Ainsworth, A. Oxford : JMHS, Report: 1926 2008, A4 format

Work undertaken by: JMHS

"John Moore Heritage Services conducted an archaeological evaluation of school playing fields to the west of Garth Hill School, Bracknell on the 7th-10th April 2008. Berkshire Archaeology, the archaeological advisory body to Bracknell Forest Borough Council, called for an archaeological evaluation in order to make an informed decision on the planning application for a proposed redevelopment. CgMs Consulting commissioned the evaluation on behalf of their client Garth Hill OSP. Four trenches, totalling 150 metres in length, were excavated to the natural geology. Archaeological deposits were limited to mid-20th Century school playing field landscaping and drainage features for Garth Hill School." [OASIS]

Stevens, S, Butler, C & Barber, L Portslade : Archaeology South-East, Report: 2008186 2008, 32pp, figs, tabs

Work undertaken by: Archaeology South-East

A programme of field walking was undertaken at the site in late September and early October 2008. Flintwork [including finished tools as well as debitage] was widespread across the site. There was also a thin scatter of fire cracked flint. A small quantity of medieval pottery and tile was also recovered, and there were larger assemblages of post-medieval material, including pottery, tile and a small amount of glass and metalwork. A systematic metal detector survey of the site did not produce any significant finds. [Au(abr)]

Havard, T Cirencester : Cotswold Archaeology, Report: 08094 2008, 16pp, colour pls, figs, tabs, refs

Work undertaken by: Cotswold Archaeology

The evaluation recorded two probable shallow clay extraction pits, one having been deliberately backfilled. A robbed foundation trench corresponding with a former boundary was identified towards the south-eastern corner of the site. An area of stake holes was thought likely to represent an undated boundary. Possible land boundaries identified from aerial photographs were shown to be land drains. No evidence was revealed for the survival of cottages depicted on the 1853 Brill Tithe Map. [Au(abr)]

Brown, R Milton Keynes : Archaeological Services & Consultancy Ltd., 2008, 23pp, colour pls, figs, tabs, refs, CD

Work undertaken by: Archaeological Services & Consultancy Ltd.

Two evaluation trenches were excavated butting up against the church. Each was found to contain the deep disturbed deposits characteristic of old churchyards where burials have been continually deposited over centuries. Four burials were found, two in each trench. Although this high concentration of interments was likely to continue right across the area of the new development, the depth of the skeletons found was below the formation level of the extension floor. A number of stones at the north-western corner of the north aisle of the church indicated that there was additional reinforcement of the church in this area. It was not clear whether this strengthening was part of the construction of the church or a later repair. [Au(abr)]

Work undertaken by: Northamptonshire Archaeology

An archaeological evaluation was undertaken of land at Betts Farm, Padbury. Three trenches were opened and natural clays, sands and gravels were exposed beneath the topsoil or modern hardcore surface. Several 19th century and undated archaeological features were investigated, including drains, ditches and gullies, post holes and a probable pit. Animal bone was retrieved from undated ditches in Trench 3. It is likely that the farmyard had undergone considerable truncation and alteration from the 19th century onwards. [Au(abr)]

Report on an Archaeological Evaluation at Theobalds Road, Burgess Hill, East Sussex

Dawkes, G Portslade : Archaeology South-East, Report: 2008106 2008, 38pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeology South-East

Trenches were laid out targeting or respecting geophysical anomalies, identified in an earlier survey. The evaluation identified two main phases of archaeological features. The earliest was a series of shallow ditches and pits dating to the Late Iron Age/early Roman period. The ditches possibly formed part of an enclosure located immediately south of the prehistoric ridgeway route and the recovery of significant amounts of burnt daub indicated the former presence of timber buildings, possibly roundhouses. Finds from the subsoil of sherds of Middle Iron Age and Late Roman pottery may also indicate a broader time-scale of activity. The main medieval features on the site were two large negative features, interpreted as ditches aligned north-east to south-west and east to west, possibly forming the south-west portion of an enclosure. However, only one side of each of these ditches was found and these features may alternatively be clay extraction pits or even ponds. All of the finds from the

features were sherds of pottery dating from the 13th-14th centuries and the features almost certainly related to activity focused on the medieval ridgeway route and associated with the moated settlement of Theobalds Farm, immediately to the west of the site. The results of the geophysical survey were borne out to some extent by the trial trenching. However, while the geophysical survey was beneficial in the initial identification of some the features, it appeared that generally the survey was not a wholly accurate guide to the extent or character of the archaeological remains. No archaeological features were identified in the northernmost field, closest to Theobalds Road. [Au(abr)]

LAND ADJACENT TO OLD HARRIER KENNELS, COODEN, BEXHILL

Land Adjacent to Old Harrier Kennels, Cooden, Bexhill, East Sussex: Archaeological Trial Trench and Test Pit Evaluation

Fitzpatrick, R & Greatorex, C Salisbury : Wessex Archaeology, Report: 68610.03 2008, 28pp, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

The results of the trial trench evaluation and Geo-technical observations implied that the land adjacent to Old Harrier Kennels had been utilised for pastoral purposes. The area for additional hand dug test pits revealed anthropogenically derived material of a very recent date. Both areas allocated for archaeological investigations did not identify any significant archaeological features and/ or deposits. Geophysical data suggested that a possible trackway associated with the medieval moated manor may have run into the site, however, on investigation it was revealed that this anomaly was a live service pipe/trench. A line projected from the moated manor house's existing causeway ran along a route upslope through the south-eastern part of the site, However, the projected line fell, for the most part, within the subterranean reservoir and therefore any remains of such a trackway would have already been lost. The archaeological investigations of the site provided useful information concerning the lack of archaeological potential immediately north-east of the moated manor. The site appeared to be beyond the limits of the Scheduled Ancient Monument activity and

furthermore no evidence of any pre-modern archaeology was identified within the site. [Au(abr)]

NORTHEYE, PEVENSEY LEVELS

Northeye Pevensey Levels, East Sussex. Geoarchaeological Assessment Report

Champness, C Oxford : Oxford Archaeology, 2008, 40pp, colour pls, figs, tabs, refs

Work undertaken by: Oxford Archaeology

A geoarchaeological assessment was undertaken which consisted of a field survey to record the sequence of deposits and recover samples for palaeoenvironmental assessment in the low-lying marsh area that surrounded the scheduled monument. A transect of five boreholes and two auger holes were taken through the marsh sediments. The sequence of deposits were relatively consistent. Two main phases of rising sea level [marine transgression] and one phase of lower sea-level [regression] were identified. The main period of regression was characterised by the accumulation of peats and organic deposits that represented a mosaic of different wetland environments. These deposits were believed to be prehistoric in date and stratigraphically equivalent to deposits previously investigated in the region that were radiocarbon dated to between c 4390 ± 60 BC [Late Mesolithic] to c 1790 ± 100 BC [early Bronze Age]. Palaeoenvironmental assessment for pollen, waterlogged plant remains, and insects was undertaken for one representative sequence. The assessment identified good potential for preservation of organic remains associated with accumulation of the peats. This sequence had the potential to provide detailed information on vegetation and sea-level change from the late Mesolithic period onwards. Previous studies had noted that early prehistoric utilisation of the Pevensey Levels was associated with episodes of marine regression. The organic deposits identified during this assessment had the potential to contain evidence of prehistoric activity in the form of artefacts, wooden trackways or platforms and boats. The organic deposits and any archaeological remains therein were vulnerable to both direct impacts through the digging of drainage ditches or secondary impacts such as the lowering of the water-table. The natural shallow embayments of the island were likely a significant factor in the growth of salt working in this area. Abandonment of the village was most likely partly due to a decline in the salt works. This was in part due to the declining economy and the spread of disease in the late-13th to 14th centuries. However, these affects were probably significantly exacerbated at Northeye by the storms of the late-13th century which likely infilled most of the embayments which were used in salt production. The village never appeared to recover from these events and was subsequently abandoned. Significant early salt working sites and other medieval features such as jetties may be found around the edges of the Northeye Island. Such discoveries could help inform about the activities associated with the medieval village. Within the area immediately surrounding the bedrock island these deposits were less than 1 metre from the surface and would therefore be vulnerable to direct impact. [Au(abr)]

TOWER HOUSE, RYE

An Assessment Excavation at Tower House Rye, East Sussex

Butler, C Polegate : Chris Butler Archaeological Services, 2008, 30pp, colour pls, figs, tabs, refs

Work undertaken by: Chris Butler Archaeological Services

An assessment excavation was carried out at Tower House, Rye during November 2008, a total of four evaluation trenches were excavated. Two trenches located in a car parking area revealed a deep stratigraphy of post-medieval layers dating from the late-19th century through to the late-17th century. Below this were deposits dating from the 14th to 15th century, and a possible ditch that been finally filled in in the mid-16th to early 17th century. A small trench in the garden also revealed a similar stratigraphy but at a shallower level, whilst the fourth trench encountered a large later 19th century kitchen midden. Although the excavation did not locate any confirmed medieval features, it did demonstrate that there was a deep post-medieval stratigraphy with the potential for in-situ early post -medieval and medieval features and deposits with good preservation, albeit at lower levels. The kitchen midden had the potential to provide the best 19th century assemblage from the town to date. [Au(abr)]

Work undertaken by: Wessex Archaeology

Nine trenches were excavated within the proposed tree planting areas found relatively little evidence of significant archaeological features. Only one trench contained any features which comprised two north-west-south-east running ditches, which were a continuation of medieval ditches investigated in part of the archaeological excavations 2006. A small quantity of prehistoric pottery and worked/burnt flint flakes was also recovered during excavations, though discrete features or concentrations of artefactual material were identified in another trench. KITE COTTAGE, MIDLINGTON ROAD, DROXFORD

An Archaeological Evaluation at Kite Cottage, Midlington Road, Droxford, Hampshire

Hall, N West Wittering : Development Archaeology Services, 2008, 13pp, colour pls, figs, refs

Work undertaken by: Development Archaeology Services

The evaluation identified the line and slope of the original hillside that predated the construction of Kite Cottage in the early 20th century. Cut into this slope and the underlying chalk bedrock and sealed by buried topsoil horizon was a very shallow and heavily truncated linear feature. It probably represented the line of a hedgerow, as its single fill was heavily root sorted and a single fragment of cast metal thought to date to the 19th century was recovered from this fill. A modern soakaway pit and the line of a foul sewer were also identified. [Au(abr)]

Allum, C Wincanton : Context One Archaeological Services, 2008, 12pp, colour pls, figs, tabs, refs

Work undertaken by: Context One Archaeological Services

The excavation of a trench recovered evidence for the presence of medieval archaeology. This comprised substantial remains of a large wall or foundation across the entire base of the trench constructed of chalk, mortar and flint, probably the remains of a large wall or foundation core although no wall face lay within the trench. The remains were likely to have belonged to St. Mary's Abbey, a Norman rebuild of the smaller Saxon Nunnaminster, which lay immediately south the evaluation. While the remains may have formed part of the north transept, this interpretation remained uncertain as it was not possible to establish the full width, length or alignment of the structure. St. John's Croft, Blue Ball Hill, Winchester, Hampshire. Archaeological Evaluation Report

Score, D & Sykes, D Oxford : Oxford Archaeology, Report: 8697 2008, 52pp, figs, refs

Work undertaken by: Oxford Archaeology

An evaluation was undertaken on land at St. John's Croft, Blue Ball Hill, Winchester. The evaluation revealed a significant number of pits and some associated post holes and gullies which dated to the medieval period. No structures were recorded but these features were interpreted as backyard or garden activity relating to possible tenements on the road frontage to the south. The activity appeared to be domestic in character but some evidence for metal working at the site was also noted. A number of later post-medieval and modern pits were also recorded but truncation by modern activity on the site was not extensive. No evidence of an extension to the east Winchester Roman cemetery previously recorded in adjacent sites was found but an assemblage of prehistoric flint also present within the medieval features indicated probable prehistoric activity nearby. Cass, S & Preston, S Reading : Thames Valley Archaeological Services, Report: 08/10 2008, 16pp, colour pls, figs, tabs, refs

Work undertaken by: Thames Valley Archaeological Services

There had been little systematic archaeological investigation in the area, apart from extensive aerial photographic coverage. The site had generalized potential for archaeology of most periods, and air photographs had suggested particular potential for prehistoric settlement. It was unlikely that the site contained remains of national importance. It was recommended that further information was provided by a field evaluation (trial trenches). The evaluation trenching revealed only two small features of possible archaeological relevance, both undated post holes. On the basis of these results it seemed that the site had very little potential to advance archaeological knowledge of the area. [Au(abr)]

Clarke, C Twickenham : AOC Archaeology Group, 2008, 30pp, colour pls, figs, tabs, refs

Work undertaken by: AOC Archaeology Group

The evaluation comprised eight trenches. Two trenches were recognised as containing archaeological features. These features comprised two shallow ditches and a soil horizon, both dated to the Roman period. The trenches proved that late post-medieval horizontal truncation of deposits had occurred in the south-west area, where substantial late post-medieval dumping had occurred. The evaluation also demonstrated that undisturbed subsoil and topsoil deposits were present across the remaining area of the site, up to a depth of 1m. Overall, the potential for archaeological deposits to be present on the western side of site and within the garden of 39 Medina Avenue were good, albeit of a low intensity nature. [Au(abr)]

LAND TO THE SOUTH OF RYDE STREET, CANTERBURY***An Archaeological Evaluation of Land to the South of Ryde Street, Canterbury***

Diack, M Canterbury : Canterbury Archaeological Trust, 2008, 22pp, colour pls, figs, tabs, refs

Work undertaken by: Canterbury Archaeological Trust

The evaluation consisted of the cutting of a single trench. Several deposits were noted in the trench, the earliest of which were of a Late Iron Age date and may have represented a building. There were also gravel deposits that may have represented early Roman metalling for a yard surface. A late Roman cremation burial consisting of a cinerary urn with two accompanying pottery vessels was noted in these deposits. This burial was of great significance, it appeared to have been the latest Roman burial found in Canterbury and also because it was located much further east than the previously known extent of the London Road Cemetery. Above the burial was burnt gravel. This possibly represented in situ burning though may have been industrial material dumped from elsewhere. A clay deposit was dated by a roof tile to medieval or post-medieval date. Some 19th century material was also noted. [Au(abr)]

Fallon, D Portslade : Archaeology South-East, 2008, 68pp, colour pls, figs, tabs, refs
Work undertaken by: Archaeology South-East

The evaluation comprised two trenches. In addition two geoarchaeological test pits were excavated, one in each trench, through the natural deposits to the underlying, chalk bedrock. These were excavated to assess the potential of the Pleistocene deposits for lithological or other significant artefacts from this era, but nothing of archaeological interest was discovered in either of these test pits. A cluster of late-19th -early 20th century refuse pits were observed cutting through the subsoil in Trench 2 to the south of the site. These pits contained an assemblage of animal bone, glass, ceramic building material, pottery, corroded iron, leather and linoleum. A sample of these artefacts was taken for verification with the rest discarded on site. Located at the northern end of Trench 1, a shallow linear feature was cut into the natural, although no dating evidence was recovered it was sealed by the subsoil and therefore predated the pits in Trench 2. HORNS CROSS, STONE, DARTFORD

Horns Cross, Stone, Dartford, An Archaeological Evaluation Report

Harris, P Twickenham : AOC Archaeology Group, 2008, 43pp, colour pls, figs, tabs, refs

Work undertaken by: AOC Archaeology Group

An evaluation of six test trenches was undertaken in January 2008 at Horns Cross. Within Trench 1 a pit and linear ditch, both dated as late prehistoric from recovered worked flints, were found cutting into the natural Pleistocene gravels. Under the coordination of a Palaeolithic expert the natural Pleistocene gravels and sands were machine excavated in spits of up to 250mm and 100 litre samples taken at selected depths. The samples were sieved on site for the recovery of archaeological remains. This analysis of the Pleistocene deposits produced a single flint flake, from a context interpreted as a reworked Pleistocene terrace deposit. [Au(abr)]

Ebbsfleet Crossing, Springhead, Kent. Geoarchaeological Borehole Survey, Preliminary Assessment Report

Norcott, D Salisbury : Wessex Archaeology, Report: 69410.03 2008, 17pp, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

The assessment recorded at least one possible stasis horizon immediately overlying river gravels, sealed by a layer of peat formations. Potentially in situ artefacts may have represented an intact site. Worked flint from this horizon was dated to the Mesolithic/Early Neolithic period, and may have been contemporary with known sites in the vicinity. The site had excellent potential for the preservation of archaeological remains, spanning from the Holocene through to the post-medieval periods. [Au(adp)]

An Archaeological Evaluation at Oakfield Infant's and Junior's School, Dartford, Kent

Dawkes, G Portslade : Archaeology South-East, Report: 2008005 2008, 43pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeology South-East

An archaeological evaluation of 3 trenches and 5 geoarchaeological test pits was undertaken at Oakfield Infant's and Junior's School, Dartford. The trenches and test pits recorded a broadly similar stratigraphic sequence of deposits. The lowest deposit contained inclusions of occasional burnt clay flecks and finds of fire-cracked flint and bone and above, Roman ceramic building material fragments (CBM). The upper colluvium contained finds of post-medieval CBM. The colluvium was overlain by post-medieval subsoil and topsoil. No cut features or structures were identified during the evaluation. No Palaeolithic finds were recovered. [Au(abr)]

Wenban-Smith, F Salisbury : Wessex Archaeology, Report: 58849.03 2008, 36pp, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

Thirteen test pits were excavated in the north-east corner of the Springhead Quarter, where previous investigations in 2004 and 2007 had recovered flint artefacts and faunal remains [such as a mammoth tusk]. Pleistocene deposits were recorded across the site, some quite thick in places. A possible land surface was recorded, producing flint artefacts. A further possible land surface was recorded in another part of the study area. [Au(adp)]

Lullingstone Roman Villa, Eynsford, Kent (Phase III)

Linklater, A Canterbury : Canterbury Archaeological Trust, Report: 2009/03 2008, 22pp, colour pls, figs, refs

Work undertaken by: Canterbury Archaeological Trust

Three evaluation trenches were excavated. In all three trenches a simple sequence of deposits was recorded consisting mainly of recent dump/levelling material and agricultural soils with features associated with Mote House. In Trench 3 a series of parallel walls separating an extensive area of brick flooring was encountered immediately beneath the modern ground surface. A further episode of machine stripping across this area exposed the full extent of this structure, showing it to be a single north-south aligned agricultural building sub-divided into five separate rooms, each with a central brick drain channel. Each room was accessed via its own entrance at its eastern end and was furnished with water and food troughs at opposite ends. Along the structure's eastern side was a brick and flagstone pavement. Though this structure appeared to form part of the farm associated with Mote House in the late-18th century/early 19th century, examination of early maps illustrated it was not constructed until as late as 1865. A series of later features appeared to relate to the use of the site prior to the Second World War. [Au(abr)]

13 BEDFORD STREET, WOBURN

13 Bedford Street, Woburn, Bedfordshire, Archaeological Field Evaluation

Newbould, J Bedford : Albion Archaeology, Report: 2009/1 2008, 34pp, colour pls, figs, tabs, refs

Work undertaken by: Albion Archaeology

In the southern and western parts of the development area, the evaluation revealed the remains of post-medieval and modern activity in the form of ditches, pits and structures of probable Georgian date. In the north-eastern part, the remains of late medieval/early post-medieval field systems were encountered. Also in the north-eastern part evidence was revealed for Roman settlement from the 1st-3rd centuries AD. This included evidence for late-1st-early 2nd century industrial pottery production in the form of wasters, seconds, fragments of kiln discs/plates and large quantities of pottery. The discovery of 1st-3rd century Roman settlement and industrial activity pushed back the origins of Woburn by almost one thousand years and it represented the discovery of a hitherto unknown Roman settlement in the eastern region. Despite the evident plough truncation within the development area, the presence of a nearby kiln could not be ruled out. Similarly, the presence of 2nd-3rd century brick demonstrated the potential for significant structures in the vicinity. These remains were considered to be of regional significance and had the potential to significantly add to the knowledge of Roman settlement and local pottery production in Bedfordshire and the east of England. LAND AT BROOKLANDS (I)***Land at Brooklands Phases 2-4 Evaluation. Archaeological Evaluation Report***

Dodd, M & Bedford, W Oxford : Oxford Archaeology, Report: 4019 2008, 152pp, colour pls, figs, tabs, refs

Work undertaken by: Oxford Archaeology

An evaluation was undertaken on land at Brooklands, which covered Phases 2-4 of development proposals. The evaluation works uncovered two settlement foci, as well as three

other foci of activity. The largest settlement foci was already known from the results of a geophysical survey, however, the evaluation works discovered a large peripheral zone surrounding this settlement core, and determined that it was primarily of Romano-British date. The second, smaller, settlement focus of Early Iron Age date was also confirmed centred on geophysical survey Area 10. This focus also had a zone of peripheral activity, albeit on a much smaller scale than that found around the Romano-British focus. This peripheral zone was also less well defined as there were a number of later, intrusive features throughout it, making its extent difficult to define. The other three foci consist of one possible, small undated settlement focus in the north-west of the site, one isolated group of features in Trench 178, of Bronze Age and Iron Age date, and a small collection of potentially Late Bronze Age features to the south-east of the Roman focus. The remainder of the site was covered by a sparse collection of field boundaries of various dates. [Au(abr)]

LAND AT BROOKLANDS (II)

Land at Brooklands, Milton Keynes Phase 1-Remaining Trenches. Addendum Report

Wheaton, K & Bedford, W Oxford : Oxford Archaeology, Report: 3936 2008, 50pp, figs, tabs, refs

Work undertaken by: Oxford Archaeology

Evaluation trenches previously inaccessible during the Phase 1 trenching works were completed at Brooklands in February 2008. Ten of the trenches, which had been mechanically excavated but not recorded, were examined for the presence of archaeological deposits, recorded and backfilled. The remaining trenches were excavated and recorded, with the exception of Trench 60, which was not excavated due to the presence of a newt pond. The trenches were excavated in two fields, which were defined as Field A, located to the north of Broughton Grounds Lane, and Field B, located to the south of the lane. The trenches in Field A uncovered evidence of medieval and 13th to 14th century activity in the form of linear features, pits and post holes. The highest concentration of features was found in Trench 57, which may be associated with the activity found in Trenches 44, 55 and 63, from the previous evaluation works. The group of trenches in Field B found some evidence of Roman activity in the form of a series of linear features. The highest concentration of features were found in Trenches 91 and 93, and were probably associated with the Roman settlement found to the south in the Broughton Manor Farm excavation. [Au(abr)]

MK WEST, AREA 10, PHASE 1. LAND TO THE SOUTH-WEST OF WATLING STREET AND SOUTH-EAST OF CALVERTON LANE

MK West (Milton Keynes Western Expansion) Area 10, Phase 1. Archaeological Trial Trenching

Keir, W Bedford : Albion Archaeology, 2008, 177pp, colour pls, figs, tabs, refs

Work undertaken by: Albion Archaeology

The trial trenching identified archaeological remains dating from the early Iron Age to the medieval periods. Of most significance were two distinct areas of Iron Age settlement activity located on higher ground within the site. These areas comprised ditches and pits, as well as a sizable amount of irregular shaped features more characteristic of tree rooting. The pottery from both areas of the site predominantly dated from the Middle-Late Iron Age, with a small amount dating to the Early-Middle Iron Age and Roman periods. Other remains included a series of broadly parallel ditches containing pottery suggesting a Roman date. These appeared to be on a similar alignments to Roman Watling Street located c. 300m to the north-east. The relative lack of artefacts and their character suggested they were associated with agricultural activity. Medieval ridge and furrow survived in varying states of preservation throughout the site. GROOMBRIDGE TO LANGTON GREEN WATER MAIN***Groombridge to Langton Green Water Main: Archaeological Trench Evaluation***

Thorpe, S Buckingham : Network Archaeology, Report: 406 2008, 97pp, colour pls, figs, tabs, refs

Work undertaken by: Network Archaeology

An evaluation, palaeoenvironmental assessment and metal detector survey was carried out along the route of a new water main between Groombridge and Langton Green. The evaluation comprised 19 archaeological trial trenches targeted at areas of archaeological potential identified by a desk-based assessment and geophysical survey. A metal detector survey was also undertaken along the route of the pipeline in tandem with the evaluation. The evaluation identified evidence of short-term or transient prehistoric activity at three locations, including Late-Neolithic and Early Bronze-Age activity in plots 04 and 05, Bronze Age activity in plot 22 and Iron Age activity in plot 14. The highest density of archaeology was discovered in plot 03, where a series of pits, ditches and a brick structure represented at least two phases of activity possibly associated with an old farm which once stood beside the Withyham road. Elsewhere along the route, the evaluation revealed a number of former field boundary ditches. These probably represented earlier phases of agricultural land management and indicated a degree of reorganisation of the agricultural landscape during the

post-medieval and early modern periods. Finds recovered from the topsoil during the evaluation and by the metal detector survey were probably the result of manuring and other agricultural related activities associated with these field systems. The remaining archaeology identified by the evaluation included a possible double ditched track or field enclosure in plot 05, two undated hearths or fire pits in plots 09 and 16 and a large number of tree/plant holes, two of which in plots 09 and 22 had been burnt and might represent evidence of deliberate land clearance. In addition to the archaeological trenches, four palaeoenvironmental trenches were excavated on the flood plain of the River Grom. A thin layer of alluvium and some colluvium was found but there were no former river channels or peat. The proposed pipeline would impact upon the identified archaeological remains and also any unknown remains which may have existed along its route. The overall significance of this impact was considered to be low. [Au(adp)]

LAND TO THE REAR OF 7 AND 7A, HIGH STREET, BANBURY

Land to the Rear of 7 and 7a, High Street, Banbury, Oxfordshire: An Archaeological Evaluation

Milbank, D Reading : Thames Valley Archaeological Services, Report: 08/120 2008, 17pp, colour pls, figs, tabs, refs

Work undertaken by: Thames Valley Archaeological Services

The evaluation did not reveal any deposits predating the later 19th century with just a few residual sherds of medieval and post-medieval pottery recovered to indicate any earlier activity, these need not necessarily originate on the site. The evaluation trench contained evidence for at least two structures of later 19th and 20th century date on the site and the earlier of these may correspond with a structure shown on the 1st Ordnance Survey map of 1881. However, the foundations revealed in the trench could not be matched with specific features shown on the map. [Au(abr)]

Ford, S Reading : Thames Valley Archaeological Services, Report: 04/60b 2008, 19pp, figs, tabs, refs

Work undertaken by: Thames Valley Archaeological Services

No deposits of archaeological significance were revealed during the evaluation. A small number of undated gullies were recorded along with a number of 19th/20th century land drains and service trenches relating to use of the site as part of the nearby sewage works. Trenches were placed across a possible enclosure visible on aerial photographs. No archaeological origin was determined with some of the marks possibly deriving from modern service trenches. A small number of pottery sherds of medieval and post-medieval dates were recovered, along with a single sherd of Roman pottery. These probably derived from manuring of farmland and were not indicative of settlement of these dates. [Au(abr)]

The evaluation established that the site was covered with alluvial clays that sealed a natural sandy clay substrate. While the potential remained for pre-Roman archaeological features and deposits to be sealed by this alluvium, further excavation of the deposit beyond three trial holes was not possible due to the ingress of ground water. A series of earthworks that had been previously interpreted as the remnants of ridge and furrow were found by the evaluation to have been a series of post-medieval/modern open drains running east/west and north/south across the site. SOUTH LODGE COURTYARD, MERTON COLLEGE***South Lodge Courtyard, Merton College, Oxford. An Archaeological Evaluation***

Lewis, J Reading : Thames Valley Archaeological Services, 2008, 15pp, colour pls, figs, tabs, refs

Work undertaken by: Thames Valley Archaeological Services

No dense or complex archaeological deposits were revealed during the evaluation, with just a single cut feature, a post-medieval ditch being recorded. The presence of some charcoal seemed to represent a period of activity prior to burial by later [post-medieval] activity. An orange sandy layer was considered likely to represent a river valley deposit, perhaps, a brickearth deposit, or finer sediment deposited at the margins of the floodplain of the Cherwell. Despite the presence of a high water table, no anoxic preservation was recorded for the fill of the ditch. On the basis of these results the archaeological potential of the site was deemed to be low. RUSKIN COLLEGE, OLD HEADINGTON

Ruskin College, Old Headington, Oxford

Dodd, M Oxford : Oxford Archaeology, Report: 8380 2008, 54pp, colour pls, figs, tabs, refs

Work undertaken by: Oxford Archaeology

A two-stage field evaluation was undertaken within the Headington grounds of Ruskin College. This took the form of a magnetometer survey followed by the excavation of 12 trial trenches to investigate the impact on areas of the proposed development. The geophysical survey produced limited results although the trenches identified remains of Early Iron Age, Roman and medieval/post-medieval date. The Roman remains were restricted to Trench 9 although these were consistent with previous discoveries along the western fringe of the college grounds suggesting occupation along a raised finger of land. The Roman pottery assemblages also implied the close proximity of a mortarium production site. Significant domestic charred cereal remains were recorded from the excavated Roman feature. Medieval remains were more limited although a 12th or early 13th century cow burial was encountered by Stoke House within the eastern portion of the site. No significant remains were encountered within the listed crinkle-crankle walled garden. [Au(abr)]

ST. ANTONY'S COLLEGE

St. Antony's College Oxford, Archaeological Evaluation Report

Murray, P Oxford : Oxford Archaeology, Report: 4131 2008, 22pp, colour pls, figs, tabs, refs

Work undertaken by: Oxford Archaeology

A field evaluation was carried out for St. Antony's College, Oxford. Two evaluation trenches were excavated in the college gardens. Trench one revealed Victorian soils and a Victorian brick wall, possibly forming the south wall of a backfilled cellar. Trench two revealed that the natural gravel had been truncated to a depth of 1.6m by quarrying. The quarrying was backfilled, probably prior to the formation of the garden of St. Mary's Home in the Victorian period. A Victorian garden feature and soils were also revealed, again associated with the St. Mary's Home garden. [Au(abr)]

PEMBROKE COLLEGE, BREWER STREET DEVELOPMENT

Pembroke College, Brewer Street Development, Archaeological Evaluation Report

Bashford, R Oxford : Oxford archaeology, Report: 4192 2008, 50pp, figs, tabs, refs
Work undertaken by: Oxford Archaeology

An evaluation was carried out at Brewer Street, Oxford. It revealed deeply stratified clay rich deposits which may have represented fills of the pre-conquest configuration of a branch of the Thames, subsequently known as the Trill Mill Stream. Overlying and also to the north of these possible fills were a series of deposits, which may have correlated to the deliberate deposition of material along the interface between the Thames floodplain and the second gravel terrace to the north, upon which was located the medieval walled town of Oxford. This process of "land reclamation" had been identified elsewhere along the edge of the second terrace, in particular during recent archaeological work at the Westgate car park to the west of Brewer Street, where the reclamation deposits were dated to the 12th-13th centuries. The dating evidence from the deposits encountered during the evaluation at Brewer Street suggested that these dated to the 13th-14th century. Consequently, if the interpretation of these deposits is valid, then the process appeared to be later at Brewer Street, possibly suggesting that the reclamation of land was by no means synchronous between all the sites where it has been identified. A possible pit and a north-south aligned linear feature truncated these deposits in the south of the investigation area. The function of the pit was unclear, although it may relate to a tenement plot fronting on to Brewer Street. The function of the linear feature was also unclear but it was possible that it formed a drainage channel running from the town to the Trill Mill Stream. Overlying the fills of these two features was a series of imported garden soils, which were possibly contemporary with the construction of the existing buildings fronting on to Brewer Street in the 17th century. In the north of the investigation area the land reclamation deposits were truncated by a north-south aligned limestone wall, a similarly aligned ceramic drainage pipe, and a 20th-century brick built inspection pit; associated with the use of the current building as a garage. The date of the limestone wall was uncertain, as it had been truncated to the west by the trench for the ceramic pipe, and to the east by what appeared to be a 19th-century pit. However, to the north of the wall, a potentially contemporary compacted gravel surface produced 14th-15th century roof tile. The wall also appeared to have been modified, possibly in the 19th century, by the addition of a chute, the function of which was unclear. Despite the uncertainties with regard to the date of this structure, it seemed likely that the wall related to the cellar of a building which formerly fronted onto Brewer Street. [Au(abr)]

WESTGATE CENTRE

Westgate Centre. Oxford Phase 2. Archaeological Evaluation Report

Bashford, R Oxford : Oxford Archaeology, Report: 3800 2008, 238pp, figs, tabs, refs
Work undertaken by: Oxford Archaeology

Between September 2007 and February 2008 an archaeological evaluation at The Westgate Centre, Oxford was carried out. This phase of evaluation [Phase 2] followed on from the Phase 1 evaluation carried out in 2006. Phase 2 comprised a further 19 trenches, 7 within the multi-storey car park and 5 in the surface car parks, with a further 7 in areas adjacent to the car parks which would be affected by the proposed development. The evaluation largely confirmed the results of the first phase, although the additional data recovered allowed the site specific model for the hydrological and sedimentary development of the floodplain to be refined. This model still correlated broadly with the sequence postulated from previous excavations to the south of the medieval walled town, and elsewhere on the floodplain of the Upper Thames. Evidence for an elevated area of gravel to the south-east of the site suggested that this area was on the periphery of an "island" of higher ground, although the nature and elevation of the deposits encountered implied that this was marginal land, and unlikely to be the focus of settlement similar to that previously excavated at Whitehouse Road. The evaluation provided confirmation of the Trill Mill Stream crossing the centre of the

site, and further evidence for the origin, development and orientation of the channel was recovered. In addition, the results from a number of trenches suggested the existence of a complex system of intercutting side channels [some timber lined] to the south of the stream. One of these comprised a set of substantial timber beams which were encountered in previous investigations, and have been interpreted as part of a mill race. Demolition material overlying these timbers was suggestive of an adjacent mill associated with the Greyfriars priory to the north-east. There was also some evidence for managed water courses between the Trill Mill Stream and the Thames, which may have been contemporary with the Greyfriars' ownership of this area of the site, referred to in documentary sources as Boteham Island. Additional evidence for 13th-14th century land reclamation extending southwards from the second terrace was also revealed. Further robbed and partially robbed walls associated with the Priory and its subsequent demolition were seen to cut this deposit, as was a possible western boundary to the Greyfriars complex, comprising a north-south aligned ditch, later superseded by a limestone wall. The latter appeared to correspond to the boundary between the Priory complex and the area known as Paradise to the west. The remaining recorded deposits appeared to relate to the use of the area as gardens/pasture, and subsequently the construction of Victorian terraced housing and the demolition of same in the late-1960s. FORMER BARTLEMAS NURSERY SCHOOL, OXFORD

Former Bartlemas Nursery School, Oxford

Bashford, R Oxford : Oxford Archaeology, 2008, 15pp, figs, tabs, refs

Work undertaken by: Oxford Archaeology

The evaluation revealed natural geology comprising clay overlain by colluvial soil which may have represented a buried ploughsoil. Two north-south aligned linear features produced post-medieval artefactual evidence, and were likely to have represented a precursor to the system of ceramic field drains on the same alignment, which also was evidence in a number of trenches. Evidence for 20th century landscaping of the natural topography of the site, associated with the construction of the existing school building in the 1950s, was also observed. No evidence for features or deposits predating the 18th century was revealed. [Au(abr)]

OASIS DATABASE: LAND NORTH OF MILTON PARK INDUSTRIAL ESTATE
An Archaeological Evaluation at Milton Park, OxfordshireWilliams, G. Oxford : JMHS, 2008,
Work undertaken by: JMHS

"An evaluation was carried out by John Moore Heritage Services on behalf of The Environmental Dimension Partnership (EDP) on the cropmark, Scheduled Ancient Monument OX250 on land north of Milton Park Industrial Estate, Didcot, in the parish of Sutton Courtenay. Trenching was targeted on areas of low activity as indicated by the results of geophysical survey. Evidence for some archaeological activity, extending west and south of the main cropmark site, was revealed; this dated from the late Bronze age to early Saxon. Limited Saxon activity was also revealed in the centre of the site under a post-medieval mound c. 0.7m deep, running east/west for several hundred metres. The evaluation confirmed that for the most part the apparent empty area in the centre of the scheduled monument did not contain significant archaeological remains." [OASIS]

colour pls, figs, tabs, refs*Work undertaken by: Thames Valley Archaeological Services*

Despite the potential for archaeological deposits to have survived on the site, none were observed. The areas affected by modern truncations appeared to be considerable in the area of Trenches 1 and 3 and the extent of the disturbance suggested that any deposits in these areas would not have survived. However, where the underlying geology was exposed, no archaeological features were present. Potential perhaps remains for archaeological deposits to have survived in the areas of the site to the north and south of the proposed access road, but overall the evaluation produced no evidence to suggest deposits on the site predating the late-19th and 20th centuries. Williams, G. Oxford : JMHS, 2008, A4 report

Work undertaken by: JMHS

"John Moore Heritage Services carried out an evaluation on land at Albion Street, Chipping Norton. The evaluation investigated the rear of three burgage plots. The wall that formed the line of the medieval boundary of one of the burgage plots was investigated; the stratigraphy suggests that it is no earlier than 13th/14th century in date. The evidence for this was an area of pitting, cutting a dump of possible demolition material, which may be associated with a wall also observed in the same trench. In two other trenches part of a pre-twentieth century terrace or group of outbuildings was observed. Similarly in the northernmost trench the remains of two nineteenth buildings and a cobbled surface were observed." [OASIS]

RADCOT***Radcot Oxfordshire, Archaeological Evaluation and Assessment of Results***

Thompson, S Salisbury : Wessex Archaeology, Report: 68733 2008, 65pp, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

An archaeological evaluation was undertaken at a site known locally as "The Garrison" in Radcot, to investigate the remains of Queen Matilda's moated castle complex of the 12th century Anarchy Period and a 17th century Civil War Royalist enclosure. The layout of the medieval castle complex and later Civil War earthworks had been previously investigated in a geophysical survey which revealed the castle keep and associated ancillary buildings, as well as the line of a large defensive ditch. A small evaluation trench was subsequently dug across part of the keep. The evaluation added to information gathered previously by revealing the north-eastern corner of the keep and also the supporting pier for the first floor of the castle within the interior. The remains of the heavily robbed gatehouse and main access road into the castle complex and the northern moat were identified, as well as a heavily robbed structure interpreted as a chapel. The remains of a medieval ancillary building were also revealed. These structures post-dated deposits containing 11th/12th century pottery, consistent with an early post-conquest construction date, which could link it with Hugh of Buckland, the local major landowner around the turn of the 12th century. Possible evidence of the subsequent strengthening of the keep was observed, perhaps associated with Matilda's fortification of the castle during the Anarchy Period. The abandonment of the castle complex was dated to the late 13th/early 14th century, and there was a clear hiatus in the pottery sequence from that date until the 16th century, which fits with the later occupation of the Site by the de Besilles family. In the mid-17th century a "minor Royalist fort" was constructed that involved the refortification of the eastern half of the medieval moated complex by the excavation of a large ditch which split the moated site in two. The 17th century defensive ditch was shown to surround an earthen bastion for the placing of cannon. Several late Roman ditches, possibly field boundaries, were also identified, as well as a low level of residual later prehistoric material, suggesting activity on or close to the site. The route of the medieval road from Faringdon to Witney, which apparently ran through the site, was also investigated, but no trace of the road was found. [Au(abr)]

OASIS DATABASE: MALTHOUSE FARMHOUSE, STANDLAKE***An archaeological evaluation at Malthouse Farmhouse, Standlake***

Ainsworth, A. Oxford : JMHS, 2008, A4 report

Work undertaken by: JMHS

"John Moore Heritage Services conducted an archaeological evaluation of land to the southwest of Malthouse Barn, Standlake on the 14th-17th April 2008. Oxfordshire County Archaeological Services, the archaeological advisory body to the Local Planning Authority, West Oxfordshire District Council, called for a pre-determination archaeological evaluation in order to make an informed decision on the planning application, (07/2242/P/FP), for the redevelopment. The proposed redevelopment of the area consists of demolition of the existing buildings at Malthouse Barn and the construction of five dwellings with garaging and associated services. Wychwood Homes commissioned John Moore Heritage Services to carry out the evaluation. Six trenches, totalling 79.6 metres in length, were excavated to the natural geology. Archaeological deposits mainly were confined to the Romano-British period

along with two features of Anglo-Saxon date and comprised ditches, pits, and postholes. Evidence for earlier structures was present and these are probably dated to the post-medieval period." [OASIS]

PROPOSED NEW SIXTH FORM BLOCK, KENDRICK SCHOOL, EAST STREET

Proposed New Sixth Form Block, Kendrick School, East Street, Reading, Berkshire. An Archaeological Evaluation

Milbank, D Reading : Thames Valley Archaeological Services, Report: 08/89A 2008, 16pp, colour pls, figs, tabs, refs

Work undertaken by: Thames Valley Archaeological Services

The three trenches excavated in the area of the proposed sixth form block showed that where natural geology was exposed, made ground deposits overlay the orange sand and flint gravel. These layers varied in depth from 0.92m [in the area of Trench 5] to 1.24m [in the area of Trench 3]. The finds recovered from these layers indicated that they dated to the late-19th/early 20th century and were likely to be levelling layers. As East Street sloped considerably down towards the north, it was reasonable to suggest that these layers were built up as part of the development of East Street. The wall footing was likely to correspond to the houses shown fronting East Street on the 1898 [Second Edition] Ordnance Survey map of Reading. A small pit of late post-medieval date was encountered in Trench 3 suggesting that the natural gravel geology had not been significantly truncated. A struck flint flake retrieved from pit 1 suggested some evidence of prehistoric activity within the vicinity but was clearly redeposited and otherwise of no significance. No archaeological deposits relating to the Civil War earthworks were recorded during the course of the work. [Au(abr)]

Mumford, J Oxford : Oxford Archaeology, Report: 3726 2008, 42pp, colour pls, figs, tabs, refs

Work undertaken by: Oxford Archaeology

An evaluation was carried out in advance of a planning application for the redevelopment of the Hosier Street area of Reading, and construction of a new Civic Centre. The evaluation revealed possible medieval pits overlain by a garden or cultivation soil. A recut 16th century boundary ditch, 16th and 17th century pits and post-medieval garden soils were also recorded. Redeposited medieval pottery and roof tile was recovered from the features, as well as the disarticulated skeletal remains of two individuals. It was likely that prehistoric, Roman or Saxon burials were located in close proximity to the evaluation trenches. The post-medieval features were overlain by a 19th century garden soil, which was cut by the footings of a 19th century school and terraced properties. [Au(abr)]

Cass, SReading : Thames Valley Archaeological Services, Report: 08/108 2008, 12pp, figs, refs

Work undertaken by: Thames Valley Archaeological Services

The nature of the stratigraphy encountered in both trenches, and in particular the lack of any surviving subsoil layers, suggested that the area had been truncated/landscaped in the modern period, with the possible loss of any archaeological remains which may have been previously present. However, the relative flatness of the area, coupled with the height similarity with areas outside the site suggested that the truncation may have been fairly shallow so it was possible that any larger/deeper features would have survived this truncation, although none were observed. Above the natural geology, only modern imported material remained. The results of the evaluation suggested the proposed development would have little or no archaeological impact. [Au(abr)]

Cottrell, P Southampton : Southampton City Council Archaeology Unit, Report: 901 2008, 49pp, colour pls, figs, refs

Work undertaken by: Southampton City Council Archaeology Unit

An evaluation exposed a number of worked flints and six possible linear features. Three were dated by finds to the Roman period, two were similar, but undated, and one was not excavated. They were interpreted as probable field boundaries. Late medieval to post-medieval pottery and building material were recovered from later deposits. A soil horizon below the early modern layers probably represented an earlier ploughsoil. A single feature was possibly related to a house shown on a 17th century map. Soil layers, pits, brick foundations and other features dating from the 19th century and possibly the late-18th century were exposed. Two phases of 20th century demolition debris and make-up layers were recorded. [Au(abr)]

Pole, C & Capon, L Twickenham : AOC Archaeology Group, Report: 30295 2008, 35pp, colour pls, figs, tabs, refs

Work undertaken by: AOC Archaeology Group

An evaluation revealed a series of post holes and two tree pits in the centre of the site. The post holes were undated, although one contained a small fragment of medieval pottery. The post holes may have represented a boundary dating to the use of the site by Brooklands Farm until c. 1860. Brooklands House, built on the site in 1860, was set among a heavily wooded area, and the two tree pits may date from that period. Two brick foundations recorded to the west of the site were likely to be the footings for greenhouses erected when Brooklands House was built, in the mid-19th century. The topography of the site shows the highest point to be around Brooklands House, at the end of a slight rise oriented north-east south-west. The land dropped away slightly to the south-east and north-west, but this was obscured by landscaping. The majority of the site had large areas of subsoil preserved. The absence of archaeological remains suggested a lack of human activity in the past as opposed to modern truncation. [Au(abr)]

ABBEY BARN, CHERTSEY***An Archaeological Evaluation at Abbey Barn, Chertsey***

Porteus, S Portslade : Archaeology South-East, Report: 3370 2008, 38pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeology South-East

An evaluation was undertaken on the land of the Scheduled Ancient Monument of Chertsey Abbey. Five trenches were excavated. Four pits, possibly post holes, of uncertain date were identified to the south-east of the site. A possible Saxon feature was uncovered which may have been part of a linear boundary ditch running west to east across the site. A possible medieval boundary was identified to the north of the possible Saxon ditch and was believed to run parallel, though this could not be confirmed. Compacted gravel was found which may have been a surface associated with a medieval building which was later demolished. A demolition deposit was uncovered across the site which was believed to have related to the demolition of the manor house and its associated buildings. A modern pit was found to have destroyed archaeological deposits in part of Trench 1 but all other archaeological deposits were well preserved with modern disturbance confined to the upper deposits. BISHOPSGATE HOUSE, ENGLEFIELD GREEN

Bishopsgate House, Englefield Green, Surrey. Archaeological Evaluation Report

Dinwiddy, M Salisbury : Wessex Archaeology, Report: 68180.02 2008, 16pp, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

The evaluation comprised 13 trenches, only two of which produced any archaeological deposits. This was a post-medieval ditch, oriented north-south in line with the western edge of a former tree-lined avenue. It was likely that this avenue was created in the 18th century. Modern field drains, a modern ditch and a tree throw were also identified. [Au(adp)]

ALL SAINTS CHURCH, LALEHAM
All Saints Church, Laleham, Surrey. Archaeological Evaluation Report

Webb, H Oxford : Oxford Archaeology, Report: 4124 2008, 38pp, colour pls, figs, tabs, refs

Work undertaken by: Oxford Archaeology

A field evaluation comprising two trenches was undertaken at All Saints Church. Within Trench 1 five inhumation burials were revealed with associated coffin fittings pertaining to the post-medieval period. In Trench 2 a further five inhumation burials were revealed. These had no associated post-medieval coffin fittings and were thought to date to the medieval period. A linear cut feature was also revealed in Trench 2 and although no dating evidence was recovered from it, it clearly predated the burials within this trench. No structural remains or floor surfaces pertaining to a south aisle, reportedly demolished in the 16th century, were revealed. [Au(abr)]

BROOKLANDS SCHOOL, ASHFORD

Brooklands School, Ashford, Borough of Spelthorpe, Surrey. An Archaeological Evaluation Report

Harris, P Twickenham : AOC Archaeology Group, Report: 30213 2008, 25pp, colour pls, figs, tabs, refs

Work undertaken by: AOC Archaeology Group

An evaluation was undertaken at Brooklands School comprising the excavation of four trenches, two within the footprint of a new four-storey block and two within the footprint of a temporary building. Two smaller trenches were excavated in the areas defined for soakaways. No finds were recovered from the features excavated during the investigation, making their interpretation difficult. A post hole was filled with charcoal rich material, which appeared industrial in nature and indicative of a modern or post-medieval date. Two ditches failed to yield any diagnostic finds, yet the features' perpendicular setting, similarity of form and similarity of fill suggested that they were contemporary. Their grid like setting could denote that they formed part of a field system across the site, which would be further supported by the lack of finds recovered from them. Due to the very limited scale of activity on the site and the nature of the archaeological remains it was felt that no further work was necessary. [Au(abr)]

MANOR FARM, ASHFORD ROAD, LALEHAM

Manor Farm, Ashford Road, Laleham, Surrey. An Archaeological Evaluation

Milbank, D, Pine, J & Weale, A Reading : Thames Valley Archaeological Services, Report: 08/119 2008, 79pp, colour pls, figs, tabs, refs

Work undertaken by: Thames Valley Archaeological Services

A high density of certain and probable archaeological deposits was revealed, but with a paucity of recovered dating, cultural or environmental evidence. Deposits reflecting early Neolithic and probable Middle/Late Bronze Age occupation were present with prehistoric activity of other periods represented by a few pieces of possible Mesolithic flintwork, late Neolithic and late Iron Age pottery. Roman and medieval finds and deposits were few, suggesting that the area was probably only used as farmland in those periods. Cropmarks of possible archaeological interest on the site could not be confirmed as being of archaeological origin by this evaluation. [Au(abr)]

PENDELL FARM, BLETCHINGLEY (II)

Pendell Farm, Bletchingley, Surrey: An Archaeological Evaluation, Phase 2. Fieldwalking Survey

Ford, S Reading : Thames Valley Archaeological Services, 2008, 14pp, colour pls, figs, tabs, refs

Work undertaken by: Thames Valley Archaeological Services

The arable areas of the proposal site were fieldwalked and a moderate volume of struck flint and a small volume of pottery was recovered. The struck flint included Mesolithic/earlier Neolithic finds as well as later Neolithic and Bronze Age material. A loose cluster of material towards the western end of the site was predominantly of Mesolithic/earlier Neolithic date. Only a very small amount of pottery of Roman, medieval and post-medieval date was recovered. A number of the sherds were coincident with subsoil deposits already recorded from a previous evaluation. All of the pottery could easily be derived from agricultural activity such as manuring of farmland. [Au(abr)]

Perry, J Wimbledon : Sutton Archaeological Services, 2008, 15pp, figs, refs

Work undertaken by: Sutton Archaeological Services

The evaluation did not reveal any significant archaeological remains or artefacts within the excavated trenches. The trenches revealed only turf and topsoil and made ground with subsoil overlying the natural. The depth of topsoil and subsoil varied across the site and was probably the result of modern landscaping. Two large intrusions were certainly of 20th century origin and were most likely associated with the building of the original houses. No prehistoric archaeology was found but several possible struck flints, some burnt flint and modern ceramic building material were discovered. [Au(abr)]

An Archaeological Field Evaluation of Hole 10 of the Proposed Merrow-Clandon Golf Course, Merrow, Surrey

Entwistle, R Woking : Surrey County Archaeological Unit, 2008, 13pp, figs, refs

Work undertaken by: Surrey County Archaeological Unit

Twelve trenches were excavated. The only area of archaeological potential was confined to the eastern half of the site around Trenches 116 and 117. The features revealed in that area produced sherds of pottery with date ranges extending from the Iron Age into the early Roman period. The function of the large ditch running through Trenches 117 and 117A was unclear, though its proportions suggested that it may have served as a major boundary earthwork. Most of the pottery from the ditch was recovered from tertiary silts. [Au(abr)]

NEWBURY RACECOURSE CAR PARKING AREA***Newbury Racecourse Car Parking Area, Newbury, West Berkshire. Archaeological Evaluation Report***

Budd, C Salisbury : Wessex Archaeology, Report: 70091.03 2008, 23pp, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

The evaluation was partially successful in identifying the character of the structures identified by aerial photography of the site. No specific evidence was found of the terraced workers cottages that were thought to exist, however, the heavily disturbed ground and high frequency of post-medieval/modern linear features and service trenches did suggest that the survival of archaeological features at the site was low. The remnants of the structure known as Round Oak were identified but only as backfilled cellars and demolition rubble, suggesting that the basic floor plan may have survived the demolition process. Three post-medieval ditches were revealed that were likely to represent changing land divisions or garden features associated with Round Oak. The evaluation also revealed minimal archaeology that predated the post-medieval period. An early to middle Bronze Age boundary ditch suggested that the area was probably used for agricultural purposes during this period, correlated with the general paucity of other finds. Modern landscaping was also evident. [Au(adp)]

Eight archaeological evaluation trenches were excavated in the Tower Street Car Park, Chichester. The site was previously excavated in 1974 and the remains of a Roman bath house were identified amongst other findings. The masonry bath house remains were left in place after the 1974 excavation and were partially re-excavated in 1990 to evaluate the state of preservation. The current evaluation sought to again assess the state of preservation of the bath house masonry and accurately locate the structures in advance of redevelopment of the site. The redevelopment was a mixed-use scheme including a new museum, potentially displaying the bath house remains in situ. In addition, the evaluation sought to assess the archaeological potential of the rest of the site in particular the masonry cistern supplying water to the bath house and a Roman sewer, both of which were identified in 1974. Trenches 2 and 4 identified the masonry remains of the cistern and the apsidal hypocaust room of the bath house. The trenches provided enough information to spatially locate the rest of the archaeological features initially exposed in 1974. The bath house remains in Trench 4 were in relatively good condition and seemed to have survived the repeated excavations with little structural damage. The cistern in Trench 2 had survived less well than the bath house and had certainly suffered from the excavation of the internal fill in 1974. Trench 5 was located in an area where the bath house walls survived only as robber trenches and no masonry remains were seen. However, masonry walls probably did survive in the vicinity of the trench. The Roman sewer was located in Trench 6, outside of the area of the 1974 excavation and was comparable in size and character to the portions excavated in 1974. The Roman sewer survived below the level of the natural in the north-west corner of the site and continued north-west beyond the site. In this area other Roman and medieval negative features were recorded cut into natural, but the overlying later deposits had been removed by the construction of the existing car park in the 1970s. Similarly no archaeological deposits were identified in Trenches 1, 7 and 8 located in the car park perimeter bank. Trench 3, located within the area of the 1974 excavation, did not identify any significant archaeological deposits, suggesting all features were excavated in 1974. In conclusion, it was suggested that only two areas had archaeological potential. These were the masonry structures in the south and west identified in 1974 and the negative features cut into natural to the north-west of the 1974 excavation area. [Au(abr)]

LAND AT MID LAVANT, CHICHESTER***Land at Mid Lavant, Chichester, West Sussex: An Archaeological Investigation***

Smith, L & Wolfe-Murray, C Hertford : Archaeological Solutions, Report: 3201 2008, 22pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Solutions

In October 2008 an archaeological evaluation was undertaken of land at Mid Lavant. A desk-based assessment recorded that significant archaeological remains had been found in the vicinity of the site. It concluded that the site had a moderate to good potential for prehistoric remains (Palaeolithic, Mesolithic, Neolithic and Bronze Age). The site lay to the north (440m) of Iron Age defensive entrenchments, and the projected line of the Roman road from Chichester to Silchester passed through Lavant approximately 400m west of the site. Post-medieval features were found in Trench 3 and Trench 9. An undated post hole was found in Trench 7, in Trench 8 an undated ditch and in Trench 9 undated pits and a post hole. Medieval pits were found in Trench 8 and Trench 9. The majority of pits contained just one medieval sherd, but one Pit contained 7 sherds. Two Pits contained animal bone and another pit also contained ceramic building material and oyster shell. The majority of medieval and undated features were located in Trench 9. [Au(adp)]

BLACK DOWN, HASLEMERE***An Archaeological Evaluation of Features Encountered During Excavations for a New Pond, Black Down, Haslemere***

National Trust Swindon : National Trust, 2008, 1p

Work undertaken by: National Trust

An evaluation revealed a number of probable archaeological features. The deeper pond-excavation appeared to cut through a linear stone feature which may have been a boundary, enclosure, or river-bank revetment of unknown date. It was even possible that the boundary was an earlier component of the Surrey-West Sussex county boundary. This feature overlay a buried surface or stream-bed bearing Mesolithic finds which were probably derived from upstream and the valley sides. Two areas of burnt material were unlikely to derived from an industrial process such as glass-making, and were more likely to represent demolition material brought in to stabilise the bank of the stream. LAND WEST OF HORSHAM***An Archaeological Evaluation at Land West of Horsham, West Sussex***

Garland, N Portslade : Archaeology South-East, Report: 2008104 2008, 25pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeology South-East

An evaluation was undertaken at Land West of Horsham. Four trenches were excavated across the area of proposed development. Two linear features were discovered in Trenches 1 and 3. Both were concave in profile and orientated in an east to west direction and were possibly part of the same feature, however, there was no direct evidence of this. No dating evidence was recovered from either feature. A pre-existing modern field boundary was seen to continue between Trenches 3 and 4, it was partially filled by a hill wash deposit originating from higher ground to the south. Modern deposits were encountered within Trenches 2 and 4, representing made ground laid as probable gateways between the fields that have since gone out of use. A Victorian water pipe within its original cut was observed within Trench 2. [Au(abr)]

Garland, N Portslade : Archaeology South-East, Report: 2008041 2008, 50pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeology South-East

Twenty-four evaluation trenches were excavated across the area of proposed development. The earliest identifiable activity on the site was Bronze Age in date. The termini of two large linear features and a smaller linear feature lay to the north, within Trenches 1 and 4. These features represented agricultural activity, dated by finds of pottery sherds and fire cracked flint within their fills. A separate phase of activity, dating to the Roman period, lay to the south of the site. A series of linear features, post holes and pits related to possible occupation of this area. Dating evidence in the form of sherds of Roman pottery was recovered from the fills of these features. Other post-medieval or modern levelling deposits were encountered, mainly in the centre of the area of investigation. These deposits related to the modern use of this area as allotments and later as a sports field in the 20th century. [Au(abr)]

Garland, N Portslade : Archaeology South-East, Report: 2008040 2008, 20pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeology South-East

An archaeological evaluation was undertaken at 32 Hayling Rise and 24 Woodland Avenue, Worthing. Two trenches, were excavated. Natural activity in the form of deposits and a single linear channel were encountered in Trench 1. Modern disturbance was encountered in both trenches including a dumped chalk deposit within Trench 1, most likely occurring from the excavation of a modern pond, and made ground within Trench 2 from the construction of a previous residential building. No archaeological deposits or features were encountered in either of the trenches. [Au(abr)]

Lewis, J Reading : Thames Valley Archaeological Services, Report: 08/55b 2008, 17pp, colour pls, figs, refs

Work undertaken by: Thames Valley Archaeological Services

The archaeological evaluation revealed four cut features on the site. Two features were unambiguously dated to the later post-medieval or modern period though a few sherds of medieval pottery were also recovered. Two intercutting ditches, however, were possibly of medieval date though only a single sherd of medieval pottery from ditch 2 provided any close dating evidence but could easily have been a residual find. An examination of post-medieval cartographic sources did not reveal any elements which corresponded with these features. These finds, and possibly some of the cut features, point to a low level of medieval activity in the area, perhaps reflecting areas used as paddocks close to a more intensively utilised and occupied zone. Ford, S Reading : Thames Valley Archaeological Services, Report: 08/61 2008, 17pp, colour pls, figs, tabs, refs

Work undertaken by: Thames Valley Archaeological Services

The evaluation of the site revealed just a single ditch of medieval date and was probably recut in late post-medieval times. Three additional trenches were dug to clarify if further deposits were present on the site, especially for the footprints of the proposed new houses, but nothing else was found. The medieval ditch was located at the extreme northern end of the site approximately parallel to the current boundary and may well have indicated an earlier definition of this boundary. The finding of this ditch thus made a small contribution to the knowledge of the topography of medieval and post-medieval Datchet. [Au(abr)]

BRIDGE ROAD, MAIDENHEAD

Bridge Road, Maidenhead, Berkshire. An Archaeological Evaluation, Phase 2a

Cass, S Reading : Thames Valley Archaeological Services, Report: 04/56c 2009, 13pp, figs, refs

Work undertaken by: Thames Valley Archaeological Services

The evaluation did not reveal any deposits or finds of archaeological interest on the site. It appeared, from the different relative depths of the natural geology in this southern area, when compared to those encountered in the northern area, that a greater amount of levelling/truncation had occurred in this part of the site. It was possible that the red/brown silty gravel noted in all the trenches was the highest undisturbed natural layer, which would mean that in most of the area examined, the modern demolition layer was directly above the natural geology, possibly indicating little truncation of the archaeologically relevant level. However, as neither artefacts or deposits of archaeological interest were recorded in these trenches, this area of the site was considered as having no archaeological potential. [Au(abr)]

McNicoll-Norbury, J Reading : Thames Valley Archaeological Services, Report: 08/103 2008, 11pp, figs, tabs, refs

Work undertaken by: Thames Valley Archaeological Services

Despite the site lying close to the Devil's Highway Roman Road, a series of Roman buildings to the east and other Iron Age/Roman remains to the north, no deposits or finds of Roman date or any other archaeological period were identified during the evaluation. The natural geology in both trenches had been disturbed by previous development on the site, in trench 1 excessively so. Demolition debris lay directly on top of the natural geology in both trenches and possibly indicates some truncation of the archaeologically relevant horizon for the whole site of the proposed and previous house. 39 NEW ROAD, RUSCOMBE***39 New Road, Ruscombe, Berkshire. An Archaeological Evaluation***

Milbank, D Reading : Thames Valley Archaeological Services, Report: 08/76 2008, 11pp, figs, tabs, refs

Work undertaken by: Thames Valley Archaeological Services

The two trenches demonstrated that the topsoil layer was very shallow and contained frequent gravel inclusions, and no subsoil layer was present. Taking into account the setting of the site, with arable fields on the east of New Road, it was likely that the ground level of the plot had been reduced at some stage. Previous development of the site for housing may have involved topsoil and subsoil removal, with some topsoil reinstated. The modern truncation was infilled with a deposit which contained modern brick and glass fragments and may have been associated with the construction of the previous building. It was not possible to ascertain if a significant amount of natural gravel was removed from the site previously during ground reduction, and the natural gravel observed in the bases of the two trenches may not have represented the true original upper horizon of the gravel. Nevertheless, it seemed likely that the archaeologically relevant levels had survived on the site but on this occasion, no

archaeological features or deposits were observed in the evaluation trenches. On this basis, the site had low archaeological potential. [Au(abr)]
