the line of a proposed pipeline running from Bromesberrow Heath westwards for c.4 km and discharging into the River Leadon west of Greenway. A walkover survey of the entire route was undertaken to assess the topography, current land use and survival of any above ground archaeological features or earthworks of possible interest. The assessment revealed that that the proposed route passed through a landscape with known archaeological potential. In particular, the area to the south of Great and Little Heath had been shown to retain potential for prehistoric remains. Roman occupation in the general area had been documented and isolated finds to the north of Greenway highlighted the potential for Roman remains in the area. The majority of the known archaeological sites and features within the immediate vicinity of the pipeline were, however, of medieval and post-medieval date, and related chiefly to the agricultural exploitation of the landscape, and the establishment of post-medieval manorial and private estates. Because the proposed pipeline was aligned to follow in its entirety the carriageway of the existing metalled road surface, it limited the archaeological implications and potential impacts of the scheme. In addition, the proposed construction technique of "direct drilling" between a series of discrete pits, arranged at intervals along the line of the route, limited the potential for observation and meaningful recording of any archaeological deposits. Williams, B Gloucester : Gloucestershire County Council Archaeology Service, Report: 473.3.7 2008, 12pp, colour pls, figs, tabs, refs

*Work undertaken by:* Gloucestershire County Council Archaeology Service

A desk-based assessment of land adjacent to the Shambles museum was carried out. The work had been requested in order to assess the character, distribution, importance and survival of any archaeological remains across the site and the surrounding area. The study of available sources, mainly historical, archaeological and cartographic, indicated that there was potential for archaeological deposits existing within the study area. Archaeological field evaluations previously undertaken within the study area showed evidence of post-medieval truncation due to levelling and building work, however, this may have been localised. Parts of the proposed development area had remained relatively untouched and undeveloped, due to the sites proximity to the Old Court and being in the vicinity of the former Priory. There was significant potential here for the survival of archaeological deposits. The buildings on the site may also have had some historical value. [Au(abr)]

Stratford, E Gloucester : Gloucestershire County Council Archaeology Service, Report: 477.48 2008, 26pp, colour pls, figs, tabs, refs

*Work undertaken by:* Gloucestershire County Council Archaeology Service

The study area lay within the historic core of Gloucester city, and focused on areas that had experienced only relatively slight levels of truncation. Archaeological and historical evidence indicated that there was a high potential for the survival of archaeological features and deposits from the Roman, medieval and post-medieval periods throughout the study area. Significant archaeological deposits had been recorded from depths as shallow as 0.45m below ground level and were widely recorded at depths of around 1m below ground level across the study area. Any excavation below a depth of 0.45m from ground level therefore had the potential to disturb significant archaeological deposits. [Au(abr)]

**LAND AT CATHEDRAL VIEW, ARCHDEACON STREET*****An Archaeological Desk- Based Assessment of Land at Cathedral View, Archdeacon Street, Gloucester***

Arnold, G Gloucester : Gloucestershire County Council Archaeology Service, 2008, 28pp, colour pls, figs, tabs, refs

*Work undertaken by:* Gloucestershire County Council Archaeology Service

A desk-based assessment of land at Cathedral View was carried out. The work was requested in order to assess the character, distribution, importance and survival of any archaeological remains across the site and the surrounding area, and to assess the impact of the proposed development on the nearby Scheduled Monument of St. Oswald's Priory. The study of available sources indicated that there was a high potential that archaeological deposits dating from the Romano-British period and medieval periods may have existed within the study area. There was also evidence that the area was used as a burial ground from the Roman, Anglo-Saxon and medieval periods. However, successive phases of development and road realignment in the post-medieval and modern periods may have truncated earlier archaeological deposits. Archaeological field evaluation may have helped to ascertain the presence, character and survival of any archaeological deposits on site. [Au(abr)]

Etherdige, D Kingswood : Avon Archaeological Unit, 2008, 34pp, colour pls, figs, tabs, refs

*Work undertaken by:* Avon Archaeological Unit

The site was found to have been under agricultural use until the 19th century. Non-systematic walkover of the site noted the presence of one sherd of probable medieval earthenware, one broken prehistoric flint blade, and one fragment of probable Roman glass, together with moderate amounts of later post-medieval ceramics, glass and ferrous slag. No modern intrusive archaeological work had been undertaken neither within or adjacent to the study area. [Au(adp)]

Bryant, A Salisbury : WA Heritage, Report: 69640.02 2008, 18pp, figs, tabs, refs

*Work undertaken by:* Wessex Archaeology, WA Heritage

The site was situated within an area where human activity since the later Bronze Age/iron Age period was well attested in the form of settlement activity in the area of Bishop's Cleeve. Cropmark evidence from within the study area indicated the presence of archaeological features, possibly of further settlement activity of these dates. The 19th century buildings of Wingmoor Farm were a partial survival of much more extensive range of farm buildings which were constructed. The farmhouse and the outbuildings were historic structure which remains largely unchanged since their construction in the mid to late-19th century. [Au(abr)]

**PROPOSED PARK AND RIDE SCHEME, HIGHNAM*****An Archaeological Desk-based Assessment of Land for the Proposed Park and Ride Scheme, Highnam, Gloucestershire***

Williams, B Gloucester : Gloucestershire County Council Archaeology Service, Report: 476.35.6 2008, 25pp, colour pls, figs, tabs, refs

*Work undertaken by:* Gloucestershire County Council Archaeology Service

An archaeological desk-based assessment of two potential park and ride sites at Highnam was undertaken. The desk-based assessment assessed the character, distribution, importance and survival of any archaeological remains across the site and the surrounding area. The study of available sources, mainly historical, archaeological and cartographic, indicated that the site had been utilised as agricultural land in the post-medieval and modern

periods. There had been no modern development on the site, and therefore the potential remained for undisturbed archaeological deposits dating from the prehistoric to post-medieval periods. Further archaeological work may have helped to ascertain the presence, character and survival of any archaeological deposits on site. [Au(abr)]

Etheridge, D Kingswood : Avon Archaeological Unit, 2008, 32pp, colour pls, figs, tabs, refs

*Work undertaken by:* Avon Archaeological Unit

Cleeve was formerly a tithing in the ancient Parish of Yatton, and part of the medieval Manor of Yatton that belonged to the Bishop of Wells until the later 16th century. It then passed through a brief succession of private hands, and by the later 18th century was the property of Earl Poulett. The manor was bought by the Rev. T. S. Biddulph, c. 1819, who constructed Cleeve Court house and gardens c. 1820 and laid out an area of parkland to the West and South. The house was noted for the re-use of ornamental stonework from the medieval manor house of Court de Wyck, Claverham, which Collinson had described as ruinous in 1791. Cleeve Court went through a succession of owners in the 19th and 20th centuries, of which the most notable was Robert John Sinclair, 1st Baron Sinclair of Cleeve, who acquired the estate in 1927. A study of the cartographic evidence indicated the initial size of the garden was smaller than it later became. It was extended to the south-west between 1840 and 1884, and had acquired its present shape by 1946. The house itself may have been extended with the addition of the south-east wing in the 19th century, and a more recent extension on the north-east corner had been added between 1975 and 1995. A review of the archaeological evidence within a 500m radius of the study area found that Cleeve Court house was a Grade II Listed Building. The gardens and former parkland of Cleeve Court were of local historic interest, but may also have been a consideration as a curtilage to the Listed house. There were also two Scheduled Ancient Monuments in the vicinity. Both were Iron Age earthworks. Other evidence indicated that buried settlement remains and landscape features relating to medieval and earlier post-medieval occupation may have been preserved in the vicinity of the study area. Aerial photographic evidence found nothing further of archaeological significance within the study area. At least two features were observed, one an earthwork and the other a vegetation mark, which could have indicated the presence of buried archaeological remains in the vicinity. A visit to the Study Area identified nothing further of archaeological significance within the house and garden of Cleeve Court. [Au(abr)]

Janik, J Kingswood : Avon Archaeological Unit, 2008, 144pp, colour pls, figs, tabs, refs

*Work undertaken by:* Avon Archaeological Unit

The study area comprised a large stone farmhouse fronting onto Stock Lane, with a modern extension to the rear set around a central courtyard. A manorial survey noted a farmstead on the site of the present building as early as 1567; the earliest cartographic evidence showing the specific study area dated from 1820, with subsequent maps and plans dating to between 1836 and 1925 showing that the northern, eastern and southern boundaries of the site had remained the same. The western boundary was created by the division of a larger original plot. Nearby archaeological finds and sites dating from the Roman, medieval, and post-medieval periods, culminating with two nearby WWII US troop camps had been discovered.

Of particular interest was the discovery of an 11th century figural carved stonework found near the eastern boundary of the site, interpreted to represent part of a shrine to St. Cyngar. The aerial photographic coverage of the Study Area and its environs from the 1940s onwards showed the remains of obsolete field boundaries documented on the 1820 parish map, as well as an abundance of post-medieval land drainage channels, or gripes. Some possible remains of earlier field systems could also be seen. On the basis of the documentary and cartographic evidence examined, it was concluded that there was significant potential for the preservation of buried archaeological deposits within the study area. The archaeological implications were amplified by the favourable fen-edge location of the site, as well as the nearby discovery of nationally important late Saxon carved figural stonework suggesting a late Celtic ecclesiastical site nearby. Cottam, S Bradninch : AC archaeology, 2008, 11pp, colour pls, figs, tabs, refs, CD

*Work undertaken by:* AC archaeology

An assessment of the Plymouth City College site was carried out. The site occupied the former Devonport and Stonehouse Railway Station [later to become King's Road Station], which was constructed in 1876 and closed in 1964. Prior to the construction of the railway station, historic maps indicated that the site was mainly agricultural land belonging to the rector of Stoke parish church. Within the south-west part of the site two buildings were present in 1842, although one of these [Rectory House] might have been just beyond the boundaries. Also in this area a narrow inlet for Stonehouse Pool was shown on early maps, which was probably infilled when a railway embankment was constructed. The construction of the railway station in 1876 clearly involved large scale landscaping, building and engineering works, and these were likely to have removed any traces of earlier occupation that might have existed on the site. Likewise, when the college was constructed the majority of the former railway features were demolished and the site seemingly levelled. Nevertheless, there were still surviving elements from the railway station, including a bridge and retaining wall beneath Paradise Road with their decorative railings, a stone bridge across Corea Terrace, a railway embankment leading to Stonehouse Pool and a metal footbridge across the railway line from Stoke parish church to Providence Place. Townsend, A Bristol : Bristol & Region Archaeological Services, Report: 1922/2008 2008, 41pp, colour pls, figs, tabs, refs

*Work undertaken by:* Bristol & Region Archaeological Services

Evidence gathered during the assessment suggested that the area comprised agricultural land during the medieval period, known to have included several areas of settlement including nearby Monkton Park and Cocklebury Farm. The Chippenham Secondary and Technical School opened in 1900 and subsequently underwent considerable expansion in the 20th century, culminating in the Wiltshire College that occupied the land at the time of study. Portions of the study area, however, appeared to have remained under agricultural use until the mid-20th century. It was likely that structures, features or deposits of archaeological interest were present within the burial environment of the study area, including those of an agricultural origin and demolished buildings. Possible vestiges of ridge and furrow cultivation were observed during a rapid walkover study. The northern flank was partly demarcated by a masonry boundary wall of unknown date. [Au(abr)]

Cotswold Archaeology Cirencester : Cotswold Archaeology, Report: 08181 2008, 16pp, colour pls, figs, tabs, refs

*Work undertaken by:* Cotswold Archaeology

The assessment determined that no archaeological sites were known to have existed within the study area, although this may have been a reflection on the lack of archaeological work. Cropmarks seen on an aerial photograph of 1975 were thought to have been geological in origin, and buildings on the site were all of a small-scale 20th century design. One hedgerow

within the site was thought to have some cultural heritage value, but was not considered to have been important. [Au(adp)]

Jordan, C Cirencester : Cotswold Archaeology, Report: 08123 2008, 26pp, colour pls, figs, tabs, refs

*Work undertaken by:* Cotswold Archaeology

The assessment determined that there was little potential for unrecorded archaeological remains prior to the construction of Adcroft House, later Trowbridge Hospital [1857] to be discovered on site. Limited prehistoric and Roman evidence had been found to the south, however there was no record of any settlement for these periods in the vicinity. The site lay outside the core of the medieval settlement, and appeared to have been under agricultural use until the 18th century. The original Adcroft House survived, although there had been later alterations and additions. The building was Grade II Listed. [Au(adp)]

Watson, S Coalbrookdale : Ironbridge Archaeology, Report: 214 2008, 25pp, colour pls, figs, refs

*Work undertaken by:* Ironbridge Archaeology

Hawkesbury was a key node on a major canal route connecting the Midlands with both northern and southern England, located at the junction between the Coventry and Oxford canals. A pumping station was built there in the 1820s. The first engine house was constructed on the site in 1821. Conventionally, this was assumed to have housed the second engine designed by Thomas Newcomen. The engine was second hand when it was installed at Hawkesbury, having previously been installed in several local collieries. An additional engine was installed 15 years later. The beam engine was removed and scrapped during the early 20th century, though the earlier engine remained in situ until 1963. [Au(abr)]

Tyler, REdgbaston : Birmingham Archaeology, Report: DRAFT 16.05.08 2008, 44pp, colour pls, figs, refs

*Work undertaken by:* Birmingham Archaeology

The assessment established that the study area had, for the most part of its history, consisted of undeveloped agricultural land related to the settlement of Stivichall to the south-east of the study area. From the mid-18th century on, the land remained in the hands of the Gregory family and post-enclosure field divisions survived down to the early years of the 20th century. The park was commandeered by the military during WWII for the situating of anti-aircraft artillery and it was thought possible that subsurface remains related to this phase of use survive. The overall archaeological potential was thought to be low. [Au(abr)]

**STOURBRIDGE SAND CAVERNS, ST. JOHN'S ROAD, STOURBRIDGE*****Stourbridge Sand Caverns, St. John's Road, Stourbridge, West Midlands. Archaeological Desk-based Assessment***

Tyler, R Edgbaston : Birmingham Archaeology, Report: 1858 2008, 32pp, colour pls, figs, tabs, refs

*Work undertaken by:* Birmingham Archaeology

An archaeological desk-based assessment was undertaken in respect of a series of sandstone caverns located below St. John's Road. The caverns were due to be backfilled following a condition assessment of early 2008, which raised serious concerns regarding the long term stability of the complex. The assessment aimed to collate all existing archaeological and historic information relating to the caverns site and its immediate environs, and to establish their historical context and archaeological potential. No site inspection was undertaken as part of the assessment due to Health and Safety considerations. The assessment established that the area of the caverns remained essentially undeveloped until the middle years of the 19th century, when expanding industrialisation gradually encroached onto an area of former fields and gardens. A brewery [the Stourbridge Brewery] was established at some point between 1837 and 1851, occupying the area directly above the cavern complex. The caverns were commonly held to have been originally excavated as cellars for this brewery but, though probable, no documentary sources were identified to definitively support such a conclusion and their origins remained somewhat obscure. They certainly seemed to have been sited to exploit the proximity of the Stour River, Stourbridge Canal, the railway goods yards and associated communication networks, either for the receipt of incoming raw materials or for the export of finished products. The Stourbridge Brewery was amalgamated in 1886 to form the North Worcestershire Breweries Company, subsequently being taken over by Wolverhampton and Dudley Breweries and closed soon after 1910, at which time the caverns became obsolete and were abandoned. During World War II, the complex of caverns was refurbished to function as air raid shelters for use by the general public. Following the end of the war, the caverns were once again closed and partially infilled. The caverns were clearly of significant archaeological interest, both in terms of their original purpose and in their subsequent use as air raid shelters during the Second World War. It was recommended that a further stage of archaeological work comprising a detailed survey and

analysis of the complex be undertaken in advance of stabilisation works, which was understood to involve the backfilling of the entire cavern system. [Au(abr)]

Pikes, P J Fownhope : Archenfield Archaeology, Report: 209 2008, 28pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archenfield Archaeology

Kemble House car park in Aubrey Street was in the centre of the pre-Norman town of Hereford. A marshy feature, known as the King's Ditch, was present in the area but its precise location was unknown. There was conflicting evidence about the probability of this feature underlying the site itself, which only further investigation will be able to resolve. If the King's Ditch underlay the site, then waterlogged archaeological deposits dating back to the end of the Devensian Ice Age were likely to be present. If it did not, then shallower archaeology originating in the first settlement of the town, probably in the 8th century, should be expected. In either case, archaeological structures and deposits of importance were likely to be present. [Au]

**FORMER STUDLEY GARAGE, BIRMINGHAM ROAD, STUDLEY**

***Archaeological Assessment of the Former Studley Garage, Birmingham Road, Studley, Warwickshire***

Greig, I Warwick : Warwickshire Museum Field Services, Report: 0811 2008, 1p, colour pls, figs, tabs, refs

*Work undertaken by:* Warwickshire Museum Field Services

An assessment of the former garage site revealed that it lay on the west side of the Roman Road, Ryknild Street, and probably within the precinct of the medieval Studley Priory, the main buildings of which lay further east. The existing drive to Priory Farm along the south side of the site was probably the medieval entrance with a gatehouse at its western end. The south-west corner of the site may have contained remains of this, an adjacent hospital building recorded in documents, and a precinct boundary wall. After the dissolution of the

priory the site remained agricultural land until the 20th century. The frontage area had been disturbed by fuel tanks and services connected with the garage. [Sec(abr)]

Greig, I Warwick : Warwickshire Museum Field Services, Report: 0839 2008, 1p, colour pls, figs, tabs, refs

*Work undertaken by:* Warwickshire Museum Field Services

An assessment of a proposed development site south of Tollgate Farm in August 2008 revealed no evidence of significant archaeological remains within it, apart from a diverted section of the Banbury Road, a former turnpike. In the middle ages the site lay within the open fields of Bishop's Tachbrook. It was enclosed by c.1800 and had remained as fields since then. [Au(abr)]

Blackwell, R Cirencester : Cotswold Archaeology, Report: 9995 2008, 29pp, colour pls, figs, tabs, refs

*Work undertaken by:* Cotswold Archaeology

The estate of Bentley Moor was found to date to the early medieval period. A rectangular wet moat was thought to be the focus of the site, perhaps where the medieval manor house was located. The earliest building recorded was Bentley Lodge, shown on the Tithe map of 1838, with the Manor recorded within the site constructed in the 19th century and demolished in the 20th century. Three buildings survived within the site, a single-storey building at the centre and two single-storey buildings at the northern end. There was some potential for previously unrecorded archaeological remains to be encountered. [Au(abr)]

Boucher, A Hereford : Archaeological Investigations Ltd., Report: 783 2008, 11pp, colour pls, figs, refs

*Work undertaken by:* Archaeological Investigations Ltd.

The assessment established that the cable run across the drive on the site, a ruined multi-period manor house with extensive landscaped gardens, may have exposed earlier drives, that could be usefully recorded. The cable run on the east ha-ha was near where a feature was shown on a 19th century map. The third location on the south side of the stable block was thought possible to contain evidence for possible earlier boundaries. The overall impact on the site was thought to be neutral. [Au(adp)]

**ST. MARY AND ALL SAINTS CHURCH, KIDDERMINSTER*****Desk-based Assessment of St. Mary and All Saints Church, Kidderminster, Worcestershire***

Hancock, E Worcester : Worcestershire County Council Historic Environment & Archaeology Service, Report: WSM38548 2008, 17pp, colour pls, figs, tabs, refs

*Work undertaken by:* Worcestershire County Council Historic Environment & Archaeology Service

A desk-based assessment was undertaken at St. Mary and All Saints Church. The church of St. Mary and All Saints was the most likely location of the Saxon Minster known to have existed in this area. The GPR survey found a large anomaly just to the north of the present church that appeared to be the remains of a building. The potential for the anomaly detected in the GPR survey to be the foundations of a medieval or earlier building was high. Cartographic evidence from 1753 onwards was good and there was no suggestion of a building having existed here during this period. This suggested that any building on the site predates this period and had been demolished prior to 1753. As the practice of constructing ancillary buildings, such as church houses within the curtilage of ecclesiastical buildings had died out by the post-medieval period, it would seem likely that any remains of standing structures on this site were medieval or earlier in date. The other possible source of the anomaly was a large burial vault or vaults. 18th and 19th century vaults tended to be substantial brick built structures and often of some considerable size. However, analysis of the GPR results and consultation of documentary sources relating to the burials within the churchyard indicated that the anomaly was unlikely to result from a vault. [Au(abr)]

*Work undertaken by:* Northern Archaeological Associates

An appraisal was carried out for the proposed rehabilitation of water mains within the Beverley area. The groundwork necessary for the project had the potential to disturb archaeological features or deposits, and would be carried out within the carriageways, footways and verges of public roads. Any remains encountered would be likely to have suffered a degree of truncation. Furthermore, the impact of the refurbishment would be limited to the areas of the launch and reception pits. Hunt, L Leicester : University of Leicester Archaeological Services, Report: 2008-147 2008, 42pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Leicester Archaeological Services

The assessment was carried out in advance of development of the site. The area around the site was fairly rich in archaeology, with Roman find spots, the nearby line of a Roman road and the site of a Late Iron Age/Roman villa site in the vicinity. A Roman burial, medieval encampments and the site of a Bronze Age burial were also known, and as a result, the potential for the discovery of archaeological remains on the site, particularly dating from the later prehistoric and Roman periods, was thought to be moderate to high, with a lower potential for medieval archaeology. Burrill, C Sheffield : Archaeological Research Services, Report: 2008/83 2008, 31pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Research Services

Research demonstrated that there was no evidence for pre-modern archaeological remains within the application area. Evidence for prehistoric, Roman and early medieval activity was found to be slight across the whole of the 1km research area. Map regression indicated that the majority of the site had been undeveloped land forming part of a strip field system. The only mapped features found to be within the application area was an "old coal pit" and a "well". A further two modern brick built residential structures existed in the north of the site and a raised garden area associated with the western detached property was within the application area. The only remains likely to be disturbed were possible furrows. [Au(abr)]

Bell, S Sheffield : ARCUS, Report: 1180.1(1) 2008, 30pp, colour pls, figs, tabs, refs  
*Work undertaken by:* ARCUS

A desk-based assessment of 5-7 Station Road was carried out to support a planning application for a residential development. The site consisted of two domestic dwellings built upon terraced land cut into a steep-sided slope, on the west side of Station Road. No. 5 Station Road was constructed at some point between 1968 and 1973, whilst No. 7 was constructed c. 1930. The documentary evidence suggested that these buildings were the earliest developments of what was agricultural land, which lay outside of both the historic core of the medieval town, and its later urban development following the expansion of industry in the local area, particularly the industries related to the coal-mining industry. The archaeological potential of the proposal area was considered to be low, and no further archaeological work was recommended. No. 7 Station Road was considered to be of local interest and, as the original building appeared to be largely unaltered on the basis of the external examination, it was recommended that a photographic survey be completed prior to redevelopment. Bishop, M Barnard Castle : Northern Archaeological Associates, Report: 08/77 2008, 21pp, colour pls, figs, tabs, refs

*Work undertaken by:* Northern Archaeological Associates

The proposed development site was a brownfield site, and contained standing buildings associated with the tractor factory and with the use of the site as the Ministry of Supply in the Second World War. The war buildings were considered to have been of local importance, and they related to the use of the site for filling small arms ammunition. A possible Roman site, medieval manor house, post-medieval hall and farm, and evidence for former channels of the River Don were all possibly located on the site. The proposed development would remove any remains relating to these features, and as a result further archaeological work was recommended. [Au(adp)]

***Archaeological Appraisal of 79-81 Hollis Croft, Sheffield, South Yorkshire***

Stenton, M & Thomson, J Sheffield : ARCUS, Report: 1216.1(2) 2008, 38pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* ARCUS

An archaeological buildings appraisal was undertaken at 79-81 Hollis Croft. The site comprised two areas, Plot 1, Nos. 79-81 Hollis Croft and their associated yard, and Plot 2, the car park to the west. The site, including the standing buildings, was examined in terms of its

historical development and the nature of the built structures standing at the time of the survey. Hollis Croft remained undeveloped until the 18th century. Within Plot 1, structures dating from this period were demolished during the mid-19th century redevelopment of the street frontage and were replaced by the standing buildings that continued to occupy this area. The extent to which the 18th-century structures in the remainder of Plot 1 were demolished or were incorporated into later buildings was unclear. A date stone on the Hollis Croft frontage indicated that Plot 1 was named Industry Place following its mid-19th century redevelopment. However, the site was known as the Toledo Works by 1890 and it retained this name until at least 1974. Small tool manufacture had been recorded within Plot 1 in 1876 but the works were a cutlery factory by 1888. Cutlery production continued at the site in 1922, but the works were then associated with bread platter production until the final quarter of the 20th century. Within Plot 1, the most significant sub-surface archaeological potential related to an 18th-century building that stood in the works yard and a late-19th-century building and chimney that stood along the south-east site boundary. Following the demolition of these structures, the sites were not redeveloped. The potential for survival of 18th and 19th-century sub-surface archaeological deposits in these areas was considered to be high. Buildings at No.87 Hollis Croft, along the street frontage of Plot 2, during the 1780s appeared to have remained extant in 1976, but had been demolished by 1981. These buildings were the premises of the Bacon cutlery works between 1862 and 1974. However, the buildings throughout the remainder of Plot 2 appeared to have been occupied by a succession of small-scale cutlery manufacturers known as "little mesters", who operated independent workshops and typically provided services to the larger cutlery firms. The majority of the 18th-century buildings to the rear of the street frontage of Plot 2 remained extant in 1976 but had been demolished by 1981. The plot had been cleared of all buildings by 2004. However, due to the lack of subsequent redevelopment throughout the plot, the potential survival of subsurface archaeological deposits within the present-day car park was considered to be high. The assessment of the surviving standing buildings identified the main existing elements to date to the post mid-19th century, although modern surface finishes obscured the extent to which 18th century fabric had survived, or been re-used. [Au(abr)]

*Work undertaken by:* Northern Archaeological Associates

The site was found to have been agricultural in nature until the 18th century, when large-scale quarrying, mining and milling occurred. A railway line was opened in 1884, signifying the increasing development of the area, with expansion of the quarry through the 19th and 20th centuries. The development would have no significant impact on the visual setting of the Scheduled prehistoric stone settlements at Castle Stead Ring some 1.3km west of the site and Catstones Ring some 2km to the north. The extensive quarrying would have removed all traces of archaeological activity at the site. [Au(adp)]

The assessment demonstrated that cropmarks or ring ditches, enclosures and linear features existed throughout the site, and two Roman roads ran through the eastern end of the proposed development area. Finds from the Iron Age to post-medieval periods were known to have been found during fieldwalking. The area was enclosed during the 18th and 19th centuries and had been little altered since, giving a high potential for previously unrecorded remains to be encountered. [Au(adp)]

*Work undertaken by:* Allen Archaeological Associates

A small number of artefacts had been recovered from the surrounding area. A peat horizon formed in the area during the Iron Age. At some stage following the creation of peat in the Iron Age/Romano-British periods, the site became marginal marshy ground unfit for habitation, although occasional use as summer pasture for livestock could not be ruled out. This situation was likely to have continued up until the creation of canalised New River Ancholme in the 17th century. The conclusion of the study was that there was a low potential for prehistoric remains and negligible potential for Romano-British remains. [Au(abr)]

Speed, G Barnard Castle : Northern Archaeological Associates, Report: 08/05 2008, 31pp, colour pls, figs, tabs, refs

*Work undertaken by:* Northern Archaeological Associates

The proposed development area contained a total of 55 archaeological sites or stray finds within a 1km radius, including four Scheduled Monuments. These comprised Aldborough Roman Town and Aldborough Cross, the site of Roecliffe Roman Fort and the Devil's Arrows standing stones. The site lay close to a number of areas where widespread remains of earlier and later Roman "ritual" funerary, settlement and agricultural features had been recorded. Geophysical survey had also revealed a number of previously unknown linear anomalies. The eastern part of the site had been extensively truncated, with a low archaeological potential because of this. Within the field comprising the western part of the proposed development area, it was recommended that at least a topographic survey should be carried out to record the extensive earthwork remains. [Au(adp)]

Buglass, J Northallerton : JB Archaeological Services, 2008, 28pp, pls, figs, tabs, refs

*Work undertaken by:* JB Archaeological Services

The assessment was carried out in response to proposals for the construction of a Heritage Centre for the Washburn Heritage Group. Fewston was a historic settlement dating to at least the 11th century. There were ten known 19th century graves laying within the proposed development area of the churchyard, with potential for further, unmarked graves to be found that may have dated back to the medieval origins of the church. A lower potential existed for other buried structural remains. The proposed development would have a major impact on any known and unknown remains, and appropriate mitigation was advised. [Au(adp)]

The assessment found evidence for a hospital set in an isolated roadside position north of the medieval town of Ripon. At the time of foundation in the 12th century, the hospital site probably contained several buildings set within a banked enclosure. One of the buildings frequently mentioned in the 14th century accounts was a leper house, later dismantled, with its stone and timber used for the construction of a chamber inside the main hospital. Other documented buildings included the Masters house and hall. By the late-17th century, all the buildings with the exception of the Chapel had been demolished. A new almshouse or hospital was built on the west side of the road. [Au(adp)]

There were a number of sites of archaeological interest within the vicinity of the study area. To the north, the presence of an extensive Iron Age or Roman field system was suggested while there was extensive ridge and furrow which was clearly visible and was noted during the walkover survey. The walkover survey showed that the narrow nature of the fields in this area was dictated by parcelling up of blocks of land based on the ridge and furrow. The only Listed Buildings in the area were to the north of the study area. [Au(abr)]

Cooper, O Barnard Castle : Northern Archaeological Associates, Report: 08/80 2008, 20pp, colour pls, figs, tabs, refs

*Work undertaken by:* Northern Archaeological Associates

The appraisal found that archaeological remains had been recorded within the vicinity, including two Roman roads, a number of burials of probable Roman date and evidence for medieval ridge and furrow cultivation. Cropmarks of field systems, enclosures and trackways of Iron Age to Roman date had been recorded within the wider area. The c.600m section of sewer that ran south from the University was located within playing field areas, with all other unenclosed sections passing through arable land. For these sections crossing arable land, it was suggested that some form of mitigation should take place, as there was the potential to encounter previously unrecorded archaeological remains. Lewis, B Nottingham : Trent & Peak Archaeological Unit, 2008, 22pp, colour pls, figs, tabs, refs

*Work undertaken by:* Trent & Peak Archaeological Unit

The site lay within the medieval town core of Bolsover. Earlier work had located Roman industrial remains and prehistoric lithic scatters to the north of the site in the early 1990s. Immediately to the south, further excavations, had revealed archaeological horizons of potential medieval and early post-medieval date, including a rock-cut possible limekiln. The latest programme of seven evaluation trenches were located to provide a 5% sample of the development area and to assess potential boundary features of 19th century date that may have had earlier origins. The evaluation trenches appeared to demonstrate that to a depth of 450mm, well within the required maximum depth of the groundworks for the new car park, no remains of archaeological significance were present, although their presence at a greater depth could not be ruled out. Thomas, J London : The Society for the Promotion of Roman Studies, Report: 39 2008, 10pp, pls, figs, refs

*Work undertaken by:* University of Leicester Archaeological Services

Excavations began in 2007 and continued until April 2008. An east-west street sealed a mid-1st to mid-2nd century sequence comprising a timber framed rectangular building and later compacted sand floors. This represented the most easterly occurrence of 1st century activity in the town to date. [Sec(abr)]

*Work undertaken by:* Archaeological Services & Consultancy Ltd.

Geophysical data contained no evidence of settlement activity. Definitive evidence of the presence of medieval settlement plots at the proposed locations was also absent from the earthwork survey. The evaluation trenching identified four shallow gullies/ditches, three pits and six post holes at the south-east of the site. Two flint artefacts and one possible Anglo-Saxon pot sherd were recovered, although all appeared to be earlier objects incorporated into later features. Two of the gullies/ditches were parallel, 15m apart, and ran orthogonal to Station Road. The location of a medieval burgage plot could be suggested. [Au(abr)]

***An Archaeological Standing Building Survey and Trial Trench Evaluation of the Former King William IV Public House, Barsby, Leicestershire***

Richards, G Leicester : University of Leicester Archaeological Services, Report: 2008-151  
2008, 15pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Leicester Archaeological Services

An archaeological standing building survey and trial trench evaluation was undertaken of the former King William IV Public House prior to demolition and redevelopment. An initial archaeological desk-based assessment identified the building as possibly 18th century in date, of some historical interest and close to known archaeological sites. The building was in a poor state of repair have suffered fire damage and been subsequently stripped of fixtures and fittings. The building survey suggested that the building was a 20th century rebuild within the footprint of the earlier building. Despite its promising location on the fringe of the historic village core, nothing of archaeological significance was located during the archaeological evaluation. [Au(abr)]

*Work undertaken by:* University of Leicester Archaeological Services

A total of 38 trial trenches were excavated across four fields, in order to assess the potential survival of archaeological deposits. The northernmost field was found to contain several features of archaeological potential, including a linear feature that contained two sherds of Neolithic pottery. No dating evidence was recovered from other fields, although several features of possible archaeological interest were recovered, along with a number of palaeochannels. Although the trenching yielded little in the way of archaeological potential, it was apparent that one field had some potential for archaeological survival despite the obvious truncation of the features found. Dailey, M      Branston : Allen Archaeological Associates, Report: 2008/010 2008, 50pp, colour pls, figs, tabs, refs

*Work undertaken by:* Allen Archaeological Associates

An evaluation on land at Sutterton Enterprise Park was undertaken. Previous work had highlighted a significant potential for Roman archaeological remains to exist in the area. Following a geophysical survey of the site in 2007, seventeen evaluation trenches were excavated to investigate the geophysical anomalies. The fieldwork revealed a sequence of Romano-British archaeological features and deposits which were centred upon an established drainage system dating from the mid-2nd to the 4th century AD. Archaeological and environmental evidence suggested that domestic occupation and industrial activity occurred, and represented the southward continuation of a known Roman settlement. The scheme of works demonstrated that the most significant area of archaeological potential was towards the western half of the site, with mainly post-medieval and early modern drainage features truncating the eastern sector. *Work undertaken by:* Allen Archaeological Associates

Two trenches were excavated within the proposed development area. At the rear of the plot, a possible Roman pottery kiln or drying oven was exposed below a sequence of late Roman to early medieval soil horizons. Part of a possible medieval keyhole-shaped oven was also identified. A second trench inside the existing building exposed a similar sequence of late Roman to medieval soil horizons, cut by a series of substantial stone walls of medieval date, some of which were likely to relate to the documented John of Gaunt's Palace that occupied the site from the late-14th century. A proposed third trench was not excavated on health and safety grounds. [Au(adp)]

Daley, M        Branston : Allen Archaeological Associates, Report: 2008/028 2008, 59pp, colour pls, figs, tabs, refs

*Work undertaken by:* Allen Archaeological Associates

The evaluation revealed evidence for possible graves that may have reflected an eastward extension of the Roman cemetery, previously excavated in the 1980s. A second phase of Roman activity was represented by two parallel gullies that may have been associated with drainage or property boundaries. These were then sealed by successive layers of 3rd century Roman waste deposits that contained significant artefactual deposits. Post-Roman build up of silts over the site were noted, and truncated by a 14th-15th century boundary ditch containing waste pottery from a nearby production site. The remains of a 14th-15th century cellar from a demolished building was identified. [Au(adp)]

Rowe, E Saxilby : Pre-Construct Archaeology (Lincoln), Report: 08/474 2008, 13pp, colour pls, figs, tabs, refs

*Work undertaken by:* Pre-Construct Archaeology (Lincoln)

An archaeological evaluation was undertaken on land between Robey Court and the rear of 49 High Street. Two evaluation trenches were excavated. Trench 1 identified only modern disturbance, probably associated with buildings that previously stood on site. Trench 2 identified an early medieval pit and two further pits which, although undated, were likely to be early medieval also. [Au(abr)]

***Archaeological Evaluation Report: Trial Trenching at St. Catherine's Church, Lincoln, Lincolnshire***

Dailey, M Branston : Allen Archaeological Associates, Report: 2008/040 2008, 46pp, colour pls, figs, tabs, refs

*Work undertaken by:* Allen Archaeological Associates

An archaeological evaluation by trial trenching was undertaken at St. Catherine's Church at Colegrave Street in Lincoln. The trench revealed a sequence of deposits and structural remains that demonstrated nine separate phases of activity, eight of which could be dated between the 13th and 16th centuries. Multiple phases of structural remains were encountered, separated by demolition deposits and naturally accumulated silts. This sequence attested to a continued programme of redevelopment on the site interspersed by clearance and periods of abandonment. The most significant building remains were dated to the 14th century and consisted of a wall foundation, floor surface and a stone-lined culvert containing a ceramic water pipe. The pipe was believed to form part of the St. Katherine's priory fresh water system that had been encountered during previous archaeological work in the surrounding area. The latest phase of building was represented by a wall with a possible internal buttress and associated floor surface dating to the 15th/16th century. [Au(abr)]

Allen, M & Chavasse, P Branston : Allen Archaeological Associates, Report: 2008/005 2008, 49pp, colour pls, figs, tabs, refs

*Work undertaken by:* Allen Archaeological Associates

An archaeological evaluation and photographic survey was undertaken in advance of a residential development on land at the Upper Witham Drainage Board building off St. Catherine's Road in Lincoln. The site was situated in the area of the southern suburbs of the Roman and medieval city, on land once occupied by the former St. Katherine's Priory and a later manor belonging to the Grantham family. Three evaluation trenches were excavated, revealing a number of inhumation burials, and a substantial stone-built wall probably associated with St. Katherine's Priory or St. Sepulchre's Hospital. Fragments of ecclesiastical stonework and painted medieval window glass provided further evidence of the nature of the structures that are likely to have existed on the site. Pottery, brick and tile dating indicated the cemetery and substantial wall were likely to have been abandoned around the time of the Dissolution in the mid-16th century. [Au(abr)]

***Land to the North of Boston Road, Sleaford, Lincolnshire. Archaeological Evaluation***

Rowe, M Saxilby : Pre-Construct Archaeology (Lincoln), Report: 422 2008, 30pp, colour pls, figs, tabs, refs

*Work undertaken by:* Pre-Construct Archaeology (Lincoln)

An evaluation was undertaken on land to the north of Boston Road, near Sleaford. Extensive evidence of activity of the Roman period, spanning the mid-1st to late 3rd centuries AD was recorded. The observed evidence consisted of several large pits, some re-used as rubbish pits. Boundary and possible enclosure ditches, gullies and post holes of possible structural origin, possible "working hollows" and furnace or oven pits were recorded. Two inhumation burials of Roman date and a possible truncated/disturbed cremation burial were also observed. A large amount of residual material was identified within the plough soil, including fragments of ceramic building material and limestone blocks, providing evidence that some structures and associated occupation may have occurred at this location. Both the residual material and the buried remains were concentrated in the southern third of the site and extended the full width of the site alongside the Boston Road. The results of the evaluation indicated that the southern third of the site was densely utilised and possibly occupied during the Roman period and that the intensity of land use diminished notably to the north, although enclosures and field systems may have been anticipated in this area. Evidence of medieval ridge and furrow agriculture was also recorded as well as post-medieval field boundaries. Although the archaeology was considered to be of local and possibly regional significance, no remains were identified that would preclude a proposed development of the area, provided that a suitable mitigation strategy was in place to ensure preservation of the most significant remains by record. Dailey, M & Chavasse, P Branston : Allen Archaeological Associates, Report: 2008/031 2008, 28pp, colour pls, figs, tabs, refs  
*Work undertaken by:* Allen Archaeological Associates

An evaluation was carried out on land to the south of Winton Road in Navenby. The site was situated approximately 350m to the west of the High Dyke, a former Roman road, in an area that had seen successive programmes of archaeological fieldwork in advance of residential development. This work encountered evidence of former activity, including settlement and burial remains, dating from the Neolithic to the Anglo-Saxon period, with an extensive and important Roman roadside settlement aligned upon the Roman road. Four trenches were excavated in order to assess the archaeological potential of the development area. The trenching identified two Early Middle Bronze Age pits, and a number of undated ditches and gullies. The Early Middle Bronze Age pits encountered during this scheme of works indicated low density prehistoric activity in the area. Without dateable material it was not possible to comment on the date or function of the linear features. [Au(abr)]

Rowe, M Saxilby : Pre-Construct Archaeology (Lincoln), Report: 08/424 2008, 24pp, colour pls, figs, tabs, refs

*Work undertaken by:* Pre-Construct Archaeology (Lincoln)

The evaluation recorded a succession of alluvial silt deposits, some of which contained material mostly dated to the late-17th-19th century, extending below the practical limit of excavation. These deposits were overlain by a succession of 19th-20th century deposits of made ground and former surfacing. The evidence gathered from this evaluation seemed to indicate that development of the site may have originally spilled over the medieval flood defences of Roman Bank after the canalisation of the River Welland. Initially this involved at least one episode of dumping to raise ground level, prior to construction probably not before the 18th-19th century. The evaluation provided no evidence of pre-17th century activity due to the depth of made ground covering the site. [Au(abr)]

Rowe, M Saxilby : Pre-Construct Archaeology (Lincoln), 2008, 15pp, colour pls, figs, tabs, refs

*Work undertaken by:* Pre-Construct Archaeology (Lincoln)

An evaluation was carried out on land adjacent to Castle Quarry. A total of eleven evaluation trenches were excavated across the proposed extension area targeted on the results of a geophysical survey. For the most part the identified geophysical anomalies were confirmed to be of human origin. All eleven trenches identified at least one feature, and these appeared to be evenly, but thinly spread across the extension area. The features identified included a large storage pit, and a nearby ditch dated to the Middle Iron Age, recorded towards the south-west limit of the site. This confirmed the presence of Iron Age remains that were speculated (a known middle Iron Age site was identified within the existing quarry in the 1960's). A series of other, undated, ditches were also found including; a broad, deep ditch, which appeared to make use of the natural contours of the hill-side, and a distinct V-profile ditch which, in profile and plan, was characteristic of a Roman 'military style' ditch, possibly indicating the presence of a temporary marching camp. Apart from the two features dated to the Iron Age, only one other, a possible pit, was securely dated to the Roman period. Other identified features, including shallow ditches, drains, pits, a possible quarry pit and a single post hole, remained undated. [Au(abr)]

Keal, L Saxilby : Pre-Construct Archaeology (Lincoln), 2008, 35pp, colour pls, figs, tabs, refs  
*Work undertaken by:* Pre-Construct Archaeology (Lincoln)

Monitoring of the excavation of 10 test pits and an evaluation was carried out of land at 16 High Street, Caistor. The majority of the evaluation revealed evidence of widespread truncation and made ground relating to post-medieval terracing of the site. A group of human burials of probable Roman date was identified towards the centre of the site. These appeared to have been affected by the terracing. Limited evidence of frontage occupation predating the Talbot Inn was revealed within the footprint of this property, surviving to the east of existing cellars. It was concluded that a specifically designed foundation, proposed by the developer, and a scheme of monitoring works would mitigate any potential detrimental effects that redevelopment may have upon the archaeological resource. ***610mm Natural Gas Cross Country Pipeline From Grayingham, Lincolnshire To West Burton, Nottinghamshire. Results of Archaeological Evaluation by Trial Trenching At Knaith Park And Blyborough, Lincolnshire***

Sherlock, S & Cox, P Chicklade : AC archaeology, 2008, 24pp, colour pls, figs, tabs, refs

*Work undertaken by:* AC archaeology

Eight evaluation trenches were excavated in September 2008 at two locations in Lincolnshire on the route of the proposed Grayingham to West Burton gas pipeline, to be constructed in 2009. At Knaith Park six trenches were excavated to test the results of geophysical survey and fieldwalking which had identified the presence of sub-surface magnetic anomalies and surface artefacts indicative of archaeological deposits at the site. Here trenches 3/4 and 6 revealed two areas of burning containing iron slag and associated material, considered to have resulted from iron smelting and smithing on the site. A small quantity of associated pottery suggested that the activity was of Roman or later date. At Blyborough the two trenches revealed no evidence for sub-surface archaeological deposits and the magnetic anomalies were believed to be of geological origin. [Au(abr)]

### **DAVENTRY WIND FARM, YELVERTOFT**

***Archaeological Evaluation: Daventry Wind Farm, Yelvertoft , Northamptonshire***

Bain, K Edinburgh : Headland Archaeology Ltd., 2008, 14pp, colour pls, figs, tabs, refs

*Work undertaken by:* Headland Archaeology Ltd.

A program of archaeological evaluation was undertaken at Daventry Wind Farm, ahead of the submission of an Environmental Statement for a proposal for the erection of eight new wind turbines. The site was deemed to be of archaeological potential as there were numerous sites ranging from the prehistoric through to the medieval period in the surrounding area. Upstanding elements of possible medieval cultivation practices were also preserved within its boundaries in the form of areas of ridge and furrow. A total of 16 trenches were excavated across the site, only one of which, Trench 9, contained any features or deposits of an archaeological nature. Here the bases of two very shallow linear plough furrows were observed toward the northern end of the trench. No further archaeological features or

deposits were identified during the course of works which was thought to represent a genuine absence of below ground features within the monitored areas, rather than their destruction by outside influences. [Au(abr)]

Morris, S Northamptonshire Archaeology : Northamptonshire Archaeology, Report: 08/217 2008, A4, blue spine, heat bound, clear cover

*Work undertaken by:* Northamptonshire Archaeology

"The detailed geophysical survey identified three parallel linear anomalies, probably drainage features. The fieldwalking recovered a single Mesolithic flint implement. The earliest ceramic material recovered were six fragments of Roman tile. The medieval finds include three sherds of pottery and one from a glazed tile. A moderate number of post-medieval pottery sherds were also recovered concentrated to the northern side of the field. The majority of the roof tile was post-medieval in date, which formed a moderate scatter, and two pieces of metalworking debris. Other finds included a fragment of 18th/19th-century wine bottle glass and an agricultural implement of undetermined date. The majority of the finds were probably related to field manuring." [OASIS]

Morris, S, and Walford, J Northamptonshire Archaeology : Northamptonshire Archaeology, Report: 08/81 2008, A4, heat bound, blue spine, clear cover

*Work undertaken by:* Northamptonshire Archaeology

"Northamptonshire Archaeology conducted geophysical survey followed by archaeological excavation on land off the 'Old' Bedford Road, Little Houghton, Northampton. The geophysical survey was not greatly informative, although the data may represent ditches. Two trenches were excavated, one of which revealed a curvilinear gully and three ditches of late Iron Age, early 1st century AD, date and a Roman ditch of probable late 1st-century date. Dominating both trenches were three large Victorian rubbish pits, from which substantial sized sherds of 18th- century Chinese export porcelain were retained." [OASIS]

Butler, A Northamptonshire Archaeology : Northamptonshire Archaeology, Report: 08/70 2008, A4, blue spine, heat bound, clear cover

*Work undertaken by:* Northamptonshire Archaeology

"Northamptonshire Archaeology conducted geophysical survey, on behalf of CLASP, on archaeological sites considered to contain Roman villas at Barn Close and Harpit, near Harpole, Northamptonshire. At Barn Close, gradiometer survey revealed a succession of likely ditched field systems, at the centre of which earth resistance surveys identified the remains of a probable Roman courtyard villa. Two kilometres south at Harpit, further field systems were detected by gradiometry, but resistance survey identified few indications of masonry structures." [OASIS]

*Work undertaken by:* Pre-Construct Archaeology (Lincoln)

A programme of archaeological trial trenching was undertaken on land off Portland Street. The site was located within the historic core of the medieval village of Mansfield Woodhouse. Five trenches were opened, though one had to be split in two due to the presence of a standing wall. Four trenches contained boundary walls that still survived as earthworks. One contained two small pits and another contained a large linear feature and a single human grave. Made ground was present in Trench 4 A and Trench 3. Overall it was concluded that the archaeological potential of the site was not high. [Au(abr)]

Parker, N Sleaford : Archaeological Project Services, Report: 80/08 2008, 15pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Project Services

The evaluation revealed two parallel linear features containing sherds of medieval pottery, and two smaller roughly circular features, possibly pits or tree holes, were also identified. One of these possible pits contained pieces of medieval pottery and bone. Notably, pottery from the linear features was fairly abundant, and mostly as large fragments. This suggested that it was discarded from the settlement that was located very close to the site. [Au(adp)]

Gregson, R Bedford : Albion Archaeology, Report: SB1352 2008, 26pp, colour pls, figs, tabs, refs

*Work undertaken by:* Albion Archaeology

An evaluation at the site of a proposed residential development at the former St. Bede's School site was undertaken. The site was located within an area of archaeological potential and was nearby to the site of Greyfriars Friary and to the south, a possible medieval moated site. Archaeological features were found in three of the four trial trenches comprising several post holes, pits, linear features and structural remains. All features were dated by artefact or circumstantial evidence to the post-medieval or modern periods. The evidence from the trial trenching suggested that the site of the proposed housing development area contained little or no significant archaeological remains. [Au(abr)]

***Land at Bromham Mill, Stagsden Road, Bromham, Bedfordshire. Archaeological Field Evaluation***

Newbould, J Bedford : Albion Archaeology, Report: 2008/94 2008, 34pp, colour pls, figs, tabs, refs

*Work undertaken by:* Albion Archaeology

The evaluation took place within the grounds of Bromham Mill and the mill house garden, close to extant 18th/19th century structures which formed part of this long lived mill. Documentary sources suggested this land may have been used for milling since the early medieval period. An early reference (AD1247) recorded that a woman drowned near the mill wheel at Bromham. Previous investigations revealed undated, truncated structural remains within the yard area of the development area (immediately north of its entrance on Stagsden Road). These were interpreted as the remains of former buildings associated with the mill. Bromham Mill and the land adjacent to the bridge has also been considered as the putative site of the Bromham chantry chapel (founded in AD1295 and dedicated to St. Mary and St. Katherine). Within the mill house garden, the evaluation revealed part of an undated structure and a post-medieval ditch containing a small quantity of 17th-18th century pottery. A post-medieval wall and a number of broadly contemporary surfaces associated with the pre-1883 mill were also revealed within the extant hovel building. These were considered to be of local significance. The undated structural remains may be part of Bromham chantry chapel. If so,

the identification of surviving elements of the chapel was of regional significance as its actual physical location had never been conclusively demonstrated before. Trenches in the northern part of the development area revealed no archaeological remains. Earlier phases of the mill were likely to be encountered nearer the extant buildings and mill yard. The potential for encountering remains in this area was low. [Au(abr)]

Osborn, V Bedford : Albion Archaeology, Report: 2008/87 2008, 26pp, colour pls, figs, tabs, refs

*Work undertaken by:* Albion Archaeology

No significant archaeological remains were discovered during the course of the evaluation. Despite the presence of modern features in two of the trenches, the area evaluated had not been significantly truncated by modern activity. The absence of activity earlier than the post-medieval period, suggested that there was a genuine lack of significant archaeological remains within the evaluation area, and was therefore extrapolated that the development area as a whole had a negligible archaeological potential. Ingham, D & Newbould, J Bedford : Albion Archaeology, Report: 2008/13 2008, 31pp, colour pls figs, tabs, refs

*Work undertaken by:* Albion Archaeology

The evaluation revealed Saxo-Norman rubbish pits and an early medieval post hole and buried topsoil, with evidence of domestic and industrial activity. Evidence of similar post-medieval activity was also discovered. A large assemblage of horn cores in a pit was evidence of specialist post-medieval activity. Two 19th century walls and the remains of modern gardens were also found. The western half of the site produced no remains earlier than the 19th century. This area had, however, been subject to intensive modern quarrying which would most likely have destroyed any earlier archaeological remains. [Au(adp)]

Preece, T Bedford : Albion Archaeology, Report: 2008/50 2008, 59pp, colour pls, figs, tabs, refs

*Work undertaken by:* Albion Archaeology

In the Western Area, six of the trenches contained features, mainly comprising ditches. A combination of location, alignment and datable finds recovered from the fills indicated evidence for Iron Age, Roman and, in particular, medieval activity in this area. There was a noticeable increase in the number of medieval features to the west, which included pits and evidence for a timber building. A significant amount of medieval pottery was recovered, indicating that the study area extended into the settlement area of the deserted medieval village of Holme. Further east there was evidence for associated medieval arable cultivation. Eight of the trenches contained features, with a concentration of activity towards the eastern margin adjacent to the A1 trunk road. This consisted of undated ditches and pits, a variable survival of furrows (characteristic of medieval arable cultivation). The evaluation confirmed the presence of features ranging in date from the Iron Age and Roman to the medieval and post-medieval periods. Preservation of the remains across the site was generally good, as indicated by the survival of features such as post holes and the depth of the features. [Au(abr)]

*Work undertaken by:* Cambridgeshire Archaeology

An archaeological evaluation was undertaken on land to the rear of 1 The High Street. Just over 6% of the development site was investigated by trial trenching. This revealed several layers representing medieval land reclamation and modern land levelling. In addition three small possible medieval pits were found indicating activity on the site close to the previous medieval street frontage. Prehistoric remains were present in the form of a previous land surface, which contained animal bone, early Bronze Age flint flakes and one fragment of disarticulated human bone. [Au(abr)]

**ST. ANDREWS SCHOOL**

***St. Andrews School, Cambridge, Cambridgeshire: An Archaeological Evaluation***

Phillips, T Bar Hill : Cambridgeshire Archaeology, Report: 997 2008, 24pp, colour pls, figs, tabs, refs

*Work undertaken by:* Cambridgeshire Archaeology

An evaluation was carried out at St. Andrews School, Cambridge, in advance of the construction of a new school building. All features cutting the loose sand were modern with the exception of pit 33, which contained three sherds of Roman pottery. There were two possible interpretations for what the loose sand could be. Firstly the loose sand may represent the unwanted material or backfill within large post-medieval quarry pits and pit 33 may have been of a later date, the pottery being residual. The second interpretation was that the sand was a water lain deposit, part of a palaeochannel or an area prone to flooding. Regardless of which interpretation is correct, there was little evidence for archaeological evidence on this site. [Au(abr)]

***An Archaeological Evaluation St. John's College Playing Fields, Cambridge***

Cessford, C Cambridge : Cambridge Archaeological Unit, Report: 893 2008, 26pp, colour pls, figs, tabs, refs

*Work undertaken by:* Cambridge Archaeological Unit

An evaluation consisting of six trenches and one soakaway was undertaken at St. John's College Playing Fields, Cambridge. The evaluation revealed a ditch and a number of gravel quarry pits, probably dating to the early Roman period. No evidence of the St. John's College Racquets Court, Anglo-Saxon cemetery or the early 13th century Franciscan and later Trinity College conduit (known to be located in the general vicinity) were present in the evaluation trenches. It was likely that the cemetery lay to the north-west of the proposed development area, while subsequent research indicated that the conduit lay in close proximity to the Bin Brook sewer trench in the middle of the site, and was not investigated. Clarke, C Twickenham : AOC Archaeology Group, Report: 30167 2008, 29pp, colour pls, figs, tabs, refs

*Work undertaken by:* AOC Archaeology Group

An evaluation was undertaken at the site of Perse Upper School, comprising five machine excavated trenches. Archaeological features were identified in two of the five trenches. Two trenches (3 and 4) contained elements of three ditches, whereas the remaining trenches contained several naturally formed tree pits. Two of the ditch sections were part of the same east-west aligned post-medieval boundary ditch, with the remaining smaller north-east-south-west orientated ditch being of uncertain function or date. The trenches also demonstrated that undisturbed subsoil and topsoil deposits survived across the site up to a depth of 0.6m. Overall, a moderate density of archaeological features were encountered, all of which were of limited significance. This, taken into account with the undisturbed soil horizons identified across the site, indicated a negligible potential for further archaeological significant features to be present. [Au(abr)]

Slater, A & Dickens, A Cambridge : Cambridge Archaeological Unit, Report: 826 2008, 67pp, colour pls, figs, tabs, refs

*Work undertaken by:* Cambridge Archaeological Unit

Eighty-six evaluation trenches were excavated across six areas. Area 1 showed slight traces of prehistoric activity, with a number of late Bronze Age/early Iron Age features relating to previously known archaeology. Medieval activity was probably related to extraction. Some evidence of post-medieval coprolite extraction was also discovered, as well as a number of unusual features that were thought to relate to medieval rabbit husbandry. Area 5 displayed the only clear evidence for Roman activity, with a series of close set planting beds. Area 6 had the widest date range, with features dating from the prehistoric to post-medieval periods. The main focus were elements of the "triple ditched" enclosure adjacent to the railway line, dated in previous work to the Middle Bronze Age. [Au(adp)]

**LAND EAST OF ST. PETER'S FIELD, BOTTISHAM*****An Archaeological Fieldwalking Survey and Evaluation of Land east of St. Peter's Field, Bottisham, Cambridgeshire. Amended***

Crawley, P Norwich : NAU Archaeology, Report: 1904 2008, 34pp, colour pls, figs, tabs, refs

*Work undertaken by:* NAU Archaeology

An evaluation was undertaken on land east of St. Peter's Field, Bottisham. The evaluation began with a small fieldwalking survey in the southern half of the development area. Two test pits were also excavated within the wooded northern half of the site. No large concentrations of finds resulted from this survey. Six evaluation trenches were then excavated across the site. Three shallow ditches and two short segments of gully were observed within the trenches. Although undated the features were sealed by a layer of subsoil, perhaps indicating

a pre-medieval date. They may have represented elements of a field system. The ditch in Trench 5 produced environmental evidence which indicated that it had existed within a managed environment. Trench 6 contained an irregular pattern of natural hollows which held small amounts of Neolithic pot. Prehistoric people often utilised naturally occurring features, although the amounts of ceramic in this case were small and could have been deposited from the overlying subsoil. [Au(abr)]

Fletcher, T Bar Hill : Oxford Archaeology East, Report: 1050 2008, 37pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology East

The investigation consisted of 6 trenches within the proposed redevelopment area of the school which was to include the construction of new buildings followed by the demolition of the modern buildings. The evaluation occurred at the pre-planning stage of the proposed development. The site lay within an area of archaeological sensitivity next to a known moat which was a Scheduled Ancient Monument (SM 33588). Trench 2, directly in front of the primary school, picked up the south-east corner of the moat, where it turned to the north-west, this had previously only been a projected location. Other archaeological features present included a linear rubble constructed feature recorded along the length of Trench 4, which may have represented a 19th century farm track visible on early OS maps, and a boundary ditch dated to the 19th century was recorded in Trench 5. **THURLOW NUNN STANDEN SITE, LISLE LANE, ELY*****Thurlow Nunn Standen Site, Lisle Lane, Ely, Cambridgeshire. Archaeological Trial Trenching Evaluation***

Germany, M Braintree : Essex County Council Field Archaeology Unit, Report: 1924 2008, 58pp, colour pls, figs, tabs, refs

*Work undertaken by:* Essex County Council Field Archaeology Unit

The former Thurlow Nunn Standen site on Lisle Lane, Ely was subject to archaeological evaluation by trial trenching in advance of its proposed redevelopment. The trial trenching established the presence of significant archaeological remains in the south-eastern corner of the site. These comprised 1.4m of vertical stratigraphy, a 14th to 16th-century gully and two late-15th/16th-century ditches. It was probable that the vertical stratigraphy was due to a combination of alluviation, the dumping of human refuse, and deliberate increases in the height of the area in order to protect it from flooding. The gully was aligned perpendicular to Lisle Lane, and may have been used as a drain and/or property boundary. The two ditches were very large and probably both in use at the same time. It was conjectured that they formed the corner of a moat or a large-ditched enclosure. The environmental remains retrieved from the ditches suggested that they had held stagnant water and that they had been surrounded by scrub and poorly-maintained weedy grassland. The trial trenching produced a wide variety of finds, although the overall quantity was small. The rest of the site contained a small number of post-medieval and modern features, probably related to its earlier use for horticultural purposes. It seems likely that the north-western and central parts of the site were severely truncated when the Thurlow Nunn Standen site was constructed in the early 1970s. It is not known if the site had been previously occupied at any point, since the trial trenching found no clear remains of buildings. [Au(abr)]

*Work undertaken by:* Archaeological Solutions

The evaluation revealed eight features, including a large north to south oriented ditch and a large sand quarry pit that appeared to have occupied a significant portion of the centre and north-east of the site. Two 19th-20th century garden features were also recorded, one of which was a pond constructed from re-used 19th and 20th century gravestones. A moderate assemblage of 12th to 14th century pottery was recovered from a ditch whose size suggested that it may have formed an important boundary in the medieval village, possibly associated with the 13th century church, or with an earlier manorial boundary on the site of the Manor. ***Kennett Hall Farm, Nr Newmarket, Cambridgeshire: An Archaeological Evaluation (Fieldwalking & Metal Detecting Survey)***

Adams, M & Brook, M Hertford : Archaeological Solutions, Report: 3179 2008, 37pp, figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

In September 2008 a fieldwalking and metal detector survey was undertaken on land at Kennett Hall Farm. The fieldwalking recovered pottery, struck and burnt flint, animal bone, ceramic building material, plough fragments, miscellaneous metal fragments, glass sherds, plastic items, and gun cartridges. The pottery comprised a prehistoric sherd, three Roman sherds and seven post-medieval sherds. The earliest pottery recovered was a single slightly abraded rim sherd and was part of a late Neolithic/Early Bronze Age 'Beaker' vessel. The Roman pottery sherds recovered were all highly abraded. With such sparse finds of Roman pottery it was unwise to identify a 'distribution pattern' and the pottery may have been associated with manuring. Nonetheless, two sherds were found in close proximity. The struck flint and burnt flint was very sparsely distributed, however, A 'concentration' was evident in the northern sector of the site (Areas 1A and 1B), the same area the prehistoric sherd was found. The site lay within a Bronze Age funerary landscape and had some potential for associated settlement. The identification of a Bronze Age post hole on adjacent land to the east was suggestive of Bronze Age activity in the area. In addition, there was some possibility of signs of transitory Mesolithic/Neolithic exploitation of the landscape. [Au(abr)]

Dickens, A Cambridge : Cambridge Archaeological Unit, Report: 853 2008, 15pp, colour pls, figs, tabs, refs

*Work undertaken by:* Cambridge Archaeological Unit

Other than a sawmill structure and bottle dump, little of interest was encountered during the investigation. It was clear however, that the site had been subjected to significant landscaping in the past with evidence for both cutting down into the prevailing topography and a build-up of redeposited clay over much of the site, raising the level by as much as 0.80m. This appeared to be an episode of deliberate and determined effort to create a level area in which to situate the Toilyard and probably took place in the later part of the 19th century. Had any archaeology from earlier periods existed on the site it would not have survived this process. The sawmill was typical of structures that would have at one time been distributed across a chiefly agricultural working landscape. The standing building on the site was constructed entirely from sawn timber and it was likely that the material for it was processed on this site at the mill. There was no evidence to indicate how the sawmill was powered. [Au(abr)]

The site had a relatively high potential for archaeological remains, particularly dating from the Roman and post-medieval periods. The principal find during the evaluation was a large ditch

containing 16th-early 17th century pottery. The size of the ditch was consistent with those located on moated or monastic sites. The remaining features comprised small ditches, gullies, post holes and pits, and were consistent with back-yard activity. Cartographic evidence had indicated dwellings on the site from the 19th century onwards. [Au(abr)]

Thatcher, C Bar Hill : Cambridgeshire Archaeology Archaeological Field Unit, Report: 1023 2009, 26pp, colour pls, figs, tabs, refs

*Work undertaken by:* Cambridgeshire Archaeology

The evaluation recorded medieval settlement features, including a boundary ditch, several pits and a metalled surface. Cartographic sources had suggested that there had been a building present on the site in 1656, and that the Old Hall overlay the site of a building and its associated yards and boundaries. A large portion of the area was truncated by post-medieval quarrying, possibly for clunch, and as a result no earlier remains were thought to have survived in the eastern part of the site. However, evidence for Roman pitting was encountered in the north-eastern part of the development area, and it was also expected that further archaeological remains would be preserved beneath the footprint of the existing parish hall, as the post-medieval quarrying did not extend into this area. Unger, S & Adams, M Hertford : Archaeological Solutions Ltd (AS), Report: Report No. 3185 2008, A4 Ring-Bound Document

*Work undertaken by:* Archaeological Solutions Ltd (AS)

"In September and October 2008, Archaeological Solutions Ltd (AS) carried out an archaeological evaluation of land at 12 Jobs Lane. A residential development is proposed for the site comprising the construction of two residential dwellings with associated garages, access and services. The evaluation was required to comply with a planning condition. The desk-based assessment showed potential for numerous periods, predominantly the prehistoric, Roman and medieval periods. The evaluation revealed a broad range of features dating from the early Bronze Age (2100-1700 BC) to the modern (1900+) period. An early Bronze Age pit a 'V' shaped Roman ditch, and a medieval pit and posthole were revealed. Several undated features including a curvilinear gully, two postholes and two pits were also excavated. The site had clearly undergone some extensive activity in the modern period as several modern rubbish pits and evidence of demolition of old buildings was revealed to the south-east area. Imported topsoil suggested landscaping of the site when the current building was constructed in the 1960's. The presence of early Bronze Age activity broadens current understanding of prehistoric activity in the area, and the presence of Roman and medieval features contributes to the picture of these periods as provided by previous archaeological work to the north of the site." House, J Bar Hill : Cambridgeshire Archaeology, Report: 1027 2008, 21pp, colour pls, figs, refs

*Work undertaken by:* Cambridgeshire Archaeology

A total of eight archaeological features were identified within a single excavated trench, three large pits and five smaller pits. The archaeology was consistent with the kind of activities expected towards the rear plots of buildings of medieval date. There was an earlier undated phase of pit features, with later medieval quarrying activity, however, the majority of the finds were domestic in nature and mostly residual. [Au(abr)]

Bailey, G Bar Hill : Cambridgeshire Archaeology Archaeological Field Unit, Report: 1033 2009, 14pp, colour pls, figs, tabs, refs

*Work undertaken by:* Cambridgeshire Archaeology

The evaluation revealed two phases of land reclamation and evidence for the canalisation of the Rover Nene. The first phase was dated via ceramic evidence to the mid to late-19th century. Evidence for further reworking of the area during the post war period was also uncovered. This level of modern intrusion and the evidence for the nature of the palaeoenvironments, indicated by the accompanying borehole survey, led to the conclusion that the area as probably unsuitable for occupation prior to the post-medieval period. The first indication of occupation did not appear until the 18th century, suggesting that the natural environment, up to this time, discouraged occupation. [Au(abr)]

*Work undertaken by:* Oxford Archaeology East

An evaluation was carried out in advance of the construction of an extension to the existing school. This evaluation involved the excavation of a trial trench aligned north-west to south-west. The trench was 12m long and 1.50m wide at both ends. The evaluation did not reveal any significant archaeological features, finds or deposits that indicated the presence of any substantial human archaeological activity occurring at the site prior to the 18th century. There were two pits containing post-medieval material and a brick built structure, clearly 19th century in date. [Au(abr)]

Phillips, T Bar Hill : Oxford Archaeology East, Report: 1048 2008, 41pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology East

A small trench was opened at the site. Over 3m of archaeological deposits were encountered, the earliest activity consisting of a ditch/terrace dating to the early medieval period, possibly relating to the castle moat. This feature was truncated by an apparently later phase of castle ground work. The fills of this feature dated to the late medieval period. Approximately 1.5m of post-medieval fills overlay this, including a mortar construction surface and two phases of a brick-built wall. The evaluation was thought to have significantly advanced the knowledge of the Norman castle, about which little was known. [Au(abr)]

Gilmour, N Bar Hill : Cambridgeshire Archaeology, Report: 1008 2008, 23pp, colour pls, figs, tabs, refs

*Work undertaken by:* Cambridgeshire Archaeology

An archaeological evaluation was carried out along part of the route of a proposed Water pipeline, which ran alongside the major Roman route of Ermine Street, through a landscape of known archaeological features from prehistory to the present. At the southern end of the route, just south of Monk's Wood farm, several ditches and other features were identified, that may represent Later Iron Age enclosures and possible settlement. These were likely to relate to known cropmarks in the same field, which had previously been identified as Roman in date. Along the remaining length of the route, to the north of Monk's Wood Farm, no significant archaeological finds of features were recorded. [Au(abr)]

***Medieval Occupation and Post-medieval Building Remains at Manor Farm, Colne, Cambridgeshire. Archaeological Evaluation***

Fletcher, T Bar Hill : Cambridgeshire Archaeology, Report: 1036 2008, 44pp, colour pls, figs, tabs, refs

*Work undertaken by:* Cambridgeshire Archaeology

An archaeological evaluation was undertaken on land at Manor Farm, Colne. Ten trenches were investigated revealing a number of early medieval pits and post holes, which may have represented occupation fronting East Street, and two undated ditches which may have been associated with these features. A large, deep feature interpreted as a pond was present in a trench to the rear of the site. A rectangular feature with timber foundations set in clay was recorded in a trench close to East Road. This feature, which may have represented a building, was on an unusual alignment which predated the current farm buildings and was dated to the 17th/18th century. [Au(abr)]

Melikian, M & Carew, T Twickenham : AOC Archaeology Group, Report: 7969 2008, 45pp, colour pls, figs, tabs, refs

*Work undertaken by:* AOC Archaeology Group

The results showed that the evaluated site could be divided into two areas. The smaller of these, along the south-west edge of the site and used as a golf driving range, had not been significantly affected by modern truncation. The larger part, occupied by buildings, had been severely affected by horizontal truncation caused by the construction and demolition of several generations of buildings since its first use by the RAF in the 1920s. Archaeological evidence appeared to have been distributed across the site, with a focus in the western corner. Truncation by the RAF base had had a marked effect on the survival of archaeological remains in the built over area. Dating evidence was not yet available, but the remains were reminiscent of a prehistoric settlement with an associated field system. Most of the features appeared to have been field boundaries, but a possible roundhouse entrance was recorded near the west corner. [Au(abr)]

Unger, S, Smith, L & Woolhouse, T Hertford : Archaeological Solutions, Report: 3004 2008, 22pp, tabs, refs

*Work undertaken by:* Archaeological Solutions

An evaluation was carried out on land at Home Farm. Evidence of Bronze Age activity had been found in the north-west of the parish. A substantial Iron Age settlement, which continued to be partially occupied into the Roman period, had been investigated in the same area. Abington Pigotts had abundant evidence of medieval settlement, with five moated sites known in the parish. The parish church was built in c. 1217 and a market was recorded in the 14th century. There was evidence that the village shifted in the later medieval period, possibly in conjunction with the Pigott family's prominence in the village. Home Farm itself lay within a moated enclosure of medieval date, the larger part of the moat located to the south-east, on the other side of a road. Cartographic sources showed that the site had been a farmyard, occupied by various agricultural buildings, since at least 1838. The Grade II Listed current barn, cart shed and granary, which were proposed for conversion, may be of late-17th to early 18th century date. Trenches 2 and 4 traversed the moat. The pottery from the basal fill of the moat was relatively recent (16th-18th century) and indicated that the moat had been cleared out. The post-medieval period saw a fair degree of building and modifications of cottages/farmhouses in the village. Home farmhouse next to the site and several of the farm buildings were built and modified in the post-medieval period, suggesting possible remains on the site of previous buildings. In the event no features contemporary with the original moat or later periods of activity were revealed. [Au(abr)]

*Work undertaken by:* Heritage Network

The development lay in the historic core of the village of Litlington, less than 250m east-south-east of the parish church of St. Catherine, which dated to the 13th century or earlier, and just to the north-west of a green space which may represent the remnants of an earlier village green. The manor of Litlington was mentioned in the Domesday Survey of 1086, and the county historic environment record detailed evidence of Late Iron Age and Roman occupation within 260m to the south of the site, including a substantial Roman villa, Saxon and medieval activity within 250m to the west of the site, and further medieval and post-medieval activity within 450m to the north-west of the site. A Mesolithic mace head and flint implements were recorded within 350m to the south-east of the site. Two trenches were excavated on the site both contained frequent rubble, glass and other assorted modern debris. Trench 1 contained a single course of brick walling which appeared to be contained within the existing topsoil. The walling was formed from a mixture of bricks including frogged and unfrogged 19th century white bricks with traces of lime mortar attached, and modern machine-made red bricks with cement mortar attached. The topsoil in this area contained brick and tile fragments, and glass. Trench 2 contained three features. Feature [201] was the base of rectangular pit measuring 0.50 x 0.48m and 0.03m deep. This contained clayey silt with frequent chalk and charcoal inclusions, and 3 pieces of metalworking slag. Feature [203] was a large cut measuring over 3.60m long, over 1.60m wide and 0.48m deep. It had vertical sides and a flat base and contained charcoal and chalk inclusions. Finds from this feature consisted of 1 sherd of modern glazed pottery, 8 fragments of brick and tile, 4 fragments of modern mortar, 1 piece of animal bone, 1 piece of flint, and 1 piece of modern bottle glass. A modern rubbish pit was also observed. [Au(abr)]

Rees, G Bar Hill : Oxford Archaeology East, Report: 1053 2008, 98pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology East

An evaluation was undertaken in advance of development. Twenty-six trenches were excavated, fifteen of which were targeted over features identified in an earlier geophysical survey. Eleven were located on previously developed land to the north-west of the site. All but two trenches contained archaeological remains. A high density of archaeology across the site

dated from the Late Iron Age to the post-medieval periods. A scatter of flints across the site suggested Mesolithic and Bronze Age activity in the area. Evidence was uncovered of two or more phases of Late Iron Age activity including settlement and associated land boundaries. The settlement appeared to have continued into the Roman period. At this time there was evidence of an intensification of activity, with a mixed farming regime, and the possible rearing of cattle and horse. A cremation burial dating to the 2nd century was uncovered, along with Roman activity across the whole site. In the north west of the development area an area of medieval activity (11th-14th century) was identified. Post-medieval garden features were identified to the south-west. [Au(adp)]

Boyer, P      Brockley : Pre-Construct Archaeology Ltd., 2008, 46pp, colour pls, figs, tabs, refs

*Work undertaken by:* Pre-Construct Archaeology Ltd.

An evaluation was carried out at the site. A large quarry pit, possibly for the extraction of clay, was cut through the subsoil and deliberately backfilled with rubbish deposits including significant amounts of building rubble, probably of 19th or 20th century date. Other features of this date were also encountered. Overall, the findings of the work were disappointing, given the archaeological potential of the site. No features earlier than the 19th century were identified, and there had clearly been recent modifications to the ground surface. [Au(abr)]

Pocock, M Braintree : Essex County Council Field Archaeology Unit, Report: 1940 2008, 28pp, colour pls, figs, tabs, refs

*Work undertaken by:* Essex County Council Field Archaeology Unit

The site was situated in close proximity to known Roman rural settlement remains, while finds of Palaeolithic implements and Pleistocene faunal remains were potentially made in nearby gravel quarries. The evaluation established the presence of both prehistoric and late post-medieval remains, but did not identify any Pleistocene/potential Palaeolithic deposits or Roman activity. Beneath a thick layer of modern debris in the southern part of the site was evidence for successive layers of hill wash built up against the steeply sloping edge of a natural gravel terrace overlooking the River Brain. Within this, presumably residual but certainly not well travelled, Neolithic worked and burnt flint and pottery were discovered. At the front of the property a large, probably late-19th century, roadside quarry pit was discovered, while the remaining areas investigated contained no archaeological features or deposits. Generally, the evidence suggested that considerable parts of the site had been affected in the past by episodes of quarrying and/ or dumping and levelling, particularly in the case of the latter at the rear of the site. However, the prehistoric remains uncovered occurred at such depth below the existing ground surface that they did not appear to have been affected by past episodes of quarrying and were unlikely to be impacted upon by the development proposals. Ennis, T Braintree : Essex County Council Field Archaeology Unit, Report: 1888 2008, 55pp, colour pls, figs, tabs, refs

*Work undertaken by:* Essex County Council Field Archaeology Unit

An evaluation was carried out at the former Bayer site located between Parsonage Street and Colchester Road. Ten Trenches were excavated, representing a 5% sample targeted on areas of new build. The investigation excluded the former Quaker burial ground, basements of the former Bayer factory, and areas of live services and ground contamination. Residual Roman finds pointed to the existence of a Roman rural settlement in the vicinity. No evidence relating to the perceived Saxon origins of Halstead was identified. Medieval remains were confined to the north-west corner of the development area. A large ditch aligned north-south probably formed the medieval eastern boundary to St. Andrew's churchyard. Pottery dated to the 14th century was recovered from the lower fills of the ditch and from a group of pits located to its east. These pits were probably associated with property fronting onto Colchester Road. Buildings on the Colchester Road frontage are depicted on the Bois Hall estate map of c. 1625, and there appeared to have been a limited eastwards expansion of the town in the late medieval/early post-medieval period. Further pitting occurred in the same area in the 16th-17th century. By this date the churchyard ditch had been infilled and the boundary re-aligned. In the 18th or early 19th century a house identified as St. Andrew's Lodge was constructed in the north-west corner of the site, and two cottages were constructed to the east of No. 8 Colchester Road. The archaeological remains of these buildings correlated well with documentary and cartographic records. From the mid-19th century the interior of the site became progressively built up, including the construction of the Friends (Quaker) Meeting House in 1850-1. The Quaker burial ground was found to extend to the Parsonage Street frontage. One post-medieval burial was excavated that appeared to predate the Quaker

burials, but the Quaker burials themselves were not investigated. All burials were removed by professional undertakers for reburial elsewhere. [Au(abr)]

Holloway, B Colchester : Colchester Archaeological Trust, Report: 494 2008, 4pp, figs, tabs

*Work undertaken by:* Colchester Archaeological Trust

Three evaluation trenches were excavated on the site. Two trenches were 10m in length [Trench 1 and Trench 2] and one was 5m [Trench 3]. Trench 1 contained a single post-medieval/modern pit. Peg-tile and brick fragments were recovered from the fill but not retained. Trench 2 was located in the centre of the site and had no features within it. Trench 3 was located to the south-east of the current building. Two features were identified within it, a modern pit and a modern soakaway. The pit contained modern pottery, glass and animal bone consistent with a domestic rubbish dump. The site appeared to have suffered a high level of modern truncation. This was probably a result of the 19th-century construction of the railway cutting and bridge to the north-west of the site. It appeared that there were substantial groundworks at the time, with only a minimal build-up of topsoil subsequently. The latter included modern domestic debris. [Au(adp)]

Smith, L Hertford : Archaeological Solutions Ltd, Report: 3023 2008, 20pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

An archaeological evaluation was conducted on land adjacent to Spring Lodge Community. An Iron Age hillfort was known to the south of the site with multi-period occupation starting during the Mesolithic/Neolithic. The site was also used in the medieval period. A Roman hypocaust was discovered immediately to the south of the site, and the centre of the Roman settlement was located to the south-east of the site. Evidence of the inception of a market in 912 was recorded, although the centre of the Saxon burgh had never been located. The town prospered during the medieval period. In recent years land around Witham had been increasingly developed, so much so that Chipping Hill and Witham formed one settlement. The trial trench evaluation revealed a small number of archaeological features comprising a ditch, a gully terminus two pits and a post hole. The majority of archaeological features were identified towards the western edge of the site (Trenches 1 and 2), and were post-medieval. The site had a relatively high potential for archaeological remains, in the event small scale post-medieval features were revealed. [Au(abr)]

No remains of the Tudor palace or medieval manor were identified during the excavation of a T-shaped trench. The earliest feature found was a pit tentively dated to the 17th century. In the centre of the trench was a substantial path, comprising reused Tudor bricks suggesting a mid-18th century date for it. The Tudor building had been demolished in 1737. Two parallel later features cutting the base were possibly planting pits or evidence for robbed out structures. Also discovered was some 19th -20th pottery and a brick pathway of 20th century date leading to a former outbuilding. [Au(adp)]

Germany, M Brentwood : Essex County Council Field Archaeology Unit, 2008, 4pp, colour pls, tabs

*Work undertaken by:* Essex County Council Field Archaeology Unit

An archaeological evaluation consisting of two trial trenches preceded the conversion of the Beechcroft Hotel into a residential care home. The site was located about 500m south-west of the former Roman town of Caesaromagus, to the south of Chelmsford's modern town centre. Roman burials in cremation urns had been found in the area of Oaklands Park and near the junction of Moulsham Street and Writtle Road to the south-east. Moulsham Street was known to have been a Roman road and Writtle Road was conjectured to have been one. Both the subsoil and the topsoil contained modern artefacts and may have previously been stripped. The trial trenching found three modern post holes and a modern cut feature within the eastern end of Trench B. It discovered no Roman burials or other features, deposits or finds or any other archaeological remains predating the 19th and 20th centuries. The modern features were probably part of the former small garage. The absence of Roman material possibly indicated that Roman cremation cemeteries were closely confined to the immediate area of Moulsham Street and its junction with Writtle Road. [Au(abr)]

Holloway, B & Brooks, H & Alston, L Colchester : Colchester Archaeological Trust, Report: 491 2008, 28pp, colour pls, figs, tabs, refs, CD

*Work undertaken by:* Colchester Archaeological Trust

The historic building survey described a late-18th or early 19th century barn with re-used 12th to 13th century timber elements, and a group of 19th to 20th century farm buildings. An evaluation by three trenches uncovered two 19th century rubbish pits which may have been contemporary with the last few decades of the life of a house which stood there in 1623 but had been demolished prior to 1839. Ten medieval architectural fragments found in a residual context under the piggery yard almost certainly derived from the nearby church of St. Andrew. Documentary sources indicated a 12th century origin for this site, but the date of the moat (now mostly filled in) was not known. Apart from the architectural fragments, no material contemporary with or predating the 1623 house was revealed during this evaluation. [Au(abr)]

**'SOUTH SITE' BUILDINGS AT THE SIXTH FORM COLLEGE, NORTH HILL, COLCHESTER*****An Archaeological Evaluation of the Proposed Extension to the 'South Site' Buildings at the Sixth Form College, North Hill, Colchester, Essex***

Holloway, B &amp; Brooks, H Colchester : Colchester Archaeological Trust, Report: 483 2008, 17pp, figs, tabs, refs

*Work undertaken by:* Colchester Archaeological Trust

An evaluation by three trenches identified the uppermost significant archaeological horizon of Roman date on the site of the proposed extension to the 'south site' buildings at the Sixth Form College. A north-south profile was reconstructed using the results from all the trenches, and it became apparent that the Roman levels showed no clear evidence of terracing but instead broadly reflected the natural north-south slope of the land today. The finds from the evaluation were dominated by fragments of Roman brick and tile, with lesser quantities of mortar, opus signinum, and tesserae. This material must be derived from the demolition of Roman buildings, and specifically of the Roman building first discovered in 1865 and investigated further in 1910 when the Technical College was constructed. Although two of the trenches were cut within the footprint of this Roman building, none of its foundations or floors were seen, mainly because the evaluation trenches were not sufficiently deep. The highest Roman deposits were rubble or mortuary layers dating to the early-mid 3rd to 4th century, when the Roman building was probably demolished. The Roman deposits were sealed by a deep late medieval or post-medieval topsoil, which was itself sealed by soils dumped during the 1980s landscaping. [Au(abr)]

**A BARBER & SON, 10 WILLIAM'S WALK, COLCHESTER*****Archaeological Evaluation by Trial-trenching at A Barber & Son, 10 William's Walk, Colchester, Essex***

Holloway, B Colchester : Colchester Archaeological Trust, Report: 471 2008, 13pp, figs, tabs, refs

*Work undertaken by:* Colchester Archaeological Trust

An archaeological evaluation of a site in Insula 13 of the Roman town found modern strata and footings lying over a considerable depth of post-medieval soils. The highest significant archaeological horizons were Roman in date. A quantity of Roman brick and tile and other building material in residual contexts in the post-medieval soils were the only indication found of a Roman building. A small area of compacted gravel was likely to represent the north-south Roman street between Insula 12 and Insula 13. Historic maps indicated that this was an area of gardens in the post-medieval period. That fact, combined with the gradual infilling of buildings over the 18th to 20th centuries, would explain the depths of soil and the modern footings observed. [Au(abr)]

Brooks, H, Holloway, B & Masefield, R Colchester : Colchester Archaeological Trust, Report: 504 2008, 23pp, figs, tabs, refs

*Work undertaken by:* Colchester Archaeological Trust

Colchester Garrison Alienated Land (GAL) Area K coincided with the northern part of Goojerat Barracks, situated to the north of Goojerat Road and to the east of Butt Road. This evaluation linked the two previously evaluated Areas at the former Cavalry Barracks (Area J2, to the north) and Goojerat Barracks (Area L/N, to the south). The principal remains revealed by the twelve evaluation trenches were the widespread remains of the barracks (constructed in 1900-1902, and rebuilt in the early 1970s). Significant archaeological features were very thinly distributed. Three undated features may have been Roman in date, mainly because one, a ditch, shared the orientation of a Roman field system found, on GAL Area J2, to the north of Areas K1 and K2, and elsewhere. Only three sherds of pottery were found during this evaluation (two late Roman and one medieval), all of which were residual. Other features included natural linears (probably of glacial origin), and tree-throw pits, of which some were natural and some possibly due to the deliberate removal of tree stumps in connection with agricultural land clearance. [Au(abr)]

Wightman, A Colchester : Colchester Archaeological Trust, Report: 497 2008, 4pp, figs, tabs

*Work undertaken by:* Colchester Archaeological Trust

An evaluation trench was excavated prior to the extension of a classroom on the eastern side of All Saints' Church of England Primary School. No archaeological deposits or remains were observed in the layers. The topsoil contained infrequent fragments of post-medieval and modern building material. Beneath the topsoil the subsoil contained no observable artefactual evidence. No archaeological features were observed cut into the natural and the only finds collected were fragments of peg-tile and modern building material. These were not retained. No evidence of the Early Iron Age settlement to the north of the site or of activity relating to the Saxon burgh to the east was uncovered. It was decided that extension of the excavation to encompass the full footprint of the proposed classroom was not required, and the trench was backfilled. [Au(abr)]

*Work undertaken by:* Wessex Archaeology

Two zones of heightened archaeological activity were highlighted during the evaluation, with concentrations of features in both the north-east [Zone 1] and south-west [Zone 2] corners of the site. The archaeology of both areas was characterised by linear features dating to the Late Bronze Age/Early Iron Age [Zone 1] and the Middle Bronze Age and Middle/Late Iron Age [Zone 2]. This may have represented a degree of land division and activity associated with the water management and drainage of the site. Deep ploughing had caused some truncation, but in general the preservation of the remains was good. [Au(adp)]

Pocock, M Braintree : Essex County Council Field Archaeology Unit, Report: 1964 2008, 31pp, colour pls, figs, tabs, refs

*Work undertaken by:* Essex County Council Field Archaeology Unit

An archaeological evaluation was undertaken at Kings Walk, Grays. The evaluation encountered remains that included brick walls, brick wells, services, pits, ditches and gullies associated with properties that would once have existed along the street frontage in the medieval, post-medieval, and modern periods. However, it failed to identify further medieval or post-medieval structural remains along the old street frontage or further parts of the buildings first discovered during the previous trial trenching. Primarily, this was because the post-war redevelopment of Kings Walk had efficiently cleared the area of all previous above ground remains and all but the deepest features that represented any previous phase of activity. The extent of that truncation reached c.7m OD and certainly exceeded the depth of the pre-1970s, 97-107 High Street building foundations, which did not survive. Overall, modern features dominated the site. Along the old High Street frontage, the modern walls and services of recent 1970s buildings were discovered, while the eastern half of the site contained services, wells, pits, ditches, a post hole, and other unexcavated but obviously modern disturbance. Post-medieval activity was implied by the presence of 17th-18th century pottery in two of the pits that were discovered. Medieval remains included a large pit located in the north-east corner of the site and an uncharacterised feature located beneath a modern concrete drain. Both were poorly dated by small quantities of mid-14th to 15th century pottery, but do appear to suggest that the former High Street/ Kings Walk Area was a focus for activity in the medieval period. Nine evaluation trenches were excavated. Several late Neolithic or early Bronze Age flints were recovered from the west of the development area. A high density of largely undated archaeological remains were noted in the central area. These included ditches, pits and post holes. One group of three post holes may represent a four posted structure of Bronze or Iron Age date. An earlier subdivision of the landscape, probably post-medieval in date was identified in the form of several parallel ditches, aligned perpendicular to the modern road. A small palaeochannel was recorded running through the development area. Several undated ditches were recorded over the rest of the development area. It is likely that the evaluation encountered the edge of a prehistoric settlement. However, the lack of dateable material precluded a firmer interpretation. [Au(abr)]

Essex County Council Field Archaeology Unit Braintree : Essex County Council Field Archaeology Unit, Report: 1872 2008, 29pp, figs, tabs

*Work undertaken by:* Essex County Council Field Archaeology Unit

An evaluation was undertaken on the proposed site of two residential and commercial developments. The developments were in an area of high archaeological potential, either within or immediately outside the suggested extent of a Roman small town and to the east of the medieval market place. Excavations in 1927, immediately to the south of the site, at Chequers Lane, uncovered a range of prehistoric to medieval remains, including a small 2nd century cremation cemetery and 4th century shrine. Five trenches were opened, two along the road frontage of Chequers Lane and Stortford Road and three to the rear of the Chequers Inn. The trenches to the rear of the Chequers Inn contained no significant archaeological remains and their stratigraphic make up suggested that this area had been landscaped in the past, effectively removing any features once present. The trenches along the road frontage revealed features predominantly dating to the 17th century or later, although one 14th century pit and a single 2nd/3rd century pit were also identified. It was likely that later activity had removed the majority of any Roman and medieval remains in the frontage area. Overall, little evidence for Roman, Saxon or medieval activity survived in either part of the site and the development was deemed unlikely to significantly impact upon the archaeological record. ***The Crossing Point of Thames Water Pipeline Across the M11 at Great Hallingbury, Essex. An Archaeological Evaluation***

Cummings, R London : Compass Archaeology, 2008, 36pp, colour pls, figs, tabs, refs  
*Work undertaken by:* Compass Archaeology

An archaeological evaluation was undertaken at two sites either side of the M11 motorway near Great Hallingbury. Both sites consisted of two 25m trenches excavated in a cross fashion. In the eastern site, Trench 1, exposed a series of probable plough furrows running on the same axis on a north-west to south-east alignment. A further narrow linear feature was exposed running on the opposite orientation and cut by one of the former group. This was thought to represent an earlier phase of ploughing. None of the probable furrows produced finds or datable material, and thus could not be affixed to a specific archaeological period. A further six features were exposed in Trench 1, a group of three probable intercutting pits, a linear feature cut by a later small circular feature, and a larger linear feature running east-west. A small Neolithic/Mesolithic flint blade was recovered from the fill of the pit sequence, and a further piece of probable modified thermally shattered flint was produced from the fill of the narrow linear cut to the north. No further datable material was recovered from any of the features, all of which appeared to be heavily truncated by ploughing. The natural deposit in this area was of a very mixed nature, and was considered to represent sediments laid down by glacial activity or tills. In the western site, Trench 2, exposed no archaeological finds or features, bar a series of modern ceramic field drains and a large corrugated plastic drain. The ground appeared to be heavily truncated, with a significant drop in ground level from the east, possibly the result of intrusion from the construction of the M11 motorway. Overall no particularly significant remains were recorded during the evaluation. It was therefore proposed that no further archaeological work should take place on the site. [Au(abr)]

**HENRY LAVER'S POSTULATED ROUTE OF THE ROMAN ROAD FROM COLCHESTER TO MERSEA ISLAND**

***Investigation of Henry Laver's Postulated Route of the Roman Road from Colchester to Mersea Island***

Holloway, B Colchester : Colchester Archaeological Trust, Report: 478 2008, 6pp, figs, tabs

*Work undertaken by:* Colchester Archaeological Trust

A single evaluation trench was excavated under archaeological supervision. The trench bisected the projected line of an existing track that was of suspected Roman origin. Two features were identified within the evaluation trench, a modern field-drain, and a trackway. The track was 4m wide and formed of roughly compacted gravel and cobbles. Within the lower make-up of the track, crushed brick and salt-glazed pipe fragments were recorded. The brick fragments were frogged, indicating that the earliest possible date for deposition was the mid-19th century. This suggested that the track was constructed in the post-medieval/modern period and was possibly a farm-track. It was possible that it replaced an older track, which had been removed (although no material predating the post-medieval period was observed). Also noted was a lack of any accumulation material, in conjunction with the fact that modern topsoil directly sealed natural layers, this suggested that material had been removed from here, possibly at the time of works associated with the construction of the main reservoir. Pocock, M Braintree : Essex County Council Field Archaeology Unit, Report: 1842 2008, 27pp, colour pls, figs, tabs, refs

*Work undertaken by:* Essex County Council Field Archaeology Unit

An evaluation and follow up monitoring work was undertaken in an area of perceived archaeological potential on land adjacent to Westwood House. The evaluation demonstrated the survival of archaeological remains in some areas of the site, possibly relating to the road frontage. The earliest remains were Late Iron Age, and consisted of a loosely metalled surface and an east-west ditch. Later remains included a 2nd century north-south ditch and two further east-west ditches close to the road frontage, one of which remained undated, the other was post-medieval in date. A cluster of large undated pits was also discovered in addition to several small isolated stake holes. Some of these undated features may have related to "back yard" activity associated with nearby properties. Little impact had been made on archaeological levels across the site by recent development principally because of the importation of up to 1.20m of waste material and soils in the early modern/ modern period. Consequently, groundwork taking place on the property frontage only impacted on the upper

0 to 0.10m of the features present. Overall, the investigation established the character and extent of the archaeological remains encountered and many of the significant features and deposits were preserved in situ. [Au(abr)]

Hogg, I Twickenham : AOC Archaeology Group, 2008, 37pp, colour pls, figs, tabs, refs

*Work undertaken by:* AOC Archaeology Group

An archaeological evaluation revealed evidence of medieval and post-medieval activity between the High Street and River Bulbourne in Berkhamsted. The evaluation comprised ten machine excavated trenches. Natural chalk was only exposed in two of the trenches, alluvium sealing the chalk across the rest of the site. Much of the western part of site was disturbed by modern intrusions. In the north-eastern area of the site a Roman ditch was excavated, although this appeared heavily truncated. In the southern part of site were a number of pits of medieval date, containing finds suggesting direct occupation of the site, although no occupation horizons remained. The post-medieval character of the site was typified by a number of large pits, and by several lines of post holes defining fence lines, and possibly, a building. Garden features were also present. [Au(abr)]

Barber, A Cirencester : Cotswold Archaeology, Report: 08132 2008, 21pp, colour pls, figs, tabs, refs

*Work undertaken by:* Cotswold Archaeology

An evaluation was carried out at Hemel Stags Rugby League Club. Three evaluation trenches and thirty trial pits were excavated. No archaeological features or artefacts predating the modern period were encountered. Modern dump deposits, including redeposited natural clays, noted along the southern edge of the site would seemingly confirm anecdotal evidence that a shallow valley was infilled in the mid to late-20th century with landfill generated during construction works within Hemel Hempstead. Evidence that natural ground levels were truncated during construction of the existing clubhouse, pitch and playing field was also identified. [Au(abr)]

Ennis, T Braintree : Essex County Council Field Archaeology Unit, Report: 1871 2008, 19pp, colour pls, figs, tabs, refs

*Work undertaken by:* Essex County Council Field Archaeology Unit

An evaluation was carried out on the proposed site of a combined parish centre for St. Michael's and St. Joseph's Churches. Two trenches were excavated, one contained two pits of probable 18th-19th century date and the other only showed signs of modern disturbance. Although the area was of some perceived archaeological potential, no features of Prehistoric, Roman, Saxon or medieval date were identified. While further remains of 18th-19th century date may have been present within the wider footprint of the proposed new building they were deemed likely to be of limited archaeological significance and the overall impact of the proposed new development appeared to be low. Ennis, T Braintree : Essex County Council Field Archaeology Unit, Report: 1935 2008, 20pp, colour pls, figs, tabs, refs

*Work undertaken by:* Essex County Council Field Archaeology Unit

An evaluation was carried out on land south of Landguard. Three evaluation trenches were excavated. No archaeological features predating the post-medieval period were identified, however, the recovery of single sherds of Late Iron Age and early medieval pottery from the topsoil did indicate that there may have been earlier activity in the vicinity. In the medieval period this may have been agricultural in nature given the considerable distance from the site to the street frontages [c.50m south of Station Road and c.0.75m north of The Forebury]. Two archaeological features were investigated, one was an undated pit of possible natural origin and the other a post-medieval boundary ditch. The ditch was aligned east-west and contained a variety of finds broadly dating from the late-18th to the 20th century. This boundary was shown on the first four editions of the Ordnance Survey. In addition, the rubble filled remains of a former swimming pool were noted at the northern end of Trench 1. Based upon the results of the investigation, it was deemed unlikely that the development would have any impact upon the archaeological record and no further work was required. [Au(abr)]

Cushion, B Gressenhall : Brian Cushion, 2008, 5pp, figs

*Work undertaken by:* Brian Cushion

An earthwork survey demonstrated that that the earthworks may well have been of some considerable age, as indicated by the few mature trees, which may have had a possible medieval origin. A depression could be a remnant of a larger pit which extended further north, although this would need to be verified by some core sampling or trenching. The depth of this would suggest that it went deeper than the Pudding Stone layer, thus extending into the chalk, presumably for flint. [Au(adp)]

*Work undertaken by:* Heritage Network

A programme of archaeological evaluation and a historic buildings impact assessment was undertaken at 72-74 South Road. Five trial trenches were excavated across the site. Identified features consisted of an undated gully and modern wall. Despite the potential for remains dating to the Iron Age and Roman period nothing of this date was identified. A rapid survey and detailed digital photographic record of the buildings on the site was undertaken. This combined with desk-based assessment demonstrated that there had been several building phases on the site. The four extant buildings could be divided into two distinctive groups. No. 72, a former farmhouse with its stable block, and granary, all dated to the 19th century, and No. 74, a detached house built in the grounds of the farm to the south in c. 1925. [Au(abr)]

**74 Icknield Way & Icknield House, Baldock, Hertfordshire. An Archaeological Impact Assessment and Evaluation**

Rozwadowski, M. Williams, M & Newton, A Hertford : Archaeological Solutions, Report: 3186 2008, 46pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

Archaeological impact assessment and evaluation was undertaken of land at Icknield House & 74 Icknield Way. Baldock was the site of a substantial Roman town centred around Clothall Road to the east of the present High Street, covering an area of over 30ha. It superseded a large Late Iron Age settlement, and was established by the mid-1st century at the crossroads of two important Roman roads and the major prehistoric routeway of the Icknield Way. A medieval planned market town was then established in order to capitalise on trade along the old Great North Road which passed through the town. Archaeological projects nearby had revealed evidence of Roman roadside burial and other land use, in addition to medieval/post-medieval activity. Extensive prehistoric ritual activity [e.g. the construction of Bronze Age round barrows] had been recorded along the Icknield Way [e.g. at Works Road, Letchworth, to the west, and to the north-east of Baldock]. The field evaluation revealed a possible Roman pit or well and sherds of post-medieval pottery. All other features were modern. The site had been subject to extensive previous ground disturbance when it was developed for industrial use in the 19th and 20th centuries. [Au(abr)]

Newbould, J Hertford : Albion Archaeology, Report: 2008/126 2008, 60pp, colour pls, figs, tabs, refs

*Work undertaken by:* Albion Archaeology

The evaluation revealed the remains of a known Iron Age pit alignment. Evidence for a number of late Iron Age/early Roman livestock enclosures were also found, including two large ditched enclosures. These may have been associated with a storage pit which could indicate human occupation at the site. Other remains included late Iron Age/Roman boundary ditches, several smaller enclosures and a probable Roman inhumation burial, contained within a large early Roman enclosure ditch. This boundary ditch probably defined the eastern extent of the known early Roman Wallington Road cemetery c. 70m to the west. Several undated linear remains and enclosures and a possible post-built structure were also identified. [Au(adp)]

Winter, M Letchworth : Heritage Network, Report: 461 2008, 38pp, colour pls, figs, tabs, refs

*Work undertaken by:* Heritage Network

Sixteen trenches were excavated in order to investigate the archaeological potential of the site. The evaluation revealed the presence of one pit of either Early to Middle Iron Age or Early Saxon date, and a pit of possible Roman date. Four other features may have been associated with the use of the site as allotments. A post hole yielded pottery, ceramic building material and slag which was potentially dated to the Roman period, unfortunately, the fragmentary nature of the assemblage made it impossible to assign a date with any real certainty. A further post hole yielded fifteen pieces of stone. This probably represented packing material for a post, but no dating material was recovered from this feature. Pit [1401] contained pottery and animal bone, dated to either the Early to Middle Iron Age or the Early Saxon period. A significant amount of archaeology from these periods is known in the immediate vicinity. A pit contained a single piece of glass, indicating that this feature was of modern date, potentially associated with use of the site as allotments. A gully terminus yielded no finds. This may have represented a drainage channel, as the site did appear to have a high water table. The archaeological evaluation demonstrated a low density of features across the site, including two features of potentially Roman and Iron Age or Saxon date. The quantity of ceramic building material, tile and brick recovered during the evaluation was unsurprising in the context of the site's previous use as allotments. On the basis of these findings, there was a demonstrable risk that the proposed development would encounter archaeological features and deposits, but the density of such features was low, and there was no evidence of intensive occupation of any period. The risk that significant occupation features from any period would be disturbed was considered to be low. [Au(abr)]

***Proposed Urban Expansion, Land East of Luton, Hertfordshire: Archaeological Evaluation***

Sheldon, S Cirencester : Cotswold Archaeology, Report: 08195 2008, 91pp, figs, tabs, refs

*Work undertaken by:* Cotswold Archaeology

A total of 164 trenches were excavated. The evaluation identified archaeological deposits across most of the application area, with evidence for activity dating from the Middle Neolithic through to the modern period. Prehistoric activity was sparsely represented across the site and was limited to isolated pits and ditches, probably indicative of agricultural activity. A concentration of activity was apparent to the immediate south-east and north-west of Brick Kiln wood, including Roman clay extraction pits and adjacent areas of hardstanding,

associated with finds of tile, pottery, animal bone and tesserae. No kilns, kiln furniture, over-fired or distorted tiles were encountered, however, to indicate tile production took place immediately within the areas examined. No archaeological features were encountered within the extreme southern periphery of the site. The evaluation indicated that where archaeological deposits were present they typically survived at depths of between 0.4m and 0.6m below the existing ground surface. [Au(abr)]

Sparrow, P Hertford : Archaeological Solutions, Report: 2998 2008, 22pp, colour pls, figs, refs

*Work undertaken by:* Archaeological Solutions

Trenches 1 and 2 were placed parallel to the south-west and north-east of the site. The remaining earthworks of Beech Bottom Dyke were clearly visible. The south-east end of each of the trenches was occupied by a ditch, of which only the north-east edge was visible. Further to the north-east a ditch and bank were visible. Though only 20th century dated finds were recovered during the evaluation, it was highly probable that underneath the modern disturbance earlier deposits may have been present. Trench 3 revealed no archaeological features. [Au(abr)]

Winter, M Letchworth : Heritage Network, Report: 460 2008, 6pp, colour pls, figs, tabs

*Work undertaken by:* Heritage Network

Due to an oversight the archaeological condition on the planning consent for two extensions at 6 Sopwell Lane was not acted upon. Following discussions it was agreed that a trench should be excavated adjacent to the new foundations in order to assess the nature and extent of any archaeological remains which might have been disturbed. A brick of probable 19th century date was recovered from the topsoil suggesting that this represented a garden soil associated with the existing property. Despite the site's proximity to known medieval archaeology, and evidence of earlier settlement from the prehistoric, Iron Age and Roman periods, no cut features, deposits or artefacts were encountered from any period during the project. Doyle, K Hertford : Archaeological Solutions Ltd, Report: AS Report No. 3069 2008, A4 ringbound document

*Work undertaken by:* Archaeological Solutions Ltd

"In February and March 2008, Archaeological Solutions (AS) carried out an archaeological evaluation at the B and Q site and Cromwell House, 142-146 High Street, Stevenage, Hertfordshire (NGR TL 2340 2480). The evaluation was conducted in advance of residential development (Planning Ref. 2/05/0473 and 2/05/0609). The site lies within the historic core of Old Stevenage, to the west of the High Street. The Old Town of Stevenage is primarily medieval in origin. Much of the medieval settlement, including the site, lies within Area of Archaeological Significance No. 2, as designated on the Local Plan. Stevenage remained largely unchanged until the development of the New Town from 1946 onwards. Cartographic evidence shows that the site was not developed until the later 19th century. The trial trench evaluation revealed that the majority of the site was developed during the mid 20th century, and services traversed the site. Three modern archaeological features were identified. Archaeology pre-dating the 20th century, if present, was likely to have been disturbed or destroyed by development during the mid to late twentieth century. Further excavation at the site is likely to reveal modern remains." [OASIS]

Woolhouse, T &amp; Unger, S          Hertford : Archaeological Solutions Ltd, Report: Report No: 2984 2008, A4 ringbound document

*Work undertaken by:* Archaeological Solutions Ltd

"In January 2008, Archaeological Solutions carried out an archaeological evaluation of land opposite Manor Farm House, Ickburgh, Norfolk (NGR TL 8149 9499). The evaluation was commissioned in advance of works for a housing development (Planning ref 03/0682). Desk-based assessment showed a wealth of evidence for prehistoric remains in the area,

specifically from the Palaeolithic period although the evidence also suggests that the Ickburgh area was occupied throughout most of the prehistoric period. Anglo-Saxon evidence within Ickburgh is limited. Medieval Ickburgh was probably a substantial settlement with five manors noted in the Domesday Book, the 13th century leper's chapel and the 14th century St Peter's Church. Post-medieval Ickburgh developed at a reasonable pace but the village remained agricultural in character. The evaluation revealed ditches, pits, possible postholes, a brick structure, a service trench, a well/soakaway and a hollow. The features were concentrated on the eastern side of the site with only two features of modern date being identified in Trench 1. Two features contained late medieval/early post-medieval pottery. Posthole F1004 (Trench 3) contained a sherd of 13th- mid 16th century pottery, and Pit F1038 contained two sherds of 14th- 16th century pottery. The other finds within the features do not suggest that the sherds were residual. The remaining features contained predominantly 17th-19th century pottery. The features likely relate to cottages/domestic dwellings located on the southern boundary of the plots and were identified as still being occupied on the second edition Ordnance Survey map in 1906." ***An Archaeological Evaluation at Watton Sewage Treatment Works, Little Cressingham, Norfolk***

Ratcliff, M Norwich : NAU Archaeology, Report: 1950 2008, 42pp, colour pls, figs, tabs, refs

*Work undertaken by:* NAU Archaeology

An evaluation was carried out at the Watton Sewage Treatment Works. Six trenches were excavated of varying depth, and revealed a disturbed subsoil, alluvial deposits of silt, and natural sands and gravels. Four of the six trenches revealed archaeological features, including small pits and ditches containing animal bones, medieval pottery fragments, Roman pottery and tile. The trenches in the central area of the site revealed alternating bands of fine grey silt and peaty organic deposits, suggesting phases of flooding. A break of slope observed in Trenches 2, 3, and 5 possibly indicated an earlier, more southerly deviation of the river bank from its present course. Roman features and finds pointed to the close proximity of a substantial structure, which included a hypocaust or bathhouse. The size and type of Roman tiles and ceramic building material suggested the presence of two different buildings or at least a single building with two phases of construction. Combined with the close proximity of the river, it seemed likely that this building was a bathhouse. The pottery and coins indicated settlement between the 2nd and 4th centuries AD. A small quantity of Anglo-Saxon and medieval pottery was recovered, which may indicate activity on the site during these periods, although they may have been introduced via other means, such as manuring. ***Affordable development site, Pound Hill, Saham Toney, Norfolk. An archaeological evaluation.***

Unger, S. & Smith, L. Hertford : Archaeological Solutions Ltd, Report: AS Report No: 3010 2008, A4 ringbound document

*Work undertaken by:* Archaeological Solutions Ltd

"In March 2008 Archaeological Solutions (AS) carried out an archaeological evaluation of land on Pound Hill, Saham Toney, Norfolk (NGR TF 9002 0209). The evaluation was required to support a planning application for redevelopment of the site for the provision of affordable housing. The desk-based assessment indicated a moderate potential for prehistoric remains, in particular Bronze Age and Iron Age remains are prevalent in the area. Two Roman forts, a late Roman villa and probably market town were discovered c. 1km south east of the village at Woodcock Hall. Spot finds in the area indicate Saham Toney may have had limited occupation in the Roman period. Archaeological evidence for Anglo-Saxon settlement is scarce. Medieval Saham Toney was likely focused around St George's Church, close to the site. Saham Toney prospered into the post-medieval period with moderate industrial and domestic development. The trial trench evaluation revealed a significant number of archaeological features. All the trenches contained archaeological features, and they were generally well preserved. Ditch F1036 (Tr3), Ditch F1044 (Tr4) and Posthole F1056 (Tr4) were the earliest features and they contained medieval and late medieval pottery (12th-

14th; Late 14th-16th; and 15th - 16th C, respectively). The ditches may represent the remains of plot boundaries associated with medieval domestic settlement, fronting Pound Hill, and suggest an expansion of the medieval town in this direction. Ditch F1019 (Trs 2-4) contained 18th century pottery and associated finds. Pit 1048 (Tr. 4) may also date to the post-medieval period. The absence of substantial post-medieval and modern activity indicates that this area was used as agricultural land after the decline of the medieval town." [OASIS]

Emery, G      Norwich : NAU Archaeology, Report: 1759 2008, 49pp, colour pls, figs, tabs, refs

*Work undertaken by:* NAU Archaeology

An evaluation was carried out on the former site of the Drayton Rice Hospital. Topographically, the site commanded a visually impressive view along the Wensum river valley. A relatively large number of prehistoric flint objects had been recovered in the area, including Upper Palaeolithic, Mesolithic and Neolithic artefacts. A significant quantity of Upper Palaeolithic and Mesolithic material derived from findspots within 200m to the south and south-west of the site, including a few examples of Upper Palaeolithic long blades. Fifty test pits were excavated across the site and followed by 15 trial trenches in order to assess the site for significant archaeological artefacts, horizons and features. A large majority of the test pits and evaluation trenches encountered modern disturbance associated with the construction and demolition of the former hospital. A small number of features predating the hospital were discovered in both the test pits and the evaluation trenches. These included a tree-throw/hollow, which produced numerous flint artefacts likely to be of Neolithic/Bronze Age date, and a prehistoric pit which contained large quantities of burnt flint and stone. Five linear features of uncertain date were also revealed of which two could be clearly interpreted as ditches. An assemblage of up to 137 prehistoric flints was collected from the site. Much of the flint was likely to be of later prehistoric date [i.e. Neolithic/Bronze Age], although a small number of pieces may have been of Upper Palaeolithic date. These artefacts include a crested blade and an end scraper. One microlith of a likely late Mesolithic date was collected. No in situ Palaeolithic artefacts or deposits were encountered. Subsurface deposits consisted of aeolian sands below a sterile sand colluvium. A lower subsoil lay above the colluvium from which prehistoric flints and three sherds of prehistoric pottery were collected. This material lay below modern material and was entirely absent across some areas of the site, primarily due to levelling activity associated with the construction and demolition of the hospital. ***An Archaeological Evaluation at Little Plumstead Hospital, Norwich***

Hickling, S      Norwich : NAU Archaeology, Report: 1845 2008, 22pp, colour pls, figs, tabs, refs

*Work undertaken by:* NAU Archaeology

Nineteen trenches were excavated across the area of a proposed new school at Little Plumstead Hospital. Sparse evidence for prehistoric activity and medieval enclosures was discovered, together with post-medieval features associated with Plumstead Hall and the construction of the hospital buildings. It was thought unlikely that any further significant archaeological remains would lay within the development area. [Au]

**NORWICH NORTHERN DISTRIBUTOR ROUTE**

***Norwich Northern Distributor Route. Archaeological Evaluation by Trial Trenching***

Trimble, G & Watkins, P Norwich : NAU Archaeology, Report: 1363 2008, 86pp, colour pls, figs, tabs, refs

*Work undertaken by:* NAU Archaeology

Targeted trial trenching along the proposed route took place following the completion of systematic fieldwalking and metal detecting. This work saw the investigation of eight locations of known or probable archaeological potential. These sites included significant cropmark features, fields where denser artefact scatters were recovered during fieldwalking and where geophysical survey had identified possible features. Each site was investigated via the excavation of one to three trenches. Three sites were investigated where significant cropmarks had been identified within the proposed road corridor. In Taverham a series of enclosures and other linear cropmarks were shown to be of predominantly medieval date. It was possible that an earlier Roman phase was also present. A long linear cropmark that stretched across the site was shown to be a substantial ditch. Research showed it to be part of a much larger, previously unidentified linear earthwork. Although no dating evidence was recovered from this significant feature, a Saxon or Iron Age date was likely. The sites of two cropmark enclosures within Horsford were also evaluated. A rectangular crop mark enclosure at Bell Farm, Reephham Road was found to be of probable Bronze Age date. A series of large pits was also identified which could be from an earlier, perhaps Neolithic, phase of activity. A similar cropmark enclosure was investigated close to where the proposed route crossed Drayton Road. Trial trenches here failed to identify any evidence for the enclosure ditch, presumably destroyed since the photographs were taken. In Horsham St. Faith and Newton St. Faith evaluation trenches failed to identify any evidence relating to St. Faith's Fairstead. A medieval and post-medieval fair was known to have taken place nearby, and this field produced dense scatters of medieval and post-medieval metalwork, including coins, tokens and trade weights. Two fields within Beeston parish that had produced relatively large collections of material [including metalworking debris] during an earlier fieldwalking survey were also evaluated. No archaeological evidence was recovered from either field, suggesting that these scatters were not associated with sub-surface remains. A single trench was placed across the projected line of a Roman road, which supposedly ran from Brampton to Thorpe St. Andrew. No evidence for the road was present although it was possible that any physical remains may have been destroyed by ploughing. Within Postwick parish trenches were placed in two locations where geophysical survey work had identified the presence of sub-surface remains. Trenching confirmed the existence of a substantial ditch. This ring-ditch was likely to be the remains of a ploughed-out Bronze Age barrow. A discrete anomaly in the centre of the ring-ditch proved to be a large pit, although this was unlikely to have been dug at the same time as the ditch itself. Two ditches revealed could be linked to a large cropmark enclosure, identified from satellite images of the site. No dating evidence was recovered when one of these ditches was evaluated. [Au(abr)]

Bailey, G D Norwich : NAU Archaeology, Report: 1990 2008, 27pp, colour pls, figs, tabs, refs

*Work undertaken by:* NAU Archaeology

Five evaluation trenches were excavated, four of which contained archaeological features and deposits. Evidence for occupation of the site took the form of a number of ditches, pits and post holes. These belonged to three periods, the Early Neolithic, the Early Bronze Age and the medieval period. Features attributed to the Early Neolithic comprised two ditches and three pits containing pottery and worked flint. The Bronze Age was represented by a single pit with associated pottery. The medieval period was represented by two pits and a post hole containing 12th-14th century pottery. All features were well preserved and sealed by a substantial overburden. The depth and structure of some of the Early Neolithic features indicated they were more than purely functional features. The alignment of the ditches suggested they may have formed part of an enclosure. The paucity of comparative sites in the area made this a site of potential regional importance. The medieval features were part of a domestic structure associated with buildings around the hub of Horstead village. [Au(abr)]

Bradley-Lovekin, T Sleaford : Archaeological Project Services, Report: 001/09 2008, 42pp, figs, tabs, refs

*Work undertaken by:* Archaeological Project Services

An evaluation was undertaken on land at 17 Roman Way. The site lay in an area of archaeological interest and potential immediately outside the eastern line of the outermost defences of a Roman coastal fort. Many finds of Roman date had been identified in the area

adjacent to the fort and an extensive spread of Romano-British material including kilns, tile and a military burial occurred to the south of the monument. Anglo-Saxon remains were also known within close proximity to the proposed development. The evaluation comprised a single trench excavated across the development area. Although Roman artefacts were recovered, for the most part, these were found to be mixed with medieval and post-medieval material, indicating a high degree of residuality and re-deposition. A linear ditch partially exposed at the western end of the trench produced exclusively Roman material and may have represented the extreme eastern edge of the fortress defences, although this was uncertain. A single rosette shaped copper alloy mount was recovered during a metal detector survey undertaken as part of the evaluation. Although similar mounts of Romano-British date had been recovered elsewhere in Caister-on-Sea, the closest parallel was with a 15th to 16th century example found in Norwich. [Au(abr)]

Henry, K, Greene, R, Unger, S & Newton, A S Hertford : Archaeological Solutions, Report: 3188 2008, 39pp, colour pls, figs, tabs, refs  
*Work undertaken by:* Archaeological Solutions

An evaluation was carried out of land at Plot 20a, Bergen Way, North Lynn Industrial Estate. The desk-based assessment showed potential for multi-period remains. The prehistoric and Roman periods were not represented in this area of Kings Lynn which was likely due to the site lying within uninhabitable marshland during these periods. The town of Kings Lynn originated in the late Anglo-Saxon period although the area of the site was still likely to have been wetland. By the medieval period, the surrounding area was in use for the saltern industry and it was considered possible that evidence relating to that industry could be encountered on the site. Cartographic sources suggested the site was marshland throughout the post-medieval period up until the 1970's when the North Lynn housing and industrial development were constructed. The evaluation comprised the excavation of three trenches. No archaeological features were observed during the evaluation. [Au(abr)]

Adams, M, Schofield, T, McCall, W & Dollman, C Hertford : Archaeological Solutions, Report: 3231 2008, 25pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

A metal detector survey and an archaeological evaluation was undertaken of land off Lamsey Lane. The site had potential for late Iron Age and Romano-British features, predominantly associated with an area of crop marks in fields immediately adjacent to the site. The evaluation revealed nine features comprising pits, ditches and a gully. Several natural features were also observed. The undated features included a ditch which may have been associated with the late Iron Age/Romano-British enclosure based on its alignment. The undated pits largely occurred towards the eastern side of the site and showed similar characteristics to Iron Age pits, however, they lacked finds. The dating evidence was sparse. An east/west ditch contained late post-medieval to early modern ceramic building material, and a pit contained a hammer stone and a fragment of daub. It was considered that features from the adjacent farmstead would be likely to encroach on to the proposed site. In the event archaeological finds were sparse, and any association of the features with the known evidence was tentative. [Au(abr)]

Allen, M & Chavasse, P Branston : Allen Archaeological Associates, Report: 2008/015 2008, 39pp, colour pls, figs, tabs, refs

*Work undertaken by:* Allen Archaeological Associates

Three evaluation trenches were excavated. The presence of live services on the site meant that it was not possible to adequately shore trenches 1 and 2. In trenches 2 and 3 modern deposits showed that the removal of tanks and pipes associated with a previous petrol station on the site removed over 3m of deposits. The sequence exposed in Trench 1 showed consolidation of marshy ground with wood chippings and bark, probably during the 13th century, with a ditch or pit and wooden post probably fairly contemporary with this activity. A series of flooding events then deposits of alluvial silts over the site, before a large ditch or pit was excavated during the 13th to 14th century. This silted naturally with some dumping of domestic refuse. A later cut feature showed some activity on the site in the 16th century. [Au(abr)]

*Work undertaken by:* Oxford Archaeology

Sixteen trenches were excavated across the site as part of a programme of archaeological evaluation. Six of the trenches targeted anomalies recorded in an earlier geophysical survey of the site, and one targeted a former water filled pit. There was little correlation between the geophysical survey results and the archaeology encountered. The evaluation revealed a series of six ditches, four pits, two post holes and one tree throw, but no dating was recovered. It was likely that most of the features recorded relate to post-medieval drainage and agricultural use of the site. [Au(abr)]

Bradley-Lovekin, T Sleaford : Archaeological Project Services, Report: 65/08 2008, 39pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Project Services

An archaeological evaluation was undertaken in order to determine the archaeological implications of the planned redevelopment of the site. The site lay in an archaeologically sensitive location, close to finds of Bronze Age metalwork and high status Iron Age metalwork, as well as Iron Age and Roman settlement and religious activity. Close to the site were remains of Iron Age and Roman field systems and enclosures evident as cropmarks. Post-medieval occupation has been identified a little to the west, by the modern bypass, and field boundaries of the period were revealed a short distance to the east. The evaluation revealed three parallel ditches within Trench 6. Whilst one of these ditches was undated, the other two were of probable medieval date. Fragments of Roman pottery and building materials recovered with the medieval material were indicative of 2nd to 4th century AD activity occurring in proximity to Trench 6. Elsewhere evidence was limited to an undated pit identified within Trench 2 and recent features found within Trenches 3 and 4. Only deposits of natural, subsoil and topsoil were found at the northern end of the site within Trenches 1 and 5. A range of archaeological artefacts including, Roman pottery, and building material, medieval pottery, post-medieval pottery and marine mollusc shells were found during the evaluation. [Au(abr)]

*Work undertaken by:* Oxford Archaeology East

An archaeological field evaluation was undertaken on land at Overby Quarry. The results of a previous desk-based assessment found a high potential for the survival of subsurface archaeological remains, dating to the prehistoric period. Within Area B were a series of five well preserved in situ urns. Archaeology was also noted within Area C, in the form of small linear gullies and pits. This area went immediately to excavation, and resulted in the discovery of approximately thirty cremations, eight of which were within urns [mostly collared, though one had been tentatively identified as a food vessel, dated 2000-1700 cal BC]. The number of cremations was tentative, as some pits were also excavated which contained only small amounts of bone, and which may not have been "true" cremations, but could have represented ritual activity associated with the cremation rites. However, despite the discovery of the cremations, the archaeology within the remainder of the excavation area, proved to be of little interest and appeared demonstrably modern in some. This appeared to be mirrored by the results from Areas D through to F. During the evaluation, a number of linear features were

noted within trenches in all three areas, and as these were undated, they were believed to be of prehistoric date, and related to the cremation cemetery. However, analysis of the 19th century tithe map indicated that most of the archaeological remains may have been of fairly recent date, and corresponded to known field boundaries. The evaluation at Overby Quarry successfully investigated a series of fields to the south-west of the current quarry site, but, beyond the cremation cemetery which was investigated as an open area excavation, no archaeological finds were recovered to indicate that the site was being used for any other purposes than agricultural, and no identifiable evidence of further settlement or ritual activity was noted, though stray prehistoric finds were recovered. The lack of secure dating for the features found during this evaluation means that features must be dated using morphological characteristics. [Au(abr)]

Cooper, O Barnard Castle : Northern Archaeological Associates, Report: 08/43 2008, 56pp, colour pls, figs, tabs, refs

*Work undertaken by:* Northern Archaeological Associates

The evaluation found archaeological features on five of the eight trenches excavated, although some of these may have related to natural silted-up creeks [roddons]. Several of the anomalies located by a previous geophysical survey were found to have been of a natural origin. Only one trench contained evidence for a complex sequence of archaeological deposits. The earliest features were located towards the western end of the trench, and within the trench extension. A beam slot was identified on a north-west to south-east alignment, the fill of which produced a single sherd of 13th to 14th Grimston ware pottery. A series of post settings were also recorded on the seaward side of the trench that may have formed supports for a timber revetment or breakwater. Associated layers of silt on the landward side of the timber revetment yielded a large number of poorly-fired clay fragments, probably briquetage, accompanied by medieval and later pottery and a number of other artefacts. The latest datable pottery from these layers was Bourne "D" ware, produced between the late-15th and early 17th centuries. These layers were sealed by alternating silt sequences. Although the evaluation did not reveal any unequivocal evidence of slatten structures such as troughs and hearths, it was clear that several episodes of burning had taken place at the site, and some of the residue had become incorporated into a series of layers of silt. Any proposed groundwork had the potential to impact upon archaeological remains at the site, and as a result, further archaeological work was recommended. [Au(adp)]

Hickling, S Norwich : NAU Archaeology, Report: 1856 2008, 18pp, colour pls, figs, tabs, refs

*Work undertaken by:* NAU Archaeology

An evaluation was carried out on the site of a proposed flood alleviation scheme at Hall Lane, West Winch, during which a medieval furrow and two undated pits were discovered. The presence and depth of the subsoil, the presence of ridge and furrow cropmarks in aerial photographs and the discovery of a furrow in two of the trenches proved that this area was under some form of open-field cultivation during the medieval period. Finds of 12th-14th century pottery within the topsoil were probably a result of manuring the open field. The furrow in Trenches 2 and 3 also contained a fragment of 12th-14th-century pottery. The two pits in Trench 1 may have predated this subsoil, but they remained undated. [Au]

Two trial trenches were excavated. Trench 1 contained no archaeological features. Trench 2, towards the south-east of the site, revealed a large Roman ditch and a sequence of 19th/20th century made ground layers and yard surfaces associated with the farm complex which occupied the site until around the 1960s. The only evidence of medieval land use was a buried subsoil, sealed beneath layers of post-medieval made ground. [Au(abr)]

Trimble, G Sleaford : Archaeological Project Services, Report: 73/08 2008, 47pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Project Services

The evaluation identified a number of archaeological features and deposits. The earliest features comprised large pits of probable 13th or 14th century date, most likely representing excavation for sand and/or chalk extraction. In the later medieval or early post-medieval period a timber structure with a chalk floor was built which fronted onto the road now known as Wellington Lane. Sometime within the 18th century the timber building was replaced by a flint and brick structure and by the early 20th century this was demolished. All other features were modern relating to the most recent, 1970s and later demolished use of the site. Finds retrieved from the evaluation comprised a small collection of medieval pottery and several pieces of animal bone. Several bricks and tiles from the post-medieval structures were retained. ***An Archaeological Evaluation at 26–36 Rose Lane, Norwich***

Percival, J W Norwich : NAU Archaeology, Report: 1523 2008, 35pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* NAU Archaeology

Two trenches were excavated on a site at 26–36 Rose Lane. The site lay close to the historic core of Norwich. Natural deposits were revealed in both evaluation trenches. The earliest archaeological features identified on the site were pits of probable early medieval date [c.12th–14th century] that were present in both of the evaluation trenches. The pits may be associated with contemporary occupation on the Rose Lane frontage. The recovery of metalworking debris from some of these pits suggested industrial activity had taken place nearby. In each of the evaluation trenches similar deposit sequences of layers and spreads containing medieval pottery were seen to overlay this earlier pitting. These remains were interpreted as 14th-century landscaping and connected to the expansion of the Greyfriars Franciscan friary at this time. Post-medieval pitting and garden soils sealed the landscaping remains. [Au(abr)]

***in Advance of the Duke's Wharf Redevelopment: Evaluation Trenches 7 and 8 Report No 1579***

Emery, G Norwich : NAU Archaeology, Report: 1579 2008, 38pp, colour pls, figs, tabs, refs

*Work undertaken by:* NAU Archaeology

Two additional trial trenches ahead of the Dukes Wharf redevelopment revealed features of probable medieval to modern date. The trenches were located in the south-eastern corner of the site in an area with potential for in-situ evidence of the Duke of Norfolk's palace complex. No evidence for substantial footings or deposits relating to the palace complex was found. However, the foundations of an 18th century cellar post-dated the deposition of a large quantity of mortar rich rubble. This material could have comprised demolition waste from the early 18th century demolition of the Duke of Norfolk's palace complex. A single architectural fragment of decorated stone was recovered from this deposit, which appeared to be an example of Palladian-style masonry from the palace. The deepest deposits investigated may be interpreted as riverine deposits sealed by medieval consolidation layers. A 16th century midden pit truncated this material. The pit contained a mixture of hearth waste and foul waste from which sherds of chamber pots were recovered. A chance discovery was made inside the Boardman building, which formed part of the current Duke Street frontage. This took the form of a finely decorated mosaic floor motif dated 1912 with the legend "Norwich Corporation Electricity Works". [Au(abr)]

***An Archaeological Evaluation at Land to the Rear of 67-69 Magdalen Street, Norwich***

Hickling, S Norwich : NAU Archaeology, Report: 1345 2008, 26pp, colour pls, figs, tabs, refs

*Work undertaken by:* NAU Archaeology

The evaluation trench produced evidence of intensive medieval and post-medieval occupation. The earliest deposit encountered, a garden soil, possibly filling one to two pits, was dated to the 12th-13th centuries, but contained a large proportion of late Saxon/Saxo-Norman pottery, suggesting occupation of this period in the immediate vicinity. This was followed, probably in the 15th century, by a build-up of possible clay floor surfaces, levelling deposits of mortar rich material and the construction of a major east to west aligned wall. There was a paucity of pottery dated to the 13th and 14th centuries. A similar drop in cultural material was noted in excavations at the corner of Magdalen Street and Cowgate in 1974. This was interpreted as due to the area being incorporated into the precinct of St. Paul's Hospital (commonly known as Norman's Hospital). Possibly in the 16th century this wall was demolished and a large amount of garden soil was imported. It was likely similar remains

survived beneath the whole of proposed development area. It was also possible that due to the amount of Late Saxon/ Saxo-Norman material found, remains of that early date may have survived elsewhere in the development area. [Au(abr)]

*Work undertaken by:* Cambridgeshire Archaeology

Two evaluation trenches were excavated. Excavation of one of these was hampered by the presence of a post-medieval well and modern cellars. The second trench revealed a sequence of archaeological deposits, the earliest of which took the form of ditches and probably dated to the 12th century. Evidence of at least two sequential 13th-14th century buildings was recorded. These were followed by a series of 14th-15/16th century pits. Further post-medieval pits were also found, suggesting buildings along the St. Georges Street frontage. The construction of buildings with cellars in the late-19th to 20th century had truncated the post-medieval deposits. [Au(abr)]

Ratcliff, M Norwich : NAU Archaeology, Report: 1767 2008, 27pp, colour pls, figs, tabs, refs

*Work undertaken by:* NAU Archaeology

An archaeological evaluation was carried out on land around the Roundwell Public House, Costessey. Nineteen trenches were excavated within the car park and surrounding field, prior to the proposed development. The work took place in two phases, the first comprised seven trenches, within the car park and south field, the second phase comprised a further twelve trenches within the northern field. A number of modern surfacing deposits were revealed within the trenches excavated in the car park. There were some modern intrusions, such as service trenches, drains and concrete posts, but no earlier archaeological features. The trenches excavated in the adjacent fields revealed a subsoil and a shallow sandy natural, disturbed only by roots and burrows. Some metal artefacts were recovered from this subsoil, including a small bronze waste fragment, a copper-alloy thimble and a medieval silver cut farthing. A fragment of fire-cracked flint, prehistoric pottery and some small flint flakes were also recovered. Two small pits containing traces of burning and a single narrow ditch were found in the northern field during Phase 2. No further archaeological features were present in these trenches. [Au(abr)]

Burke, J Northampton : Northamptonshire Archaeology, Report: 08/216 2008, 31pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* Northamptonshire Archaeology

An evaluation was carried out at Cathedral Square, three trenches were excavated . Archaeological horizons including pitched stone surfaces dated to the 18th and 19th centuries, pits and a post hole were identified. Most of the deposit layers encountered represented a series of levelling layers and dumps, some of which were related to a series of pitched stone and cobble or rough pebble surfaces, probably related to old roads or the market square, but this was unconfirmed in the small areas available for investigation. Cut features included pits and a post hole, the post hole produced no diagnostic material, but was overlain by layers containing late medieval pottery. The bulk of the pottery was retrieved from Trench 3. Pottery from the layers indicated that they derived from medieval and post-medieval contexts, although late medieval/early post-medieval pottery from the base of Trench 3 posed a stratigraphic problem. Either this was from an intrusive context such as pit fill, not fully recognised in the limited excavation areas, or the overlying layers which produced medieval pottery had been redeposited from elsewhere. Cooper, S Bar Hill : Cambridgeshire Archaeology, Report: 1032 2008, 25pp, colour pls, figs, tabs, refs

*Work undertaken by:* Cambridgeshire Archaeology

An archaeological evaluation was undertaken at Westmoreland Gardens near St. John Street, Peterborough. One stepped trench (7m long) was excavated to a depth of 2m below modern ground level. The results of the evaluation revealed that modern and post-medieval layers overlay medieval waterlain deposits. Due to the limited area investigated, interpretation of the sequence was problematic but the medieval deposits are likely to represent either a silted-up river channel which would have run north to south as a tributary of the River Nene or possibly a pond. Artefactual material recovered from the lower deposits included Lyveden Stanion and Bourn B type pottery dating to AD1200-1400. Environmental samples taken from earlier deposits provided useful data regarding the contemporary local environment. [Au(abr)]

Craven, J A & Caruth, J Ipswich : Suffolk County Council Archaeological Service, Report:  
2008/109 2008, 43pp, colour pls, figs, tabs, refs

*Work undertaken by:* Suffolk County Council Archaeological Service

Archaeological evaluation was carried out on the site of a small 17th/18th century farm on Lakenheath High Street. It was proposed to renovate the existing chalk lump farm buildings for residential use and construct new houses on the rest of the site. Trenches were inserted across all parts of the site and identified evidence that the existing site boundaries were long-standing and maintained, possibly originating in the middle Saxon period. Some undated ditches, possibly predating these boundaries were also found. Pits containing medieval pottery, and rubble deposits including re-used medieval building material were also found, and late medieval post holes, possibly indicating a structure, and perhaps suggesting a medieval farm predating the existing single phase farmyard. Much of the archaeology was deeply buried and the evidence for medieval activity on the site lay within an area where, apart from an access road, little intrusive groundwork was planned. In order to mitigate for the planned development it was recommended that a level 2 building survey was carried out to record the existing farm buildings before alteration, a documentary survey to establish the use of the site, and whether it may have been a medieval farm site before the existing farm, and monitoring of groundworks in areas where there may be risk to the archaeological deposits from the development. Craven, J.A. Bury St Edmunds : SCCAS, Report: SCCAS Report No. 2008/07 2008, SCCAS Evaluation report

*Work undertaken by:* SCCAS

"An archaeological evaluation carried out in advance of residential development on land adjoining the Smoke House Inn and Skelton's Drove, Beck Row, identified a substantial phase of Late Iron Age/Roman occupation. The dense spread of features, consisting of a network of ditches and scattered pits, is clearly an extension of the contemporary activity seen at the adjacent excavated site to the north, MNL 502. An absence of features in southern trenches indicated a probable south-eastern boundary to this area of occupation. Further excavation in advance of development has been recommended." [OASIS]

Webster, J Cirencester : Cotswold Archaeology, Report: 08151 2008, 36pp, figs, tabs, refs

*Work undertaken by:* Cotswold Archaeology

Archaeological evaluation of 102 trenches was undertaken. Despite the potential for archaeological features and deposits of prehistoric and Roman date to survive on the site no features predating the 20th century were noted. The modern features included former field boundaries and animal burials. The flint concentrations recorded during a prior fieldwalking survey were observed to lie within the course of a former river system, suggesting that post-depositional processes were responsible for the apparent clustered pattern of flint recorded during the previous survey. **LAND WEST OF TURNPIKE ROAD RED LODGE*****Land West of Turnpike Road Red Lodge, Suffolk. An Archaeological Evaluation***

McCall, W Hertford : Archaeological Solutions, Report: 3037 2008, 28pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

An evaluation of land west of Turnpike Road was carried out. The north-eastern half of the site contained the majority of a square shaped enclosure and the south-eastern corner of another. Cartographic sources dated the two enclosures from at least 1824, the time of the Freckenham parish enclosure map. The features had been removed from the cartographic sources by 1952. The two enclosures were thought to date to the post-medieval period,

particularly since the enclosure of warrens by earthwork banks was common in the 17th and 18th centuries. It was probable that the warren existed on the site during the medieval period, possibly from 1248 onwards. The evaluation was focused on the south-western sector of the site, which consisted of the land between the enclosures and a caravan park. The evaluation comprised 45 trenches revealing very few archaeological features. The latter consisted exclusively of natural features and modern rubbish pits. [Au(abr)]

Muldowney, M Ipswich : Suffolk County Council Archaeological Service, Report: 2008/269  
2009, 74pp, colour pls, figs, tabs, refs

*Work undertaken by:* Suffolk County Council Archaeological Service

This large scale evaluation revealed, in relation to the size of the area under investigation, scant archaeological deposits and features. Those identified were primarily located in Area D, with a small number of other features appearing in all areas, with the exception of Area B, Area C2 and Area F, which contained none. A small number of modern intrusions were also observed across the site, including possible post-medieval quarrying and modern military and waste pits. The archaeology of Area D was Late Iron Age to Early Roman, although a large ditch that ran across the area may have been a medieval field boundary. As part of the evaluation programme, further trial trenching was undertaken in Waldringfield Quarry on an area which was thought to contain tumuli. No evidence for the presence of the double burial mound was found, although a narrow ditch of modern origin was identified. Additional stripping around the known burial mound on Grainger [Scheduled Ancient Monument 21267] was undertaken, but no evidence for 'satellite' cremations or Anglo-Saxon burials that are sometimes associated with Bronze Age burial mounds such as this was identified. Crawley, P Norwich : NAU Archaeology, Report: 1977 2008, 28pp, colour pls, figs, tabs, refs

*Work undertaken by:* NAU Archaeology

A total of 33 trenches were excavated on the site to sample 5% of the development area. Seven archaeological features were observed during the course of the work. These included three small shallow pits containing charcoal rich fills, a shallow burnt patch on the surface of the gravel, a gully, a shallow ditch and a possible post hole. One of the shallow pits contained prehistoric, probably Iron Age, pottery and the fill of the post hole contained a moderate amount of burnt flint. The other features remained undated. The charcoal rich pits formed a loose cluster towards the centre of the site and could indicate prehistoric activity. [Au(abr)]

2008, 35pp, colour pls, figs, tabs, refs*Work undertaken by:* Suffolk County Council Archaeological Service

One of the main reasons for archaeological interest in the site was its location fronting the medieval green, where settlement was traditionally focussed. A significant quantity of medieval domestic pottery was present within Trenches 3 and 4 in particular. Features in these trenches, along with Trench 6, were suggestive of quite concentrated medieval activity, possibly associated with a dwelling, but difficult to interpret within the small trenched area available. Some of the glazed pottery may have originated from unidentified local production centres. Where greenside activity was identified, it was sealed by relatively shallow depths of overburden (between 300 and 370mm thick), making archaeological evidence at risk of damage during development. A second focus of activity was present in the southern part of the site, within the northern part of Trench 10 and the east of Trench 12. Features here contained finds of Iron Age date, comprising worked flint, burnt flint and a quantity of pottery, which raised the possibility of an Iron Age settlement in the vicinity. Again, these deposits were encountered at a relatively shallow depth, making them vulnerable to damage during development. Elsewhere, a number of ditches were recorded. Many of these were undated and probably represented field boundaries and drainage ditches related to former field systems. [Au(abr)]

'Tester, A.' Bury St Edmunds : SCCAS, Report: SCCAS Report No 2008/114 2008, Short PDF file

*Work undertaken by:* SCCAS

"This report combines the results from an archaeological evaluation and sample excavation at 15-17 Eastgate Street. The development comprises four town houses and two flats in an area of 870 square metres that lie at c. 31m OD. The construction involved the removal of temporary buildings and a substantial concrete slab and the piling of the site. The monitoring of excavations for a housing development was carried out on this site which lies alongside the River Lark outside of the East gate of the town. A short trench was also excavated in lieu of monitoring. Up to three wells were uncovered and the remains of five clay-lined troughs towards the rear of the property that are interpreted as tanning pits. Supporting evidence included a large collection of animal horn cores, which are a waste product of tanning. The finds evidence suggests that at least one of the troughs is dated to the 17th century. A documentary search of the evidence confirms the presence of tanners in the area from medieval times." [OASIS]

Tester, A. Bury St Edmunds : SCC, Report: SCCAS Report No 2007/142 2008, Short ringbinder

*Work undertaken by:* SCC

"An archaeological evaluation at 57-59 College Street identified the remains of a cellar with flint and mortar walls. The cellar had been infilled and a small trench exposed brick fragments that were medieval in date. It is uncertain how rare stone lined cellars were within the medieval town but it seems reasonable to suggest that this was from a high status building and may be related to Jesus College, which was dissolved during the Reformation. A flint surface with a mortar spread may have been contemporary. A sequence of brick foundations are thought to be the remains of the former workhouse which was sold in 1884." [OASIS]

*Work undertaken by:* Suffolk Archaeology Service, SCC

"An archaeological evaluation and monitoring was carried out during the conversion of the surviving buildings of Fornham Hall, Fornham St Genevieve into houses. The monitoring of construction and service trenches during the building of houses and garages exposed evidence for the village of Fornham St Genevieve. Surfaces of chalk and clay and soil layers with medieval pottery which are likely to be the remains of buildings were found below a destruction layer from the north end of Fornham Hall. These surfaces survived between brick foundations for the Hall. An undated ditch on a separate alignment to the hall was probably from the redundant village and a gravel surface may be evidence of the NW-SE road through Fornham that was later diverted when the hall was built. The reopening of an iron sewage

pipe unearthed human bones skeletal remains within the redundant churchyard' these were reburied." [OASIS]

*Work undertaken by:* Suffolk County Council Archaeological Service

No features of archaeological interest were uncovered during an evaluation on land to the rear of 82-104 Westgate Street. Below the topsoil diagonal plough marks were observed cutting the top of weathered chalk and gravel and it was suggested that a deeper accumulation of soil toward the base of the slope was the result of soil creep accelerated by arable farming. Unger, S & Adams, M Hertford : Archaeological Solutions, Report: 3082 2008, 50pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

The evaluation revealed features ranging from the early medieval to the modern period. Medieval features were mainly concentrated on the western side of the site in Trench 1. They consisted of a large ditch with deposits derived from a bank, and the remains of burnt wood in the base. A large pit and a ditch terminus were also recorded. Post-medieval features were found in the centre of the site and comprised walls, surfaces, ditches and gullies. A deep well contained a quantity of clay pipes and a German stoneware tankard. Early modern features were found in the north-east of the site, comprising a brick wall a brick lined furnace pit a flue-drain, a cess pit and a brick lined ditch. A medieval oven/kiln was found in this area also, it had been heavily truncated by modern features. Much of the activity discovered could be described as back yard activity, associated with the properties that fronted Risbygate and St. Andrews Street. [Au(abr)]

*Work undertaken by:* Wessex Archaeology

The evaluation located at least two inhumation burials which predated the Priory complex. These were radiocarbon dated to AD 670-780 and AD 890-1020 respectively. What may have been the Vallum Monasteria, the enclosing ditch around the monastic complex, was also revealed. The two early graves had been disturbed by the construction of the nave of the priory church, probably in the 11th or 12th century and by the extension to the single-celled church by the addition of a crossing-tower and extended chancel. No clear date for this later extension was ascertained, but the recovery of a 14th century brooch from a burial at the eastern end of the extension provided a possible terminus post quem. [Au(abr)]

*Work undertaken by:* Suffolk County Council Archaeological Service

Two trial trenches were excavated. Archaeological features were recorded in one of the two evaluation trenches, cutting the geological stratum. Seven small pits or postholes, apparently arranged in two parallel rows oriented east-west, were possible evidence for buildings/structures, although other interpretations (such as planting holes) were possible. Three of the pits produced medieval pottery dated to the late-12th-14th centuries, although the presence of earlier pottery suggested previous occupation or use of the site. An east-west ditch, presumed to be a former field boundary or enclosure ditch, produced post-medieval pottery dated to the 16th-18th centuries. [Au(abr)]

Hogg, I & Mellkian, M Twickenham : AOC Archaeology Group, 2008, 67pp, figs, tabs, refs  
*Work undertaken by:* AOC Archaeology Group

The evaluation comprised the excavation of thirteen trenches, and revealed possible evidence of prehistoric activity, in the form of struck flint, a Middle Saxon burial and post-medieval pits and a building. Cut into natural sands and gravels were around twenty archaeological features including small ditches, pits, animal burials and a human inhumation burial. In the western part of the site evidence of marshland was discovered, with alluvial clays covering the natural sands. No archaeological features were observed in this part of the site. There was a low level of prehistoric activity, represented by a number of worked flints discovered across the site, with a slight concentration in the northern section. In the southern area of the site a wall relating to a possible 16th to 17th century building was discovered. No other features directly relating to this were encountered. [Au(abr)]

Good, C Ipswich : Suffolk County Council Archaeological Service, Report: 2008/137  
2008, 24pp, figs, tabs, refs

*Work undertaken by:* Suffolk County Council Archaeological Service

An evaluation was undertaken prior to a planning application being submitted for a plot of land to the south of St. Peter and St. Paul's Church. The evaluation identified a small cluster of medieval features to the west of the site, close to the church. The plot was within the defined site of Wangford Priory and the potential for the monastic church, and/or ancillary burials and buildings within the development area was high, as well as medieval dwellings fronting onto Church Street to the east. Six trenches were excavated over the plot, with those adjacent to Church Street revealing a Neolithic/early Bronze Age ditch and pit, but no medieval evidence. This was restricted to the rear of the plot, where a large 12th-14th century extraction pit and a small cluster of other medieval features were recorded. No evidence of the priory or ancillary buildings was revealed, with the medieval evidence somewhat expected due to the site's location adjacent to the church and within the medieval core of Wangford village. Lister, C Colchester : Colchester Archaeological Trust, Report: 488 2008, 39pp, figs, tabs, refs

*Work undertaken by:* Colchester Archaeological Trust

The site was located on the Thames estuary in an area that had been densely populated from the Roman period onwards, and was considered to be potentially archaeologically rich. An evaluation by 35 trial-trenches revealed thinly spread evidence of activity ranging from the Mesolithic to the modern period. Features of note were a Roman pit and a medieval ditch. A collection of unstratified Palaeolithic flints was found deposited on the site from the river margin somewhere upstream. The low incidence of datable archaeological features was surprising given the proximity of the Mucking site to the south-west, and the number of findspots of Roman pottery from the foreshore and Mucking Creek. Approximately one-third of the features excavated were modern, reflecting the impact of developing industries in the area over the past 100 years. This probably explains the paucity of surviving archaeological features and finds here, as the industrial use of the site and, later, stripping of topsoil to remove contaminants, had severely affected in situ preservation. A geological appraisal of the site included palaeontological identification of molluscs which indicated that the shallow channels crossing the site were active in the Roman or later periods. Germany, M Braintree : Essex County Council Field Archaeology Unit, Report: 1923 2008, 25pp, colour pls, figs, tabs, refs

*Work undertaken by:* Essex County Council Field Archaeology Unit

An evaluation was undertaken on the proposed site of a new learning centre at Kings Walk. The Kings Walk area was formerly part of Grays High Street, prior to its redevelopment in the 1970s, and was situated in the oldest part of the town. The evaluation revealed that the proposed construction site for the new learning centre contained the remains of commercial and domestic buildings, which were formerly standing along the eastern side of Grays High Street. The remains lay beneath 0.3m of building rubble and re-deposited topsoil and were reasonably well preserved. The survival of compacted surfaces for floors implied that although the buildings had been levelled, they had not been completely grubbed out or seriously truncated. Analysis of the results led to the identification of five former buildings, which accorded with the general picture presented by the first four editions of the Ordnance Survey, which reveal that the south end of High Street was formerly densely occupied with houses and shops. While one of the buildings appeared to be 17th or 18th century in date, the other structures identified did not appear to predate the 19th century, suggesting that any evidence for the early development of the High Street area had been removed by 19th and 20th century redevelopment. De'Athe, R & Mephram, L Salisbury : Wessex Archaeology, Report: 68380.02 2008, 25pp, colour pls, figs, tabs, refs

*Work undertaken by:* Wessex Archaeology

An evaluation was undertaken on land at Copland Community School. No archaeological sites or findspots of prehistoric or Roman date had been recorded in the vicinity of the site, although an undated alluvial deposit was noted by the GLSMR. A desk-based assessment, undertaken in 2003, concluded that there was a potential for late Saxon or medieval remains to be present on the site as well as evidence of a house [Wembley House] and farm [Dairy Farm] of post-medieval date. The evaluation identified limited archaeological remains and finds, dating from the late Bronze Age, medieval and post-medieval periods within four of the eleven excavated trial trenches. Land drains were also identified in seven trenches. The earliest activity comprised a single residual sherd of late Bronze Age pottery, recovered from a modern shallow pit. In addition, medieval remains comprised a shallow gully and a shallow ditch, adjacent to each other and on the same alignment, which were likely to have been cut to facilitate drainage in the medieval period. The natural clays were found to be at a very shallow depth across the site which was waterlogged during the evaluation. The low level of archaeological remains revealed during the evaluation suggested that there was little potential for archaeological remains to be affected by the proposed development. [Au(abr)]

McCall, W Hertford : Archaeological Solutions, Report: 3061 2008, 31pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

The site lay within the boundary of a Scheduled Ancient Monument (145). Saxon graves were discovered to the north-east of the site. Also in the vicinity was a Roman bathhouse. In the current phase of evaluation, seven trenches were opened. Four of these were contained within the Scheduled Ancient Monument. Archaeological features and finds were sparse and consisted almost exclusively of modern rubbish pits. A metallised surface was located in Trench 5. [Au(abr)]

*Work undertaken by:* Museum of London Archaeology Service

The evaluation located some horizontal deposits of medieval and Roman date in the western and eastern parts of the site, as predicted by an earlier assessment. Deeper cut features included medieval building footings, domestic refuse pits and Roman quarry pits located in

most trenches. A further feature of note may have been a metalled surface discovered in the western part of the site, which could have been associated with known Roman roads in the area. The central part of the site was shown to have no archaeological potential due to more recent development. [Au(abr)]

Taylor, J Brockley : Pre-Construct Archaeology Ltd., 2008, 38pp, colour pls, figs, tabs, refs

*Work undertaken by:* Pre-Construct Archaeology Ltd.

The evaluation revealed a varied pattern of survival across the site. In the west of the site, possible brickearth slab foundations were recorded. In the centre of the site, two cut features were observed, the dating material recovered indicated a Roman or possibly post-Roman date. In the east, natural deposition or undated quarry pits were revealed. Any groundworks intrusive beyond the horizons of archaeological interest would impact upon the in situ archaeological sequence. *Work undertaken by:* Archaeological Solutions Ltd

"In January 2008 Archaeological Solutions Ltd (AS) carried out an archaeological evaluation on land at 12-40 Sanderstead Road, South Croydon, London (NGR TQ 3255 6315). The evaluation was commissioned in advance of the redevelopment of the site, which is currently used as a factory. The site lies to the south of central Croydon. The latter developed as an urban centre from the mid Anglo-Saxon period due to its status as an important, and later administrative, centre of the estates of the Archbishop of Canterbury. The site lies within a dry valley containing gravels of the Wandle, thought to have the potential for archaeological remains of prehistoric date. The site also lies within an Archaeological Priority Zone of the LB Croydon. The evaluation revealed that quarrying or marling pre-dating the construction of the modern factory had significantly truncated the site, with up to 3.50m of made ground present." [OASIS]

Compass Archaeology London : Compass Archaeology, 2008, 21pp, colour pls, figs, tabs, refs

*Work undertaken by:* Compass Archaeology

Archaeological evaluation of land to the rear of 65 Kingswood Lane, took place on 1st April 2008. The site lay within an area of known archaeological importance. A Roman settlement, enclosed by a small semi-circular earthwork, was partially excavated by R.I. Little during 1955 and 1959 to the north of the site on the northern boundary of Kings Wood. The excavations in 1959 discovered Roman burial-urns and a small 1st century cemetery beyond the gateway to the settlement and alongside a short stretch of metalled road. A complex of ancient roads and track ways connected this site and others along the clay capped chalk ridges linking the site to ancient trade routes. Kings Wood was closely linked with an area of land now occupied by Atwood Primary School further north along the Limpsfield Road. In 1960 during building operations, a Romano-British settlement was discovered and part of the site was re-excavated in 1989 and further significant evidence discovered, indicating Iron Age and Roman occupation and this settlement was again linked to the Kings Wood community by ancient roads and track ways. For the 2008 evaluation, two trenches were excavated each

measuring approximately 8m x 1.5m. The first trench was excavated running north-east to south-west within the footprint of the proposed new build, the second and southernmost trench lay at right angles to the first and was located over the hammer head of the access driveway. No archaeological remains were found, there was a straightforward sequence of deposits across the site, with a rich humic garden soil overlying the slightly weathered sterile surface of the natural clay with flints. During the course of the evaluation the site was metal detected and a selection of small finds were recovered including a base metal copy of a one-third guinea (the original coin of which was introduced in 1774, although it may be that this particular example incorrectly copied an earlier design possibly of coin types of the reign of William and Mary/William III (1689-1702), a gilded brass Masonic fob of recent design, a bullet from a .303 rifle and a fragment of shrapnel from a drive belt. These finds were not of any special archaeological significance. The shrapnel and bullet were not surprising considering the proximity of Biggin Hill airport, the Masonic fob was probably of very recent date, and although the replica coin was of some numismatic interest, it probably represented just a lost chance find and may have been of relatively recent date. Its provenance here was not of any obvious archaeological significance. Given the lack of any significant findings it was suggested that no further archaeological measures should be undertaken in relation to the proposed developments. [Au(abr)]

**4-6 New Inn Broadway, London Borough of Hackney. Archaeological Evaluation Report**

Knight, H London : Museum of London Archaeology Service, 2008, 39pp, colour pls, figs, tabs, refs

*Work undertaken by:* Museum of London Archaeology Service

The evaluation found remains in all three trenches excavated. Potentially significant remains of what appeared to be the foundations of a polygonal structure were recorded in the south-western corner of the site, and may have formed the remains of the 16th century playhouse known as The Theatre, which documentary evidence suggested existed on or close to the site. The remains were of national, if not international, importance and were recorded and preserved in situ on the site. Earlier archaeological remains were sealed by the 16th century deposits, however, due to the requirement for preservation in situ, it was not possible to fully investigate. Later remains were investigated, and these included 17th and 18th century foundations with garden soils. These were only of local significance. Any remains of the priory, which cartographic sources suggested existed in the vicinity close to the New Inn Broadway frontage, could be of regional importance. The remains found were thought to be significant and rare enough to warrant preservation across the majority of the site. [Au(adp)]

ArchaeoScape, Report: 14324.R03revB 2008, 41pp, colour pls, figs, tabs, refs

*Work undertaken by:* ArchaeoScape

Environmental archaeological investigations at Lots Road and land at Thames Avenue revealed considerable variation in the thickness of alluvial deposits due to truncation associated with successive stages of industrial development. Peat deposits dating from the Late Bronze Age to Middle Iron Age were recorded in one of the boreholes, with a later date recorded in another. Unfortunately, due to the poor preservation and low concentration of bioarchaeological remains, namely pollen, plant macrofossils, insects and diatoms, little could be stated about the nature of the vegetation cover and general environmental conditions of the site. Seddon, G Brockley : Pre-Construct Archaeology Ltd., 2008, 39pp, colour pls, figs, tabs, refs

*Work undertaken by:* Pre-Construct Archaeology Ltd.

The evaluation revealed considerable evidence for late prehistoric occupation, with a number of pits, linear features, post holes and two probable cremations cut into the natural clay. It was likely that the features related to a farmstead and possible cremation cemetery, occupied from the Late Iron Age until the early 1st century AD. With the majority of discoveries being confined to the very southern end of the site, it was possible that part of the settlement was removed with the construction of the train line. The depth of the features also indicated horizontal truncation through years of ploughing. [Au(abr)]

Eddisford, D Twickenham : AOC Archaeology Group, Report: 30222 2008, 28pp, colour pls, figs, tabs, refs

*Work undertaken by:* AOC Archaeology Group

An evaluation comprised the excavation of ten 40m x 2m trenches. Selected hand excavation of archaeological features was undertaken where present. The area examined represented approximately 5% of the site area. With the exception of cremated human bone, no finds were recovered from the features excavated during the investigation, making the dating of the features identified difficult. A linear feature recorded in Trench 5 appeared to represent two pits containing burnt material. A feature in Trench 4 contained an upper clay fill and a primary charcoal rich fill, but had no finds. Feature [1003] in Trench 10 contained a single clay fill which contained a significant quantity of charcoal, burnt bone and burnt flint. A sample taken from feature [1003] contained heavily burnt human bone fragments. The cremation burial [1003] was clearly of archaeological importance. There was no dating evidence associated with the burial. The burial was likely to be of prehistoric date when considering the known archaeology in the area, the nature of the burial and its location. However, given the known Roman and Saxon activity in the area a later date could not be discounted. The presence of cremated human remains on the site suggested similar burials may be encountered nearby. The archaeological features encountered on the site were sealed by c.0.30m of overburden, in the form of subsoil and topsoil. Therefore, intrusive works on the site were likely to have an adverse impact on any archaeological deposits. As a result it was likely further archaeological works will be required in order to mitigate for the proposed development. [Au(abr)]

***Site H & L, Hillingdon House Farm, Uxbridge, London Borough of Havering. An Archaeological Evaluation Report***

Harris, P Twickenham : AOC Archaeology Group, 2008, 34pp, figs, refs

*Work undertaken by:* AOC Archaeology Group

An evaluation was carried out at Hillingdon House Farm, Uxbridge. It comprised the excavation of five machine excavated trenches. Silt and modern building materials were found to extend beyond 1.2m below ground level, completely truncating any possible archaeological remains. Further modern truncation was found in the north-east of the site where a modern building previously stood. Scarce archaeological remains were uncovered within Trench 3 in the centre of the site and Trench 4 in the south-east of the site. A small undated pit and shallow linear gully were excavated in Trench 3 and a silted gully, shallow

pit containing hearth material and post-medieval soil horizon were uncovered in Trench 4. Flint and pottery sherds recovered from silting deposits suggested a prehistoric occupancy of the area, whilst buried soil horizons dated to the post-medieval period illustrated the recent deposition of made ground. [Au(abr)]

Harris, P Twickenham : AOC Archaeology Group, Report: 30078 2008, 40pp, colour pls, figs, tabs, refs

*Work undertaken by:* AOC Archaeology Group

The aim of the evaluation was to assess the impact of any new development on any surviving archaeological remains within the site. In particular the evaluation sought, to establish if the leat of a medieval moat [Scheduled Ancient Monument 29] ran through the northern corner of the site and to establish if any of the structures previously noted on an 1896 OS map were present in the eastern corner of the site. The evaluation comprised the machine excavation of three trenches. The trenches were positioned within an Area of Archaeological Sensitivity. Natural London clay deposits were identified at between 40.73mOD and 41.39m OD. Sealing the clay were late post -medieval and modern deposits of made ground, layers of hardcore levelling material, and buried tarmac and concrete surfaces. Within the northern corner of the site a series of post holes denoting the layout of a possible medieval structure, and a pit were uncovered. The pit contained sherds of early medieval pottery, and three further similar sherds were recovered from the post holes. A small quantity of animal bone was also recovered. The artefacts were interpreted as being domestic in nature, and the features probably represented a timber building and a rubbish pit. The pottery dated to AD 1050-1150, and it was therefore likely that these remains were from occupation of the site following either the construction of the motte and bailey castle by Ernulf de Hesdin after the Norman Conquest, or the acquisition of the manor by the Abbey of Bec after 1097, and the replacement of the castle with a religious house on the site. The moat and leat were not found during the investigations. Within the eastern corner of the site the brick foundations of a 17th century building's exterior wall was uncovered. The foundations were heavily truncated by a 20th century concreted storage tank to the north-west and by Bury Street itself to the north-

east. Two Roman artefacts were found in later features, indicating the presence of a Roman building in the vicinity. [Au(abr)]

Wessex Archaeology Salisbury : Wessex Archaeology, Report: 69960.03 2008, 17pp, colour pls, figs, tabs, refs

*Work undertaken by:* Wessex Archaeology

An evaluation of land at 590 Chiswick High Road in Hounslow was undertaken. The proposed development was for construction of a terrace of four houses and refurbishment of the John Bull public house, built in 1853, which still occupied the southern part of the site. No archaeological features, deposits or artefacts of note were recorded from the evaluation. All the recorded deposits had been deposited at some point in the 20th century, which was supported by the presence of crushed brick rubble deposits, which may have been derived from the demolition of outbuildings or livery stables associated with the public house in the early 20th century. The finds were all residual reflecting the disturbed nature of the site's stratigraphy and were almost entirely post-medieval in date aside from stratified single pieces of undiagnostic, prehistoric worked and burnt flint. Knight, H London : Museum of London Archaeology Service, 2008, 42pp, colour pls, figs, tabs, refs

*Work undertaken by:* Museum of London Archaeology Service

The evaluation showed the eastern area of the site had been significantly truncated by modern service trenches. Ground reduction had also removed any archaeological remains from the central and south-western parts of the site. An 18th-19th century cess pit and a late post-medieval brick wall foundation was found on the site. The proposed development involved pilings that would affect archaeological remains if present, however, the scale of the truncation probably meant that no further remains would be affected. *Work undertaken by:* Museum of London Archaeology Service

The evaluation revealed evidence for Early Bronze Age agriculture in the form of ard marks, plough soils and flint knapping. Groups of stake holes and finds of daub with wattle impressions gave tantalizing evidence for settlement. Post-medieval industrial activity was also recorded, with 17th-18th century tin glazed wares and kiln furniture from a series of pits acknowledging the local pottery manufacture. Imported Dutch ware found at the site may have indicated an affluent area. The presence of a 16th/17th century drain and a later ditch in

the northern part of the site may have demonstrated that the area was prone to flooding, even though the site had been reoccupied. [Au(adp)]

*Work undertaken by:* Museum of London Archaeology Service

The evaluation revealed a series of external 16th century gravel and brick surfaces, as well as the remains of an 18th century brick and flint wall. The back wall of a 19th century cellar was recorded in the eastern part of the trench. The results of the evaluation were thought to be of local interest only. [Au(abr)]

*Work undertaken by:* Museum of London Archaeology Service

The evaluation revealed natural clay, cut by a possible former palaeochannel or ditch, backfilled in the 16th century. A sequence of archaeological layers overlay the channel, to a thickness of over 2.5m. These dated to the 16th and 17th centuries and could be associated with land reclamation at this time. In the light of revised understanding of the archaeological

potential of the site, the report concluded that post-medieval remains of local significance survived in the lift and stair core. [Au(abr)]

Mackinder, T London : Museum of London Archaeology Service, 2008, 41pp, colour pls, figs, tabs, refs

*Work undertaken by:* Museum of London Archaeology Service

The evaluation did not reveal any remains that could be attributed to the Hope Theatre. A sequence of alluvial deposits contained concentrations of dog, bear and horse bones, and was thought to represent bear-baiting that had taken place on Bankside. The largest concentration of bone was associated with 17th century pottery, and was deposited over a short period of time. Other features included a pit filled with building debris, a possible timber drain and a brick tank that probably belonged to the 18th century iron foundry. Development on the site was thought to have removed significant archaeological remains such as the Hope Theatre and bear-baiting arenas. [Au(abr)]

Godden, D London : Wessex Archaeology, Report: 69940.03 2008, 24pp, colour pls, figs, tabs, refs

*Work undertaken by:* Wessex Archaeology

An evaluation was undertaken in August 2008 in advance of proposed redevelopment of the western part of the former Queen Mary's Hospital at Carshalton. The evaluation comprised the excavation and recording of 15 trial trenches and were mostly positioned between the existing buildings. Of the 19 trenches originally proposed, four trenches could not be excavated due to site constraints. Archaeological features comprising ditches and a pit containing a horses head of Romano-British date were found on the eastern edge of the site and would suggest a degree of settlement activity in the early Roman period on the site. To the west a probable Bronze Age ditch, partially exposed may be associated with the Scheduled Bronze Age enclosure (SM163) to the southeast. Two trenches dug in garden areas in the north-west of the site both revealed a series of closely spaced parallel features interpreted as possible planting trenches used to increase food production in one of the World Wars. Some truncation and modern landscaping of the site was evident. [Au(abr)]

***Cuba Street, Isle of Dogs, London, E14, London Borough of Tower Hamlets. Archaeological Evaluation April 2008***

Sankey, D London : Museum of London Archaeology Service, 2008, 31pp, colour pls, figs, tabs, refs

*Work undertaken by:* Museum of London Archaeology Service

A geotechnical watching brief and archaeological evaluation was carried out. Two evaluation trenches were excavated on the site. The results of the evaluation revealed an alluvial sequence from Terrace Gravels fining up to sandy clay. Gravel spreads and overbank deposits [levees or crevasse-splay], which included washed in fire-cracked flint, were identified within the sandy clay. The alluvial sequence was cut by 19th century cess pits and industrial building foundations [which also cut through coal-ash , nightsoil , land-raising

dumps]. In the light of the revised understanding of the archaeological potential of the site the report concluded the proposed redevelopment would have no significant archaeological impact. No further archaeological work was recommended. [Au(abr)]

*Work undertaken by:* Museum of London Archaeology Service

The evaluation detected a large, homogeneous deposit above the natural gravel. This was dated to between 1660 and 1800 and appeared to be filling an earlier, medieval episode of quarrying. The nature of the layer indicated that the site was open land between the quarrying episode and the development of the site in the 19th century. Brickwork and a culvert of 18th century date were recorded. The remains of a rendered tank of unknown function were found in the cellar. The impact of the proposed development was negligible. Capon, L Twickenham : AOC Archaeology Group, Report: 30188 2008, 41pp, colour pls, figs, tabs, refs

*Work undertaken by:* AOC Archaeology Group

Eight trenches were excavated, few archaeological remains were found in most of them. However, two trenches close to the High Road contained ditches, probably marking property or field boundaries, dating to around 1580-1700. A thick layer of organic topsoil across the majority of the site represented the use of most of the site as orchards until the late-19th century. The history of the site was dominated by successive school buildings. The earliest was built in 1708, and may have been represented by a very fragmentary foundation. The second phase school was built in 1748, and had been mostly demolished. The most recent school building had very deep foundations. [Au(abr)]

Doyle, K., Adams, M. Hertford : Archaeological Solutions Ltd., Report: Report No. 2990 2008, A4 ring-bound document

*Work undertaken by:* Archaeological Solutions Ltd.

"During January 2008, Archaeological Solutions Ltd (AS) conducted an archaeological trial trench evaluation of land at 63-65 Garratt Lane, Wandsworth, London, SW18 (NGR TQ 257 742; Figs. 1 and 2). The evaluation was commissioned as part of a planning permission prior to the proposed redevelopment of the site (Planning Ref. 2007/3234). The redevelopment comprises commercial floor-space on the ground floor and 27 residential apartments on the upper floors, with provision for car and cycle parking spaces. An archaeological desk-based assessment has been prepared by CgMs Consulting Limited (Darton 2007). The assessment indicated the site had moderate potential for Mesolithic and Neolithic periods, low to moderate potential for Palaeolithic and post-medieval periods, and low potential for later prehistoric, Roman, early medieval and medieval periods, (Darton, 2007). Despite its archaeological potential only post-medieval and modern remains were present. The evaluation revealed an 18th -early 19th century brick wall and its associated construction cut. Wall W1004 was located on the eastern side of the site aligned roughly east-west and extending towards Garratt Lane. It was most likely to have been a boundary wall between either 63-64 or 64-65 Garratt Lane. The OS Maps dated AD 1868, AD1893,

and AD 1916 depict a boundary wall in this location to the rear of the properties that bound onto Garratt Lane (Darton 2007)." [OASIS]

Cummings, R London : Compass Archaeology, 2008, 43pp, colour pls, figs, tabs, refs

*Work undertaken by:* Compass Archaeology

An evaluation was undertaken prior to redevelopment of part of the former North Westminster Community School. Two trenches were excavated within the footprint of the area of proposed redevelopment. No archaeological finds or features predating the later 19th century were observed. The remains of one of many Victorian terraced properties were exposed in the form of brick walls, concrete slabs and drainage features at the northern limits of the site. To the south three concrete and brick probable column foundations were exposed which may reflect the remains of the temporary church of St. Barnabas, which stood on the site between 1863 and 1874. Further drainage features were exposed in this area and were considered to represent later 19th century development, possibly relating to the building of Bell Street School in 1874. [Au(abr)]

Sankey, D            London : Museum of London Archaeology Service,    2008, 28pp, colour pls, figs, tabs, refs

*Work undertaken by:* Museum of London Archaeology Service

Three evaluation pits were excavated on the site and seven geotechnical trial pits were monitored. The results of the evaluation helped to refine the initial assessment of the archaeological potential of the site. In the desk-based assessment, Hackney Gravels were predicted to lie under the north half of the site. The interface between them and the lower later Taplow Terrace was potentially an area where soft sediments and Lower Palaeolithic implements could have survived. Trial pits, however, demonstrated that the northern part of the site was terraced into underlying marine clay (London Clay). The gravels that survived to the south and west were at a lower level than this marine clay and, consequently, thought to have been derived from the Taplow Terrace where that cut through the earlier river terrace. The soft sediments that were found within the natural gravel sequence were thought to indicate subsequent reworking by water emerging from springs associated with the nearby marine clay [where the thickness of water-bearing gravels has been reduced]. There was no evidence of Ice Age land surfaces or Palaeolithic remains. The remains of a lower cellar, or sub-basement, were found near to and beneath the party wall with 7 St. James's Square. It was built of brown bricks with terracotta floor tiles set on Yorkstone slabs. The depth below St. James's Square was considered deep for the 16th century house that formerly occupied

the site. The bricks were considered to be a later engineering type brick rather than the red, or purple-red bricks common in the 17th or 18th century. They were similar to Ketley engineering bricks still in production. So too were the floor tiles which were similar to hand-made floor tiles made to this day. Taking the evidence as a whole, the lower cellar, or sub-basement, was considered to have been a late-19th or early 20th century modification of that earlier building and to be of low archaeological, or architectural significance. *Work undertaken by:* Ian Farmer Associates

The evaluation consisted of two trenches either side of the 1980s play area and a single pit centrally located within its southern boundary. Both trenches revealed medieval/post-medieval deposits and artefacts. Trench 2 revealed a medieval stone spread. A modern tramline feature, likely to be associated with the construction of the play area, extended across the whole of Pit 1. [Au(abr)]

*Work undertaken by:* Wessex Archaeology

An archaeological evaluation was carried out by Channel 4's "Time Team", at the site of the Scheduled Ulnaby deserted medieval settlement. The evaluation largely confirmed the results of the 2007 English Heritage earthwork survey, while highlighting the different information that excavation can yield as opposed to non-intrusive investigation. The village of Ulnaby appeared to have been occupied for a relatively short period in the late-13th or early 14th century, becoming largely unoccupied by the 14th century. No evidence was found to support a pre-medieval origin for the settlement. [Au(adp)]

Frain, T South Shields : Tyne & Wears Museum Archaeology Department, Report: 715 2008, 43pp, figs, tabs, refs

*Work undertaken by:* Tyne & Wears Museum Archaeology Department

Fifteen trenches were excavated which found that there were few archaeological features, the truncated remains of ridge and furrow or boundary features of medieval/early post-medieval date were the only surviving features. However, in the southern corner of the site there was a significant concentration of pits and features which predated this agricultural activity. A significant quantity of prehistoric pottery sherds, of Bronze Age tradition, was recovered from two of these features. [Au(abr)]

***Back Silver Street, Durham City; archaeological desk based assessment and evaluation***

Claydon, M Durham : Archaeological Services Durham University, Report: Report 1791 2008, Bound report and CD

*Work undertaken by:* Archaeological Services Durham University

"Archaeological desk-based assessment and evaluation conducted in advance of a proposed development at Back Silver street, Durham City, between December and January 2008. The proposed development area falls within the Durham City conservation area. There are no indications that it was occupied during the prehistoric or Romano-British periods. It was occupied during the medieval and post-medieval periods. The evaluation trenches confirmed that deposits relating to these periods of occupation do exist, and probably survive over most of the site. The archaeological resource surviving on the site has the potential to provide significant information regarding the medieval and post-medieval development of the historic core of Durham City. The report recommends that a larger excavation of the site be carried out prior to the groundworks for the proposed development." [OASIS]

*Work undertaken by:* Pre-Construct Archaeology Ltd.

The evaluation consisted of two trial trenches within the footprint of a proposed new residential development. Trench 1 encountered a stone culvert of likely 19th century date, cut into natural sand and gravel. Trench 2 exposed truncated natural sand and gravel and a west-east aligned stone retaining wall. On its south side was an associated cobbled surface, and the remains of ginnel skirting to the rear of a former street frontage building. These structural remains were of likely later post-medieval date. [Au(abr)]

Carlton, R J Newcastle upon Tyne : The Archaeological Practice Ltd., 2008, 31pp, colour pls, figs, refs

*Work undertaken by:* The Archaeological Practice Ltd.

The remains recovered from Trench 1 included those of substantial clay-bonded stone wall and possible flooring of likely Roman origin. In Trench 2 there was no evidence for intensive Roman activity, but indication the area had been heavily disturbed. A post-medieval structure identified as a soakaway was found in the upper levels. Discovered In Trench 3 was a drystone wall, identified as the footings and lower wall courses of a substantial Roman building, associated with a flagged surface and more ephemeral remains of gulleys and/or further building footings. Trench 4 revealed a series of gulleys containing Roman pottery, interpreted as the foundations of wooden buildings and/or associated drainage trenches. A spread of sandstone rubble uncovered in Trench 5 was associated with abundant Roman pottery, indicating that it was the product of Roman building activity, perhaps representing a demolition phase or degraded revetment wall. [Au(abr)]

*Work undertaken by:* Pre-Construct Archaeology Ltd.

The evaluation comprised a single trial trench, sited within the footprint of the proposed development. Throughout the north-western half of the evaluation trench, natural boulder clay fell away sharply to the east, reflecting the natural topography of the undulating ground of the upper valley site. Boulder clay was overlain by a developed soil of likely medieval origin, which produced a few sherds of pottery of probable 13th century date. Throughout the south-eastern half of the trench, a large intrusive feature of late-20th century date truncated this horizon. [Au(abr)]

An evaluation established that two banks of coke ovens of 19th century date, which survived to the west of the site (designated as a Scheduled Ancient Monument) extended eastward

into the development site. Three coke ovens belonging to a more northerly bank were found beneath the make-up for a concrete yard at the north end of the site, and a fourth belonging to a more southerly row immediately west of the present roadway adjacent to the site boundary. The southernmost coke oven was relatively well preserved surviving up to ten courses in height, the three more northerly examples having been disturbed to the level of their last working floor. *Work undertaken by:* The Archaeological Practice Ltd.

Five trenches were excavated. Trench 1, on the site of a public house, revealed no remains or significant structures and it was considered likely that the buildings formerly present on the site destroyed any archaeological remains formerly existing there. Trench 2 revealed modern structural remains of little archaeological significance, including brick walls and a concrete surface from the terraced houses built on the site following the demolition of the Scotswood Housing estate. Trenches 3 and 4 on the site of the former Delaval farm uncovered fragmentary remains of surfaces and ditches considered likely to have been associated with the farm. Trench 5 uncovered deposits consistent with the dumping of industrial waste on the north side of the line of the former railway, close to the Scotswood Road embankment. [Au(abr)]

Attwood, G Durham : University of Durham, Archaeological Services, Report: 1801 2008, 45pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Durham, Archaeological Services

Tom Oliver's map of 1830 showed the proposed development area as open farm land. By his 1844 revision a building called St. Lawrence's House was shown. This was marked as two semi-detached buildings with associated sheds or outhouses, with some clay pits nearby. The clay pits were later abandoned and filled with water to become reservoirs. The Malings B Ford pottery was constructed around the cottage in the 1890s. This included a large concrete lined reservoir that provided water for a flint mill. Photographs show that this had a brick water inlet and a set of steps for access and cleaning, with both of these surviving. The reservoir was filled in after 1963 when the potteries went out of business. The remains of the reservoir and St. Lawrence's House were identified and recorded within the evaluation trenches. No other significant archaeological features were uncovered, and no further scheme of archaeological works was recommended in relation to the development. [Au(abr)]

Amat, D & Carey, C Gateshead : Archaeological Research Services, Report: 2008/74  
2008, 59pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Research Services

The evaluation excavations on the site revealed the exact location of Smeaton's snuff mill, as well as a remnant works from the brewery. Evidence of the water-wheel pit survived in the form of sandstone foundations, but there was no trace of the wheel itself. The millrace ran through the centre of the site from north to south and was present in both trenches. Aside from the mill race channel the most dominant feature on the site was the ashlar wall of the mill which existed in Trench 2. The brewery remains were more obvious in Trench 1 than in Trench 2. They mainly existed in the form of walls and drains but also included a large brick lined well/sump found in the higher ground levels of Trench 2. Evidence of the brewing process was revealed by the discovery of corks and glass bottles during the excavations of the mill race. Specialist macrofossil assessment also found large quantities of cereal grains and hops which related to the brewery. [Au(abr)]

*Work undertaken by:* The Archaeological Practice Ltd.

The evaluation revealed a modern floor structure, below which were deposits of silty layers consistent with gradual infill. The depth of made deposits recorded by excavation, particularly when compared with levels recorded locally, suggested that the fill of Hadrian's Wall ditch was encountered, although the restricted nature of the site meant that the edges of the ditch were not revealed. The presence of a ditch was further supported by bio archaeological evidence of water logging. The presence of a roughly made, clay bonded sandstone wall upon and partly within the ditch fill suggested that it may have been part of a causeway across the ditch constructed in the medieval or early post-medieval periods. Murray, R Edinburgh : Headland Archaeology Ltd., 2008, 27pp, colour pls, figs, tabs, refs

*Work undertaken by:* Headland Archaeology Ltd.

A total of 67 trenches were excavated showing that agricultural remains, in the form of furrows, survived across the parts of the development area. The spacing between these and pottery recovered from them suggested that they dated to the medieval period. An area of upstanding ridge and furrow was surveyed. Two features of archaeological interest were discovered in proximity to each other. A small curvilinear feature, containing fragments of Iron Age pottery and a north-south aligned ditch containing charcoal and burnt clay, were found on an area of flat high ground. No relationship between these features was evident. [Au(abr)]

***Archaeological Evaluation of Land at the Site of the Former Newport Ironworks, North Middlesbrough Accessibility Scheme, Teeside***

Liddell, T Alston : North Pennines Archaeology Ltd., Report: CP/590/08 2008, 30pp,  
colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

An evaluation was undertaken on the former Newport Iron Works as part of archaeological mitigation works for the North Middlesbrough Accessibility Scheme. The work involved the excavation of three targeted trial trenches. The evaluation trenching produced substantial 19th and 20th century industrial remains relating to the Newport Iron Works. Trench 1 revealed a concrete floor, a curved wall and the remains of a large cast-iron pipe, which could

possibly have powered the bellows in the nearby furnace. Trench 2 contained large deposits of iron slag, with the remains of a flagged floor, a concrete floor and bases for machinery. While structural material was present, it could not be tied into a base for a furnace as suggested by the targeted trench. Trench 3 contained the potential edge of a concrete puddling floor, as well as a number of brick structures and the remains of a tarmac road running over the brick remains. Unfortunately, Trench 2 was deemed too unstable due to sand deposits over the archaeology causing the deep overburden to shift and move uncontrollably for the trench to be cleaned and recorded properly. In Trenches 2 and 3 fibrous asbestos was found, again disallowing further access for cleaning and full recording. The trenches were all backfilled by mechanical excavator due to asbestos contamination. [Au(abr)]

Platell, A. Durham : Archaeological Services Durham University, Report: Report 1984 2008, Bound A4 document with a grey cover

*Work undertaken by:* Archaeological Services Durham University

"An evaluation was carried out by Archaeological Services Durham University in the grounds of Narrowgate House, Narrowgate, Alnwick in July 2008. A small number of medieval pits and gullies, together with post-medieval pits and cobble surfaces, were identified immediately west of the building. They were severely truncated by a large modern cut that occupied much of this area. In the remainder of the grounds, a soil build up more than 1m deep was found and this was not fully excavated. A post-medieval horse burial and 19th century glasshouse foundation were identified in this area. A watching brief was recommended, should further construction works take place. A stable block in the grounds was photographed and assessed. It is likely to be contemporary with the main building (i.e. 18th century) but is in a poor state of repair and is of local significance. The north wall of the garden possibly contains internal flues for heating. If so, this is of greater significance. More work was recommended on this wall." [OASIS]

Dingwall, K Edinburgh : Headland Archaeology Ltd., Report: WGAN08 2008, 68pp, colour pls, figs, tabs, refs

*Work undertaken by:* Headland Archaeology Ltd.

In total, 25 trenches were excavated across three fields at the site. Several areas containing stratified deposits and structures were encountered, generally of medieval date, although some post-medieval features were recorded. Part of the site represented a medieval agricultural area, with other areas of the site having been truncated or altered. The features identified could be broadly summarised as a large ditch and metalworking area along the

south-east corner of the development area, a series of medieval walls and deposits along the northern fringe, and partially demolished post-medieval and modern structures on the north-west and north-east corners. Pottery recovered from the features dated largely to the 12th to 14th centuries, with a small concentration in the 15th to 16th centuries. 18th and 19th century material was recovered from the post-medieval and modern structures and deposits. *St. Lawrence's Churchyard, Warkworth*

Carlton,R. Newcastle upon Tyne : The Archaeological Practice Ltd, 2008,

*Work undertaken by:* The Archaeological Practice Ltd

"This document reports on archaeological evaluation trenching conducted to inform a proposal for the stabilisation of the north wall of St Laurence's Church, Warkworth, a process that will require groundworks in the adjacent churchyard, an area of high archaeological potential. The trench was excavated by hand until archaeological features or sub-soil were encountered, at which point all anomalies or features of potential interest were examined closely to appraise their importance and, if necessary, for recording purposes. The investigation of the site in this way revealed a variety of remains the most significant of which were intact human burials at depths below 0.75 metres. The results of the excavation support a recommendation for mitigation by avoidance using narrow piles and pile caps above the level of the burials. However, where it is impractical in whole or part of the area concerned to avoid disturbing deposits at depths likely to contain human remains, then mitigation by record will be necessary, including the archaeological excavation of pile-cap foundation trenches and the full recording of any burial remains encountered." Carlton, R J Newcastle upon Tyne : The Archaeological Practice Ltd., Report: AP08/26 2008, 28pp, colour pls, figs, tabs, refs

*Work undertaken by:* The Archaeological Practice Ltd.

The evaluation revealed a variety of archaeological remains, the most significant of which were substantial stone building remains close to the north wall of the church at c.0.5m depth, and intact human burials below 0.25m. It was considered that the footings were related to a pre-Conquest church, parts of which had already been recorded inside the 13th century structure. It's precise date was unknown, and was thought to be anywhere between the 8th and 11th centuries. The nature of the remains on the site was enough to support a recommendation for mitigation. Frudd, A Lancaster : Oxford Archaeology North, Report: 2008-9/864 2008, A4 Document

*Work undertaken by:* Oxford Archaeology North

"Rural Solutions, on behalf of Richard Roberts, have submitted a planning application (reference B38/47: 4160) for the expansion of the Elmbank Caravan Park, Cow Road, Spittal, Northumberland (NGR NU 0055 5101). The planning application covers two fields with a total area of 4.2ha, although only the central 1.7ha will be developed under current proposals. An appraisal of the site, organised by OA North in January 2008, identified putative archaeological features through aerial photograph analysis and geophysical survey, several of which could have been affected by the proposed development. Accordingly, Northumberland County Council Conservation Team (NCCCT) issued a brief for a programme of archaeological investigation to be undertaken in advance of the development,

in order to further inform the planning process. Oxford Archaeology North (OA North) was commissioned by Rural Solutions on behalf of Richard Roberts to undertake an archaeological evaluation meet the standards of the NCCCT brief, which was conducted in July 2008. The evaluation, comprising the excavation of seven trial trenches of various dimensions, principally focused on those putative features identified during the previous appraisal, including several curvilinear features, possible boundary ditches, and areas of potential settlement activity. Three trial trenches represented a control sample to test the veracity of the geophysical results in areas that appeared nominally blank or affected by magnetic interference. The evaluation revealed the presence of 23 archaeological features, most of which had not been identified during the appraisal. Expand Of these, the presence of artefacts indicated that three were modern or late industrial period in date, but the remainder were undated. Any development impacting beyond the lowest horizon of the modern topsoil will have a significant negative effect on these features." [OASIS]

Frudd, A Lancaster : Oxford Archaeology North, Report: 2008-9/864 2008, 52pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology North

The evaluation was carried out on an area previously investigated, and recorded a further 23 archaeological features. These comprised a series of ditches, most of which followed alignments similar to local pre-enclosure boundaries. Most seemed to have been post-medieval or industrial period in date, as attested by their fills that contained the weathering of industrial waste [coal and shale] that appeared to have been periodically dumped on the area. There was an extremely sparse finds assemblage, and the spreading of industrial material across the site may have explained the magnetic "noise" that an earlier geophysical survey picked up. With the exception of a possibly shallow and enigmatic curvilinear feature in the northern part of the site, any groundworks in the topsoil were unlikely to have any significant impact on the archaeological resource. 2008, 23pp, colour pls, figs, tabs, refs*Work undertaken by:* The Archaeological Practice Ltd.

The evaluation recorded the presence of a deep build-up of highly organic, silty waste deposits. The presence of medieval deposits immediately below the modern concrete surface suggested that the medieval and post-medieval land surface may have been truncated prior to, or during the construction of the modern building platform in the centre of the site. The presence of pottery of an exclusively medieval date from within the medieval deposits provided a date for them. The presence there of drains and pits was in keeping with the function of back plots as waste disposal sites. Mitigation by avoidance was the preferred suggested course of action, but where this was not possible, limited archaeological excavation was recommended. [Au(adp)]

Bamburgh Research Project Bamburgh : Bamburgh Research Project, Report: BRP08/03 2008, 34pp, colour pls, figs, tabs, refs

*Work undertaken by:* Bamburgh Research Project

An evaluation was carried out at the site and revealed three main phases of activity. Phase 1 dated to the 13th/14th century, and comprised a midden layer and a cut feature dating to the 13th century. This was sealed by another midden layer, containing 14th century pottery, overlain by another midden, less substantial than the others. Phase 2 was dated to the 14th/15th centuries, and included a cut feature and compacted soil layer. Phase 3 was post-medieval in date and was represented by two large pits and later dumping activity and structural activity. A possible 16th century pad stone may have tentatively indicated medieval structural activity. The limited pottery assemblage contained imported wares in limited quantities, which indicated that the recovery of a larger assemblage may have helped to provide a better understanding of the pottery used in Berwick during the medieval period. Carlton, R J Newcastle upon Tyne : The Archaeological Practice Ltd., 2008, 35pp, colour pls, figs, refs

*Work undertaken by:* The Archaeological Practice Ltd.

The investigation of the site revealed deposits of waste materials, most of which could be identified as domestic refuse dating to the 19th and 20th centuries, with some later dumping of farm waste materials. There was some evidence for flagged flooring which appeared to have been removed following the abandonment of the building as a residence. Exposure of the walls indicated that the structure underwent successive phases of substantial rebuilding, so little of the original structure survived. A full photographic and partial drawn recorded was made of the building prior to and following the clearance of rubble from the interior and partial demolition of the upper courses of the east gable end wall. Adams, J Durham : University of Durham, Archaeological Services, Report: 1851 2008, 45pp, colour pls, figs, refs

*Work undertaken by:* University of Durham, Archaeological Services

The evaluation showed that an archaeological resource of medieval and post-medieval period date existed in the area around Dilston Hall, Area 1 of the proposed development. It was likely that similar resources survived in other areas across the site. Archaeological monitoring may have been required in the areas that would be affected by the groundworks and building work. Two ditches were found in Trench 1, but no dateable artefacts were recovered. In Trench 2 the remains of probable post-medieval square rubbish pit or garden feature were found. A ditch and gully were also recorded in Trench 2, the ditch fill contained a piece of medieval pottery, and the gully fill contained fragments of brick which were probably post-medieval in date. [Au(abr)]

*Work undertaken by:* North Pennines Archaeology Ltd.

The evaluation comprised the excavation of two trenches. Trench 1 revealed nothing of archaeological interest, but Trench 2 revealed the footprint of a set of modern outbuildings along with an earlier structure, possibly a cellar, below. The presence of a rim sherd of medieval pottery within a service cut demonstrated the potential for medieval activity in the vicinity. Monitoring was recommended for any further groundworks. Wright, J & Annis, R Durham : University of Durham, Archaeological Services, Report: 1849 2008, 13pp, figs, refs

*Work undertaken by:* University of Durham, Archaeological Services

The works comprised topographic and photographic survey of areas affected by animal and vehicle erosion, and of the prehistoric cairn within the circuit of the camp's defences. A total of 46 significant erosion sites were recorded and photographed. All of these were due to stock damage. A few of the sites had been further damaged by quad bikes or tractors. At seven sites there was significant exposure of the stone core. A number of features not previously recorded were picked up, these included possible clearance cairns, circular holes probably caused by artillery shells and shallow single-use slit trenches. Three features may have been worthy of further examination. [Au(abr)]

**LAND AT TODLAW HOUSE, ROCHESTER*****Archaeological Desk-based Assessment, Walkover Survey and Evaluation on Land at Todlaw House Rochester, Northumberland***

Gaskell, N Alston : North Pennines Archaeology Ltd., Report: CP/674/08 2008, 25pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

In April 2008 a rapid archaeological desk- based assessment and field evaluation on land to the north of Todlaw House was undertaken. The site was located within an area of known archaeological interest, particularly concerning the Roman Fort of Bremenium, and the medieval village of Rochester. The rapid desk-based assessment showed that two late prehistoric settlement sites and one important medieval village were located within close proximity to the proposed groundwork. A study of cartographic sources demonstrated that little post-medieval or modern activity had affected the area, and that should subsurface archaeological remains exist in the area, they were likely to be undisturbed and well preserved. The walkover survey indicated that anomalies in the form of a raised linear feature and a round feature were visible within the site boundary. The subsequent evaluation of three linear trial trenches within the site boundary revealed no layers, deposits, features or artefacts of a significant archaeological nature. Trench 1 contained a small deposit of ash, presumably from the fire grates of the neighbouring houses and a few sherds of 19th century pottery from kitchen jugs and plates. Trenches 2 and 3 provided no such information, only naturally accumulated layers. It was considered that no further work was necessary. [Au(abr)]

Amat, D Gateshead : Archaeological Research Services, Report: 2008/4 2008, 21pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Research Services

An archaeological evaluation was undertaken at Halton Chesters. The work was carried out prior to the installation of a new telegraph pole in a field to the west of Halton Chesters Roman Fort. Six fragments of pottery were found within the plough soil dating to around AD120-150. No structures were located during this excavation down to the natural level, and given that no artefacts were found below the topsoil layer, it was deemed unlikely that the proposed work would damage anything of archaeological significance. Vyner, B, Grahame, R, Innes, J, Rowe, P & Hall, A Hartlepool : Tees Archaeology, Report: TA08/10 2008, A4 bound report

*Work undertaken by:* Tees Archaeology

"This report describes the methodology and results of two archaeological evaluations undertaken by Tees Archaeology Research and Fieldwork Section at Upleatham, Redcar and Cleveland, and Goldsborough, North Yorkshire. The fieldwork was undertaken in August and September 2008 as part of an English Heritage funded partnership project between Tees Archaeology and the North York Moors National Park Authority researching the Mesolithic in north east Yorkshire. Both sites are lowland locations in prominent positions, and have been previously identified as sites of potential settlement due to the presence of lithic scatters. They were evaluated using a programme of shovel pitting followed by targeted test pitting. This replaced a fieldwalking programme which could not be carried out due to poor weather delaying the harvesting of crops at both site. At Upleatham, the flint assemblage demonstrates occupation from at least the late Mesolithic (and possibly early Mesolithic) through to later prehistory. In addition several features were identified: a large ditch, probably an enclosure ditch, a pit and a hearth. Pottery finds indicate that these are all likely to date to the Late Bronze Age or Pre-Roman Iron Age. At Goldsborough, the shovel pitting produced a very mixed flint assemblage, but two ditches, probably enclosure ditches, were identified. Flint finds indicate that one of these dates to the Mesolithic or early Neolithic." [OASIS]

Dodd, LEwloe : Earthworks Archaeological Services, 2008, 21pp, colour pls, figs, refs

*Work undertaken by:* Earthworks Archaeological Services

Three trial trenches were excavated in the small churchyard area fronting the church. The results demonstrated clearly that complex multi-period archaeology survived on the site. The area was a cemetery during the post-medieval period, and probably earlier, and two in situ burials were recorded. Where undisturbed by grave digging, deposits and features dating to both the Roman and medieval periods were identified, including the vestigial remnants of a Roman cobbled surface, the remains of a fine medieval wall that once belonged to a stone building the stood south of the site and the remains of an earlier retaining wall. Possible earlier church foundations was also noted beneath the south-west corner of the existing building. [Au(abr)]

McPhillips, S Lancaster : Oxford Archaeology North, Report: 2007-08/805 2008, 70pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology North

The evaluation comprised the excavation of 27 trenches and confirmed that significant archaeological remains survived in situ. Particular concentrations of buried archaeological remains were identified in the south-western and central parts of the site, with more sporadic remains existing to the north. The majority of these archaeological remains were of a Roman date (pits and possible ditches), and partial excavation yielded a large assemblage of Roman pottery. Conversely, trenches excavated across other parts of the site, including the eastern edge and a strip to the south of the field boundary that traversed the site, were devoid of archaeological features of interest. Noakes, H Alston : North Pennines Archaeology Ltd., 2008, 39pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

An evaluation comprising a programme of eighteen trial trenches was undertaken in 2008 The trenches were positioned so as to target and test areas which were identified as having cropmarks present in or near them during a 2006 Desk-based assessment, as well as a general coverage of 'background' trenches to examine the areas shown as negative or blank.

Four of the trenches [Trenches 2, 4, 6 and 10] did not contain any archaeological or modern remains. Four of the trenches [Trenches 1, 7, 13 and 15] contained plough marks. Trenches 1, 2 and 8 were also observed to have been disturbed by extensive animal burrowing. Archaeological deposits were observed within ten of the eighteen trenches. Possible prehistoric features were observed within Trenches 3, 5, 8, 16 and 18. This comprised a continuous linear feature which was observed to be aligned approximately north-east-south-west within Trenches 5, 8, 16 and 17, and correlated to known aerial cropmarks and geophysical anomalies. Within Trench 3, a similar linear feature was aligned at right angles to this, aligned on a roughly west-east alignment. The formation of these features suggested that this represented an enclosure field system, which was putatively dated to the Bronze Age based on nearby discoveries. Possible post-medieval features were observed within Trenches 8, 9, 11, 12 and 14. These comprised linear features within Trenches 8 and 9 that were aligned in a north-east-south-west direction and which correlated to a hedgerow, the presence of which was clearly visible in aerial photographs of the site, and on Tithe maps dating from the 1800's. Similarly, in Trenches 12 and 14, a continuous linear feature was aligned in a north-east-south-west direction, and appeared to correlate to a boundary on the 1800's Tithe maps. In Trench 17 a linear feature may have formed a right angle to the linear feature in Trenches 8 and 9, and suggested that this was part of a boundary ditch, as shown in the 1800's Tithe boundary maps of the area. A linear feature in Trench 11 which was aligned in an east-west direction correlated to a known hedgerow, which was observed in the aerial photography in 1975, suggesting that this feature was relatively modern in date. Modern plough furrows were observed in Trenches 15, 14, 13, 12, 16 and 17. In Trench 16 intensive plough marks were observed, although archaeological deposits within this trench were substantial in depth, suggesting that the deposits remained relatively untouched. The evaluation at High House Quarry revealed that some well preserved archaeological deposits existed. However, these appeared to be clustered towards the north-west of the evaluation area, as shown by the preservation of linear ditches within Trenches 16 and 18. [Au(abr)]

**OVERBY QUARRY, AIKSHAW, ASPATRIA**

***Archaeological Evaluation at Overby Quarry, Aikshaw, Aspatria, Cumbria***

Town, M Alston : North Pennines Archaeology Ltd., Report: CP/665/08 2008, 75pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

An archaeological field evaluation was undertaken on land at Overby Quarry. The results of a previous desk-based assessment found a high potential for the survival of subsurface archaeological remains, dating to the prehistoric period. Within Area B were a series of five well preserved in situ urns. Archaeology was also noted within Area C, in the form of small linear gullies and pits. This area went immediately to excavation, and resulted in the discovery of approximately thirty cremations, eight of which were within urns [mostly collared, though one had been tentatively identified as a food vessel, dated 2000-1700 cal BC]. The number of cremations was tentative, as some pits were also excavated which contained only small amounts of bone, and which may not have been "true" cremations, but could have represented ritual activity associated with the cremation rites. However, despite the discovery of the cremations, the archaeology within the remainder of the excavation area, proved to be of little interest and appeared demonstrably modern in some. This appeared to be mirrored by the results from Areas D through to F. During the evaluation, a number of linear features were noted within trenches in all three areas, and as these were undated, they were believed to be of prehistoric date, and related to the cremation cemetery. However, analysis of the 19th century tithe map indicated that most of the archaeological remains may have been of fairly recent date, and corresponded to known field boundaries. The evaluation at Overby Quarry successfully investigated a series of fields to the south-west of the current quarry site, but,

beyond the cremation cemetery which was investigated as an open area excavation, no archaeological finds were recovered to indicate that the site was being used for any other purposes than agricultural, and no identifiable evidence of further settlement or ritual activity was noted, though stray prehistoric finds were recovered. The lack of secure dating for the features found during this evaluation means that features must be dated using morphological characteristics. [Au(abr)]

Lakin, D York : AOC Archaeology Group, Report: 21154 2008, 25pp, figs, tabs, refs

*Work undertaken by:* AOC Archaeology Group

Fifteen evaluation trenches were excavated. No archaeological features of prehistoric or Roman date were encountered. One potentially medieval feature, a linear boundary ditch was encountered in the western part of the site. A palaeochannel of the Speet Gill was noted in the eastern part of the site. No anthropogenic material was discovered within the excavated sections of the channel, however, modern (late-19th or 20th century) material was observed to be concentrated in the soil filling the hollow above the infilled channel indicating that it may have remained a landscape feature until relatively recent times. The archaeological significance and potential of the remains encountered were generally considered to be low and it was recommended that further archaeological works be limited to a watching brief on groundworks in the western part of the site where such groundworks involved excavation below the existing slab base. Potten, S Twickenham : AOC Archaeology Group, Report: 21176 2008, 24pp, colour pls, figs, tabs, refs

*Work undertaken by:* AOC Archaeology Group

An archaeological evaluation was carried out on land to the south of Syke Road, Wigton. Twenty-three evaluation trenches were excavated. No archaeological features or artefactual material of prehistoric, Roman or medieval date were encountered. The only datable features encountered were associated with demolished buildings of probable 19th century date located in the north-eastern corner of the site. These included a rectilinear foundation trench for a robbed out wall, a possible yard surface and abundant demolition debris. The buildings most likely represented a small 19th century farmstead. A few undated features were also encountered. A network of shallow undated ditches, generally aligned north-west to south-east, most likely represented a field drainage system. A large undated ditch and a shallow undated gully were also located in the vicinity of the demolished farm buildings. These may have been associated with the occupation of the farmstead. The archaeological significance and potential of the remains encountered were considered to be low and no further archaeological works were recommended. [Au(abr)]

Gaskell, N Alston : North Pennines Archaeology Ltd., Report: CP/634/08 2008, 34pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

The evaluation consisted of the excavation of eight trenches, and was required as part of the subsequent development works, that had the potential to impinge on any as yet unidentified features in the area. Previous archaeological investigations to the west of the development

area had revealed undated remains of possible post hole structures, and the wider vicinity contained evidence for prehistoric activity, including two Neolithic axe heads from the Morton area. Furthermore, the course of a Roman road ran along the southern boundary of the site. The results of the evaluation revealed no deposits of archaeological interest dating to any historic or prehistoric period. Although three pieces of post-medieval pottery were recovered from three of the trenches, they came from the topsoil or subsoil layer and not from any archaeological feature. [Au(abr)]

Ridings, C Lancaster : Oxford Archaeology North, Report: 2008/09-839 2008, 50pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology North

A walkover survey highlighted that development in the form of the Willowholme Industrial Estate was fairly extensive and there were few areas of open ground. In total 28 sites were identified. Some 26 were located as a result of the desk-based assessment. Most of the sites [21] were of post-medieval date, although one prehistoric and three Roman were also recorded. The remaining three sites were not closely dated but were likely to have been in existence by the medieval period at least. The line of the turf phase of Hadrian's Wall was not known in this area but must cross the site, so it could be affected by the proposed sewer. Two evaluation trenches were placed over the earlier sewage pipelines, post-medieval pottery and glass was encountered. [Au(abr)]

McPhillips, S Lancaster : Oxford Archaeology North, Report: 2008-09/899 2008, 52pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology North

The proposed development site was identified as being in an area of high archaeological potential due to its proximity to the Roman fort and vicus. It was occupied more recently by nineteenth century buildings, such as railway goods station and a grain shed. The process of levelling and associated disturbance of the site for the construction of the goods station and yard appeared to have largely removed the original topsoil. As a result, only two trenches retained evidence of activity preceding the industrial development of the site in the later nineteenth century. These comprised a buried horticultural soil in Trench 2, which contained eighteenth and early nineteenth century pottery and the remains of a similarly dated wall and field enclosure ditch in Trench 3. The evaluation demonstrated that, other than twentieth century metal working remains along the eastern part of the proposed development site, there was no significant archaeological deposits and/or features present in the evaluation trenches. Sowerby, M Alston : North Pennines Archaeology Ltd., Report: CP601/08 2008, 25pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

An field evaluation consisting of six trial trenches was undertaken on land at The Old Clydesdale Stud. The area was located within the Hadrian's Wall World Heritage Site and was also a Scheduled Ancient Monument. The evaluation was required, as part of the works would directly impinge on the projected line of Hadrian's Wall. The groundwork carried out at the Stud had the potential to confirm the exact location of Hadrian's Wall within an area that had seen little in the way of modern archaeological interventions. The line of the wall was originally mapped by the Ordnance Survey, and indicated that the projected course of it ran through the grounds of the stud. However, the evaluation demonstrated a distinct lack of archaeological features and deposits relating to the Roman period. It was highly likely therefore, that the wall was located either to the west or east of the study area. [Au(abr)]

A total of 22 trenches were excavated, and found evidence for former ridge and furrow cultivation, post-medieval field boundaries and ceramic land drains. The remains of a truncated roundhouse of later prehistoric date were recorded together with a small number of associated features comprising pits, post holes and ditches. There was no evidence that the roundhouse was part of an enclosure, despite the extension of the trench. Two further ditches contained late medieval and post-medieval pottery and were thought to date to these periods. Further archaeological monitoring was recommended in order to fully understand the prehistoric feature. [Au(adp)]

Peters, C & Sowerby, MAIston : North Pennines Archaeology Ltd., Report: CP/563/08 2008, 32pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

An archaeological building recording in advance of a proposed redevelopment of Pears House was undertaken. A previous desk-based assessment had revealed that the existing building had 1925-1938 origins, and its elaborate frontage made it worthy of further study prior to demolition. The north-west facing internal wall had evidence for the incorporation of pre-existing adjacent boundary walls into the fabric, shown by differing fabrics of different style and period, particularly in the southern half of the elevation. In addition, it showed that the building extended south-eastwards into the back plot of the Public House, increasing its known boundary. An evaluation revealed significant post-medieval occupation debris, rubble spreads, wall foundations and floor surfaces showing significant human activity in the area during this period. This, however, was expected given the proximity of the site to the town and dock area. In addition to the later post-medieval features and modern makeup layers, present in all three trenches, an earlier wall and cobbled surface were revealed. The section of walling and cobbles appeared to relate to an earlier boundary structure and possible yard or pathway. Three fragments of Delft Ware pottery were recovered from within the foundations of this structure, indicating a possible early to mid eighteenth century date. Three other walls were also exposed, and were related to a small square building constructed between 1874 and 1925 shown on Ordnance Survey mapping for the area. During the evaluation a wall was exposed running north south, which related to the original extant building recently demolished on the site. It appeared that the wall formed the western wall of the cellar and it was likely that

this is the surviving remnants of a long linear building, first shown on contemporary mapping in 1790. The work also confirmed that the land to the northeast of the site had been levelled, with the deposition of large amounts of overburden, which showed that the ground level had been raised by c 3m. [Au(abr)]

### **BROUGH CASTLE, BROUGH**

#### ***An Archaeological Field Evaluation at Brough Castle, Brough, Cumbria***

Noakes, H Alston : North Pennines Archaeology Ltd., 2008, 22pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

An archaeological field evaluation was undertaken at Brough Castle in order to provide further information on the depth and condition of the north curtain wall foundations. It had been observed that the northern side of the castle was potentially suffering from the effects of subsidence, accelerated by the positioning of the north curtain wall on the side of a steep slope. The castle was located within the northern limit of the Roman fort and civilian settlement of Verterae. The effects of subsidence, combined with the gradient of the hillside could cause significant damage to both this Scheduled Monument and the associated Roman earthworks. An evaluation consisting of two linear trial trenches was undertaken from the 28th of August to the 2nd September 2008. Both trenches were positioned to abut the north curtain wall, in order to assess the depth and condition of the foundations at specific points along the wall's course. Archaeological deposits (comprising three distinct archaeological horizons), and the foundations of the north curtain wall were encountered in both trenches. In Trench 1 the evenly coursed foundations were observed at a depth of approximately 0.9m from the current ground level, and were vertically faced. No finds were recovered from this trench. In Trench 2 the foundations were observed to a depth of approximately 0.6m from the current ground level and were also vertically faced. Within the middle of the section of the wall was observed an area which seemingly represented a rebuild phase as the coursing became uneven and irregular. Animal bone was recovered from the trench and was retained for further analysis. Tumble was recorded within the upper horizons of the trench, within which was a stone observed to have decorative moulding on both sides. The evaluation at Brough Castle revealed that the foundations of the north curtain wall were present to a depth of between 0.6m and 0.9m below the current ground level. Within trench 1 was noted the presence of an offset belonging to part of a possible 13th century buttress. However, within both Trench 1 and Trench 2 no offset was observed to the foundation, and within Trench 2 there was evidence of a phase of rebuilding. It was possible that these related to rebuilding of the wall in 1245, as well as the construction of latrines in the 17th century. The evaluation also revealed that the angle of repose between the foundations of the wall and the gradient of the slope below was less than 45 degrees which suggested that damage to the castle and its associated earthworks was likely to be accelerated if no intervention occurred. The findings of the evaluation suggested that a mitigation strategy to stabilise or repair the north curtain wall should be implemented in order to prevent further damage of the northern parts of the castle wall, and the Roman earthworks associated with it. Peters, C & Gaskell, N Alston : North Pennines Archaeology Ltd., Report: CP651 2008, 30pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

The site lay within the medieval village of Warcop, between a medieval manor, a 12th century church and a 16th century hall, and as such, the area was considered to have high potential for below ground remains associated with medieval settlement and land use. The evaluation comprised a rapid desk-based assessment of the site, a visual site inspection and the excavation of a number of trial trenches across the site. The rapid desk-based assessment involved the examination of all pertinent documents and cartographic sources. In addition a site visit allowed an above ground investigation. The following evaluation phase of works constituted three linear trenches that revealed no layers, features, deposits or datable artefacts of significant archaeological interest. Therefore it could only be concluded that the area had not been disturbed before it was used as a timber yard and then the Eden Garage. [Au(abr)]

Clark, PLancaster : Oxford Archaeology North, Report: 2008-09/836 2008, 35pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology North

During a previous evaluation at the school in 2005, four human cremations were uncovered, three of which were of late Bronze Age date and grouped together. The fourth was Neolithic in date. Thirteen features of archaeological significance were identified within the study area. Four evaluation trenches were excavated. A number of possible features were identified and investigated by manual excavation, although only a possible post hole merited record. This

possible undated post hole measured 0.3m in diameter and 0.38m in depth. There was no evidence of significance truncation across the site and it appeared that the lack of archaeological remains identified genuinely reflected the area examined. [Au(abr)]

*Plot 104, Crown Square, Spinningfields, Manchester: An Archaeological Excavation*

Gregory, R Manchester : University of Manchester Archaeological Unit, 2008, 45pp, pls, colour pls, figs, tabs, refs

*Work undertaken by:* University of Manchester Archaeological Unit

The excavation identified the remains of four late-18th century buildings and early and mid-19th century worker's housing. One of these buildings probably functioned as industrial premises in the late-18th/early 19th century before being converted to worker's housing in the early decades of the 19th century. From a heat affected brick-lined channel found within the interior of this building a sizeable assemblage of clay tobacco pipes and clay tobacco pipe kiln waste was also recovered. An assessment of this assemblage indicated that it formed a key group for the region, comprising a range of products produced by a member of one of the principal pipe making families of the area. In view of the significance of these remains a further level of analysis was recommended, comprising a detailed analysis of the clay tobacco pipe and kiln waste assemblage alongside a further phase of historical research. Wild, C Lancaster : Oxford Archaeology North, 2008, 50pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology North

The excavation of five evaluation trenches revealed in situ archaeological deposits across the site. In particular, the well-preserved remains of a boiler house were exposed in the central part of the site, seemingly associated with a dye works that is shown to have occupied the site on late-18th-century maps. Evidence for an early 19th-century extension to the dye works was also observed, at a depth of approximately 2m below present ground level, suggesting that further remains are likely to survive underneath a later concrete floor, which spans most of the western part of the site at a similar depth. In the northern part of the site, structural remains associated with a 19th-century smallware factory were revealed, surviving to a significant depth, suggesting that the building had a basement. Physical remains of the steam-power plant associated with the factory was not encountered, although the evaluation established that this almost certainly lay to the north-east of the trench that was targeted on this feature. It was recommended that a programme of further investigation was carried out before and during the remediation of the site, to mitigate the damage or destruction of significant archaeological remains during the proposed development, and that an area, targeted on the footprint of a dye works shown on a map of 1794, was subject to detailed excavation. In addition, it was recommended that an archaeological watching brief monitors ground reduction works associated with the proposed development in peripheral areas. [Au(abr)]

*Work undertaken by:* University of Manchester Archaeological Unit

An evaluation and building survey was undertaken at the proposed site of the City of Salford Stadium. The evaluation involved the excavation of twelve trenches across a low promontory of land to the south of the present A57. The trenches identified early activity on the higher portions of the promontory in the form of ephemeral post holes/pits and linear gullies, along with artefacts indicative of prehistoric and late pre-Roman Iron Age/Romano-British occupation/settlement of the area. The building survey recorded the extant remains of a small brick and concrete structure which was identified as being a potential WWII structure. [Au(abr)]

Williams, M London : L-P: Archaeology, Report: LPO639L-AER-"I. I 2008, 51pp, colour pls, figs, tabs, refs

*Work undertaken by:* L-P: Archaeology

Seven trenches were excavated at the site of the former Thomas Story Works. The natural gravels survived immediately below the concrete slab of the former works in three trenches, and the remaining four trenches showed the gravels to be disturbed by abandoned services or heavily contaminated, probably by drainage running off the slab. Two features were recorded in the trenches where the gravels survived. The first was a small circular pit that contained no finds. The second was a small east-west ditch that contained one piece of Willow Pattern pottery. Due to the disturbance of the natural gravels and the lack of significant features in the surviving gravels, it was suggested that no further works were required on the site. [Au(abr)]

Baldwin, S Lancashire : S J Baldwin, Report: 002/08 2008, 39pp, colour pls, figs, tabs, refs

*Work undertaken by:* S J Baldwin

An evaluation was undertaken at Bradley Youth and Community Centre. The proposed development site appeared to have been occupied since at least 1200 by Bradley Hall, an important farm within the township of Great Marsden. As part of the development of the town of Nelson the Bradley estate was subdivided and new roads laid out, with the lots being offered for sale in 1885. One of these new roads was Priory Road, at the north end of the site, which ran just north of Bradley Hall and required partial demolition of a large barn complex associated with the hall. The remaining section of the barn was purchased by the Catholic Church, incorporated in their new school and was still extant. The hall itself was subsequently cleared and a Wesleyan Methodist chapel was erected just south of the former hall site in 1899. The 2008 archaeological evaluation at Bradley Hall consisted four trenches. Survival of the Wesleyan Methodist Chapel was confirmed by the presence of a large in situ sandstone wall and a possible backfilled cellar in Trench 2. Trial trenching showed that the raised plateau immediately north of the 1960s youth centre comprised deposits sealed with clay, most probably demolition material from Bradley Hall. Building materials from the c. 1962 demolition of the Wesleyan Chapel and construction of the modern youth centre appeared to cut earlier deposits associated with Bradley Hall in Trench 4. No in situ structural remains of Bradley Hall were encountered and further trenching would be needed in excess of 2 metres depth to resolve the question of survival. [Au(abr)]

*Work undertaken by:* Archaeological Services & Consultancy Ltd.

Two evaluation trenches were excavated butting up against the church. Each was found to contain the deep disturbed deposits characteristic of old churchyards where burials have been continually deposited over centuries. Four burials were found, two in each trench. Although this high concentration of interments was likely to continue right across the area of the new development, the depth of the skeletons found was below the formation level of the extension floor. A number of stones at the north-western corner of the north aisle of the church indicated that there was additional reinforcement of the church in this area. It was not clear whether this strengthening was part of the construction of the church or a later repair. [Au(abr)]

Rouse, C Milton Keynes : Archaeological Services & Consultancy Ltd., 2008, 20pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Services & Consultancy Ltd.

An archaeological evaluation was undertaken at Gorse View in advance of residential development. Trenches were targeted on the footprints of the proposed new dwellings. A modern pit was uncovered at the southern end of the site. No other archaeological finds or features were observed within the trenches. However, the garden of Gorse View was dominated by a large hollow, which appeared to be an unrecorded extraction pit, possibly related to the tile industry in the area. [Au(abr)]

*Work undertaken by:* Chris Butler Archaeological Services

An archaeological evaluation trench was excavated at Dovecote Barn. A previous desk-based assessment had identified the site to be situated in the area of a large pond, which had probably been in-filled between 1910 and 1927. The excavation located the pond which had a clay lining. All of the artefacts recovered dated from the late-19th to early 20th century which corresponded with its later use and final infilling. Dawkes, G Portslade : Archaeology South-East, Report: 2008106 2008, 38pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

Trenches were laid out targeting or respecting geophysical anomalies, identified in an earlier survey. The evaluation identified two main phases of archaeological features. The earliest was a series of shallow ditches and pits dating to the Late Iron Age/early Roman period. The ditches possibly formed part of an enclosure located immediately south of the prehistoric ridgeway route and the recovery of significant amounts of burnt daub indicated the former presence of timber buildings, possibly roundhouses. Finds from the subsoil of sherds of Middle Iron Age and Late Roman pottery may also indicate a broader time-scale of activity. The main medieval features on the site were two large negative features, interpreted as ditches aligned north-east to south-west and east to west, possibly forming the south-west portion of an enclosure. However, only one side of each of these ditches was found and these features may alternatively be clay extraction pits or even ponds. All of the finds from the features were sherds of pottery dating from the 13th-14th centuries and the features almost certainly related to activity focused on the medieval ridgeway route and associated with the moated settlement of Theobalds Farm, immediately to the west of the site. The results of the geophysical survey were borne out to some extent by the trial trenching. However, while the geophysical survey was beneficial in the initial identification of some the features, it appeared that generally the survey was not a wholly accurate guide to the extent or character of the archaeological remains. No archaeological features were identified in the northernmost field, closest to Theobalds Road. [Au(abr)]

**LAND ADJACENT TO OLD HARRIER KENNELS, COODEN, BEXHILL*****Land Adjacent to Old Harrier Kennels, Cooden, Bexhill, East Sussex: Archaeological Trial Trench and Test Pit Evaluation***

Fitzpatrick, R & Greatorex, C Salisbury : Wessex Archaeology, Report: 68610.03 2008, 28pp, colour pls, figs, tabs, refs

*Work undertaken by:* Wessex Archaeology

The results of the trial trench evaluation and Geo-technical observations implied that the land adjacent to Old Harrier Kennels had been utilised for pastoral purposes. The area for additional hand dug test pits revealed anthropogenically derived material of a very recent date. Both areas allocated for archaeological investigations did not identify any significant archaeological features and/ or deposits. Geophysical data suggested that a possible trackway associated with the medieval moated manor may have run into the site, however, on investigation it was revealed that this anomaly was a live service pipe/trench. A line projected from the moated manor house's existing causeway ran along a route upslope through the south-eastern part of the site, However, the projected line fell, for the most part, within the subterranean reservoir and therefore any remains of such a trackway would have already been lost. The archaeological investigations of the site provided useful information concerning the lack of archaeological potential immediately north-east of the moated manor. The site appeared to be beyond the limits of the Scheduled Ancient Monument activity and furthermore no evidence of any pre-modern archaeology was identified within the site. [Au(abr)]

**NORTHEYE, PEVENSEY LEVELS*****Northeye Pevensy Levels, East Sussex. Geoarchaeological Assessment Report***

Champness, C Oxford : Oxford Archaeology, 2008, 40pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology

A geoarchaeological assessment was undertaken which consisted of a field survey to record the sequence of deposits and recover samples for palaeoenvironmental assessment in the low-lying marsh area that surrounded the scheduled monument. A transect of five boreholes and two auger holes were taken through the marsh sediments. The sequence of deposits were relatively consistent. Two main phases of rising sea level [marine transgression] and one phase of lower sea-level [regression] were identified. The main period of regression was characterised by the accumulation of peats and organic deposits that represented a mosaic of different wetland environments. These deposits were believed to be prehistoric in date and stratigraphically equivalent to deposits previously investigated in the region that were radiocarbon dated to between c 4390 ± 60 BC [Late Mesolithic] to c 1790 ± 100 BC [early Bronze Age]. Palaeoenvironmental assessment for pollen, waterlogged plant remains, and insects was undertaken for one representative sequence. The assessment identified good potential for preservation of organic remains associated with accumulation of the peats. This sequence had the potential to provide detailed information on vegetation and sea-level change from the late Mesolithic period onwards. Previous studies had noted that early prehistoric utilisation of the Pevensy Levels was associated with episodes of marine regression. The organic deposits identified during this assessment had the potential to contain evidence of prehistoric activity in the form of artefacts, wooden trackways or platforms and boats. The organic deposits and any archaeological remains therein were vulnerable to both direct impacts through the digging of drainage ditches or secondary impacts such as the lowering of the water-table. The natural shallow embayment's of the island were likely a

significant factor in the growth of salt working in this area. Abandonment of the village was most likely partly due to a decline in the salt works. This was in part due to the declining economy and the spread of disease in the late-13th to 14th centuries. However, these affects were probably significantly exacerbated at Northeye by the storms of the late-13th century which likely infilled most of the embayments which were used in salt production. The village never appeared to recover from these events and was subsequently abandoned. Significant early salt working sites and other medieval features such as jetties may be found around the edges of the Northeye Island. Such discoveries could help inform about the activities associated with the medieval village. Within the area immediately surrounding the bedrock island these deposits were less than 1 metre from the surface and would therefore be vulnerable to direct impact. [Au(abr)]

***An Assessment Excavation at Tower House Rye, East Sussex***

Butler, C Polegate : Chris Butler Archaeological Services, 2008, 30pp, colour pls, figs, tabs, refs

*Work undertaken by:* Chris Butler Archaeological Services

An assessment excavation was carried out at Tower House, Rye during November 2008, a total of four evaluation trenches were excavated. Two trenches located in a car parking area revealed a deep stratigraphy of post-medieval layers dating from the late-19th century through to the late-17th century. Below this were deposits dating from the 14th to 15th century, and a possible ditch that been finally filled in in the mid-16th to early 17th century. A small trench in the garden also revealed a similar stratigraphy but at a shallower level, whilst the fourth trench encountered a large later 19th century kitchen midden. Although the excavation did not locate any confirmed medieval features, it did demonstrate that there was a deep post-medieval stratigraphy with the potential for in-situ early post -medieval and medieval features and deposits with good preservation, albeit at lower levels. The kitchen midden had the potential to provide the best 19th century assemblage from the town to date. [Au(abr)]

The excavation of a trench recovered evidence for the presence of medieval archaeology. This comprised substantial remains of a large wall or foundation across the entire base of the trench constructed of chalk, mortar and flint, probably the remains of a large wall or foundation core although no wall face lay within the trench. The remains were likely to have belonged to St. Mary's Abbey, a Norman rebuild of the smaller Saxon Nunnaminster, which lay immediately south the evaluation. While the remains may have formed part of the north transept, this interpretation remained uncertain as it was not possible to establish the full width, length or alignment of the structure. *Work undertaken by:* Oxford Archaeology

An evaluation was undertaken on land at St. John's Croft, Blue Ball Hill, Winchester. The evaluation revealed a significant number of pits and some associated post holes and gullies which dated to the medieval period. No structures were recorded but these features were interpreted as backyard or garden activity relating to possible tenements on the road frontage to the south. The activity appeared to be domestic in character but some evidence for metal working at the site was also noted. A number of later post-medieval and modern pits were also recorded but truncation by modern activity on the site was not extensive. No evidence of an extension to the east Winchester Roman cemetery previously recorded in adjacent sites was found but an assemblage of prehistoric flint also present within the medieval features indicated probable prehistoric activity nearby. *Work undertaken by:* Thames Valley Archaeological Services

There had been little systematic archaeological investigation in the area, apart from extensive aerial photographic coverage. The site had generalized potential for archaeology of most periods, and air photographs had suggested particular potential for prehistoric settlement. It was unlikely that the site contained remains of national importance. It was recommended that further information was provided by a field evaluation (trial trenches). The evaluation trenching revealed only two small features of possible archaeological relevance, both undated post holes. On the basis of these results it seemed that the site had very little potential to advance archaeological knowledge of the area. [Au(abr)]

The evaluation comprised eight trenches. Two trenches were recognised as containing archaeological features. These features comprised two shallow ditches and a soil horizon, both dated to the Roman period. The trenches proved that late post-medieval horizontal truncation of deposits had occurred in the south-west area, where substantial late post-medieval dumping had occurred. The evaluation also demonstrated that undisturbed subsoil and topsoil deposits were present across the remaining area of the site, up to a depth of 1m. Overall, the potential for archaeological deposits to be present on the western side of site and within the garden of 39 Medina Avenue were good, albeit of a low intensity nature. [Au(abr)]

**LAND TO THE SOUTH OF RYDE STREET, CANTERBURY*****An Archaeological Evaluation of Land to the South of Ryde Street, Canterbury***

Diack, M Canterbury : Canterbury Archaeological Trust, 2008, 22pp, colour pls, figs, tabs, refs

*Work undertaken by:* Canterbury Archaeological Trust

The evaluation consisted of the cutting of a single trench. Several deposits were noted in the trench, the earliest of which were of a Late Iron Age date and may have represented a building. There were also gravel deposits that may have represented early Roman metalling for a yard surface. A late Roman cremation burial consisting of a cinerary urn with two accompanying pottery vessels was noted in these deposits. This burial was of great significance, it appeared to have been the latest Roman burial found in Canterbury and also because it was located much further east than the previously known extent of the London Road Cemetery. Above the burial was burnt gravel. This possibly represented in situ burning though may have been industrial material dumped from elsewhere. A clay deposit was dated by a roof tile to medieval or post-medieval date. Some 19th century material was also noted. [Au(abr)]

Helm, R Canterbury : Canterbury Archaeological Trust, Report: 2008/42 2008, 31pp, colour pls, figs, tabs, refs

*Work undertaken by:* Canterbury Archaeological Trust

Archaeology of local significance was exposed in Trench 1 and 2. In Trench 1, a pit backfilled with late medieval roof tile was identified. In Trench 2, a mid to late Anglo-Saxon pit, backfilled with cess and domestic waste, was identified. Finds included 81 sherds of mid to late Anglo-Saxon pottery, animal bone, ceramic building material and iron working residue, burnt flint and chalk, a number of iron objects and a rare cast copper alloy skimmer utensil of probable late to mid Anglo-Saxon date. Linklater, A Canterbury : Canterbury Archaeological Trust, Report: 2008/63 2008, 18pp, colour pls, figs, tabs, refs

*Work undertaken by:* Canterbury Archaeological Trust

A single evaluation trench was located to assess the overall survival and recent agricultural disturbance to a pair of concentric ditches associated with a double-ring ditched barrow. This possible funeral monument was one of a series of principal features forming a group of barrows following a north to east by south-west linear alignment across this field and an adjoining field to the west. During the evaluation, sections through both the inner and outer ditches, found to cut through the underlying natural geology, were revealed. A single slot

hand-excavated through the infilling deposits of each ditch revealed two very different profiles and infilling sequences. [Au(abr)]

Fallon, D          Portslade : Archaeology South-East, 2008, 68pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

The evaluation comprised two trenches. In addition two geoarchaeological test pits were excavated, one in each trench, through the natural deposits to the underlying, chalk bedrock. These were excavated to assess the potential of the Pleistocene deposits for lithological or other significant artefacts from this era, but nothing of archaeological interest was discovered in either of these test pits. A cluster of late-19th -early 20th century refuse pits were observed cutting through the subsoil in Trench 2 to the south of the site. These pits contained an assemblage of animal bone, glass, ceramic building material, pottery, corroded iron, leather and linoleum. A sample of these artefacts was taken for verification with the rest discarded on site. Located at the northern end of Trench 1, a shallow linear feature was cut into the natural, although no dating evidence was recovered it was sealed by the subsoil and therefore predated the pits in Trench 2. Harris, P Twickenham : AOC Archaeology Group, 2008, 21pp, colour pls, figs, tabs, refs

*Work undertaken by:* AOC Archaeology Group

The aim of the evaluation was to assess the impact of development on any surviving archaeological remains within the site and to specifically establish the presence any Roman remains related to the adjacent Roman road of Watling Street. The evaluation comprised the excavation of two trenches. Natural chalky clay deposits were identified, sealing the clay were late post-medieval and modern deposits of made ground, in places below layers of disturbed topsoil and hardcore levelling. Within the northern end of Trench 2 a modern concrete and iron culvert was located. No archaeological remains were identified and no artefacts recovered from the site. [Au(abr)]

Harris, P Twickenham : AOC Archaeology Group, 2008, 43pp, colour pls, figs, tabs, refs

*Work undertaken by:* AOC Archaeology Group

An evaluation of six test trenches was undertaken in January 2008 at Horns Cross. Within Trench 1 a pit and linear ditch, both dated as late prehistoric from recovered worked flints, were found cutting into the natural Pleistocene gravels. Under the coordination of a Palaeolithic expert the natural Pleistocene gravels and sands were machine excavated in spits of up to 250mm and 100 litre samples taken at selected depths. The samples were sieved on site for the recovery of archaeological remains. This analysis of the Pleistocene deposits produced a single flint flake, from a context interpreted as a reworked Pleistocene terrace deposit. [Au(abr)]

Norcott, D Salisbury : Wessex Archaeology, Report: 69410.03 2008, 17pp, colour pls, figs, tabs, refs

*Work undertaken by:* Wessex Archaeology

The assessment recorded at least one possible stasis horizon immediately overlying river gravels, sealed by a layer of peat formations. Potentially in situ artefacts may have represented an intact site. Worked flint from this horizon was dated to the Mesolithic/Early Neolithic period, and may have been contemporary with known sites in the vicinity. The site had excellent potential for the preservation of archaeological remains, spanning from the Holocene through to the post-medieval periods. [Au(adp)]

*Work undertaken by:* Archaeology South-East

An archaeological evaluation of 3 trenches and 5 geoarchaeological test pits was undertaken at Oakfield Infant's and Junior's School, Dartford. The trenches and test pits recorded a broadly similar stratigraphic sequence of deposits. The lowest deposit contained inclusions of occasional burnt clay flecks and finds of fire-cracked flint and bone and above, Roman ceramic building material fragments (CBM). The upper colluvium contained finds of post-medieval CBM. The colluvium was overlain by post-medieval subsoil and topsoil. No cut features or structures were identified during the evaluation. No Palaeolithic finds were recovered. [Au(abr)]

Linklater, A Canterbury : Canterbury Archaeological Trust, Report: 2009/03 2008, 22pp, colour pls, figs, refs

*Work undertaken by:* Canterbury Archaeological Trust

Three evaluation trenches were excavated. In all three trenches a simple sequence of deposits was recorded consisting mainly of recent dump/levelling material and agricultural soils with features associated with Mote House. In Trench 3 a series of parallel walls separating an extensive area of brick flooring was encountered immediately beneath the modern ground surface. A further episode of machine stripping across this area exposed the full extent of this structure, showing it to be a single north-south aligned agricultural building sub-divided into five separate rooms, each with a central brick drain channel. Each room was accessed via its own entrance at its eastern end and was furnished with water and food troughs at opposite ends. Along the structure's eastern side was a brick and flagstone pavement. Though this structure appeared to form part of the farm associated with Mote House in the late-18th century/early 19th century, examination of early maps illustrated it was not constructed until as late as 1865. A series of later features appeared to relate to the use of the site prior to the Second World War. [Au(abr)]

**Archaeological Evaluation at the Barn Field, Sissinghurst Castle Garden, Sissinghurst, Kent**

Rumley, P Bromley : Peter Rumley, 2008, 1p  
*Work undertaken by:* Peter Rumley

Barn Field was ascribed to this plot of land on the 1836 Tithe Map, probably on account that it lay immediately north of the extant brick Elizabethan Barn, a further barn was known to have stood adjacent to the site. The land required drainage and an archaeological watching brief evaluation was implemented while the new drains were installed. No finds were encountered other than evidence of previous clay drainages pipes. [Sec]

*Work undertaken by:* Archaeology South-East

An archaeological evaluation was undertaken at Sissinghurst Castle. Two trenches were excavated on the lawn opposite Castle Farmhouse, in advance of the installation of LPG storage tanks. A single demolition deposit dating from the 20th century was identified in Trench 2 and a deposit possibly dating to the 18th century identified in Trench 1. No evidence was found for buildings depicted in 18th century illustrations of the site. No significant archaeological features or deposits were identified. Undisturbed natural geology was encountered at 0.3m-0.5m below the present ground surface. [Au(abr)]

**13 BEDFORD STREET, WOBURN****13 Bedford Street, Woburn, Bedfordshire, Archaeological Field Evaluation**

Newbould, J Bedford : Albion Archaeology, Report: 2009/1 2008, 34pp, colour pls, figs, tabs, refs

*Work undertaken by:* Albion Archaeology

In the southern and western parts of the development area, the evaluation revealed the remains of post-medieval and modern activity in the form of ditches, pits and structures of probable Georgian date. In the north-eastern part, the remains of late medieval/early post-medieval field systems were encountered. Also in the north-eastern part evidence was revealed for Roman settlement from the 1st-3rd centuries AD. This included evidence for late-1st-early 2nd century industrial pottery production in the form of wasters, seconds, fragments of kiln discs/plates and large quantities of pottery. The discovery of 1st-3rd century Roman settlement and industrial activity pushed back the origins of Woburn by almost one thousand

years and it represented the discovery of a hitherto unknown Roman settlement in the eastern region. Despite the evident plough truncation within the development area, the presence of a nearby kiln could not be ruled out. Similarly, the presence of 2nd-3rd century brick demonstrated the potential for significant structures in the vicinity. These remains were considered to be of regional significance and had the potential to significantly add to the knowledge of Roman settlement and local pottery production in Bedfordshire and the east of England. ***Land at Brooklands Phases 2-4 Evaluation. Archaeological Evaluation Report***

Dodd, M & Bedford, W Oxford : Oxford Archaeology, Report: 4019 2008, 152pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology

An evaluation was undertaken on land at Brooklands, which covered Phases 2-4 of development proposals. The evaluation works uncovered two settlement foci, as well as three other foci of activity. The largest settlement foci was already known from the results of a geophysical survey, however, the evaluation works discovered a large peripheral zone surrounding this settlement core, and determined that it was primarily of Romano-British date. The second, smaller, settlement focus of Early Iron Age date was also confirmed centred on geophysical survey Area 10. This focus also had a zone of peripheral activity, albeit on a much smaller scale than that found around the Romano-British focus. This peripheral zone was also less well defined as there were a number of later, intrusive features throughout it, making its extent difficult to define. The other three foci consist of one possible, small undated settlement focus in the north-west of the site, one isolated group of features in Trench 178, of Bronze Age and Iron Age date, and a small collection of potentially Late Bronze Age features to the south-east of the Roman focus. The remainder of the site was covered by a sparse collection of field boundaries of various dates. [Au(abr)]

***Land at Brooklands, Milton Keynes Phase 1-Remaining Trenches. Addendum Report***

Wheaton, K & Bedford, W Oxford : Oxford Archaeology, Report: 3936 2008, 50pp, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology

Evaluation trenches previously inaccessible during the Phase 1 trenching works were completed at Brooklands in February 2008. Ten of the trenches, which had been mechanically excavated but not recorded, were examined for the presence of archaeological deposits, recorded and backfilled. The remaining trenches were excavated and recorded, with

the exception of Trench 60, which was not excavated due to the presence of a newt pond. The trenches were excavated in two fields, which were defined as Field A, located to the north of Broughton Grounds Lane, and Field B, located to the south of the lane. The trenches in Field A uncovered evidence of medieval and 13th to 14th century activity in the form of linear features, pits and post holes. The highest concentration of features was found in Trench 57, which may be associated with the activity found in Trenches 44, 55 and 63, from the previous evaluation works. The group of trenches in Field B found some evidence of Roman activity in the form of a series of linear features. The highest concentration of features were found in Trenches 91 and 93, and were probably associated with the Roman settlement found to the south in the Broughton Manor Farm excavation. [Au(abr)]

***MK West (Milton Keynes Western Expansion) Area 10, Phase 1. Archaeological Trial Trenching***

Keir, W Bedford : Albion Archaeology, 2008, 177pp, colour pls, figs, tabs, refs  
 Work undertaken by: Albion Archaeology

The trial trenching identified archaeological remains dating from the early Iron Age to the medieval periods. Of most significance were two distinct areas of Iron Age settlement activity located on higher ground within the site. These areas comprised ditches and pits, as well as a sizable amount of irregular shaped features more characteristic of tree rooting. The pottery from both areas of the site predominantly dated from the Middle-Late Iron Age, with a small amount dating to the Early-Middle Iron Age and Roman periods. Other remains included a series of broadly parallel ditches containing pottery suggesting a Roman date. These appeared to be on a similar alignments to Roman Watling Street located c. 300m to the north-east. The relative lack of artefacts and their character suggested they were associated with agricultural activity. Medieval ridge and furrow survived in varying states of preservation throughout the site. #### ***Groombridge to Langton Green Water Main: Archaeological Trench Evaluation***

Thorpe, S Buckingham : Network Archaeology, Report: 406 2008, 97pp, colour pls, figs, tabs, refs

*Work undertaken by:* Network Archaeology

An evaluation, palaeoenvironmental assessment and metal detector survey was carried out along the route of a new water main between Groombridge and Langton Green. The evaluation comprised 19 archaeological trial trenches targeted at areas of archaeological potential identified by a desk-based assessment and geophysical survey. A metal detector survey was also undertaken along the route of the pipeline in tandem with the evaluation. The evaluation identified evidence of short-term or transient prehistoric activity at three locations, including Late-Neolithic and Early Bronze-Age activity in plots 04 and 05, Bronze Age activity in plot 22 and Iron Age activity in plot 14. The highest density of archaeology was discovered in plot 03, where a series of pits, ditches and a brick structure represented at least two phases of activity possibly associated with an old farm which once stood beside the Withyham road. Elsewhere along the route, the evaluation revealed a number of former field boundary ditches. These probably represented earlier phases of agricultural land management and indicated a degree of reorganisation of the agricultural landscape during the post-medieval and early modern periods. Finds recovered from the topsoil during the evaluation and by the metal detector survey were probably the result of manuring and other agricultural related activities associated with these field systems. The remaining archaeology identified by the evaluation included a possible double ditched track or field enclosure in plot 05, two undated hearths or fire pits in plots 09 and 16 and a large number of tree/plant holes, two of which in plots 09 and 22 had been burnt and might represent evidence of deliberate land clearance. In addition to the archaeological trenches, four palaeoenvironmental trenches were excavated on the flood plain of the River Grom. A thin layer of alluvium and some colluvium was found but there were no former river channels or peat. The proposed pipeline would impact upon the identified archaeological remains and also any unknown remains which may have existed along its route. The overall significance of this impact was considered to be low. [Au(adp)]

*Work undertaken by:* Thames Valley Archaeological Services

The trenching revealed no archaeological deposits, features or finds. Subsoil survival across trenches 1-3 indicated that this area of the site had not been extensively truncated. In trenches 4-6 the absence of subsoil suggested some truncation presumably from the recent episode of landscaping for the present nursing home. Based on the results of this trenching exercise, the site appeared to have little or no archaeological potential. [Au(abr)]

A sequence of at least five ditches recut on roughly the same alignment were located. All appeared to date from the Early to Middle Iron Age, with perhaps the last ditch of Late Iron Age date. There was limited later Roman activity in the 2nd-4th centuries AD on the site, which was probably associated with the local pottery production centre. [Au(abr)]

*Work undertaken by:* John Moore Heritage Services

Four trenches were excavated to revealed the underlying natural geology. Amongst several modern features, one ditch dating to the Roman period and one undated post hole were located in Trench 1. A further gully feature investigation, also within Trench 1, contained one residual sherd of Roman pottery but was found to cut a modern field drain on closer inspection. A further undated but apparently later gully was also located within Trench 2 on a similar alignment to the Roman ditch in Trench 1. [Au(abr)]

**SOUTH LODGE COURTYARD, MERTON COLLEGE**

***South Lodge Courtyard, Merton College, Oxford. An Archaeological Evaluation***

Lewis, J Reading : Thames Valley Archaeological Services, 2008, 15pp, colour pls, figs, tabs, refs

*Work undertaken by:* Thames Valley Archaeological Services

No dense or complex archaeological deposits were revealed during the evaluation, with just a single cut feature, a post-medieval ditch being recorded. The presence of some charcoal seemed to represent a period of activity prior to burial by later [post-medieval] activity. An orange sandy layer was considered likely to represent a river valley deposit, perhaps, a brickearth deposit, or finer sediment deposited at the margins of the floodplain of the Cherwell. Despite the presence of a high water table, no anoxic preservation was recorded for the fill of the ditch. On the basis of these results the archaeological potential of the site was deemed to be low. Dodd, M Oxford : Oxford Archaeology, Report: 8380 2008, 54pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology

A two-stage field evaluation was undertaken within the Headington grounds of Ruskin College. This took the form of a magnetometer survey followed by the excavation of 12 trial trenches to investigate the impact on areas of the proposed development. The geophysical survey produced limited results although the trenches identified remains of Early Iron Age, Roman and medieval/post-medieval date. The Roman remains were restricted to Trench 9 although these were consistent with previous discoveries along the western fringe of the college grounds suggesting occupation along a raised finger of land. The Roman pottery assemblages also implied the close proximity of a mortarium production site. Significant domestic charred cereal remains were recorded from the excavated Roman feature. Medieval remains were more limited although a 12th or early 13th century cow burial was encountered by Stoke House within the eastern portion of the site. No significant remains were encountered within the listed crinkle-crinkle walled garden. [Au(abr)]

*Work undertaken by:* Oxford Archaeology

A field evaluation was carried out for St. Antony's College, Oxford. Two evaluation trenches were excavated in the college gardens. Trench one revealed Victorian soils and a Victorian brick wall, possibly forming the south wall of a backfilled cellar. Trench two revealed that the natural gravel had been truncated to a depth of 1.6m by quarrying. The quarrying was backfilled, probably prior to the formation of the garden of St. Mary's Home in the Victorian period. A Victorian garden feature and soils were also revealed, again associated with the St. Mary's Home garden. [Au(abr)]

**PEMBROKE COLLEGE, BREWER STREET DEVELOPMENT*****Pembroke College, Brewer Street Development, Archaeological Evaluation Report***

Bashford, R      Oxford : Oxford archaeology, Report: 4192 2008, 50pp, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology

An evaluation was carried out at Brewer Street, Oxford. It revealed deeply stratified clay rich deposits which may have represented fills of the pre-conquest configuration of a branch of the Thames, subsequently known as the Trill Mill Stream. Overlying and also to the north of these possible fills were a series of deposits, which may have correlated to the deliberate deposition of material along the interface between the Thames floodplain and the second gravel terrace to the north, upon which was located the medieval walled town of Oxford. This process of "land reclamation" had been identified elsewhere along the edge of the second terrace, in particular during recent archaeological work at the Westgate car park to the west of Brewer Street, where the reclamation deposits were dated to the 12th-13th centuries. The dating evidence from the deposits encountered during the evaluation at Brewer Street suggested that these dated to the 13th-14th century. Consequently, if the interpretation of these deposits is valid, then the process appeared to be later at Brewer Street, possibly suggesting that the reclamation of land was by no means synchronous between all the sites where it has been identified. A possible pit and a north-south aligned linear feature truncated these deposits in the south of the investigation area. The function of the pit was unclear, although it may relate to a tenement plot fronting on to Brewer Street. The function of the linear feature was also unclear but it was possible that it formed a drainage channel running from the town to the Trill Mill Stream. Overlying the fills of these two features was a series of imported garden soils, which were possibly contemporary with the construction of the existing buildings fronting on to Brewer Street in the 17th century. In the north of the investigation area the land reclamation deposits were truncated by a north-south aligned limestone wall, a similarly aligned ceramic drainage pipe, and a 20th-century brick built inspection pit; associated with the use of the current building as a garage. The date of the limestone wall was uncertain, as it had been truncated to the west by the trench for the ceramic pipe, and to the east by what appeared to be a 19th-century pit. However, to the north of the wall, a potentially contemporary compacted gravel surface produced 14th-15th century roof tile. The wall also appeared to have been modified, possibly in the 19th century, by the addition of a chute, the function of which was

unclear. Despite the uncertainties with regard to the date of this structure, it seemed likely that the wall related to the cellar of a building which formerly fronted onto Brewer Street. [Au(abr)]

**WESTGATE CENTRE**

***Westgate Centre. Oxford Phase 2. Archaeological Evaluation Report***

Bashford, R Oxford : Oxford Archaeology, Report: 3800 2008, 238pp, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology

Between September 2007 and February 2008 an archaeological evaluation at The Westgate Centre, Oxford was carried out. This phase of evaluation [Phase 2] followed on from the Phase 1 evaluation carried out in 2006. Phase 2 comprised a further 19 trenches, 7 within the multi-storey car park and 5 in the surface car parks, with a further 7 in areas adjacent to the car parks which would be affected by the proposed development. The evaluation largely confirmed the results of the first phase, although the additional data recovered allowed the site specific model for the hydrological and sedimentary development of the floodplain to be refined. This model still correlated broadly with the sequence postulated from previous excavations to the south of the medieval walled town, and elsewhere on the floodplain of the Upper Thames. Evidence for an elevated area of gravel to the south-east of the site suggested that this area was on the periphery of an "island" of higher ground, although the nature and elevation of the deposits encountered implied that this was marginal land, and unlikely to be the focus of settlement similar to that previously excavated at Whitehouse Road. The evaluation provided confirmation of the Trill Mill Stream crossing the centre of the site, and further evidence for the origin, development and orientation of the channel was recovered. In addition, the results from a number of trenches suggested the existence of a complex system of intercutting side channels [some timber lined] to the south of the stream. One of these comprised a set of substantial timber beams which were encountered in previous investigations, and have been interpreted as part of a mill race. Demolition material overlying these timbers was suggestive of an adjacent mill associated with the Greyfriars priory to the north-east. There was also some evidence for managed water courses between the Trill Mill Stream and the Thames, which may have been contemporary with the Greyfriars' ownership of this area of the site, referred to in documentary sources as Boteham Island. Additional evidence for 13th-14th century land reclamation extending southwards from the second terrace was also revealed. Further robbed and partially robbed walls associated with the Priory and its subsequent demolition were seen to cut this deposit, as was a possible western boundary to the Greyfriars complex, comprising a north-south aligned ditch, later superseded by a limestone wall. The latter appeared to correspond to the boundary between the Priory complex and the area known as Paradise to the west. The remaining recorded deposits appeared to relate to the use of the area as gardens/pasture, and subsequently the construction of Victorian terraced housing and the demolition of same in the late-1960s. Bashford, R Oxford : Oxford Archaeology, 2008, 15pp, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology

The evaluation revealed natural geology comprising clay overlain by colluvial soil which may have represented a buried ploughsoil. Two north-south aligned linear features produced post-medieval artefactual evidence, and were likely to have represented a precursor to the system of ceramic field drains on the same alignment, which also was evidence in a number of trenches. Evidence for 20th century landscaping of the natural topography of the site, associated with the construction of the existing school building in the 1950s, was also observed. No evidence for features or deposits predating the 18th century was revealed. [Au(abr)]

*Work undertaken by:* Thames Valley Archaeological Services

Despite the potential for archaeological deposits to have survived on the site, none were observed. The areas affected by modern truncations appeared to be considerable in the area of Trenches 1 and 3 and the extent of the disturbance suggested that any deposits in these areas would not have survived. However, where the underlying geology was exposed, no archaeological features were present. Potential perhaps remains for archaeological deposits to have survived in the areas of the site to the north and south of the proposed access road, but overall the evaluation produced no evidence to suggest deposits on the site predating the late-19th and 20th centuries. Thompson, S Salisbury : Wessex Archaeology, Report: 68733 2008, 65pp, colour pls, figs, tabs, refs

*Work undertaken by:* Wessex Archaeology

An archaeological evaluation was undertaken at a site known locally as "The Garrison" in Radcot, to investigate the remains of Queen Matilda's moated castle complex of the 12th century Anarchy Period and a 17th century Civil War Royalist enclosure. The layout of the medieval castle complex and later Civil War earthworks had been previously investigated in a geophysical survey which revealed the castle keep and associated ancillary buildings, as well as the line of a large defensive ditch. A small evaluation trench was subsequently dug across part of the keep. The evaluation added to information gathered previously by revealing the north-eastern corner of the keep and also the supporting pier for the first floor of the castle within the interior. The remains of the heavily robbed gatehouse and main access road into the castle complex and the northern moat were identified, as well as a heavily robbed structure interpreted as a chapel. The remains of a medieval ancillary building were also revealed. These structures post-dated deposits containing 11th/12th century pottery, consistent with an early post-conquest construction date, which could link it with Hugh of Buckland, the local major landowner around the turn of the 12th century. Possible evidence of the subsequent strengthening of the keep was observed, perhaps associated with Matilda's fortification of the castle during the Anarchy Period. The abandonment of the castle complex was dated to the late 13th/early 14th century, and there was a clear hiatus in the pottery sequence from that date until the 16th century, which fits with the later occupation of the Site by the de Besilles family. In the mid-17th century a "minor Royalist fort" was constructed that

involved the refortification of the eastern half of the medieval moated complex by the excavation of a large ditch which split the moated site in two. The 17th century defensive ditch was shown to surround an earthen bastion for the placing of cannon. Several late Roman ditches, possibly field boundaries, were also identified, as well as a low level of residual later prehistoric material, suggesting activity on or close to the site. The route of the medieval road from Faringdon to Witney, which apparently ran through the site, was also investigated, but no trace of the road was found. [Au(abr)]

Ainsworth, A. Oxford : JMHS, 2008, A4 report  
*Work undertaken by:* JMHS

"John Moore Heritage Services conducted an archaeological evaluation of land to the southwest of Malthouse Barn, Standlake on the 14th-17th April 2008. Oxfordshire County Archaeological Services, the archaeological advisory body to the Local Planning Authority, West Oxfordshire District Council, called for a pre-determination archaeological evaluation in order to make an informed decision on the planning application, (07/2242/P/FP), for the redevelopment. The proposed redevelopment of the area consists of demolition of the existing buildings at Malthouse Barn and the construction of five dwellings with garaging and associated services. Wychwood Homes commissioned John Moore Heritage Services to carry out the evaluation. Six trenches, totalling 79.6 metres in length, were excavated to the natural geology. Archaeological deposits mainly were confined to the Romano-British period along with two features of Anglo-Saxon date and comprised ditches, pits, and postholes. Evidence for earlier structures was present and these are probably dated to the post-medieval period." [OASIS]

Milbank, D & Cass, S Reading : Thames Valley Archaeological Services, Report: 08/89b 2008, 12pp, colour pls, figs, tabs, refs

*Work undertaken by:* Thames Valley Archaeological Services

The results of this evaluation indicated that parts of this inner courtyard had undergone extensive disturbance in the relatively recent past. While there was some survival of subsoil and undisturbed natural levels, no archaeological deposits or finds were recorded. It was believed that the area affected by the development had little or no archaeological potential. [Au(abr)]

**PROPOSED NEW SIXTH FORM BLOCK, KENDRICK SCHOOL, EAST STREET**  
***Proposed New Sixth Form Block, Kendrick School, East Street, Reading, Berkshire. An Archaeological Evaluation***

Milbank, D Reading : Thames Valley Archaeological Services, Report: 08/89A 2008, 16pp, colour pls, figs, tabs, refs

*Work undertaken by:* Thames Valley Archaeological Services

The three trenches excavated in the area of the proposed sixth form block showed that where natural geology was exposed, made ground deposits overlay the orange sand and flint gravel. These layers varied in depth from 0.92m [in the area of Trench 5] to 1.24m [in the area of Trench ]). The finds recovered from these layers indicated that they dated to the late-19th/early 20th century and were likely to be levelling layers. As East Street sloped considerably down towards the north, it was reasonable to suggest that these layers were built up as part of the development of East Street. The wall footing was likely to correspond to the houses shown fronting East Street on the 1898 [Second Edition] Ordnance Survey map of Reading. A small pit of late post-medieval date was encountered in Trench 3 suggesting that the natural gravel geology had not been significantly truncated. A struck flint flake retrieved from pit 1 suggested some evidence of prehistoric activity within the vicinity but was clearly redeposited and otherwise of no significance. No archaeological deposits relating to the Civil War earthworks were recorded during the course of the work. [Au(abr)]

*Work undertaken by:* Thames Valley Archaeological Services

An evaluation was carried out in response to proposals for the construction of a new teaching block on the site along with associated remodelling of car parks. A small gully terminal was revealed containing probable post-medieval brick and tile fragments. It was buried by a subsoil deposit which contained two pottery sherds, one of medieval and one of early post-medieval date. The site was considered to have low archaeological potential. [Au(abr)]

Mumford, J Oxford : Oxford Archaeology, Report: 3726 2008, 42pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology

An evaluation was carried out in advance of a planning application for the redevelopment of the Hosier Street area of Reading, and construction of a new Civic Centre. The evaluation revealed possible medieval pits overlain by a garden or cultivation soil. A recut 16th century boundary ditch, 16th and 17th century pits and post-medieval garden soils were also recorded. Redeposited medieval pottery and roof tile was recovered from the features, as well as the disarticulated skeletal remains of two individuals. It was likely that prehistoric, Roman or Saxon burials were located in close proximity to the evaluation trenches. The post-medieval features were overlain by a 19th century garden soil, which was cut by the footings of a 19th century school and terraced properties. [Au(abr)]

Cass, S Reading : Thames Valley Archaeological Services, Report: 08/108 2008, 12pp, figs, refs

*Work undertaken by:* Thames Valley Archaeological Services

The nature of the stratigraphy encountered in both trenches, and in particular the lack of any surviving subsoil layers, suggested that the area had been truncated/landscaped in the modern period, with the possible loss of any archaeological remains which may have been previously present. However, the relative flatness of the area, coupled with the height similarity with areas outside the site suggested that the truncation may have been fairly shallow so it was possible that any larger/deeper features would have survived this truncation, although none were observed. Above the natural geology, only modern imported material remained. The results of the evaluation suggested the proposed development would have little or no archaeological impact. [Au(abr)]

Cottrell, P Southampton : Southampton City Council Archaeology Unit, Report: 901 2008, 49pp, colour pls, figs, refs

*Work undertaken by:* Southampton City Council Archaeology Unit

An evaluation exposed a number of worked flints and six possible linear features. Three were dated by finds to the Roman period, two were similar, but undated, and one was not excavated. They were interpreted as probable field boundaries. Late medieval to post-medieval pottery and building material were recovered from later deposits. A soil horizon below the early modern layers probably represented an earlier ploughsoil. A single feature was possibly related to a house shown on a 17th century map. Soil layers, pits, brick foundations and other features dating from the 19th century and possibly the late-18th century were exposed. Two phases of 20th century demolition debris and make-up layers were recorded. [Au(abr)]

Pole, C & Capon, L      Twickenham : AOC Archaeology Group, Report: 30295 2008, 35pp, colour pls, figs, tabs, refs  
*Work undertaken by:* AOC Archaeology Group  
An evaluation revealed a series of post holes and two tree pits in the centre of the site. The post holes were undated, although one contained a small fragment of medieval pottery. The post holes may have represented a boundary dating to the use of the site by Brooklands Farm until c. 1860. Brooklands House, built on the site in 1860, was set among a heavily wooded area, and the two tree pits may date from that period. Two brick foundations recorded to the west of the site were likely to be the footings for greenhouses erected when Brooklands House was built, in the mid-19th century. The topography of the site shows the highest point to be around Brooklands House, at the end of a slight rise oriented north-east south-west. The land dropped away slightly to the south-east and north-west, but this was obscured by landscaping. The majority of the site had large areas of subsoil preserved. The absence of archaeological remains suggested a lack of human activity in the past as opposed to modern truncation. [Au(abr)]

Porteus, S Portslade : Archaeology South-East, Report: 3370 2008, 38pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

An evaluation was undertaken on the land of the Scheduled Ancient Monument of Chertsey Abbey. Five trenches were excavated. Four pits, possibly post holes, of uncertain date were identified to the south-east of the site. A possible Saxon feature was uncovered which may have been part of a linear boundary ditch running west to east across the site. A possible medieval boundary was identified to the north of the possible Saxon ditch and was believed to run parallel, though this could not be confirmed. Compacted gravel was found which may have been a surface associated with a medieval building which was later demolished. A demolition deposit was uncovered across the site which was believed to have related to the demolition of the manor house and its associated buildings. A modern pit was found to have destroyed archaeological deposits in part of Trench 1 but all other archaeological deposits were well preserved with modern disturbance confined to the upper deposits. [Au(abr)]

**BROOKLANDS SCHOOL, ASHFORD*****Brooklands School, Ashford, Borough of Spelthorpe, Surrey. An Archaeological Evaluation Report***

Harris, P Twickenham : AOC Archaeology Group, Report: 30213 2008, 25pp, colour pls, figs, tabs, refs

*Work undertaken by:* AOC Archaeology Group

An evaluation was undertaken at Brooklands School comprising the excavation of four trenches, two within the footprint of a new four-storey block and two within the footprint of a temporary building. Two smaller trenches were excavated in the areas defined for soakaways. No finds were recovered from the features excavated during the investigation, making their interpretation difficult. A post hole was filled with charcoal rich material, which appeared industrial in nature and indicative of a modern or post-medieval date. Two ditches failed to yield any diagnostic finds, yet the features' perpendicular setting, similarity of form and similarity of fill suggested that they were contemporary. Their grid like setting could denote that they formed part of a field system across the site, which would be further supported by the lack of finds recovered from them. Due to the very limited scale of activity on the site and the nature of the archaeological remains it was felt that no further work was necessary. [Au(abr)]

Milbank, D, Pine, J &amp; Weale, A Reading : Thames Valley Archaeological Services, Report: 08/119 2008, 79pp, colour pls, figs, tabs, refs

*Work undertaken by:* Thames Valley Archaeological Services

A high density of certain and probable archaeological deposits was revealed, but with a paucity of recovered dating, cultural or environmental evidence. Deposits reflecting early Neolithic and probable Middle/Late Bronze Age occupation were present with prehistoric activity of other periods represented by a few pieces of possible Mesolithic flintwork, late Neolithic and late Iron Age pottery. Roman and medieval finds and deposits were few, suggesting that the area was probably only used as farmland in those periods. Cropmarks of possible archaeological interest on the site could not be confirmed as being of archaeological origin by this evaluation. [Au(abr)]

***Pendell Farm, Bletchingley, Surrey: An Archaeological Evaluation, Phase 2. Fieldwalking Survey***

Ford, S Reading : Thames Valley Archaeological Services, 2008, 14pp, colour pls, figs, tabs, refs

*Work undertaken by:* Thames Valley Archaeological Services

The arable areas of the proposal site were fieldwalked and a moderate volume of struck flint and a small volume of pottery was recovered. The struck flint included Mesolithic/earlier Neolithic finds as well as later Neolithic and Bronze Age material. A loose cluster of material towards the western end of the site was predominantly of Mesolithic/earlier Neolithic date. Only a very small amount of pottery of Roman, medieval and post-medieval date was recovered. A number of the sherds were coincident with subsoil deposits already recorded from a previous evaluation. All of the pottery could easily be derived from agricultural activity such as manuring of farmland. [Au(abr)]

*Work undertaken by:* Thames Valley Archaeological Services

The results from the vast majority of the evaluation trenches were negative with neither artefacts nor archaeological deposits revealed. A single undated ditch and a posthole of Roman or later date were revealed in the southern part of the site, relatively close to some of the archaeological findings revealed by the first phase of evaluation. Single sherds of late Bronze Age/Early Iron Age, medieval and late post-medieval date were recovered from spoil heaps. Three flint flakes, not closely datable but presumably prehistoric, were also recovered. [Au]

*Work undertaken by:* Sutton Archaeological Services

The evaluation did not reveal any significant archaeological remains or artefacts within the excavated trenches. The trenches revealed only turf and topsoil and made ground with subsoil overlying the natural. The depth of topsoil and subsoil varied across the site and was probably the result of modern landscaping. Two large intrusions were certainly of 20th century origin and were most likely associated with the building of the original houses. No prehistoric archaeology was found but several possible struck flints, some burnt flint and modern ceramic building material were discovered. [Au(abr)]

Twelve trenches were excavated. The only area of archaeological potential was confined to the eastern half of the site around Trenches 116 and 117. The features revealed in that area produced sherds of pottery with date ranges extending from the Iron Age into the early Roman period. The function of the large ditch running through Trenches 117 and 117A was unclear, though its proportions suggested that it may have served as a major boundary earthwork. Most of the pottery from the ditch was recovered from tertiary silts. [Au(abr)]

Budd, C Salisbury : Wessex Archaeology, Report: 70091.03 2008, 23pp, colour pls, figs, tabs, refs

*Work undertaken by:* Wessex Archaeology

The evaluation was partially successful in identifying the character of the structures identified by aerial photography of the site. No specific evidence was found of the terraced workers cottages that were thought to exist, however, the heavily disturbed ground and high frequency of post-medieval/modern linear features and service trenches did suggest that the survival of archaeological features at the site was low. The remnants of the structure known as Round Oak were identified but only as backfilled cellars and demolition rubble, suggesting that the basic floor plan may have survived the demolition process. Three post-medieval ditches were revealed that were likely to represent changing land divisions or garden features associated with Round Oak. The evaluation also revealed minimal archaeology that predated the post-medieval period. An early to middle Bronze Age boundary ditch suggested that the area was probably used for agricultural purposes during this period, correlated with the general paucity of other finds. Modern landscaping was also evident. [Au(adp)]

*Work undertaken by:* Archaeology South-East

Eight archaeological evaluation trenches were excavated in the Tower Street Car Park, Chichester. The site was previously excavated in 1974 and the remains of a Roman bath house were identified amongst other findings. The masonry bath house remains were left in place after the 1974 excavation and were partially re-excavated in 1990 to evaluate the state of preservation. The current evaluation sought to again assess the state of preservation of the bath house masonry and accurately locate the structures in advance of redevelopment of the site. The redevelopment was a mixed-use scheme including a new museum, potentially displaying the bath house remains in situ. In addition, the evaluation sought to assess the archaeological potential of the rest of the site in particular the masonry cistern supplying water to the bath house and a Roman sewer, both of which were identified in 1974. Trenches 2 and 4 identified the masonry remains of the cistern and the apsidal hypocaust room of the bath house. The trenches provided enough information to spatially locate the rest of the archaeological features initially exposed in 1974. The bath house remains in Trench 4 were in relatively good condition and seemed to have survived the repeated excavations with little structural damage. The cistern in Trench 2 had survived less well than the bath house and had certainly suffered from the excavation of the internal fill in 1974. Trench 5 was located in an area where the bath house walls survived only as robber trenches and no masonry remains were seen. However, masonry walls probably did survive in the vicinity of the trench. The Roman sewer was located in Trench 6, outside of the area of the 1974 excavation and was comparable in size and character to the portions excavated in 1974. The Roman sewer survived below the level of the natural in the north-west corner of the site and continued north-west beyond the site. In this area other Roman and medieval negative features were recorded cut into natural, but the overlying later deposits had been removed by the construction of the existing car park in the 1970s. Similarly no archaeological deposits were identified in Trenches 1, 7 and 8 located in the car park perimeter bank. Trench 3, located within the area of the 1974 excavation, did not identify any significant archaeological deposits, suggesting all features were excavated in 1974. In conclusion, it was suggested that only two areas had archaeological potential. These were the masonry structures in the south and west identified in 1974 and the negative features cut into natural to the north-west of the 1974 excavation area. [Au(abr)]

***Land at Mid Lavant, Chichester, West Sussex: An Archaeological Investigation***

Smith, L & Wolfe-Murray, C Hertford : Archaeological Solutions, Report: 3201 2008, 22pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Solutions

In October 2008 an archaeological evaluation was undertaken of land at Mid Lavant. A desk-based assessment recorded that significant archaeological remains had been found in the vicinity of the site. It concluded that the site had a moderate to good potential for prehistoric remains (Palaeolithic, Mesolithic, Neolithic and Bronze Age). The site lay to the north (440m) of Iron Age defensive entrenchments, and the projected line of the Roman road from Chichester to Silchester passed through Lavant approximately 400m west of the site. Post-medieval features were found in Trench 3 and Trench 9. An undated post hole was found in Trench 7, in Trench 8 an undated ditch and in Trench 9 undated pits and a post hole. Medieval pits were found in Trench 8 and Trench 9. The majority of pits contained just one medieval sherd, but one Pit contained 7 sherds. Two Pits contained animal bone and another pit also contained ceramic building material and oyster shell. The majority of medieval and undated features were located in Trench 9. [Au(adp)]

**BLACK DOWN, HASLEMERE*****An Archaeological Evaluation of Features Encountered During Excavations for a New Pond, Black Down, Haslemere***

National Trust Swindon : National Trust, 2008, 1p

*Work undertaken by:* National Trust

An evaluation revealed a number of probable archaeological features. The deeper pond-excavation appeared to cut through a linear stone feature which may have been a boundary, enclosure, or river-bank revetment of unknown date. It was even possible that the boundary was an earlier component of the Surrey-West Sussex county boundary. This feature overlay a buried surface or stream-bed bearing Mesolithic finds which were probably derived from upstream and the valley sides. Two areas of burnt material were unlikely to derived from an industrial process such as glass-making, and were more likely to represent demolition material brought in to stabilise the bank of the stream. Garland, N Portslade : Archaeology South-East, Report: 2008104 2008, 25pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

An evaluation was undertaken at Land West of Horsham. Four trenches were excavated across the area of proposed development. Two linear features were discovered in Trenches 1 and 3. Both were concave in profile and orientated in an east to west direction and were possibly part of the same feature, however, there was no direct evidence of this. No dating evidence was recovered from either feature. A pre-existing modern field boundary was seen to continue between Trenches 3 and 4, it was partially filled by a hill wash deposit originating from higher ground to the south. Modern deposits were encountered within Trenches 2 and 4, representing made ground laid as probable gateways between the fields that have since gone out of use. A Victorian water pipe within its original cut was observed within Trench 2. [Au(abr)]

Garland, N Portslade : Archaeology South-East, Report: 2008041 2008, 50pp, colour pls, figs, tabs, refs  
*Work undertaken by:* Archaeology South-East  
 Twenty-four evaluation trenches were excavated across the area of proposed development. The earliest identifiable activity on the site was Bronze Age in date. The termini of two large linear features and a smaller linear feature lay to the north, within Trenches 1 and 4. These features represented agricultural activity, dated by finds of pottery sherds and fire cracked flint within their fills. A separate phase of activity, dating to the Roman period, lay to the south of the site. A series of linear features, post holes and pits related to possible occupation of this area. Dating evidence in the form of sherds of Roman pottery was recovered from the fills of these features. Other post-medieval or modern levelling deposits were encountered, mainly in the centre of the area of investigation. These deposits related to the modern use of this area as allotments and later as a sports field in the 20th century. [Au(abr)]

Garland, N Portslade : Archaeology South-East, Report: 2008040 2008, 20pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeology South-East

An archaeological evaluation was undertaken at 32 Hayling Rise and 24 Woodland Avenue, Worthing. Two trenches, were excavated. Natural activity in the form of deposits and a single linear channel were encountered in Trench 1. Modern disturbance was encountered in both trenches including a dumped chalk deposit within Trench 1, most likely occurring from the excavation of a modern pond, and made ground within Trench 2 from the construction of a previous residential building. No archaeological deposits or features were encountered in either of the trenches. [Au(abr)]

Lewis, J Reading : Thames Valley Archaeological Services, Report: 08/55b 2008, 17pp, colour pls, figs, refs

*Work undertaken by:* Thames Valley Archaeological Services

The archaeological evaluation revealed four cut features on the site. Two features were unambiguously dated to the later post-medieval or modern period though a few sherds of medieval pottery were also recovered. Two intercutting ditches, however, were possibly of medieval date though only a single sherd of medieval pottery from ditch 2 provided any close dating evidence but could easily have been a residual find. An examination of post-medieval cartographic sources did not reveal any elements which corresponded with these features.

These finds, and possibly some of the cut features, point to a low level of medieval activity in the area, perhaps reflecting areas used as paddocks close to a more intensively utilised and occupied zone. [Au(abr)]

*Work undertaken by:* Thames Valley Archaeological Services

The evaluation of the site revealed just a single ditch of medieval date and was probably recut in late post-medieval times. Three additional trenches were dug to clarify if further deposits were present on the site, especially for the footprints of the proposed new houses, but nothing else was found. The medieval ditch was located at the extreme northern end of the site approximately parallel to the current boundary and may well have indicated an earlier definition of this boundary. The finding of this ditch thus made a small contribution to the knowledge of the topography of medieval and post-medieval Datchet. [Au(abr)]

Cass, S Reading : Thames Valley Archaeological Services, Report: 04/56c 2009, 13pp, figs, refs

*Work undertaken by:* Thames Valley Archaeological Services

The evaluation did not reveal any deposits or finds of archaeological interest on the site. It appeared, from the different relative depths of the natural geology in this southern area, when

compared to those encountered in the northern area, that a greater amount of levelling/truncation had occurred in this part of the site. It was possible that the red/brown silty gravel noted in all the trenches was the highest undisturbed natural layer, which would mean that in most of the area examined, the modern demolition layer was directly above the natural geology, possibly indicating little truncation of the archaeologically relevant level. However, as neither artefacts or deposits of archaeological interest were recorded in these trenches, this area of the site was considered as having no archaeological potential. [Au(abr)]

*Work undertaken by:* Thames Valley Archaeological Services

Despite the site lying close to the Devil's Highway Roman Road, a series of Roman buildings to the east and other Iron Age/Roman remains to the north, no deposits or finds of Roman date or any other archaeological period were identified during the evaluation. The natural geology in both trenches had been disturbed by previous development on the site, in trench 1 excessively so. Demolition debris lay directly on top of the natural geology in both trenches and possibly indicates some truncation of the archaeologically relevant horizon for the whole site of the proposed and previous house. Milbank, D Reading : Thames Valley Archaeological Services, Report: 08/76 2008, 11pp, figs, tabs, refs

*Work undertaken by:* Thames Valley Archaeological Services

The two trenches demonstrated that the topsoil layer was very shallow and contained frequent gravel inclusions, and no subsoil layer was present. Taking into account the setting of the site, with arable fields on the east of New Road, it was likely that the ground level of the plot had been reduced at some stage. Previous development of the site for housing may have involved topsoil and subsoil removal, with some topsoil reinstated. The modern truncation was infilled with a deposit which contained modern brick and glass fragments and may have been associated with the construction of the previous building. It was not possible to ascertain if a significant amount of natural gravel was removed from the site previously during ground reduction, and the natural gravel observed in the bases of the two trenches may not have represented the true original upper horizon of the gravel. Nevertheless, it seemed likely that the archaeologically relevant levels had survived on the site but on this occasion, no archaeological features or deposits were observed in the evaluation trenches. On this basis, the site had low archaeological potential. [Au(abr)]

***Merchants Almshouses, King Street, Bristol. Archaeological Evaluation***

Adam, N Cirencester : Cotswold Archaeology, Report: 08250 2008, 23pp, figs, tabs, refs

*Work undertaken by:* Cotswold Archaeology

An archaeological evaluation was undertaken at Merchants Almshouses, King Street, Bristol. Two trenches were excavated. The evaluation established the presence of wall foundations

associated with the former west wing of the Merchants Almshouses, constructed in the late-17th century. These foundations were themselves established upon what appeared to be the foundations of an earlier building. The former Marsh Wall was not exposed, although a combination of auger survey and observations of subsidence affecting neighbouring standing buildings suggested the route predicted in an earlier desk-based assessment was reasonably accurate. Significant amounts of redeposited soil and rubble, dating from the mid-17th to mid-18th centuries, found in both trenches probably reflects activity associated with the construction of the Almshouses in the late 17th Century. [Au(abr)]

**REDCLIFFE VILLAGE**

***Redcliffe Village, Bristol. Archaeological Evaluation***

Cullen, K & Barber, A Cirencester : Cotswold Archaeology, Report: 07095 2008, 56pp, colour pls, figs, tabs, refs

*Work undertaken by:* Cotswold Archaeology

A programme of archaeological evaluation was undertaken between May 2007 and January 2008 at Redcliffe Village, Bristol. Thirteen trenches were excavated. Evidence for activity from the 12th/13th centuries AD onwards was identified behind the Redcliff Street frontage in the western half of the development area, including possible medieval hearths, drains, pits, walls and floor surfaces. The evaluation also identified the post-medieval line of the Law Ditch, an originally medieval feature that runs north/south through the centre of the development area, and demarcates the boundary to the rear of plots fronting Redcliff Street to the west, and St. Thomas Street to the east. Possible medieval wall footings, a stone-lined drain and possible garden soils of both medieval and post-medieval date were noted immediately west of the Law Ditch, in areas that would have been to the rear of plots fronting Redcliff Street. To the east of the Law Ditch medieval wall footings and further garden soils of medieval and later date were identified. The evaluation demonstrated that archaeological deposits of medieval and later date survived at a depth of around 0.5m below the modern ground surface. [Au(abr)]

Hughes, S Bradninch : AC archaeology, Report: ACD09/2/0 2008, 18pp, colour pls, figs, tabs, refs, CD

*Work undertaken by:* AC archaeology

An evaluation was undertaken on land at Millbrook. The site was located to the north-east of the historic core of the town, in an area where evidence for prehistoric and Romano-British occupation had been previously identified. The Fosse Way Roman road was located immediately to the west of the site. Ten trenches were excavated totalling, one trench specifically targeted the line of a former leat, which once provided power to a mill recorded in the post-medieval period, but potentially had earlier origins. The remaining trenches provided representative coverage across the rest of the site. The trench across the route of the leat exposed a shallow, flat based channel, with the inner silts containing 19th-century or later finds. No evidence for a date of construction was identified, as the leat had been probably been cleaned out on a regular basis prior to going out of use. Towards the southern end of the site a large ditch was exposed, which seemed to extend along the contour of the northern edge of the hilltop. This feature might have represented the northern edge of a prehistoric hilltop enclosure, with finds recovered from the fills comprising possible Neolithic pottery and worked flint. A further prehistoric linear feature and an adjacent pit were recorded on the east side of the site, but down slope and therefore outside the possible enclosure. Across the rest of the site the only features recorded were a linear boundary ditch and post hole, both of which were likely to date to the 19th century. [Au(abr)]

Robinson, S & Valentin, J Bradninch : AC archaeology, Report: ACD06/3/0 2008, 28pp, colour pls, figs, tabs, refs, CD

*Work undertaken by:* AC archaeology

An evaluation on land at the junction of Harepath Hill and Harepath Road was carried out. The site was located adjacent to the probable course of the Fosse Way Roman road, in an area where extensive evidence for prehistoric and Romano-British settlement had been previously identified. A geophysical survey undertaken on the site prior to trenching identified a series of sub-surface anomalies, including a large number of probable linear features and what appeared to be a ring ditch towards the centre of the site. Many of the trenches excavated as part of this work targeted these anomalies. A total of 24 trenches were excavated, establishing that archaeological features were present across large parts of the site, mainly comprising a network of ditches and gullies of varying size, profile and orientation. Other features recorded include a 7m diameter, probable prehistoric, ring ditch and associated features towards the centre of the site, a large possibly modern pit at the southern end and a spread/deposit in the south-west corner, which contained a large quantity of worked flint and chert, including diagnostically prehistoric material alongside post-medieval gunflint. The general character of the archaeology recorded here was not dissimilar to parts of the Honeyditches site located c. 800m to the southwest. At Honeyditches a network of ditches was also recorded, as well as small ring ditches. On that site, however, the proximity to known settlement meant that far more artefacts were recovered and the features could be more precisely dated to the Late Iron Age and Romano-British periods. **FOUR PLOTS OF LAND IN SIDMOUTH, WESTON*****Archaeological Survey, Sid Meadow, Pond Meadow, Peak Hill Field and The Shack***

Reading, F Swindon : National Trust, 2008, 2pp

*Work undertaken by:* National Trust

The survey was completed for four plots of land owned by the National Trust in Sidmouth, Weston (known as Sid Meadow), Pond Meadow, Peak Hill field and the field known as The Shack. Each plot of land was walked over and anything visible of interest was photographed. At Sid Meadow and Peak Hill Field the field boundaries had changed since the Sidmouth Tithe Map of 1839 and in the case of Sid Meadow the surrounding land had been considerably built upon with domestic housing within the last 100 years. ***Archaeological Trench Evaluation at the Old Nurseries, Kingsbridge, Devon***

Steinmetzer, M Exeter : Exeter Archaeology, Report: EA6421 2008, 3pp, colour pls, figs

*Work undertaken by:* Exeter Archaeology

An archaeological trench evaluation was undertaken at the Old Nurseries, Kingsbridge. The Old Nurseries lay at the north end of the historic town of Kingsbridge. The nearest known

archaeological site was the remains of a medieval manor house, located less than 200m to the east, while the pattern along the north side of Fore Street of houses, with narrow street frontages and long back closes, was typically medieval in character. The site was shown as an orchard by 1841, with a property and nurseries added by 1885. The trench evaluation comprised the machine excavation of two trenches, with Trench 1, 1.8m long and Trench 2, 18m. Each trench was 2m wide. Trench 2 was moved east of its intended position because of the presence of a large spoil heap. No features or dating evidence were found to indicate post-medieval or earlier archaeological activity within the site. The remains of a 20th century greenhouse, shown on the 1955 Ordnance Survey map, were uncovered running parallel with Trench 1. [Au(abr)]

Griffin, L Tardebigge : Martin Cook, Report: AR.2008.19 2008, 27pp, colour pls, tabs, refs

*Work undertaken by:* Martin Cook

The features recorded by the evaluation were almost exclusively ditches, originally identified by a geophysical survey in 2004. The ditches ran either north to south or east to west. A single sherd of pottery in the top of the fill tentatively dated one of the ditches to the medieval period. At the southern extremity of the site another ditch, running east to west, was a boundary against which a lynchet built-up and was subsequently overwhelmed. The quantity of recovered finds of any sort, stratified or unstratified, was tiny, notwithstanding the fairly large sample size. The presence of the lynchets, both recent and in the more distant past and, to lesser extent, the slight nature of some of the features, clearly indicated that the site had been, to some extent, damaged by ploughing. ### **18 POTACRE STREET, GREAT TORRINGTON**

***Archaeological Evaluation Trenching on the Site of Proposed Town Houses in the Grounds of 18 Potacre Street, Great Torrington. Devon County Council Historic Environment Record***

Gillard, M South Molton : South West Archaeology, 2008, 7pp, figs, tabs

*Work undertaken by:* South West Archaeology

Five evaluation trenches were excavated, revealing little evidence for activity on the site prior to the 19th century. The site appeared to have originated as a pair of burgage plots, probably medieval in date. The lack of early features and finds was suggestive of low-intensity use of the area, possibly as gardens or yards. By the early 19th century the plots had been amalgamated and a group of small stone and brick buildings were erected. These may have had a light industrial purpose, with one feature interpreted as a smithy and another built over a pit containing numerous animal bones, perhaps indicating some sort of carcass processing. The paving in Trench 2 may have been related to this phase. These buildings were demolished between the later 19th and early 21st centuries, when the site was used as a garden with some cobbled surfaces and pathways being laid down. Most of the north-western area of the site would be severely impacted by the proposed development. The eastern and southern extremities of the site (as investigated by Trenches 1 and 5 respectively need not be severely impacted as it was proposed to lay this down to gardens following removal of surface concrete in the area of Trench 5). The exception to this was excavation required for a soakaway drain at the eastern end of the plot although this area had already been investigated by the evaluation. The only clearly datable features in the evaluation were modern and matched buildings seen in 19th century mapping. The proposed development would have little impact upon areas in the southern and eastern parts of the site, therefore further archaeological intervention was deemed unnecessary. [Au(abr)]

### **SCHOOL LANE, HARTLAND**

***Archaeological Works Associated with Development at a Site off School Lane, Hartlan. Devon County Council Historic Environment Record***

Preece, C South Molton : South West Archaeology, 2008, 6pp, colour pls, figs

*Work undertaken by:* South West Archaeology

A desk-based cartographic study, archaeological evaluation and historic building survey was undertaken on an irregularly shaped plot of land representing the rear yard, garden and outbuildings formerly belonging to number 54 The Terrace. The plot was sited near to the centre of Hartland and was within the conservation area. The initial cartographic study concluded that the land was probably part of a burgage plot in the medieval borough of Hartland, and in the early medieval period may have been within a strip field system. The western boundary of the tongue of land to the north (Area B) may have originated as a strip boundary within an early medieval field-system. It was not possible to make any reliable statement about the eastern boundary. The north-western boundary of Area C was present in 1813. The eastern boundary of areas A and C was of 19th century origin. The former agricultural buildings in Areas A/C were of mid-19th century origin (1846-1862). The remaining building was surveyed and recorded. The building was of rubble stone construction with a slate roof, and appeared to be of 19th century date, but of two phases. The southern portion, of which most remained, was originally a two storey stable with symmetrically

arranged openings in the north west front on the ground floor and a first floor loading door, all with brick arches and reveals. There was also a window, or loading door at first floor level in the south west gable but the original opening had been reduced, the lintel raised, presumably to accommodate another later, possibly single storey building to the south east, now removed. The stable abutted the earlier two storey northern portion, which had been recently truncated and the fabric of which contained no brick and had a single large opening at ground floor level in the north- west elevation. The north end of the north- west wall was formerly the right hand jam of an opening. There was one remaining roof truss in this portion with bolted joints. The north- east wall at the north end contained a small four light window and a blocked door. There was not enough of this building remaining to give a definite idea of the original function. The archaeological evaluation comprised the excavation of four trenches. It revealed evidence predominantly from the 19th century use of the site as a garden. The exceptions were a north-south linear in the base of Trench 2 which may be an earlier field division and an east-west linear in Trench 5. In Trench 4, the remains of a previously demolished barn were found at foundation level and a small portion of possibly earlier clay bonded wall external to this to the west. Trench 1 contained 19th - 20th century artefacts with a few sherds of medieval coarseware. The only features were two modern postholes. Trench 2 contained sherds of medieval and post-medieval pottery and a linear feature. The full depth was not investigated as it lay below the level of the full depth of the groundworks required by the development and the width could not be determined as it was truncated by modern disturbance to the west of the trench. This feature may be associated with the former western boundary of Area A . Trench 3 contained no features, except a 0.4m wide concrete, brick and stone wall on the former site of a modern building. Trench 4 was 0.2m deep at the north- east end due to the masonry immediately below the surface consisting of a length of lime mortared stone rubble wall 0.4m in width, which aligned with similar masonry to the south-west . The slight splay in the gap between the two suggested an entrance. Parallel [to the north-west] lay another portion of clay bonded wall of variable width. Trench 5 was positioned along the proposed line of a service trench. There were no finds. Sealing this was a modern layer of stone rubble and brick containing local post-medieval earthenware and sealed by the modern tarmac surface. To the south-west of the trench the natural was very shallow and had been cut by a modern service trench. [Au(abr)]

*Work undertaken by:* AC archaeology

An archaeological evaluation, consisting of the excavation and recording of four machine-dug trenches, was undertaken in advance of the proposed construction of new school buildings at Milldown School, Blandford. The trenches were located to examine several possible archaeological features, detected as magnetic anomalies by geophysical survey. A curvilinear anomaly was confirmed by trenching to be an arc of a ditch which may have represented a ring ditch (ploughed-out barrow). The fill of the ditch contained a small quantity of worked flint flakes. The other magnetic anomalies thought to be archaeological in origin were shown by excavation to be either geological or of modern date. [Au(abr)]

*Work undertaken by:* AC archaeology

An archaeological evaluation consisting of three trial pits was undertaken in advance of the submission of a planning application for a proposed extension to Shaftesbury Museum. Two pits were mechanically-excavated with a third being hand dug. A single, undated, feature was recorded in Trial Pit 1 with significantly deep 19th/20th century soil deposits recorded in Trial Pits 1 and 2, possibly resulting from landscaping. Within the hand dug trial pit, Trial Pit 3, a large, probably medieval pit and a wall were encountered in addition to two gullies, one of which was likely to be of medieval origin. A moderate amount of medieval and later pottery was recovered from Trial Pit 3. [Au(abr)]

Whelan, J & Evans, P Chicklade : AC archaeology, Report: ACW143/2/0 2008, 22pp, colour pls, figs, tabs, refs

*Work undertaken by:* AC archaeology

The evaluation was undertaken in two phases and consisted of twenty-one machine-excavated trenches and four hand dug test pits, within which were recorded a hearth/fire pit, four ditches and a spread of demolition materials, all of Roman date. These results confirmed the extent of the site previously identified by evaluation, and a subsequent watching brief, undertaken prior to the development of the existing all-weather pitch on the site in 1997. These earlier investigations revealed Roman structures, stone built drains, a corn dryer, 2 burials, metalled surfaces and spreads of demolition debris. Severe modern truncation was observed across the northern part of the site, within the playing fields, and this appeared to increase with depth to the west of the proposed new facilities. The evaluation has enabled a deposit model to be created indicating areas of archaeological potential in relation to the proposed new facilities. [Au(abr)]

Arnold, G Gloucester : Gloucestershire County Council Archaeology Service, Report: 473.4.22 2008, 12pp, figs, refs

*Work undertaken by:* Gloucestershire County Council Archaeology Service

Four trenches were excavated in order to evaluate an area of proposed development at Kyrleside. The earliest features recorded were a linear ditch and a pit, in Trench 3, which were dated to the medieval period. The remaining features were of post-medieval and modern date and consisted of a post-medieval ditch, running parallel to the road, in Trench 1, a linear ditch, of post-medieval date, and a modern animal burial in Trench 2. Two large post-medieval ditches and a pit were recorded in Trench 3 and two irregular features, of post-medieval date, in Trench 4. There was no evidence for Romano-British activity within the evaluation trenches. However, significant Romano-British and medieval features were present in the area to the south and it was possible that the post-medieval features may have been masking earlier archaeological remains. It had also been noted, at other sites in Dymock, that features were often poorly defined and it may have been that more ephemeral structural remains were not evident in the confines of the evaluation trenches. [Au(abr)]

***An Archaeological Evaluation at the Former Site of Ann Cam's School, Dymock, Gloucestershire.***

Macpherson Barrett, R Gloucester : Gloucestershire County Council Archaeology Service, Report: 473.4.23 2008, 12pp, figs, refs

*Work undertaken by:* Gloucestershire County Council Archaeology Service

An evaluation was undertaken prior to the resubmission of a planning application. The withdrawn application comprised an indoor pool enclosure, gym and plant room, installation of new railings and a gate, and the demolition of the existing garden store, on the site of the former Ann Cam's School. The evaluation recorded Romano-British deposits and an undated animal burial, all of which were truncated by modern features. Romano-British pottery and a copper alloy brooch of first century BC to first century AD date were retrieved from the deposits. Although some of the pottery was abraded, the preservation of the brooch and imported pottery demonstrated that there was the potential for significant in situ Romano-British deposits within the immediate vicinity of the evaluated areas. [Au(abr)]

Phear, S & Williams, D Woodbury : Worcestershire County Council Historic Environment & Archaeology Service, Report: 1610 2008, 33pp, colour pls, figs, tabs, refs

*Work undertaken by:* Worcestershire County Council Historic Environment & Archaeology Service

An archaeological evaluation was undertaken at Gloucester Folk Museum. One trench was excavated at the rear of the site. A 17th century ditch with one recut was recorded, oriented roughly north-south, which contained a number of residual medieval artefacts including pottery, decorated floor tiles and masonry fragments along with 17th century pot sherds. The ditch was cut into a thick soil deposit similar to dark earth, the base of which was not reached in the evaluation. It was thought that deposition of this layer began in the medieval period, and continued until the 18th century. After this time, evidence for surface levelling was apparent, with a brick floor surface and wall related to a small building forming the structural remains from the 20th century. The site had a high potential for surviving medieval and Roman archaeological and environmental remains, although these were at a depth greater than the required depth for the evaluation trench. The recovery of a heavily corroded iron and copper alloy artefact was also considered significant and further analysis was recommended through X-ray and consequent interpretation. [Au(abr)]

Witchell, N Gloucester : Gloucestershire County Council Archaeology Service, Report: 474.33 2008, 10pp, figs, refs

*Work undertaken by:* Gloucestershire County Council Archaeology Service

The excavations did not reveal any stratified medieval or earlier deposits. Given what was known about the archaeology in the area, there was a high probability that archaeological remains existed within the proposed development areas, however, any archaeological remains present would be covered by significant depths of post-medieval deposits. The impact of any proposed construction work would be highly dependent on the depth of groundwork, the evaluation demonstrated that post-medieval and modern deposits existed at a depth of 1.21m in the southwest proposed development area and 1.40m in the north-west proposed development area. **THE OLD PRIORY, NORTH WOODCHESTER**

***Archaeological Evaluation at the Old Priory, North Woodchester, Gloucestershire***

Nichols, P Gloucester : Gloucestershire County Council Archaeology Service, 2008, 11pp, figs, refs

*Work undertaken by:* Gloucestershire County Council Archaeology Service

An archaeological evaluation was carried out on land at The Old Priory, North Woodchester. The evaluation was carried out prior to the determination of an application for Scheduled Monument Consent for the upgrading of services to the house and ancillary buildings, the reorganisation of the driveway, the insertion of new flower beds and the resurfacing of a tennis court. The works were within the site of Woodchester Roman Villa, which was a Scheduled Monument. The Department for Culture, Media and Sport granted Class 7 Consent (HSD 9/2/9892) for the evaluation work to be carried out. Four trenches were excavated by machine in order to evaluate the route of proposed new service runs and the realignment of a driveway. A wall foundation, orientated north-east to south-west, was recorded in Trench 3 and two ditches, both aligned north-east to south-west, were recorded in Trench 4. None of the features produced any dateable finds, however the foundation was on the line of a wall for a building shown on Lysons' plan of 1797 and was interpreted as the wall of a barn or outbuilding associated with the Old Priory. Lysons' plan also showed a boundary on the approximate line of the ditches, in Trench 4, and these ditches may have been boundaries or landscape features associated with the house. Deposits above the ditches in Trench 4 suggested that the site had been landscaped in the post-medieval/modern period. The wall foundation was recorded at a depth of as little as 0.39m below ground level, a height of 49.03m and the ditches were at a depth of as little as 0.74m below ground level, a height of

48.64m (based on the site survey). No archaeological features were recorded in Trenches 1 and 2. [Au(abr)]

*Work undertaken by:* Terrain Archaeology

This phase of evaluation targeted those areas previously inaccessible below the previous industrial building. Seven trenches were excavated and archaeological features were revealed in every trench. Primarily the archaeology comprised a series of small ditches, very similar to the Late Iron Age and Roman ditch systems found previously on this site and the adjacent site of Shapwick Road, together with a smaller number of pits and post holes. A small number of more recent features were also found. [Au(abr)]

The evaluation revealed extensive modern disturbances across most of the site, including a land drain and two quarries, relating to a former garden nursery which operated from 1851. Several very shallow and truncated furrows, possibly the remnants of medieval ridge and furrow and perhaps associated with the Wearne shrunken medieval village was located. Three slightly deeper ditches, including a ditch terminus in the same part of the site may have represented the remains of a field system or enclosure. A single sherd of pottery, probably dating to the 11th/12th century, was recovered from the ditch terminus. [Au(abr)]

*Work undertaken by:* JMHS

"John Moore Heritage Services concluded an archaeological evaluation of the proposed development site between 21st July and 1st August 2008. Thirteen trenches, totalling approximately 340 metres in length, were excavated to reveal the underlying natural geology. The investigation revealed that although aerial photographs showed significant detail along the road much of this was not reflected in the geophysical results. These results were themselves questioned by the lack of archaeological features in the majority of trenches. The Roman road was bisected by three trenches where it was seen to survive in varying degrees of preservation." [OASIS]

*Work undertaken by:* C. & N. Hollinrake Ltd.

An archaeological evaluation consisting of five trenches recorded numerous medieval occupation deposits and features beginning in the 12th/13th century and continuing through to the present date. Late-medieval or early post-medieval plot boundaries, running off West Street, appeared to have been formed of stone walls, rather than ditches. A large pit, backfilled with loose rubble stone, contained considerable quantities of pottery and bone. This feature was probably a quarry pit, opened when the new town was built in the 13th century and backfilled by the 14th century. [Au(abr)]

Two evaluation trenches were opened in each of two possible footprints for the spots pavilion whilst a fifth trench was opened alongside the south-eastern boundary of the area. Trenches for Option A revealed up to 1m of recent made ground. Trenches within option A2 revealed structures and deposits of medieval date, and remnants of a possible metalled surface. In Trench 2, several pottery sherds dating to the 12-13th century were recovered from the fills of a pit and adjacent narrow gully or slot over which a sandstone wall was located. In the fifth trench, further structural remains dated to the 12th-13th centuries were located. Evidence of Romano-British activity was restricted to the recovery of residual sherds. [Au(abr)]

Meara, H Oxford : Oxford Archaeology, Report: 4093 2008, 126pp, colour pls, figs, tabs, refs

*Work undertaken by:* Oxford Archaeology

An evaluation was undertaken along with monitoring of contamination remediation of land at North Field, Filton Airfield. A total of 269 trenches were proposed for the evaluation. 154 of these trenches were excavated, while the locations of 45 trenches were monitored by a watching brief. The remaining 70 trenches were to be excavated at a later date, as areas became available. Five additional trenches were excavated. The evaluation revealed the site

to have been heavily truncated by ploughing and landscaping relating to the use of the site as an airfield during the 20th century. Archaeological remains consisted of a sparse collection of field boundaries and isolated small pits. The majority of these features were undated, although a small number dated to the Iron Age and Roman period. The evaluation revealed two further features of note. The first was a large pit or waterhole dating to the Iron Age. This feature, along with the small number of ditches and small pits recorded during the course of the evaluation are among the only Iron Age and Romano-British archaeological remains known from within the study area. The second feature was a collection of limestone walls located in the eastern part of the site. These appeared to be the remains of a limekiln structure noted on the 1881 O.S. map. In addition, a small number of features were observed that related to the use of the site as a military airfield. [Au(abr)]

***An Archaeological evaluation at Moredon Road, Swindon, Wiltshire***

Hammond, S. Oxford : JMHS, Report: 1859 2008, A4 Report

*Work undertaken by:* JMHS

"John Moore Heritage Services concluded an archaeological evaluation of two proposed development sites, from 16th -21st January 2008. A magnetometer (gradiometer) survey was

undertaken that found that more than half of the site was affected by magnetic 'clutter' from modern ferrous and other debris which had effectively masked underlying features. In areas where the ground survey proved relatively free of magnetic disturbance there was little evidence for features of obvious archaeological interest. Subsequently four trenches, totalling approximately 85 metres in length, were excavated to reveal the underlying natural geology. The land itself falls under two planning applications. Trench 1 deals with the planning application associated with the proposed Children's Centre, whilst Trenches 2-4 are relevant to planning application S/072088/SC, the anticipated new Medical Centre. For the purpose of this report both areas will be discussed together. However, the discussion and conclusion will be used to differentiate the two areas. Four potential features, two gullies and one possible ditch/large pit were revealed in Trench 1 and one potential shallow ditch/spread was revealed in Trench 3. Despite full excavation of the gullies within the confines of Trench 1, no dating evidence was recovered from either and only animal bone and one iron nail was unearthed in the ditch/large pit. The shallow ditch or spread in Trench 3 contained pottery dating to some time from the mid 12th century to late 14th century." [OASIS]

*Work undertaken by:* Cotswold Archaeology

The evaluation comprised three trenches and recorded a possible Anglo-Saxon ditch 0.6m below the ground surface. It was cut into the underlying chalk and sealed by modern topsoil, subsoil and recent yard surfaces. An undated ditch with similar forms and fills to the Anglo-Saxon ditch were also recorded, and may have been of the same date. A modern wall foundation and modern pit were also encountered. *Work undertaken by:* Cotswold Archaeology

One trench was excavated as part of the evaluation, and identified two undated but probably medieval post holes, along with a medieval pit and ditch likely to have formed part of a western continuation of the Anglo-Saxon and later High Street. Taken together with the results of an earlier evaluation on the site, these features suggested the presence of a burgrave plot fronting onto the street. [Au(adp)]

ACW150/3/0 2008, 52pp, colour pls, figs, tabs, refs*Work undertaken by:* AC archaeology

An archaeological evaluation, by trial trenching, was undertaken at North and South Tidworth. A total of 145 trenches was excavated to test both magnetic anomalies detected by an earlier gradiometer survey and to act as a control across the remainder of the proposed development areas. Few, if any, geophysical anomalies were found to be of archaeological origin. In the grid-based control trenches a single linear feature of medieval date was recorded in the northern section (NE Quadrant) and several possible subsoil features in Area 19 to the south. A highly localised group of intercutting subsoil features was also found in Dean's Close in the grid-based trenches and includes Neolithic, Bronze Age and Romano-British artefacts. The nature of the activity represented by these feature was unclear. [Au(abr)]

tabs, refs*Work undertaken by:* Kim Watkins Archaeological Consultant

The evaluation involved the excavation of two trial trenches, one within an existing outbuilding known as the Coach House and one on the adjacent lawn area to the north of the main house, on the site of the Scheduled Roman villa complex on an area to the north-east of the parish church in Box. Both trenches revealed sections of wall on north-east by south-west

alignments, probably part of the same structure. These sections were dated to the Roman period, and were probably associated with the villa complex that had been excavated to the north-east. There were indications that the wall may have formed the southern wall of a building constructed on a terrace created by dumping material in the natural hill slope. [Au(adp)]

*Work undertaken by:* Wessex Archaeology

An evaluation was carried out on the site following a geophysical survey that identified suspected archaeological features. Seven trenches were machine excavated. Trench 6,

targeted on the northern enclosure, revealed a pit and a 6m wide enclosure ditch that had fallen out of use in the early Roman period. Trenches 1-4, located on the southern enclosure, revealed ten pits, five post holes and a stake hole. The enclosure ditch was 10m wide, and fell out of use at the same time as the northern example. The features inside the southern enclosure were dated to the Middle Iron Age. Notable across the site was the prevalence of burnt flint. Evidence of a further Iron Age ditch, situated to the east of the site, which measured at least 200m long and extended in an arc towards the east, was revealed in Trench 7. A possible pit or tree throw in Trench 5 may have indicated further Iron Age activity, external to the enclosures. [Au(adp)]

#### **FORMER SOHO GLASSWORKS, LODGE ROAD, WINSON GREEN**

***Former Soho Glassworks, Lodge Road, Winson Green, Birmingham, West Midlands. Historic Building Record and Archaeological Evaluation***

Tyler, R & Mitchell, W Edgbaston : Birmingham Archaeology, Report: 1753 2008, 130pp, colour pls, figs, tabs, refs

*Work undertaken by:* Birmingham Archaeology

A programme of historic building recording and archaeological evaluation was carried out at the site of the former Soho Glassworks at Lodge Road. The Soho Glassworks were established in 1805 on land owned by Samuel Shakespear and was, during its lifetime, associated with some of the principal names of the Birmingham glass industry. Its glasshouse, erected adjacent to the Soho Branch Canal, was the second canal side glasshouse built on Birmingham Heath. Originally in the hands of Shakespear, Johnson and Berry the works were sold in 1850 to John Walsh, who was to become one of the most prominent glass manufactures of his day, and the factory continued for many years to produce a wide range of high quality glassware. A second glasshouse was erected to the east in c. 1866. The site of the glassworks was taken over in 1952 by the Ford Motor Company who undertook a radical reordering, a process that involved the demolition of a large part of the glassworks era buildings. The building stock of the factory premises as recorded has been shown to date principally to the later years of the occupation of the site, mainly to the period between the 1930s and the 1950s, though elements of a number of earlier, pre-1930s structures survived. No element of the 19th century glassworks complex was identified as surviving above ground. Throughout, the architecture was essentially utilitarian in nature and was of no inherent merit, the single exception being the main 1950s office range fronting onto Lodge Road to the south. This structure, as built, was of some architectural pretension with extensive use being made of glass-block walling. Below-ground survival of a series of tunnels associated with the remains of the earliest glass cone [c. 1805] and a later glass-house [c. 1860-1870] were located beneath the remains of the present factory buildings. At least three phases of tunnels were revealed. The earliest were associated with the original works of 1805. A second phase was associated with the addition of the glass house and a third phase related to alterations during the early part of the 20th century. The excavation of series of five evaluation trenches revealed a series of structures related to the period of manufacturing beginning in the early 19th century. Trench 1 provided limited evidence of human intervention apart from the insertion of a modern drainage pipe. Trenches 2 to 5 revealed structural and residual evidence of the 19th century glassworks buildings including the main areas of manufacturing [glass cone] and the workshop areas around the periphery. The truncated

foundations of the circular glass cone, along with the remains of a building extension attached to its exterior were exposed in Trench 2. The identified remains were likely to represent two phases of construction from this early-19th century period. A series of brick floor surfaces constructed over the early-19th to 20th century periods, were exposed in Trenches 3 and 4. These represented the remains of workshop buildings likely to have housed the glass finishing processes. Further structural evidence, of 19th to 20th century origin, were identified within Trench 5. A range of process residues and construction materials relating to the period of the glassworks were identified in Trenches 3 and 4. These could be grouped into the discarded remains of the glass products, broken lumps of raw glass, sieges and furnace bricks. [Au(abr)]

**LAND OFF WELLHEAD LANE, PERRY BARR**

***Land off Wellhead Lane, Perry Barr, Birmingham. Archaeological Evaluation***

Paul, S & Colls, K Edgbaston : Birmingham Archaeology, Report: PN1773 2008, 12pp, figs, tabs, refs

*Work undertaken by:* Birmingham Archaeology

An evaluation was undertaken at a site considered to have a high archaeological potential, located on land accessed by Wellhead Lane. Along the eastern part of the site, the projected route of Icknield Street, a Roman Road known to run through Birmingham, may have bisected the area. Icknield Street ran from the Roman town of Wall to the north of Birmingham, through Sutton Park where it was still an upstanding monument, through Birmingham where later development had largely obscured the route, and further south towards the Roman Fort in Edgbaston and then to the Roman town of Alcester. A total of seven trial trenches were excavated across the area of the site, essentially in order to assess the archaeological potential of the site. Two of the trenches were positioned across the proposed route of the Roman Road, with a further five excavated across the site in order to locate any associated Roman occupation and to investigate the possible continuation of post-medieval features found to the east of the site in 1999. A ditch was located in two of the trenches, aligned north-east to south-west, at the putative location of the road. This feature could not be dated and if a twin of this ditch existed at any point on the site it is probable that it had been subsequently truncated by modern service trenches. There was no sign of any built road surface associated with the ditch. A further ditch was encountered close to the eastern limit of the site that corresponded to the line of a field boundary illustrated on some of the earliest detailed maps of the area. The feature appeared to have silted up through natural processes and no finds were recovered. This feature was sealed by 1.8m of modern debris, especially broken glass bottles, dating to the mid-20th century. This material most probably represented a levelling deposit brought in to level the site prior to the existing sports facilities. [Au(abr)]

**NEW LIBRARY, CAMBRIDGE STREET**

***New Library Site, Cambridge Street, Birmingham, Archaeological Evaluation***

Ramsey, E Edgbaston : Birmingham Archaeology, Report: 1788 2008, 42pp, colour pls, figs, tabs, refs

*Work undertaken by:* Birmingham Archaeology

The evaluation comprised four trenches, which were located over potential archaeological structures and deposits identified from cartographic evidence, and to avoid known services. A previous desk-based assessment proved that the site was formerly within the vicinity of John Baskerville's house in the 18th century, and was the later location of the Union Brassworks in the early 19th century, and Winfields Brass Works, one of the largest brassworks in Birmingham during the mid to late-19th century. The archaeological evaluation demonstrated good survival of below ground archaeological deposits relating to the former brassworks and the canal basin constructed to serve the works. The results both correlated with known cartographic evidence, and also provided additional detailed information regarding specific rooms and structures within the works. Archaeological structures and deposits were found in all of the trenches. The principle dated structures and deposits were the canal and associated towpaths and infrastructure. Industrial structures including walls, a chimney, machine bases and floor surfaces associated with the Rolling Mills and subsequent brass and iron works. These features were multiphase, though all were of a post-medieval date from 19th century to early 20th century. The archaeological structures and deposits identified correlated well with the historic maps and plans, and supplemented this information with detail regarding internal structures and functions within the buildings. The dating of the structures was problematic, as no artefactual dating evidence was recovered from stratigraphic contexts within the site. Architectural detail, in particular brick type and form and stratigraphic relationships were used to phase the site. The phasing of the site is therefore roughly early to mid-19th century, mid to late-19th century, and late-19th to early 20th century. It should be noted, however, that these were provisional dates only. [Au(abr)]

AN ARCHAEOLOGICAL EVALUATION**

***New Library Site, Cambridge Street, Birmingham: An Archaeological Evaluation***

Ramsey, E Birmingham University : Birmingham Archaeology, 2008, Birmingham Archaeology Report No 1788

*Work undertaken by:* Birmingham Archaeology

"An archaeological evaluation at Cambridge Street, Birmingham was commissioned by Capita Symonds on behalf of Birmingham City Council. The work was undertaken by Birmingham Archaeology in May 2008. The evaluation comprised four trenches, which were located over potential archaeological structures and deposits identified from cartographic evidence, and to avoid known services. The work was required as part of an assessment of the impact of the proposed development of the new Library on below-ground archaeological remains, in order to determine the necessity for further archaeological mitigation in advance of the commencement of the development. A previous desk-based assessment showed that the site was formerly within the vicinity of John Baskerville's house in the 18th century, and was the later location of the Union Brassworks in the early-19th century, and Winfields Brass Works, one of the largest brassworks in Birmingham during the mid to late-19th century. The archaeological evaluation demonstrated good survival of below-ground archaeological deposits relating to the former brassworks and the canal basin constructed to serve the works. The results both correlate with known cartographic evidence, and also provide additional detailed information regarding specific rooms and structures within the works." [OASIS]

Charles, M Edgbaston : Birmingham Archaeology, Report: 1765 2008, 22pp, colour pls, figs, tabs, refs

*Work undertaken by:* Birmingham Archaeology

Two evaluation trenches were sited to assess possible locations of palaeochannels and prehistoric burnt mounds that had been exposed in the immediate vicinity to the east in 1989. The evaluation found no evidence of palaeochannels, burnt mounds or other archaeological deposits. The stratigraphy was consistent with undisturbed subsoil and buried topsoil subsequently built up during the late-1980s landscaping during the construction of the Queen Elizabeth Psychiatric Hospital buildings. *Work undertaken by:* Birmingham Archaeology

Five evaluation trenches were excavated at strategic positions across the site. The same general pattern of deposition was encountered across the five trenches. Archaeological features were found in three of the five trenches. All but one of the features identified were undated. Trenches excavated within the northern part of the site provided evidence of the geological formation of this elevated part of site, but revealed no evidence of cultural activity. One trench, provided evidence of agricultural activity in the form of a single shallow plough furrow which ran down-slope, providing evidence that ploughing activity was influenced by the

contour of the land. Evidence of the field management and agricultural use of the site was identified, in the southern part of the site, in the form of several linear ditches. These ditches would probably have functioned as agricultural plot or field boundaries and would have provided site drainage and irrigation. The majority of the features were undated, however, one ditch provided evidence of an 18th-19th century construction. Another wide ditch corresponded with the location of the watercourse depicted on the Ordnance Survey map of 1882-9. No significant archaeological features or deposits were recorded during the evaluation and no further archaeological work was recommended. [Au(abr)]

Burrows, B & Colls, K Edgbaston : Birmingham Archaeology, Report: PN1767 2008, 40pp, colour pls, figs, tabs, refs

*Work undertaken by:* Birmingham Archaeology

The evaluation successfully highlighted the survival of a substantial sandstone building apparently dating to the 14th century. Part of the eastern and southern walls of the structure were uncovered although the depth of the sandstone foundations meant that it was not possible to reach the base of the walls due to health and safety considerations. The sandstone walls measured approximately one metre in width and represented the earliest archaeological remains unearthed, they were abutted by a number of later brick walls extending to the east and south which were probably indicative of cellaring activity in the post-medieval period. Interestingly the lower courses of the sandstone walls appeared to bow out and one of the brick "cellar" walls slumped markedly to the south, perhaps suggesting that the structures were built on unstable ground, possibly indicating the presence of a deep ditch. Environmental samples which were taken towards the southern edge of the evaluation area appeared to confirm the presence of an organic deposit perhaps supporting the theory of a moat. A dome shaped brick built structure situated towards the northern edge of the area of excavation which had truncated the upper course of one of the sandstone walls, may have suggested a capped well or a water tank, probably dating to the 19th century. Without doubt the most important element of the finds assemblage was the group of fragmented 18th century clay pipes. With pipes of this date being sparse within the archaeological record, this

group formed an important dataset that is significant both on a regional and national context.

*Work undertaken by:* Ironbridge Archaeology

The area was archaeologically sensitive and had long been thought to be the site of a hill fort. The excavation revealed the substantial remains of a large ditch, which appeared to be running around the contour of church hill. The fill of the ditch contained early medieval pottery, and the ditch was consequently interpreted as part of a possible hill-top enclosure. This could be the presumed Saxon 'Woden's Burgh' and may have earlier origins as an Iron Age hillfort. [Au(abr)]

Charles, M Edgbaston : Birmingham Archaeology, Report: 1774 2008, 48pp, colour pls,  
figs, tabs, refs

*Work undertaken by:* Birmingham Archaeology

The evaluation took place in advance of a proposed residential development and aimed to locate archaeological evidence of the origin and development of Great Barr from the medieval period to the present day. More specifically the aim was to locate the site of Hamstead House which was visible on 19th century maps. The trial trenching uncovered evidence of brick foundations. It was not possible to confirm whether these were associated with Hamstead House due to the location of live services within the trench concerned. However, the foundations were overlain by a brick demolition layer that may have been associated with the destruction of a structure dating to the late-18th or 19th centuries. [Au(abr)]

#### ***Land at Park Farm, Berkswell, Solihull: Archaeological Evaluation of the Proposed Park Farm Pond***

Hart, J Cirencester : Cotswold Archaeology, Report: 08209 2008, 19pp, figs, tabs, refs

*Work undertaken by:* Cotswold Archaeology

Eleven trenches were excavated within the footprint of the proposed Park Farm pond. The results of the evaluation were similar to those of a previous evaluation to the immediate west. A low density of ditches were identified across the site, they were similar to those identified during the previous evaluation and conformed to the alignments, but not the locations, of field boundaries depicted on the Tithe Map of 1841. Since none of the ditches identified during the evaluation corresponded with the location of boundaries depicted on the historic mapping, it was likely that they were slighted before 1841, and evidence for such an event was present within Trench 101. Two pits identified within the northern part of the site remained undated and of undetermined function. It was possible that they represented tree throw pits, although their regular edges were more suggestive of them having an anthropogenic origin. Tree throw pits were present across much of the site. A possible alignment of these in Trench 104 might have represented a former boundary. [Au(abr)]

Craddock-Bennet, L & Doyle, D Hereford : Archaeological Investigations Ltd., 2008, 25pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Investigations Ltd.

Borehole cores were taken on 23rd and 24th January 2008, and pressure plate test pits were excavated on 30th and 31st January 2008. Pottery and tile were recovered from core samples, and were from a broadly similar date range. It was likely that they were from debris associated with demolition of priory buildings in the mid-16th century. The trenches for the pressure plate bearing tests revealed no archaeology in the top 0.50cm, this was confirmed by the bore hole cores. The cores proved that an archaeological layer was present at approx. 0.80m which corresponded with findings from previous excavations. The small quantity of artefacts recovered indicated that the archaeology on the site was of a medieval date and was likely to be associated with the Blackfriars priory. Small sherds of Hertfordshire fabrics suggested that occupation predating the priory was present on or near the site. Excavations were not carried out on a large enough scale to give a more in depth insight into the site history, but in general did conform with earlier deposit models. [Au(abr)]

*Work undertaken by:* Worcestershire County Council Historic Environment & Archaeology Service

The trench exposed significant remains of medieval date. The most significant was a wall made of local stone rubble faced with lias. The wall suggested a substantial stone building the same axis and scale as a 13th/14th century hall and chapel to the east. A few sherds of pottery were found in earlier and later contexts. These suggested that the building was built in

the 13th century and demolished in the late-16th or 17th century. It certainly formed part of the medieval hospital of St. Katherine, and may have been another hall or range of chambers. Other remains included a line of post holes that seemed to indicate a timber scaffold. The medieval remains were buried beneath post-medieval and modern made ground. [Au(abr)]

Arnold, G Fownhope : Archenfield Archaeology, Report: 200 2008, 19pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archenfield Archaeology

The Roman settlement at Leintwardine (Branogenio) was believed to have originated as a vicus attached to a fort at Jay Lane, itself built in about 70 AD. The site lay immediately north of modern (and Roman) Leintwardine, on a Roman road which ultimately connected Chester with Caerleon. A magnetometer and topographic survey identified anomalies, which may have had an archaeological origin (pits, fires, etc). A feature found by trial trenching, which was not identified by the geophysical survey, was a keyhole-shaped hearth or oven feature. This was radiocarbon dated to Cal AD 10 to 120 (intercept date of 60 AD) and evidence from the environmental samples suggested that it was used for industrial rather than domestic purposes. The date was extremely early for activity associated with Branogenio and indeed the earlier part of the range predated Roman occupation of this area. It was likely that significant archaeology survived on the site, and had the potential to radically alter the perception of the origins of Leintwardine. [Au(abr)]

The excavation of three evaluation trenches revealed features and finds related to the post-medieval occupation of the site. A large amount of brick and stone rubble from the demolition of late post-medieval buildings was observed. Much of the site appeared to have been built up with imported or redeposited material, partially removing or truncating underlying deposits in places. Underlying these deposits was an accumulation of late post-medieval occupation/garden soils across the entire site. A number of 17th-18th century features and deposits were uncovered below this layer, including a stone-lined pit and a substantial deposit of cattle horn cores. [Au(abr)]

Ellesmere, Shropshire*

Logan, W & Archer, J Leominster : Border Archaeology, Report: BA0805SCCEBP 2008, 36pp, pls, figs, tabs, refs

*Work undertaken by:* Border Archaeology

An archaeological programme of work was carried out on land adjacent to Ellesmere Business Park, where aerial photography had revealed evidence of a double ditched cropmark feature of unknown date and function. The initial phase of work comprised a geophysical (magnetometry) survey, which identified a number of positive responses, suggesting the presence of cut features such as ditches and pits. These results, in conjunction with the aerial photographic evidence, were then used to assist in the locating of six evaluation trenches. Of these, Trenches 1 and 2 were positioned with respect to the cropmark feature shown on the aerial photography and revealed the remains of two ditches possibly forming part of a double ditched enclosure. Trenches 3 and 4 were located in the southern part of the site, where the geophysical survey indicated several possible subrectilinear or curvilinear features. Trench 3 revealed part of a very large shallow ditch, while Trench 4 contained two ditches running parallel with a third, a probable post-medieval ditch, cutting across the outer one. The survey also indicated a series of pit like features aligned roughly north-west/south-east in the northern area of the site and a trench (Trench 6) was opened in this area to investigate these features. However, what appeared to be pits were in fact patches of loose sand, which probably represented natural variations in the geological composition of the site. The larger linear features revealed in the evaluation trenching appeared to be enclosure or boundary ditches and parallels may be drawn between these features and other subrectangular and rectangular enclosure sites, existing as cropmarks, which had been identified from aerial photography just across the border in Flintshire and which may be of late prehistoric date. ***Land to the Rear of 8 Mardol, [Rear of former Elephant & Castle PH], Shrewsbury***

Frost, P Pontesbury : Castlering Archaeology, Report: 305 2008, 16pp, colour pls, figs, refs

*Work undertaken by:* Castlering Archaeology

The evaluation showed that on the east side of the trench any medieval deposits had been obliterated by ground disturbance in post-medieval and more modern times. The bulk of the demolition material date to disturbance during construction of the Elephant and Castle public house and subsequent demolition of the structure in the 1960s period when the flat roofed function room was added. On the west side, the evaluation uncovered well-preserved medieval deposits that appeared to have had very little disturbance over the years. The results of the evaluation suggested that there was a strong possibility that undisturbed medieval deposits could be located at depths of c.400mm. The composition of the medieval deposits suggested they were part of garden areas related to burgage plots. [Au(abr)]

The archaeological evaluation fieldwork established that no significant evidence for the presence of Rykneild Street Roman road survived within the application site. Two features were sampled and recorded in Trench 1. Cut 103 comprised the remains of a possible small quarry pit similar to the "gravel pit" and "old marl pit" depicted on 19th century Ordnance Survey mapping. Cut 107 may have been the remains of feature fills and was unlikely to have remained open for any length of time. A lens of rounded pebbles within a subsoil matrix was recorded in Trench 2. An archaeological evaluation was undertaken. Three trenches were excavated across the lines of two possible banks associated with Wolseley Park, which was created as a deer park at the end of the 15th century. The evaluation demonstrated that one of the banks survived as an earthwork, with an adjacent ditch along part of its length. The other bank did not survive as an earthwork, but was visible below the subsoil. No dating evidence was recovered during the evaluation, but the form and location of the boundaries was consistent with them having formed part of the deer park. [Au(abr)]

Cramp, R Hanley : Stoke-on-Trent Archaeology, Report: 238 2008, 16pp, colour pls, figs, tabs, refs

*Work undertaken by:* Stoke-on-Trent Archaeology

An evaluation was undertaken on land off Ridgway Road. The site was occupied by a crate-maker's yard during the late-19th century, which was replaced by an electricity generating station in the early 20th century. The evaluation involved the machine excavation of a single trench targeted upon the timber pond of the crate works. No evidence of the pond was found during the course of the evaluation. Large reinforced concrete fragments, probably representative of a partially sunken water storage tank associated with the electricity works, were encountered, suggesting that this structure had destroyed the earlier crate-maker's pond. Hill, T Edgbaston : Birmingham Archaeo-Environmental, 2008, 40pp, colour pls, figs, tabs, refs

*Work undertaken by:* Birmingham Archaeo-Environmental

A palaeoenvironmental evaluation was undertaken at the former Victoria Ground football ground, Stoke. Deposits of palaeoenvironmental potential were suggested to be present within the site's sedimentary archive due to the identification of a former channel of the River Trent within the site boundaries. A total of 11 window sample boreholes were taken across the site, of which seven were positioned along the route of the palaeochannel. It was concluded that organic-rich silt was likely to have accumulated in a lagoonal backwater floodplain setting of the River Trent. It was unclear when this deposit accumulated however and a suite of palaeoenvironmental assessments were recommended to provide an insight into the landscape conditions that prevailed at the time of deposition. figs, tabs, refs*Work undertaken by:* Birmingham Archaeology

An evaluation was undertaken at the Castle Farm Campus of the University of Wolverhampton. The work was carried out in advance of the proposed development of the site, which was within the boundary of a Scheduled Ancient Monument. Previous work had recorded evidence of a double ditched Iron Age enclosure at the eastern part of the site and this was subsequently destroyed during the construction of Priorslee Lake. It was thought that cropmarks visible on aerial photographs of the present site may be associated with the features previously recorded, perhaps evidence of an annex to the enclosure. Five trial trenches were excavated within the boundary of the SAM, with two of the trenches located to investigate the cropmarks. No archaeological features, deposits or finds were identified. It is possible that the presence of the cropmarks could be explained by variations in the natural geology observed during the evaluation. [Au(abr)]

pls, figs, tabs, refs*Work undertaken by:* Birmingham Archaeology

An evaluation was carried out in advance of a mixed-use development. Residual Roman pottery was recovered from a pit of post-medieval date, suggesting that there may have been some potential for remains of Roman date to be present. A ditch from the mid-13th-mid-14th century was recorded, along with a pit from the 15th-16th century. Other medieval and post-medieval pits and post holes were encountered, as well as early post-medieval sandstone wall foundations. Brick-built cellars were discovered and were thought to date to the 18th, 19th and 20th centuries, and possibly related to industrial applications such as tanning. [Au(abr)]

*Work undertaken by:* Warwickshire Museum Field Services

Investigations on the Round Room, a circular, brick-built burial cloister belonging to St. Mary's Priory, established at Princethorpe in 1833, was undertaken in 2008. Built between 1835 and 1838 to the south-east of the first priory church, to the design of John Russell, a Leamington Spa architect. The cloister comprised an open pointed-arched arcade around a, formerly grassed, garth with a central cross. The building was remodelled in 1842 by J. A. Hansom when a mortuary chapel was added to the church. It was in use for burial of members of the community between 1838 and c. 1910. A radar survey had suggested the presence of radial ground beams across the garth, perhaps belonging to a crypt. Investigation revealed an unusual arrangement of twenty, radial, tapering, brick burial vaults, covered by stone slabs and topsoil. The three vaults opened contained between two and four burials, some in coffins. [Sec(abr)]

Ingham, D Bedford : Albion Archaeology, Report: 2008/110 2008, 26pp, colour pls figs, tabs, refs

*Work undertaken by:* Albion Archaeology

The only archaeological remains positively identified during the borehole survey comprised building floors and foundations, a probable cobbled surface, and garden soil all of which were post-medieval. The clays and gravely clays underlying the post-medieval deposits represented a combination of make-up layers and alluvial deposits, the date of which was uncertain. However, if these clays were Roman in date then the potential would have existed for Roman features to have been cut into them. [Au(abr)]

***Archaeological Field Evaluation at No. 9 Church Street, Alcester, Warwickshire***

Benchmark Archaeology Sheffield : Benchmark Archaeology, 2008, 17pp, colour pls, figs, tabs, refs

*Work undertaken by:* Benchmark Archaeology

A programme of archaeological field evaluation was carried out at Helping Hands Homecare. The archaeological work was a condition of planning permission for the construction of a two-storey extension at the site. Trial-trenching comprised the excavation of a single trench within the eastern half of the proposed development. Archaeological features dating to the post-medieval period were encountered at c.1m below the modern ground surface. These features consisted of two pits/post holes of c.17th century date, an undated probable post hole, and a linear cut of 19th century date. These features and deposits were overlain by disturbed deposits, 19th century structural layers, and modern surfacing with a combined depth of c.1m. The 19th century activity almost certainly related to stables and other outbuildings associated with the former Post Office [No. 9 Church Street]. Earlier activity on the site was represented by the recovery of a single unstratified sherd of mid-1st-2nd century AD Roman pottery. The foundation design for the new building was to comprise piles and ground-beams receiving a concrete slab. Piling was scheduled to be carried out around the perimeter of the new building, largely within the footprint of the presumed foundation trenches of No. 9 and No. 10 Church Street. Excavation for the ground beams was not anticipated to exceed 0.65m- 0.75m below the existing ground surface. The evaluation fieldwork established that archaeological

deposits appeared to have been truncated by 19th century development depicted on mapping of 1886 and 1905. Based on the results of the evaluation, the remaining unevaluated area to the west of Trench 1 was likely to be more disturbed by the insertion of modern services and the footprint of existing buildings. Given the nature and extent of the proposed foundations, it was unlikely that the proposed development would impact on any deposits of archaeological significance. [Au(abr)]

**35 CASTLE HILL, KENILWORTH*****Archaeological Evaluation at 35 Castle Hill, Kenilworth, Warwickshire***

Rann, C & Thompson, P          Warwick : Warwickshire Museum Field Services, Report: 0913 2008, 1p

*Work undertaken by:* Warwickshire Museum Field Services

An evaluation involving two trial trenches was undertaken in on a site to the east of the castle and north-west of the abbey precinct proposed for residential development. The evaluation revealed evidence of activity on the site from the 13th to the 17th centuries. This included the remains of possible wall foundations and floor surfaces and a stone-lined pit or trough with 13th century pottery. Several pits and ditches were also revealed which may have belonged to a phase of 15th or 16th century activity on the site. [Sec(abr)]

Adam, N J          Cirencester : Cotswold Archaeology, Report: 08121 2008, 18pp, figs, tabs, refs

*Work undertaken by:* Cotswold Archaeology

Evaluation at the site identified the remains of the former manor house and associated stable block. The manor house was found to have been vigorously demolished with the whole site being truncated to the top of the natural substrate. Two former cellars were exposed, each filled with rubble derived from the demolition of Bentley Manor. A third trench to the north of the house failed to identify evidence of the former garden features that were known to have once existed. Four shallow and broadly parallel drainage features, dating from the late-19th century, were identified. [Au(abr)]

Two machine-excavated trenches were cut in advance of a residential development. Two parallel ditches may have represented a double-ditched feature, probably a tenement boundary from the 13th-14th century. Laying next to this feature was a former structure, identified through the remains of a horizontal foundation and large post hole, probably constructed at some time between the 15th and 17th centuries. A contemporary ditch and wall were also recorded. [Au(adp)]

*Work undertaken by:* On Site Archaeology

The site lay in a micro landscape the had been utilised since at least the Late Iron Age. The evaluation recorded the remains of a Late Iron Age/Roman enclosure, along with the remains of field boundaries and ditch systems. The possible remains of an entrance to a domestic dwelling from the period were discovered along with the inhumations of two individuals and the ritualistic internment of an animal skeleton. This lay at the possible entrance of an enclosure or roundhouse. Medieval agricultural activity was represented on the site, as well as post-medieval quarrying and activity associated with the construction of the war time airfield. [Au(adp)]

Stanley, J York : On Site Archaeology, Report: OSA08EV07 2008, 32pp, colour pls, figs, tabs, refs

*Work undertaken by:* On Site Archaeology

The evaluation revealed evidence for medieval activity and probable post-medieval garden activity, sealed by approximately 0.5m of modern garden soil. The medieval remains comprised rubbish pits truncated by linear features, interpreted as drainage ditches that may have served as land divisions. Deep circular pits in the centre of the site may have been representative of industrial activity such as leather working or cloth manufacture. Post holes on the site did not form any discernable structure and may have been of late medieval/post-medieval date. Further archaeological investigation was recommended. [Au(adp)]

Tibbles, J Kingston upon Hull : Humber Field Archaeology, Report: 260 2008, 45pp, colour pls, figs, tabs, refs

*Work undertaken by:* Humber Field Archaeology

The evaluation trenches contained evidence of three phases of site use. The earliest phase comprised a possible Iron Age/Roman pit and gully, although these may have been later. A subsequent watching brief revealed the presence of a large ditch at least 3m wide which, though undated, may have been the southern return of a north-south feature observed on a nearby site containing later 4th century pottery. If this were the case, a large enclosure may have been positioned next to the later crossing point of Driffield Beck. An early medieval presence was represented by several pits and a shallow linear gully to the rear of the site, with two of the pits containing late 9th to 11th century pottery, and a third probable 10th to late-12th century date pottery. Further features of post-medieval date were recorded, some probably associated with the construction of the cottages, including a possible gravel extraction pit in the garden area. The foundations of one of the cottages were located briefly in a post hole cut for a temporary site fence. [Au(abr)]

Adamson, N G Kingston upon Hull : Humber Field Archaeology, Report: 284 2009, 36pp, colour pls, figs, tabs, refs

*Work undertaken by:* Humber Field Archaeology

During the course of the evaluation, several archaeological features and layers were identified in both trenches, including probable early Roman ditches below a later stone-lined post setting and spreads of limestone in Trench 1, presumably representing a building next to a hard standing external yard surface. A similar limestone spread in Trench 2 sealed earlier external surfaces or dumps. These later features indicated activity in the area between the 2nd and 4th centuries, with the presence of Samian tableware and an amphora fragment reflecting the sites' proximity to Petvaria. The surfaces were overlain by silt deposits and windblown sand. [Au(abr)]

Brown, J Northampton : Northamptonshire Archaeology, Report: 08/201 2008, 27pp, colour pls figs, tabs, refs

*Work undertaken by:* Northamptonshire Archaeology

An evaluation was undertaken alongside monitored borehole sampling during November 2008. A substantial ditch was excavated that produced sherds of Roman greyware pottery and a Manning's Type 11b iron nail. A ditch of 19th-20th century date was excavated that preserved the remains of wooden shoring at its base. The ditch had a relatively short life-span and had collapsed at the time of its backfill. It may have been a military practice trench of the kind built by infantry battalions during the Great War. Borehole sampling indicated substantial buried deposits across the site, with considerable variations in depth suggesting that the area was landscaped considerably over the past couple of centuries. In particular a borehole located to the rear of Chequer House suggested that deposits relating to the documented rear gardens and ponds may still survive. [Au(abr)]

Rowe, M Saxilby : Pre-Construct Archaeology (Lincoln), Report: 481 2008, 23pp, colour pls, figs, tabs, refs

*Work undertaken by:* Pre-Construct Archaeology (Lincoln)

An evaluation was undertaken on land to the rear of The Manor House, Thorpe-in-Balne, Doncaster. A single evaluation trench was excavated within the footprint of a proposed extension to the existing "Manor House". This building was constructed in the 1980s, replacing a farmhouse and associated agricultural building. The site lay within a designated Scheduled Ancient Monument [Thorpe-in-Balne moated site, chapel and fishpond]. Well-preserved archaeological features/deposits were encountered within 200mm of the existing ground surface. These included wall footings and an associated possible surface. Negative features were also recorded, including an in-filled ditch and a possible pit or partial recut of the ditch. Stratigraphically, the ditch was the earliest archaeological feature encountered. Pottery sherds recovered from fills within the ditch and a later partial recut or pit provided a broad date range for these features of 12th-13th and 13th-14th centuries respectively. Residual pottery was also recovered from these features, including a single sherd of a middle Saxon vessel, dated to the late 7th-mid-late 9th century, and several sherds of Saxo-Norman material of late-10th-late-12th century date. Two limestone wall footings were also identified and, although these remain undated, one appeared to have been built after the ditch had silted up. Worked stone, stylistically dated to the late-13th century or later, was recovered from demolition material associated with these walls. A clay surface sealed by a charcoal-rich deposit, possibly representing the floor level of one of the wall footings was also recorded. Both footings and the clay surface were sealed below the construction horizon of the former farm, the surviving remains of which included a third wall footing and cobbled surfacing. Some modern intrusion was recorded in the form of a service trench associated with the existing building. [Au(abr)]

Cobbald, T Sheffield : ARCUS, Report: 1098b.2(1) 2008, 29pp, colour pls, figs, tabs, refs

*Work undertaken by:* ARCUS

Two trenches were excavated, Trench 1 was placed to identify any remains of ancillary buildings associated with the corn mill. Trench 2 was placed to attempt to locate the wall which formed the southern limit of the original structure, as well as any surviving internal floor surfaces. A third trench was not excavated as the development proposal would have caused minimal disturbance to this area. Trench 1 identified two substantial sandstone structural elements, likely to have been associated with the mills ancillary buildings. Also identified in Trench 1 were a number of small cut features in an area which would have originally been outside the mill buildings. Trench 2 did not identify any structural elements associated with the mill, but did locate a stone-filled land drain which seemed likely to have predated the corn mill buildings. [Au(abr)]

Scurfield, C Royston : CS Archaeology, Report: 018 2008, 49pp, colour pls, figs, tabs, refs

*Work undertaken by:* CS Archaeology

An archaeological evaluation was carried out in the garden of Moat Hill Farm farmhouse, and consisted of six trenches designed to sample the archaeological potential of the proposed development area. The results were largely negative but a number of 19th/20th century features were revealed. These features included shallow pits/burials, post holes, a stone

lined drain and a curved shaped garden feature. There were no features or residual evidence to indicate activity within the proposed development area earlier than the 19th century. [Au(abr)]

Grassam, A Morley : Archaeological Services WYAS, Report: 1902 2008, 28pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Services WYAS

Archaeological investigations at the site revealed deposits and stone-built features [a wall and possible drain] of possible 17th to 18th century date. A slag-rich deposit was identified as bloomer slag, possibly indicating late medieval iron production in the vicinity. It was not possible to establish the form or function of the wall, although the drain may have been associated with a building shown on early 19th century maps of the area. [Au(adp)]

Jackson, R Sheffield : ARCUS, Report: 1198b.1[1] 2008, 42pp, colour pls, figs, tabs, refs

*Work undertaken by:* ARCUS

An evaluation of the surrounding environment of Hanson House, a complex of Grade II Listed Buildings thought to have originated in the 16th century, was carried out. Dendrochronological analysis of timbers from the buildings had provided dates of AD1455/6 for the barn and AD1448 for the house. The evaluation comprised a total of ten trenches evenly distributed around the site. Only two of the trenches, Trenches 5 and 8, revealed features of archaeological interest. Two separate ditch features were identified, one of which contained three sherds of medieval pottery. The size and profile of the ditches suggested they were contemporary. The evidence recovered to date suggested a limited amount of activity on the site in the medieval period, probably related to agricultural or domestic enclosures. [Au(abr)]

Tibbles, D Kingston upon Hull : Humber Field Archaeology, Report: 266 2008, 50pp, colour pls, figs, tabs, refs

*Work undertaken by:* Humber Field Archaeology

The proposal area lay on the eastern bank of the River Hull and had the potential to contain archaeological remains associated with defensive works constructed during the reign of Henry VIII, as well as structures relating to more recent shipbuilding and commerce. The evaluation found the foundation of the Henrician wall, running on a north-south alignment across the site, overlaying large chalk blocks and silt layers containing plant remains. These indicated standing water in the moat and the presence of waste ground or parkland in the vicinity. Following the slighting of the wall, the ground level was raised through the dumping of soils containing 18th and 19th century pottery. To the west, parts of the late 19th century Timber Dock were recorded, along with an iron retaining rod. No dockside buildings or structures were recorded. Parts of the first mill buildings on the site and their associated cobbled yard were recorded above the remains of the Timber Dock, themselves sealed below the reinforced concrete slab of the Clarence Mill surface. Grahame, R Hartlepool : Tees Archaeology, Report: TA08/10 2008, 23pp, figs, refs  
*Work undertaken by:* Tees Archaeology

Both sites were lowland locations in prominent positions and had previously been identified as sites of potential settlement due to the presence of lithic scatters. At Upleatham, the flint assemblage demonstrated occupation from at least the late Mesolithic and possibly early Mesolithic through to later prehistory. In addition, several features were identified, including a large ditch, probably an enclosure ditch, a pit and hearth. Pottery finds indicated they were likely to have dated to the Late Bronze Age or Pre-Roman Iron Age. At Goldborough, the shovel pitting produced a very mixed flint assemblage, but two ditches, probably enclosure ditches, were identified. Flint finds indicated that one of these dated to the Mesolithic or early Neolithic periods. [Au(abr)]

Clay, C Branston : Allen Archaeological Associates, Report: 2009/001 2008, 25pp, colour pls, figs, tabs, refs

*Work undertaken by:* Allen Archaeological Associates

An archaeological scheme of works was carried out on a site located in the historic core of the village. Earthworks on the site are believed to indicate the former medieval remnants of the settlement. The topographic survey encompassed the entire field that the site occupied a portion of, and recorded a large house platform on the south-west edge of the development area, with ridge and furrow earthworks running across the centre of the field and two large hollows at the south-west end of the survey area. A single evaluation trench was excavated, this exposed a sequence of medieval to post-medieval demolition dumps and soil horizons, as well as three undated post holes and an L-shaped linear likely to represent a wooden structure of relatively modern date. *Work undertaken by:* Pre-Construct Archaeology (Lincoln)

Five evaluation trenches were investigated, three targeted on anomalies identified by geophysical survey, and two situated to the east of this survey. For the most part, it was concluded that the majority of the site was archaeologically insignificant. However, three linear ditches and two small pits associated with Iron Age pottery were exposed in one trench towards the south of the investigation. There was a strong possibility that these features were associated with a linear boundary system that had been masked by overlying ridge and furrow, with which it appeared to share a common alignment. *Work undertaken by:* Archaeological Project Services

Archaeological remains dating to the Middle Saxon period were identified in the south-east corner of the proposed development site within Trench 6. The pottery dated to the 8th/early 9th centuries AD and were in comparatively good condition, which suggested it had undergone only limited re-deposition. Fragments of fired clay, some of which may have derived from moulds, together with quantities of animal bone, worked flint, glass, ceramic building material, mollusc shell, iron, burnt stone and lava-quern stone, pointed to middle Saxon activity on or just outside this particular part of the proposed development site. With the exception of a single ditch of possible late-12th or 14th century date within Trench 2, archaeological remains were either absent from the remainder of the evaluation trenches or limited to single isolated undated features within Trenches 3 and 8. *Work undertaken by:* Northern Archaeological Associates

The evaluation was based on an earlier geophysical survey, and found a limited number of archaeological features of Roman date concentrated on higher ground at the southern end of the field. A known Roman road passed from east to west across the south-eastern corner of the field, and six presumably successive parallel ditches were noted. Limited settlement activity was demonstrated by a hearth pit, a further pit and a ditch. No finds were recovered and it was thought that this may have predated the Roman road, and may have formed part of an Iron Age field system. No further remains were encountered in other parts of the site. [Au(abr)]

Buglass, J Northallerton : JB Archaeological Services, 2008, 30pp, pls, figs, tabs, refs  
*Work undertaken by:* JB Archaeological Services

Six evaluation trenches were excavated as part of development proposals for a Heritage Centre. At least seven unmarked graves were present within the development area, with the Lister vault located directly beneath their memorial monument. A total of c.16 graves were predicted within the development area. The evaluation also showed that at some time the majority of the area appeared to have been a small quarry, probably for the 1697 rebuild of the church, which has subsequently been backfilled with the quarry and stone working waste. This seemed to have limited the use of the area for burials until the 19th century. Although not part of the evaluation, local information led to the recording of the remains of four cross marked grave slabs within and around the church and cemetery. [Au(adp)]

**ALLERTON PARK QUARRY (NORTHERN EXTENSION)*****An Archaeological Evaluation at Allerton Park Quarry (Northern Extension), North Yorkshire***

Noakes, H & Town, M Alston : North Pennines Archaeology Ltd., Report: CP/680/08 2008, 50pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

A field evaluation was undertaken of the proposed Holly Bank Extension to Allerton Park Quarry. The previous works at the quarry included an open area excavation, carried out in to the south of the proposed extension area. This excavation found evidence of a Late Roman farmstead enclosure comprising two large ditched enclosures separated by a trackway, with further linear elements parallel to the east and west sides. The northern enclosure was demarcated by a substantial V-shaped ditch. Numerous internal features were recorded including pits, intercutting curvilinear and linear ditches, and post holes. On the basis of evidence from the excavation, it was suggested that the site represented a large late Roman native farmstead. Following on from the 2007 excavation a geophysical survey of the proposed extraction area was carried out. Results demonstrated that the archaeological activity uncovered during the 2007 excavation of the quarry, continued and extended over a large part of the southern and western parts of the proposed extension. However, the extent to which the identified anomalies provided an accurate indication of surviving sub surface archaeological features was not clear. As a result, an evaluation consisting of fifteen trenches and two test pits was undertaken in July 2008. Two of the geophysical anomalies previously identified were specifically targeted and tested, and a general coverage of "background" trenches were excavated to examine areas shown as negative or blank by the geophysical survey. In three of the trenches, no archaeological or modern features were observed. Modern or Victorian field drains, comprising of either ceramic pipes or compacted stone, were observed in other trenches. Extensive animal burrowing was also observed. Archaeological remains were encountered in five trenches. This comprised the terminus of an undated linear feature, four further undated linear features, a palaeochannel was uncovered. In Trench 14 a small linear feature was uncovered, the position of this feature correlated with a projected geophysical anomaly. No finds were obtained from this feature. In Trench 15, the archaeological evidence comprised a linear feature. No finds were recovered from it; however, it exhibited a V-shaped profile on the eastern side of the trench, which tentatively suggested a Roman date. The linear feature appeared to have been recut by a further ditch.

The evaluation at Allerton Park revealed that some well-preserved archaeological deposits existed in specific zones within the proposed extraction area, but large parts of the proposed extension were likely to be clear of archaeology. [Au(abr)]

Pritchard, H York : York Archaeological Trust, Report: 2008/54 2008, 29pp, colour pls, figs, tabs, refs, CD

*Work undertaken by:* York Archaeological Trust

An evaluation was carried out on the north-west side of Ripon Market Place to the rear of 82-86a North Street. The evaluation included a desk- top assessment and the excavation of three trenches. Trench 1 was excavated within a standing building and revealed natural deposits directly below a modern concrete floor. In the other two trenches the upper layers were a cobblestone yard surface sealing 19th and 20th century make up. Trench 2 contained a sequence of gravel/sand pits from the 12th /13th century followed by an episode of truncation and levelling and further post-medieval pits. Trench 3 produced some re-deposited medieval pottery and part of a stone lined post medieval well. [Au(abr)]

*Work undertaken by:* CS Archaeology

The evaluation was undertaken on land to the rear of 6 Westgate, Ripon. It consisted of two trenches which were designed to sample the archaeological potential of the proposed development area. The results were largely negative for medieval archaeology but a number of 19th/20th century features were revealed including structural remains which were reflected in historic maps and included a brick wall and associated cobbled surface. There were no features earlier than the 19th century, however two sherds of residual medieval pottery were recovered from archaeological contexts. [Au(abr)]

*Work undertaken by:* The Landscape Research Centre

The evaluation work included the excavation of nine trial trenches targeted on areas detected in a previous geophysical survey. Excavation demonstrated that all but two of the linear magnetic anomalies detected were natural in origin. The examination of two discrete anomalies, part of a group of similar features in the northern half of the development area, indicated that these features were post-medieval limestone quarry pits. The area nearest the southern boundary of the site produced evidence of localised and probably quite intensive prehistoric activity reflected by a dense distribution of worked flints concentrated in a deposit found in Trench 428AB. Liddell, T Alston : North Pennines Archaeology Ltd., 2008, 65pp, colour pls, figs, tabs, refs

*Work undertaken by:* North Pennines Archaeology Ltd.

An evaluation was carried out following an application for a residential development. Three trenches of the 66 excavated contained archaeological remains. Late prehistoric archaeological deposits and cuts were recorded in part of the site, associated with flint debitage that was interpreted as an area of limited activity. Part of an annular ditch, possibly an Iron Age roundhouse, was recorded in an area surrounded by other cuts and waste flint. The potential for similar remains in the immediate unevaluated vicinity was extremely high. Pottery found in sealed contexts dated to the immediate pre-Roman Iron Age. Environmental remains may have pointed to rope making or similar activities on the site, as reflected by certain plant fibres recovered. The presence of continued human activity on the site from the Mesolithic through to Iron Age was indicated from the site, and parts of the site were of archaeological importance where the deposits should be mitigated through excavation or in situ preservation. Highways Agency London : Highways Agency, 2009, 54pp, colour pls, figs, tabs, refs  
*Work undertaken by:* Highways Agency

Much of the fields and pasture along the line of the A453 had been modified since World War II and were part of a continually changing and evolving landscape. The only landscape evidence for earlier land patterns was an area of planned enclosure and some floodplain fields close to the River Soar that would be affected as well as some semi-regular fields around Barton Lane. The ridge and furrow identified by geophysical survey and cropmarks also hinted at earlier field patterns, but much of these lay away from the main road. However, the offline section at Mill Hill would be clearly visible from the open areas of Clifton Pasture

and Barton Lane and would have some impact on the setting of these unenclosed areas and the view of them from Mill Hill. Both of the identified Park and Gardens lay well away from the road. The Conservation Area at Thrumpton would only be very slightly affected; however, the Conservation Area at Clifton would be more severely impacted by the works. The designated Clifton Village Green would be avoided by the works. [Au(abr)]

Several late Neolithic or Early Bronze Age flints were recovered from the west of the development area. A high density of largely undated archaeological remains were noted in the centre of the development area. These included ditches, pits and post holes. One group of three post holes may have represented a four posted structure of Bronze or Iron Age date. An earlier subdivision of the landscape, probably post-medieval in date was identified in the form of several parallel ditches, aligned perpendicular to the modern road. A small palaeochannel was recorded running through the development area. Several undated ditches were recorded over the rest of the development area. [Au(abr)]

Carrow Road football stadium lay 300m to the west with Norwich Railway Station situated 600m to the north-west. Railway sidings from the station loop around the eastern edge of the application area, immediately adjacent to the rear of the Gothic Works building. A cluster of terraced housing stands immediately to the north-west around Hardy Road, Cozens Road and Kerrison Road whilst other industrial units and related car parking areas are located to the west. Of principal interest were the archaeological excavations and observations undertaken in and around the Riverside development (NHER 1540 and 26476) and Carrow Road Football Stadium (NHER 26602). At the Riverside development, archaeological observations found peat deposits flanking the modern river to a depth of 3 metres. Analysis suggested that these had developed from the Mesolithic period onwards as a result of agricultural clearing of former woodland. Undiagnostic worked flints, Bronze Age urn fragments and Roman and medieval pottery sherds were found within the deposits. [Au(adp)]

*Work undertaken by:* GVA GRIMLEY

Although there were no statutory or non-statutory designations within Bentley Priory, as an historically important site there was potential for archaeological features of interest. A desk-based assessment was undertaken of the known and potential archaeological resources on site. In addition, a recent phase of investigation work on site was subject to monitoring. No archaeological features were detected during the watching brief. However, the potential for disturbance or loss of previously unknown buried archaeological remained during remediation and construction phases and no level of significant effect could be determined at this stage. It was agreed that a programme of intrusive and non-intrusive archaeological evaluation would be undertaken as a condition of planning permission. [Au(adp)]

Waterman Environmental London : Waterman Environmental, 2008, 16pp, colour pls, figs, tabs, refs, CD

*Work undertaken by:* Waterman Environmental

The site did not contain any archaeological resources designated as being of national importance, such as Scheduled Monuments, registered battlefields, or parks or gardens of special historic interest. The Grade II Listed White House [formerly known as Lowlands Villa], an early Regency villa, lay in the middle of the site. Impacts to any subsurface or surface archaeology would occur at the demolition and construction phase. Although the White House would be retained within the development, the undesignated original school building would be demolished. This structure was of local architectural and historic interest and therefore its loss would rate as a minor adverse impact. Additionally, construction would lead to the replacement of open space located within the western part of the site, which was designated as part of a Conservation Area, by a new building. The potential adverse impacts on archaeology would be mitigated through a programme of archaeological monitoring and recording. The impact on the Conservation Area through the loss of the Lowland Recreation

Ground within the Site would be partly mitigated through the provision of alternative public space within the Development, and the creation of enhanced green open space in the southern part of the site bordering Lowlands Road. [Au(abr)]

The built environment of the site did not contain any buildings of significance either listed or noted. Of the two factories built in the 1950s one survived partially extended on the western side of the site. The development would potentially affect sub-ground archaeological remains contained within the peat and organic clay deposits. These represented the gravel terrace at the edge of the Thames floodplain and the area beyond which, at points in prehistory was shoreline wetland. This latter area was rich in resources which prehistoric peoples may have exploited. [Au(adp)]

*Work undertaken by:* Nathaniel Lichfield and Partners

An assessment was carried out to establish the potential for archaeological remains that may be affected by the development. There was extensive evidence for the occupation of the area around the site in the later prehistoric and Roman period, but there was no direct evidence for occupation within the site itself. Medieval ridge and furrow was present over the existing cricket ground, and fields to the north of the site. The site was not developed in the post-medieval period, however, part of it was developed as a sports ground in the 20th century. Previously undiscovered archaeological remains may have been impacted by groundworks relating to the development. Geophysical, earthwork surveys and a programme of archaeological trial trenching was recommended. [Au(abr)]

#### ***Kirkharle Wind Farm. Volume 1 Non- technical Summary***

Ove Arup & Partners Ltd Solihull : Ove Arup & Partners Ltd, 2008, 16pp, colour pls, figs, tabs, refs

*Work undertaken by:* Ove Arup & Partners Ltd

A number of features of local archaeological importance, were found within the site, although none of these would be affected by the proposed turbine locations. While there remained some potential for construction to affect unknown buried remains, the potential for the site to host remains of national or regional importance was considered low. The area surrounding the wind farm area was rich in archaeological and cultural heritage resources, although the visual effect of the wind farm was not expected to result in any significant effects on these. None of the nine Scheduled Ancient Monuments within 2 km of the site would be significantly affected. The wind farm was expected to significantly affect Kirkharle Hall, a Grade II Registered Park and Garden which lay 2.3 km from the site. The wind farm's proximity with Kirkharle Hall would cause it to be visible from the Hall, and therefore affect views from the setting of the Hall. Of the four Conservation Areas within 5 km of the proposed wind farm, only Great Bavington Conservation Area was expected to be significantly affected, while the wind farm at Kirkheaton was already visible from the Conservation Area, the proposed turbines would constitute an extensive change in the Conservation Area's setting. The Church of St. Aiden at Thockrington was a Grade II Listed Building and the only Listed Building that was expected to be significantly affected by the scheme. Although it was located over 3 km from the nearest turbine, the church occupied a prominent elevated position, and was a prominent local feature. The Church of St. Aidan and Great Bavington Conservation Area were considered to receive potentially significant impacts upon their setting. Mitigation for visual effects on cultural heritage and archaeological resources was considered and the reduction from an initial 50MW scheme to the proposed eight turbine scheme. The eight turbines had further been located to reduce the probability of direct effects on buried archaeological remains through situating turbines away from concentrations of known features. However, it was possible that unknown features may be present and could be affected and implementation of an agreed programme of archaeological work before and during construction would result in the preservation by record of any remains present. *Work undertaken by:* WBB Minerals

The study area lay within a landscape that retained evidence relating to prehistoric, Roman and medieval periods. This evidence consisted largely of isolated stray finds, including stone tools and burials. Most of this seemed to be concentrated to the north and east of the proposed development and beyond the site boundary. The most significant settlement evidence related to Roman occupation, and comprised the possible Roman fort at Bent Farm, outside the proposed extension site. This was a Scheduled Ancient Monument, and although little excavation had taken place, evidence for substantial enclosure ditches and internal structures had been found. The study area also contained several Listed Buildings and a Conservation Area at Newbold Astbury, but none of these would be affected by the proposed extraction site. If required, suitable mitigation measures would be implemented to protect the archaeological resource. [Au(abr)]

*Work undertaken by:* WSP Environmental Ltd.

The site lay by the River Irwell below the Cathedral Church of St. Mary, although the Cathedral did not form part of the application site. The high ground and naturally defensible position led to speculation about late prehistoric settlement at this location, although there was no firm evidence for this and the first major phase of recorded settlement near to the site was in the medieval period following the Norman Conquest. At this time a church, a market and annual fair were established. The sites first land use was as burgage plots, over time, buildings grew up along the lines of the original plots and housed mixed- use manufacturing and commercial premises into the early 20th century. There was a low archaeological potential for remains of prehistoric date. Romano-British and Anglo-Saxon remains were also not expected to be found. There was the possibility that isolated pockets of medieval, through to industrial remains may be found preserved beneath the site. This was likely to be the foundations of earlier buildings which stood in this area. This would be of low (local) to moderate (regional) importance if present. These pockets were likely to be concentrated along the waterfront of the River Irwell and in the south-east of the site. A scheme of archaeological investigation was therefore required during key construction activities along with recording if archaeological remains were discovered. [Au(abr)]

A rapid archaeological desk-based assessment and walkover survey was conducted along the pipeline route, incorporating a 250m corridor either side of the proposed alignment. The assessment identified that the proposed pipeline route did not affect any Scheduled Ancient Monuments, Listed Buildings or Conservation Areas, additionally there are no recorded Battlefields in the area. However, it was established there was one registered Historic Park and Garden (Knowsley Hall), which is in relatively close proximity to the east of the proposed pipeline route. The desk-based assessment did not identify any regionally important sites within the study corridor and the archaeological potential of the proposed pipeline route was found to be minimal. [Au(abr)]

The proposed eastern breakwater would impact any archaeology within and directly below the alluvial clay for an area of 27.5m x 495m. The western breakwater would impact any archaeology within the upper reaches of the alluvial clay within a 30m wide and 470m long swath. There was the potential for the presence of maritime remains and stratified finds of prehistoric and through to later periods. There was a potential for Roman, Saxon and medieval salt working sites within the eastern end of the East Breakwater. A "Boat Graveyard" was the only site of interest observed in a walkover survey. A low bank, which was part of the boundary or park pale of Cobham Park, was historically an integral part of the park, but it was already substantially damaged. A ditch and mound in the park was a designated Scheduled Ancient Monument. Brewers Gate, the original north entrance to the park was demolished in 1980 and no traces survived. Dickens Chalet which was located in the park had already been relocated to Rochester. An excavation of a section of the bank was to be undertaken before the construction began as a mitigation measure. This was to record the banks profile, structure and dateable evidence. The only impacts of known archaeology was in this study area. A 20m section of bank was to be lost, but was of low archaeological potential and the impact was said to be slight. No other archaeology was thought to be affected. [Au(adp)]

Edwards, J Cheltenham : Corylus Planning & Environmental Ltd., 2008, 31pp, colour pls, figs, tabs, refs

*Work undertaken by:* Corylus Planning & Environmental Ltd.

An Environmental Impact Assessment was carried out at Stonehenge Farm. Archaeological evaluations through machine-dug trenches had been carried out in or near the development area in 1988, 1992 and 2004. The proposed extraction site lay in an area of known archaeological remains. These had been recognised mainly as cropmarks, and the most significant [Scheduled Monument] was believed to represent the remains of a Roman settlement with origins in the Iron Age. The assessment identified eight cultural heritage receptors upon which the proposed development may have had an impact. Effects varied, with the greatest impact due to direct removal of features in advance of gravel extraction. In considering cumulative effects, the assessment noted that the potential of the cultural heritage resource in this case was not exceptional. In addition, the investigation and recording of the archaeological remains which would occur in association with the proposed

development would contribute to existing knowledge of settlement in the area. Mitigation proposals relating to buried archaeological remains and Scheduled Monument Consent, were to be implemented as part of the development process. [Au(abr)]

RPS Consultants London : RPS Consultants, 2008, 26pp, colour pls, figs, tabs, refs

*Work undertaken by:* RPS Consultants

An Environmental Impact Assessment was carried out in response for proposals to redevelop the former Tropicana Pool at Weston-super-Mare into a new leisure destination. The proposed scheme entailed the complete development of the site, with clearance and removal of much of the existing Tropicana structure, to be replaced with a steel, concrete, glass and wood structure that contains a water park, cinema, bowling alley, hotel, and various retail outlets. It will provide lower ground parking, and would be built on around 950 piles. Due to the proximity of a Listed Building [shelter] to the immediate north of the Tropicana site, it was proposed that this structure would be dismantled and re-located along the sea defence some distance to the south of the Tropicana. The assessment made a number of recommendations

in order to avoid, minimise, or offset any significant adverse impacts on the historic environment. These included ensuring the Listed shelter was relocated appropriately and sensitively, and that boreholes were undertaken to sample the peat deposit underneath the site, and analysis undertaken of the peat to provide archaeological and palaeoenvironmental information with respect to the study area. Hanson Maidenhead : Hanson, 2008, 60pp, colour pls, figs, tabs, refs

*Work undertaken by:* Hanson

On the basis of available evidence, the application area was assumed to have a low potential for the recovery of archaeological remains. The SMR did not record any archaeological sites or historic landscape features within the boundaries of the application area. Prehistoric evidence was present within the wider region, but was slight. The skeletons of four mammoths dating to c.13,000 BP were excavated from an organic-rich environment on the existing quarry, but were not associated with any artefacts. A Neolithic settlement was recorded at Sharpstone Hill, c.1.5km to the north of the proposed extension and the ploughed-down remains of a Bronze Age burial barrow was recorded in a field to the west of Bayston Farm. Two Iron Age hillforts were also recorded within 1 km of the site, although it was possible that the earthworks recorded to the east of Bomere Pool were of geological

origin. Within the wider landscape there were a number of records of Roman and Saxon activity. The proposed extension lay adjacent to the Domesday Manor of Begestan, which was believed to be the site of the extant Bayston Farm. The evaluation of Condover Quarry undertaken in 1996 stated that "it was possible that ploughed-flat settlement traces might be expected to survive to the south of the present farm", but no evidence for this is recorded. Cartographic regression of the application area showed that it had changed little over the centuries. Aside from the creation of the quarry the surrounding landscape appeared almost unchanged since the mid 19th century. It was considered that the archaeological potential of the site could be adequately mitigated for by the implementation of an archaeological watching brief at the commencement of soil stripping operations. Baker, S & Tinsley, A Sheffield : ARCUS, Report: 1085c.1(1) 2008, 26pp, colour pls, figs, tabs, refs

*Work undertaken by:* ARCUS

A watching brief was carried out during re-landscaping works at Cathedral Green. The work focused on excavations for the fulcrum mechanism of a new swing bridge, as well as the cutting back of the river bank to house the bridge in the closed position. The fulcrum was situated at the southern end of the former island in the River Derwent, formerly housing the doubling shop of John Lombe's silk mill from the 1720s onwards. The raised southern end of

the island proved to have been much disturbed during construction of the early 20th century power station on the site, with deep tanks associated with water intake and outflow to the River Derwent. Footings of the extreme southern end of the doubling shop were identified in the baulk of the edge of excavation just to the south of this zone of disturbance. Further to the north, beyond the zone of deep tanking, a further portion of the doubling shop survived, preserved just above ground level across its entire width. The brick wall footings of the building proved to have been laid on wooden sleeper foundations, with wooden piles beneath driven into the river silts. A section of internal brick floor also survived. The northern end of the building had, however, been totally destroyed during the 20th century building and landscaping. Human remains [minimum of two individuals] recovered on the site following completion of the watching brief were probably derived from a nearby burial ground. The burial ground may have been associated with the former almshouses fronting Full Street, or with All Saints' [now Derby Cathedral] and St. Michael's Parish Churches located in the vicinity of the site. The remains were most likely disturbed during the insertion of an iron pipe thought to relate to the construction of an extension to the electricity power station in the early 1900s. [Au(abr)]

Edgeworth, M, Cuttler, R, Bishop, E, Ratkal, R, Tetlow, E & Geary, G : Edgbaston  
 Birmingham Archaeology, 2008, 38pp, colour pls, figs, tabs, refs  
*Work undertaken by:* Birmingham Archaeology

In 2006 an archaeological evaluation by means of topographic survey, trial trenching and environmental sampling was carried out at Hall Lane, Staveley. The site was located between the east bank of the River Rother and the former Chesterfield Canal and contained at least two ponds with associated earthworks. A total of six trial trenches were excavated and an environmental auger survey was carried out. One cut archaeological feature, in the form of a small gully, was revealed and no finds were recovered. However, profiles of alluvial deposits were obtained which were more extensive than initially envisaged, perhaps indicating the presence of a large palaeochannel. Alluvial deposits recorded in one trench designed to investigate a possible third pond, to the south, probably represented the fill of the former palaeochannel rather than a pond. The other two ponds appeared to be located within the course of this earlier undated palaeochannel and were shown to be earlier in date than the construction of the canal embankment in the 1770s, but their precise date and function remained uncertain. It was not certain that the ponds were used for rearing fish, although this remained a strong possibility. Other possible functions suggested use as retting ponds for processing hemp or flax, but this appeared to have been ruled out by the results of environmental analysis which found little direct evidence of human activity and suggested there had been a complex floodplain evolution at the site. During 2007 an archaeological watching brief monitored the contractors groundworks at the northern part of the site in the area of two of the ponds. Due to the waterlogged conditions it was too hazardous to fully excavate the area. No archaeological finds were recovered from any of the deposits. A stone culvert, probably associated with the canal, was discovered running into one of the ponds. In 2008 a further watching brief was carried out at the north-eastern part of the site to record the former Chesterfield Canal and any associated remains. The course of the canal was recorded and a section was excavated. [Au(abr)]

Marshall, B Bakewell : Archaeological Research Services, Report: 2008/47 2008, 13pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Research Services

A watching brief was carried out at Robin Hood's Stoop, Callow Bank, Hathersage. The monitoring was carried out during ground works undertaken for the realignment of the wayside cross known as Robin Hood's Stoop, which due to ground erosion was tilting downslope. The cross was interpreted to be of 17th century or earlier date. The cross and its base were carefully lifted away from the area using slings, enabling access to the ground below. An archaeologist excavated an area of 1m<sup>2</sup>, then levelled the ground and laid a base before the repositioning of the cross and its base. A 1m high fence was erected to form a perimeter around the cross of 2m square. The area surrounding the cross was then turfled. No features of archaeological significance or buried land surfaces were revealed. [Au(abr)]

Brightman, J Bakewell : Archaeological Research Services, Report: 2008/15 2008, 77pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Research Services

An archaeological excavation was carried out at Dale View Quarry. Prehistoric lithics and a single tiny prehistoric pottery sherd indicated periods of occupation during the Mesolithic and the Neolithic, with the Neolithic material perhaps representing an area of settlement within the vicinity of the site. The principal discovery on the site was a post built structure with associated hearths. Radiocarbon dating placed the structure in the 6th-7th centuries AD, a time at which the Peak District may well have been a Brittonic or Anglo-Brittonic kingdom separate from the Kingdom of Mercia. This was the first scientifically dated post built structure belonging to this period in this region. Analysis of the form of the structure, alongside the palaeoenvironmental evidence will add important data to the understanding of the early medieval period in this area. However, there were no artefacts dating to this period found on the site which meant it was not possible to ascertain the cultural affiliation of its occupants. Two Early Bronze Age dates were also obtained from within a post hole belonging to the early medieval structure and these were evidently dates on residual material from pre-existing Early Bronze Age activity on the site. The construction of the early medieval structure appeared to have disturbed earlier deposits that included Mesolithic, Neolithic and Early Bronze Age material and hence the inclusion of some of this material within the post hole fills. Jackson, R Sheffield : ARCUS, Report: 1078b.2(1) 2008, 19pp, colour pls, figs, tabs, refs  
*Work undertaken by:* ARCUS

An archaeological watching brief was undertaken during the excavation of a pipeline trench from Peak Forest to Sparrowpit. As much of the pipeline was to be instated along the route of the A623, archaeological monitoring was only required on the final section of the route, where the pipeline crossed fields between the A623 and Sparrowpit. A previous desk-based assessment in 2007 had already established the potential for impact upon buried archaeological features in this area. The archaeology in this case comprised lead-workings

and associated features. No impact was made upon these features during the monitored excavations. [Au(abr)]

**THE RIDING SCHOOL, CALKE ABBEY*****Archaeological Watching Brief: The Riding School, Calke Abbey, Derbyshire***

Allen, M Branston : Allen Archaeological Associates, 2008, 1p

*Work undertaken by:* Allen Archaeological Associates

The watching brief identified a layer of refuse that was likely to have formed to the rear of the Riding School in the 18th & 19th centuries, prior to the construction of a piggery that was shown on maps dated to 1857. The works also exposed evidence to suggest the ground was terraced in advance of the construction of the school in the late 1760s. Most unusually, a Roman brooch of late 1st to early 2nd century AD was recovered from the post-medieval refuse layer. This brooch, which was possibly an accidental discard, or from disturbance caused through the terracing, was the first possible evidence for Roman activity on the estate. [Au(abr)]

Cramp, R Stoke-on-Trent : Stoke-on-Trent Archaeology, Report: 236 2008, 44pp, colour pls, figs, tabs, refs

*Work undertaken by:* Stoke-on-Trent Archaeology

A desk-based assessment of the site, known as "Ten Acre Field", highlighted the possibility of significant river terrace archaeology, mostly prehistoric in character. The site had probably lain in a zone of unimproved agricultural land since the medieval period and the historic map evidence indicated that its boundaries had remained unaltered since c. 1840. Although the original design of the development had been modified to mitigate its effect on the site's potential archaeology, it remained possible that groundworks might impact upon surviving features. Five areas were stripped by machine, four of which represented the foundation footprints for buildings, while the fifth was the site of a lake. One trench [Trench 1] was believed to intersect a possible Iron Age pit alignment. Although no evidence for this monument was encountered, it was observed that a natural sedimentary transition across the trench closely matched the same bearing as the feature. An ephemeral linear feature was revealed in Trench 2 close to a possible rectilinear enclosure, although not obviously related to it. [Au(abr)]

Brightman, J Bakewell : Archaeological Research Services, Report: 2008/43 2008, 147pp, colour pls, figs, tabs, refs, index

*Work undertaken by:* Archaeological Research Services

An archaeological excavation was conducted on selected areas at the site of the Mercia Marina development. The investigation took the form of strip, map and sample, involving the topsoil stripping of three areas. Archaeological remains were excavated dating from most periods of prehistory including, possible late upper Palaeolithic stone tools recovered from the glacial sands and gravels, which form the first natural substratum on the site. Mesolithic flints and a possible Mesolithic pit feature. Early Neolithic "midden pits" that contained Carinated bowl ceramics, and a small amount of Impressed Ware ceramics. Early Bronze Age funerary monuments in the form of two ring ditches, one of which was closely associated with two cremation pits. Early Bronze Age structural remains comprising four discrete post-built structures. Middle-Late Bronze Age pit containing ceramics. Later prehistoric linear boundary features of probable Iron Age date. Detailed analysis of the pottery and lithic assemblages has provided information relating to the changing character and use of this site over the millennia, whilst analysis of the pollen remains and botanical macrofossils has shed light on its environmental history. The palaeoenvironmental evidence suggests that during the Bronze Age, the site was part of a riverine landscape with stands of deciduous trees and pools of standing water in which both arable agriculture and herding of domestic animals took place. A comprehensive programme of radiocarbon dating has helped unravel the chronology of the

various remains on the site and one of the more interesting outcomes has been the observation that the Early Bronze Age funerary remains appear to be contemporary with the adjacent structural remains which could relate to contemporary settlement or perhaps structures relating to the funerary process. The archaeological features and small finds from the site add important new information to the wider story of prehistory both in the Trent Valley and the wider region. [Au(abr)]

Richards, G Leicester : University of Leicester Archaeological Services, 2008, 22pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Leicester Archaeological Services

An archaeological standing building survey prior to repair and resurfacing work and a watching brief were undertaken during the subsequent work on the King William Bridge. The bridge appeared to date from the late-17th Century and was mainly rubble built with two rounded arches. The bridge had been widened on the downstream (Northern face), using brick. This widening was widely accepted to have taken place for the visit of King William III in 1696. As expected there had been extensive maintenance and repair making identification of phases and rebuilding difficult. There was, however, the possibility that some of the cobbled surface was original. The watching brief was limited to visual examination of the parapets after the old cement was raked out. No intrusive work on the deck was carried out. [Au(abr)]

*Work undertaken by:* University of Leicester Archaeological Services

A watching brief was undertaken in February 2008. The site lay within the medieval town core of Hinckley with a number of isolated prehistoric and Roman archaeological sites also being noted nearby. In view of this the site was considered to have some potential for surviving archaeological deposits. After the demolition of the 1960s building, with underground car park, only a small area of undisturbed natural substrate remained along with a brick-lined late-19th or early 20th century well. No archaeological features or deposits were observed within this undisturbed area or anywhere within the site. [Au(abr)]

Hunt, L Leicester : University of Leicester Archaeological Services, Report: 2008-057 2008, 17pp, colour pls, figs, tabs, refs

*Work undertaken by:* University of Leicester Archaeological Services

An archaeological watching brief was carried out during groundwork at Derby Road, Ashby-de-la-Zouch. The site was seen to have some potential for medieval and post-medieval archaeological remains due to its location close to the centre of Ashby. By the time of the watching brief the building that had occupied the site had been demolished. The reduction of soils down to the appropriate levels was observed. Only the southern part of the site was stripped as the northern part lay on a slightly lower level. No archaeological features or finds were discovered during the groundwork. [Au(abr)]

*Work undertaken by:* Benchmark Archaeology

A watching brief was carried out during soil stripping and groundworks associated with the erection of a new dwelling on the site. The application site had been identified as an area of archaeological potential. Archaeological monitoring consisted of the observation of ground reduction to formation level and foundation trenching. It appeared that much of the site had been cleared of former topsoil and subsoil deposits and then levelled in preparation for the former garage on the site. No features or deposits of archaeological significance were identified and no finds were recovered. [Au(abr)]

*Work undertaken by:* Allen Archaeological Associates

A survey of the cottage, carried out prior to its demolition, revealed tumbled brickwork at the western gable that was typical of 19th century brick cottages found in the county. Old jointing scars in the large timbers used in the roof construction indicated that they were re-used materials sourced from a much larger building. The watching brief encountered a sequence of levelling deposits that formed a slightly raised platform for the construction of a 19th century cottage. A single pit filled by domestic kitchen waste was dated to the 19th/20th centuries by a stoneware jar. [Au(abr)]

Clay, C Branston : Allen Archaeological Associates, Report: 2008/036 2008, 13pp, colour pls, figs, refs

*Work undertaken by:* Allen Archaeological Associates

An archaeological watching brief was undertaken during the groundworks for a residential development on land at Mawers Yard in Kidgate, Louth. There was limited evidence of later prehistoric and Roman activity around Louth. The town developed as an important religious centre in the Anglo-Saxon period, and became a prosperous market town in the medieval period, largely thanks to its involvement in the wool trade. The site is situated within the historic core of the town. The watching brief identified a modern demolition layer sealing a

possible colluvial deposit, which produced a single sherd of medieval pottery. Further monitoring was not undertaken following a change in the foundation design to a piling methodology. [Au(abr)]

Nugent, M Sleaford : Archaeological Project Services, Report: 27/08 2008, 25pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Project Services

The investigation revealed differences in the height of the surface bedrock, possibly due to quarrying. Substantial dumped deposits of medieval date were recorded. These were probable make-up deposits, however, a localised dump of medieval roof tile may have indicated the presence of former structures for this period. A further dumped deposit, perhaps indicating modern levelling, was also recorded. A moderate quantity of medieval and post-medieval artefacts was recovered. [Au(adp)]

Tann, G Lincoln : Lindsey Archaeological Services, Report: 1046 2008, 23pp, colour pls, figs, tabs, refs

*Work undertaken by:* Lindsey Archaeological Services

The watching brief identified the remains of a north-south oriented stone foundation, thought to represent a field boundary wall removed when houses were built in the 19th century. The wall may have been contemporary with the southern property boundary wall, also constructed of stone and appearing on the line of a pre-1842 field boundary. Although close to the site of the St. Peter and Fontem Church, no evidence for any burials were found. Infrequent redeposited sherds of medieval and post-medieval pottery, and one sherd of Roman pottery, were found in deposits of mixed soil horizons containing slate and brick rubble inclusions. [Au(abr)]

Dailley, M &amp; Clay, C Branston : Allen Archaeological Associates, Report: 2008/062 2008, 27pp, colour pls, figs, tabs, refs

*Work undertaken by:* Allen Archaeological Associates

A watching brief was undertaken during groundworks for a residential development at Mill Lane. The site was situated in a suburb of the Roman and medieval city that extended southwards along the line of the former Roman road, approximate to the modern High Street. A previous evaluation of the site identified Roman, Saxo-Norman and medieval deposits, as well as the foundation of an early 19th century brick windmill and later Victorian cottages. The phase of work confirmed the results of the previous evaluation. A soil horizon of Roman date was identified, sealed by a probable late Roman or post-Roman flood horizon, which was in turn overlain by a deep soil. Previous investigations in the surrounding area had shown that this layer appeared to have formed during the late Saxon and medieval periods. This deposit was cut by a number of probable quarry pits and sealed by a recent garden soil. The remains of the brick foundations of the 19th century mill were also identified, as well as the foundations and two probable chimney stacks from late-19th century cottages that post-dated the mill. [Au(abr)]

Bradley-Lovekin, T      Sleaford : Archaeological Project Services, Report: 108/08 2008, 36pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Project Services

An evaluation and watching brief were carried out at the site. Evaluation trenches revealed a stratified sequence of buried soils, occupation deposits, floor surfaces/industrial working areas, and pits of 2nd-4th century Roman date. An extensive sequence of exterior yard or road surfaces was also recorded, maintained in parts until at least the 13th or 14th centuries and possibly of Roman or earlier origin. Further features of post-medieval date were recorded. The watching brief enhanced the understanding of the remains encountered during the evaluation and produced further evidence of wall footings and occupation deposits, demonstrating that the surfaces identified on the western side of the site during the evaluation were laid down in two distinct phases. A large disturbance in the south-eastern corner of the site was thought to represent a known quarry, shown on a map of 1842. [Au(abr)]

*Work undertaken by:* Allen Archaeological Associates

An archaeological watching brief was undertaken during the excavation of four geotechnical test pits in advance of the construction of a new car park and visitor reception building on Spring Meadow. Artefactual evidence shows activity from the prehistoric to Anglo-Saxon periods in the vicinity of Belton House. The estate itself was constructed between 1684 and 1688. Four test pits were excavated in the proposed development area, the locations of which were based on the results of a preceding geophysical survey. No archaeological features or deposits of significance were observed during the groundworks, and no finds were recovered. [Au(abr)]

**TAR LANE POND, BELTON HOUSE, BELTON,**  
***Report on an Archaeological Scheme of Works. Tar Lane Pond, Belton House, Belton, Lincolnshire***

Daley, M Branston : Allen Archaeological Associates, Report: 2008/048 2008, 15pp, colour pls, figs, tabs, refs

*Work undertaken by:* Allen Archaeological Associates

An archaeological scheme of works was undertaken to record an 18th century overflow structure and culvert at Tar Lane Pond in Belton Park. The work was carried out in advance of a scheme of consolidation necessary to repair damage caused by water erosion upon the structure. This work provided an assessment of the condition of the overflow structure and the preservation of its current status by record. The remains of the overspill sluice were typical of 18th century water management in the East Midlands. The overspill device, in contrast to the use of manually operated sluice gates, reduced the need for monitoring of the water levels and the loss of fish when the water levels were reduced. The raising of fish for the household was likely to have been a primary function of the ponds prior to their incorporation into a planned woodland garden. This was perhaps demonstrated by their labelling as fish ponds on Cust's estate plan of 1800. The assessment and recording of the overspill sluice demonstrated that its structural integrity had been severely compromised by the effects of water erosion. Much of the western overspill structure had been severely undermined and the culvert and tail race beds were all but destroyed. 19th century attempts to consolidate the tail race were also clearly inadequate and had succumbed to the considerable forces generated by the outflow. ***Archaeological Assessment of St. Peter and Paul's Church, Bourne, Lincolnshire***

Cope-Faulkner, P Sleaford : Archaeological Project Services, Report: 70/08 2008, 11pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Project Services

The assessment established that the external area of the north-west corner of the church was original, and represented the south wall of the access to the medieval cloister. The interior of the church showed signs of having been replaced, either during the 1883 restoration of the west tower or the insertion of heating pipes in 1892. Mitigation, in the form of archaeological monitoring, was likely to be required. [Au(adp)]

*Work undertaken by:* Lindsey Archaeological Services

Excavation of a French drain around the tower revealed substantial foundations, especially at the south-west angle. It was thought that these were to support the internal stair at this corner of the tower. Foundations for the south porch were revealed in the drainage trench as were the foundations for the east wall of the south aisle. The disturbed remains of a burial were uncovered north-east of the vestry. These must have been previously disturbed when an

earlier drain was installed, probably when the vestry was constructed. No other finds were made. [Au(adp)]

*Work undertaken by:* Cambridge Archaeological Unit

The excavation at Glebe covered approximately 3/4 of the 5.06ha site, with the remainder to be excavated at a later date. The excavation revealed field systems of Middle Bronze Age date, in addition to pits, wells and post holes with complimentary domestic debris. The remains of a ring ditch with an inhumation, a trackway and an enclosed settlement provided an insight into the community of the Bronze Age people and placed the site in context with the surrounding landscape. Dailey, M          Branston : Allen Archaeological Associates, Report: 2008/041 2008, 18pp, colour pls, figs, tabs, refs

*Work undertaken by:* Allen Archaeological Associates

A watching brief was carried out during groundworks for the construction of a single dwelling. The village of Hanthorpe was documented as an outlying settlement of Morton to the east, and was probably founded in the late Anglo-Saxon period. Aerial survey of the area had demonstrated that the medieval precursor to the modern village was much larger, having shrunk in size probably as a consequence of the Black Death and changes in agricultural practices during the later Middle Ages. The archaeological monitoring recorded a drainage ditch that contained a small assemblage of animal bone and 13th/14th century pottery. An adjacent undated pit was also recorded. [Au(abr)]

*Work undertaken by:* Allen Archaeological Associates

An archaeological scheme of works was undertaken during groundworks on land to the rear of 87 High Street, Scotter. The site was located within an area that had yielded significant evidence from the surrounding landscape for agriculture and settlement from the prehistoric to the medieval period. The discovery of Anglian burials within 200m of the current site attested to settlement during the Anglo-Saxon period and the site was known to be located within the core of the medieval settlement. No archaeologically significant finds or features were encountered during the scheme of works, beyond a number of tree bowls that were probably associated with the former use of the site for the growing of apple trees. Cope-Faulkner, P Sleaford : Archaeological Project Services, Report: 60/08 2008, 55pp, colour pls, figs, tabs, refs

*Work undertaken by:* Archaeological Project Services

The excavation and watching brief revealed a short length of Roman ditch, as well as ditches, pits, gullies and a well that dated to the Late Saxon period. One of the ditches may have formed part of an enclosure, and may have been associated with Late Saxon buildings known from previous evaluations to the south. The pits contained domestic refuse that indicated close proximity of settlement, although no structural remains were encountered. Medieval ditches and gullies indicated little change in economy through to this period. A significant assemblage of pottery was recovered, with a concentration of pottery of 9th-11th century date. Fragments of quern stone, glass, metalwork and clay pipe were also retrieved, as well as an animal bone assemblage that demonstrated that cattle and sheep/goat were the principle livestock. Processing of environmental samples recovered cereal grains, although no evidence for crop processing was identified. [Au(adp)]
