Consumer communication when eating out of home: the role of technology

Abstract

Purpose

Despite growing demand, little product information is available when eating out. Information that is provided is often not well understood leading to a lack of consumer control and acting as a barrier to healthy food choices. The AIDA model which highlights the key stages of effective marketing communication (Awareness, Interest, Desire and Action) is applied. Information provided through technological solutions is examined to provide clear guidance on future use.

Methodology

Exploratory qualitative methods through four focused group discussions, allowed consumers views to be probed in-depth and key themes to emerge through thematic analysis.

Findings

In addition to the four key elements of the AIDA model, Accessibility and Relevance are found to be key constructs relevant to food information provision. Accessibility highlights the need for quick, and clear data display, while relevance stresses how salient information is key to each consumer. Technological solutions may offer the most responsive, effective and trusted way to provide enhanced information.

Practical Implications

With increasing consumer demand for clear information, a competitive advantage can be gained through the provision of personalised enhanced dish information when eating out. Findings from this study highlight consumers desire for online (app or web-site based) platforms.

Social Implications

The provision of enhanced food information when eating out has clear public health implications and may influence choice leading to a reduction in non-communicable disease.

Originality and Value

This study, evaluates consumers perceptions to the provision of enhanced food information out of home providing novel insights and guidance for both managerial and societal impact.

Keywords

Eating out; food choice; food information; Apps.; communication

Introduction

Eating out has become an integral part of modern life for many people; one in six meals are consumed out of the home in restaurants, cafés or workplace canteens in the EU (Benelam, 2009). Compared to meals prepared at home, the consumer often has very little control or knowledge of the ingredients, their provenance or nutritional profile. In fact, public food settings particularly are environments where there is an increased offer (availability), placement and promotion (accessibility) of unhealthy calorie-dense food and beverages (Evenhuis *et al.*, 2018), and there is a positive association between the rise in eating out and increasing rates of obesity, a major health and wellbeing societal challenge in many Western nations (Bezerra *et al.*, 2012).

There is however growing consumer interest in information on food eaten in this setting including the nutritional content of dishes, the origin of ingredients and the presence of possible allergens (Banterle *et al.*, 2012; Karamanos and Hobbs, 2018). Some argue that it is a fundamental right to know what we are eating while others more pragmatically highlight consumers' appetite for increased information regarding purchases of any kind (Case, 2012). In recent years, there has been a marked increase in the amount of information provided to consumers about the nutritional and ingredient content of meals but mainly in the retail sector and minimal while eating out. Regulation within Europe, for example, 'Provision of food information to consumers' (EU No 1169/2011) requires the clear labelling of the presence of 14 possible allergens for pre-packaged food and food served from December 2014. From 2021 this requirement is extended in the UK to food that is made and packed where it is to be sold, the 'Natasha's Law', named after a teenage consumer who suffered an allergic reaction after eating a baguette purchased from Pret A Manger which contained sesame that was not declared on the label (UK Government, 2019). Additionally, since 2016 there is a

1
2
3 requirement for retail products to display, in the same field of vision, the energy value and
4 amount of fat, saturates, carbohydrates, protein, sugars and salt per 100g or per 100ml
5
6 (EC.Europa.eu, 2015). The 2010 Patient Protection and Affordable Care Act in the USA
7
8 goes further requiring nutritional information to be posted in many restaurants and fast food
9
10 places (Gregory *et al.*, 2014), and Ireland and the UK have consulted on a similar
11
12 requirement (FSAI, 2016; Public Heath England, 2018). However, in many countries, very
13
14 little information is available to consumers, and indeed studies have found that where
15
16 increased information is provided it is not having a strong influence on consumers' choice
17
18 (Westenhofer, 2013). Further, there are indications that the information is often not
19
20 communicated in a consumer-friendly manner (Bray *et al.*, 2019).
21
22
23
24
25
26
27

28
29 Currently, most information provision on food when eating out is delivered on a printed
30
31 menu. This medium has, however, only limited space for nutritional and other enhanced
32
33 information to be provided. Where this is given it is usually limited to overall calories of the
34
35 dish and the presence of any key allergens (Breck *et al.*, 2014). There is some evidence that
36
37 such limited additional information can influence consumer choices (Roseman *et al.*, 2013),
38
39 however findings in this regard are mixed. Krieger *et al.* (2013) for example found that while
40
41 females were more likely to select lower calorie dishes when presented with nutritional data,
42
43 male consumers were not. The physical limitations of a printed menu render it impossible to
44
45 deliver personalised health messages that each consumer would like to receive in a clear and
46
47 simple manner.
48
49
50
51
52
53

54 Another method of providing enhanced dish information is through a dedicated menu board
55
56 located within the establishment (Conkin *et al.*, 2012). Through this it is possible to
57
58
59
60

1
2
3 communicate greater depth, but it does push all information to all consumers and individuals
4
5 may have to exert significant effort to find the information of importance to them.
6

7
8 Studies have highlighted the potential that technology based applications (apps) may hold in
9
10 providing detailed but clear individualised information (Hartwell *et al.*, 2019). Through
11
12 utilising web or mobile apps, data provided can be tailored to the user and can promote
13
14 greater engagement through interactivity (Appleton *et al.*, 2019). The potential of such web-
15
16 based solutions is being enabled by the rapidly growing numbers of smart phone users. Such
17
18 technology is estimated to be used by over a third of the world's population with penetration
19
20 rates of 68.4% in North America and 64.7% in Western Europe (Statista, 2019).
21
22
23
24
25

26 A small number of smart phone apps have been developed and marketed to provide
27
28 consumers with enhanced food information (Flaherty *et al.*, 2018). Examples of these include
29
30 'Tapingo' which enable university students to order food from their canteen (Barfield, 2014),
31
32 and 'SmartAPPetite' which encourages people to eat local and healthy food. Interestingly,
33
34 this latter app requires personalisation, where consumers are prompted to provide information
35
36 about their nutritional goals, and the information provided is personalised accordingly
37
38 (SmartAPPetite, 2016).
39
40
41
42
43
44

45 This study researches consumer's attitudes toward seeking and receiving food information. It
46
47 debates the current and possible future role that ICT (Information Communication
48
49 Technology) apps can play in delivering enhanced and personalised information. The
50
51 opportunities for increasing consumer engagement with and comprehension of dish
52
53 nutritional information in an out of home setting are also reviewed.

Literature review and conceptualisation

Eating out

Many different terms are used in the literature to describe eating out, and eating out does not carry the same meaning across cultures. Warde and Martens in their seminal work from 2000 describe eating out as a “*socio-spatial activity involving the commercial provision of food*” (Warde and Martens, 2000 p.46). For this study, the term eating out includes the purchase and consumption of a meal outside of the home in restaurants, pubs, fast food outlets or workplace canteens. The consumption of pre-packaged food such as sandwiches purchased from a retail setting are not included since the informational possibilities on the products’ packaging that can be considered pre-purchase are quite different, and different legislative demands are currently placed upon this provision in many countries.

Consumers increasing demand for information

Perhaps due to increased media coverage of health issues, consumers have become more health conscious and are increasingly taking greater interest in the healthiness of their food choices (Filimonau and Krivcova, 2017; Bray and Hartwell, 2018). Particularly, consumers have shown desire for more healthy food, including dishes that consist of fewer calories than usually encountered (Roseman *et al.*, 2013). However, it is important to note that not all consumers wish to receive the same information. Price *et al.* (2016) identified diverse kinds of information that different consumers are seeking when selecting food items especially out of home. The factors uncovered include information relevant to religious constraints; allergen information; environmental impacts; specific dietary requirements; production methods; provenance as well as general health and nutritional factors. There is a distinct challenge to providers to make such varied and detailed information available. Further, if information is provided, consumers often find it difficult to process such a plethora of data in a timely manner. Even if two people wish to receive the same information, they may both be

1
2
3 dissatisfied by its provision, as it could be too difficult to understand for one, whilst not
4
5 meeting the detailed needs of the other (Hartwell *et al.*, 2019).
6
7

8 *Information provision*

9

10
11 With such a wide range of consumer informational demands, there is a clear challenge for
12
13 operators to be able to deliver this information in a comprehensible, meaningful and trusted
14
15 manner (Price *et al.*, 2017). Food providers can satisfy legal requirements by delivering
16
17 information in a dry factual manner that is not necessarily received, processed or well
18
19 understood by the consumer (Sunstein, 2013). On the contrary, there is evidence to suggest
20
21 that consumers are often overwhelmed by the information presented (Mai, 2013), and can
22
23 struggle to assess its value, usefulness or quality (Ruževičius and Gedminaitė, 2007); factors
24
25 that could lead to disengagement altogether. Other studies have shown that consumers are
26
27 often not able to process and understand the information that is currently provided due to
28
29 cognitive limitations; since the information requires some prior knowledge and mathematical
30
31 ability to process (Persson, 2018). Time pressure at the point of purchase has been
32
33 highlighted as a further constraint (Persson, 2018). One study found that 78% of consumers
34
35 find the information provided on food packaging difficult to understand (Zuehlsdorf and
36
37 Spiller, 2012).
38
39
40
41
42
43
44

45 Persson (2018) highlights that to be effective, information must be concise, simple, reliable,
46
47 accurate and complete, but also communicated to the consumer in an individualised way.

48
49 There is a growing understanding in this area that the tailoring of information provision to
50
51 different consumer groups or even each individual consumer may be the only way to satisfy
52
53 current needs in a clear and comprehensible manner (Souiden *et al.*, 2013).
54
55
56
57
58
59
60

1
2
3 Food systems have evolved to be complex and although the end consumer has some
4
5 knowledge, information is vast and difficult to interpret (Bildtgaard, 2008). Moreover, food
6
7 service is anonymised and the consumer alienated from the production, therefore, it is
8
9 increasingly difficult for the consumer to judge the qualities of food through traditionally
10
11 used methods such as personal interaction or sensory judgements (Kjærnes, 2012). Trust is an
12
13 important component of foodservice, in times where the consumer takes a less active role in
14
15 production, information therefore providing transparency is important. Catering operators
16
17 that are open and transparent, demonstrate commitment and trustworthiness to their clients.
18
19
20
21
22
23

24 In summary, consumers are demanding more information, but where this is currently
25
26 provided, there is not clear evidence that it is impacting on choice. To be effective, studies
27
28 have highlighted the need for information to be presented in a clear, trusted and easily
29
30 accessible manner, and tailored to the needs of each individual consumer.
31
32
33

34 *Communication Theory*

35
36 The provision of nutritional information is communication to the consumer with the potential
37
38 to influence their purchase decision. One of the earliest and most widely cited marketing
39
40 communication theories is the progressive AIDA model which simply outlines how a
41
42 consumer must have Awareness of a product or issue; have an Interest in it; develop a Desire
43
44 for it before any Action can occur. Commonly attributed to St. Elmo Lewis (1903), this
45
46 model has appeared in several subtly different forms over the years with different researchers
47
48 proposing slightly different acronyms including various constructs.
49
50
51
52
53

54 Given that there are many precedents adapting the basic AIDA model to specific contexts, it
55
56 is useful to reflect on the communication aspects that have been discussed in the literature
57
58 concerning the role of enhanced product information in eating out food selection. Firstly, the
59
60

1
2
3 need for information to be presented in a clear manner that is easy to access and process was
4
5 discussed, and secondly, the need for the information to be relevant to each individual
6
7 consumer through tailoring the information provided. Figure I depicts a framework
8
9 integrating these two new constructs within the traditional AIDA structure.
10
11
12
13

14 {Insert Figure I about here}
15
16
17
18

19 Technological solutions offer the potential to personalise communication including health
20
21 messages (Flaherty *et al.*, 2018). Further, from a business perspective such tools could be
22
23 used to add value and target specific customer segments (Flaherty *et al.*, 2018), however no
24
25 research has been undertaken to understand consumer interest in such initiatives, likely
26
27 adoption rates or what features such tools might incorporate. This study aims to fill this
28
29 knowledge gap.
30
31
32
33

34
35 The primary research presented here will build upon our reconceptualization of the AIDA
36
37 model, and assess the potential for a technological solution to address the need for salient
38
39 information in an accessible manner on a personalised basis. **We will probe consumers'**
40
41 **attitudes towards the use of app technology in an eating out context and assess its current and**
42
43 **desired future use in this domain.**
44
45
46
47
48
49

50 **Methodology**

51
52 Since research in this area is nascent and fast moving it is necessary to approach the research
53
54 questions in an inductive manner. Further, since idea generation and discussion to develop
55
56 and debate current and possible future practice was necessary to the aims of the study, a
57
58 group-based approach was adopted through focus group discussions.
59
60

1
2
3
4
5
6 Focus groups were designed and moderated along established guidelines (Krueger and Casey,
7
8 2014). Four focus groups were conducted in the United Kingdom, two with staff from large
9
10 companies who had access to and regularly used (at least twice a week on average), a work
11
12 place canteen, and a further two with students who accessed on-campus food service. Focus
13
14 groups contained between six and eight participants each, with a total sample of 28 diners.

15
16
17 Following the guidance of Tuckett (2004) data collection was guided by the descriptive
18
19 saturation principle in qualitative research. Preliminary analysis of the four focus groups
20
21 highlighted that descriptive saturation of the data had been achieved such that no new data
22
23 themes emerged in the latter group. Other exploratory studies in the food sector have adopted
24
25 a similar approach (see Nandonde and Kuada, 2018; De Silva Kanakaratne *et al.*, 2020).
26
27
28
29

30
31 The research was not limited to participants dining in their work/study place canteen, and
32
33 also considered other out of home dining experiences such as restaurants or fast-food outlets.
34

35 Access to, and use of eating-out was the main inclusion criteria. Participants were recruited
36
37 through convenience sampling while gender balance and a range of ages was assured. The
38
39 sample was typical of a normal population with some having allergen requirements. To
40
41 reduce any possible bias in the response, the presence or absence of food allergies or
42
43 particular dietary requirements were not discussed in participant recruitment. The
44
45 composition of each focus group is summarised in table I.
46
47
48
49

50
51 {Insert Table I about here}
52
53
54
55

56 Since it is well documented that technology adoption varies between generational cohorts
57
58 (Taipale *et al.*, 2018), each focus group included participants of similar ages providing a
59
60

1
2
3 degree of commonality in terms of technological experiences. It is considered best practice
4
5 in such discussion groups to cluster participants in such a manner to ensure that all
6
7 participants feel comfortable, and that they feel fully included to facilitate the richest possible
8
9 discussion. Each participant gave informed consent prior to the commencement of the focus
10
11 group discussions and ethical approval was granted prior to data collection. It was not an aim
12
13 of this study to identify differences between different consumer groups, and after preliminary
14
15 analysis of the four focus groups data saturation had been reached.
16
17
18
19
20

21 An experienced moderator convened each discussion and was joined by a trained observer,
22
23 who was impartial to the research. The observer monitored the group discussions to ensure
24
25 that all aspects were being addressed and to interject if they observed any group member's
26
27 contribution had been missed. To ensure that each group discussion followed the same
28
29 structure and addressed the same key objectives, the same moderator and observers
30
31 conducted each group, and a structured discussion guide was compiled with a broad, open-
32
33 ended questioning route and prompts. This discussion guide was developed from the
34
35 literature and comprised probes relating to current use of technology when eating out; the
36
37 functionality sought and participant feedback on contemporary provision. To introduce the
38
39 topic and ensure that all participants were relaxed the moderator identified how eating out
40
41 was defined in this study, and discussions identified how often each participant eats out of
42
43 home during a normal week, and the aspects that were particularly liked or disliked. Current
44
45 uses of technology to aid eating out behaviours were initially collated through an individual
46
47 writing task before being discussed in each group. Participants were asked to consider
48
49 possible future technology applications that they would consider useful in this context.
50
51
52 Finally, the concept of a smartphone app that might provide enhanced dish information in a
53
54 personalised manner was introduced and discussed by each group.
55
56
57
58
59
60

1
2
3
4
5 The protocol was pre-tested with a small number of one-to-one interviews (n=6) prior to use
6 to ensure that the parlance was clear, wording used was grounded in the consumers own
7 vocabulary and initiated a free discussion (Krueger and Casey, 2014). In keeping with
8 qualitative research principles, the moderator did not follow this guide rigidly, and the
9 discussion was allowed to freely develop to ensure that all possible ideas could emerge and
10 be discussed. A relaxed and informal tone was maintained and moderator involvement was
11 kept to a minimum to ensure that discussions progressed freely without unnecessary
12 intervention. Each group discussion was around one hour in length (mean length 62.40
13 minutes).

14
15
16
17
18
19
20
21
22
23
24
25
26
27
28 Discussions were recorded and transcribed verbatim. Data were coded manually within the
29 NVivo software package using open and axial coding to develop a template of emergent
30 factors (King and Brooks, 2016), which was refined through iterative coding and recoding to
31 ensure robustness of the findings.

40 41 **Findings and Interpretation**

42
43 There was a range of differing eating out practices among the research participants, however
44 all ate out of home (according to this study's parameters) between twice and seven times a
45 week. **Key themes reflected participants attitudes towards eating out and information
46 provision, current uses of technology in this setting and future technological applications.**

47
48
49
50
51
52
53
54
55
56
57
58
59
60
These themes are summarised in Table II.

{Insert Table II about here}

Information Provision

While our participants reported enjoying eating out, and particularly appreciating the quality and variety of food served, there were aspects that they disliked. Clear frustration was expressed in each discussion group around the inability to understand the nature and properties of dishes when eating out, with the lack of sufficient information about dish ingredients, nutrients and preparatory methods being discussed. One participant commented:

“Yea, it’s not just the calories, but I think it is just about the food in general and how it is being prepared and um what goes into it. [...] we continuously get frustrated by the lack of information...”

This comment highlights that for some consumers there is a general desire to understand more about what they are eating; others had particular dietary requirements such as vegetarian or gluten free, and experienced difficulties informing such choices:

“Yea, I’m not vegetarian, but the rest of my family are, including my children. So it is quite difficult to, to sometimes ascertain what’s in it and how it’s being cooked [...] you never know when eating out.”

Further to this, one participant had a potentially dangerous nut allergy and found eating out very difficult indeed due to a perceived lack of trustworthy information:

“Peanuts, I’m allergic to peanuts and it’s just impossible”

1
2
3 Many participants expressed strong interest in understanding better what they are eating for a
4 variety of different reasons. One participant in our research compared eating out with the
5 purchase of food in grocery stores, commenting:
6
7
8
9

10
11
12 *“It is not as easy as it is. Where in the supermarket you can look at the back or like*
13 *researching before you go but in the restaurant you don’t know.”*
14
15
16

17
18
19 Others suggested that through increased availability of nutritional information on food
20 products in a retail setting they have become more informed and would like to extend this
21 informed decision making practice into the eating out arena. Discussions raised the notion of
22 control, with participants expressing the desire to know what they are eating more fully such
23 that they could be more in control and empowered to make more informed consumption
24 choices. Some expressed dissatisfaction with hospitality service staff where they were not
25 trusted to be knowledgeable or caring enough to provide accurate information if it was
26 requested:
27
28
29
30
31
32
33
34
35
36
37
38
39

40 *“And even sometimes you ask them and they just kind of act like they know but you*
41 *can tell that they don’t. “Or they just lie.” “You wouldn’t be able to tell.”*
42
43
44
45
46

47 However, whilst greater information provision was generally sought, there were clear
48 differences between participants around the nature of information demanded. For some, the
49 presence of particular ingredients was important; others were interested in provenance or the
50 calorific content and nutrient profile of dishes. Interestingly, however, providing such
51 detailed dish information to all consumers could prove problematic in unexpected ways.
52
53
54
55
56
57
58
59
60

1
2
3 Some commented that they would rather not know, and that actually the inclusion of
4
5 information such as the calorific content of dishes to menus detracted their enjoyment.
6
7

8
9
10 *“I really don’t want to know exactly what’s in my food. I just want to eat it. It’s actually*
11
12 *putting me off now.”*
13

14 *“I don’t like to be pestered”*
15
16

17
18
19 From this discussion, it is clear that there is a strong desire from some consumers to receive
20
21 enhanced information on dishes when eating out however this provision needs to be managed
22
23 carefully to ensure that each consumer can receive just the insight they want and they are not
24
25 overloaded with information. Further, the concern that operational staff are not always
26
27 trusted to have sufficient knowledge to address questions raised by diners has not been found
28
29 in previous studies and provides an additional efficacy to communication through other
30
31 means.
32
33
34
35
36
37

38 *Current technology use*

39 Technology use has become embedded into our daily lives, and in the eating out context has
40
41 been embraced in a range of different ways. Discussions identified a wide range of ICT
42
43 functionality used to support eating out practices. These factors can be summarised in three
44
45 groups: 1) Marketing; access to offers, discounts or loyalty schemes 2) Enabled convenience;
46
47 online booking, viewing a menu in advance, maps and directions, ordering deliveries and
48
49 paying for food consumed 3) Access of additional information; photo and image sharing,
50
51 customer reviews, identifying unfamiliar ingredients and translation of foreign menus.
52
53
54
55
56

57 ~~It is notable that p~~Participants described smartphones as the platform for most of their
58
59 technical engagement relating to eating out. **Several functions were accessed through web-**
60

browsers on smartphones e.g. viewing an establishment's menu, reading reviews and seeking discount codes. While other information was accessed through apps that were dedicated to either an individual restaurant chain or service provider.

"terms of ordering take always I use apps all the time. I just do it on my phone."

"I would always check out a restaurants web-site for menus and prices on my phone before booking"

It is ~~those apps classified here as providing~~that provide access to additional information that may hold the potential to address the concerns identified by our participants around wishing to understand more about dishes when eating out. However, current exchanges of information only allow subjective peer to peer assessment of an establishment and most do not provide factual dish level information from a nutrient and allergenic perspective.

Future technologies

Given the current widespread use of technology by participants, avenues for future potential usage were identified. The first area introduced by participants centered around the introduction of digital menus provided on tablets that enabled consumers to view pictures of each dish, order, and possibly pay electronically. While this was identified as a potential future innovation, several participants noted that such a digital service was already provided in a small number of establishments and was generally liked for its novelty value.

The concept of using a smartphone app to access an establishment's menu and gain enhanced dish information in a personalised manner was discussed. Participants expressed enthusiasm toward the use of such an app and suggested that they would keenly engage with such a

1
2
3 technological solution at least some of the time. It was thought to be of particular use to
4
5 people who were trying to control their eating:
6
7

8
9
10 *“It’s a really interesting concept, I think, and I think it will help a lot who are on*
11
12 *diets.”*
13
14

15
16
17 And for those diners who may have allergies, intolerances or specific dietary preferences
18
19 such as vegetarianism. One participant framed the discussion well when ~~they~~he said:
20
21

22
23
24 *“I think it is useful [...] because a lot of the time my friend is really fussy about what*
25
26 *she can eat and they also always ask the waiter or waitress does this have this and this*
27
28 *in it and sometimes what they respond you don’t have a lot of confidence in it. And you*
29
30 *be like, are you sure, am I going to have a reaction to that? And you should know this*
31
32 *a bit better, it would be nice not having to ask and to worry and to know that this is*
33
34 *going to be factual.”*
35
36
37
38
39

40 The notion of the consumer gaining control over what they were eating was felt strongly by
41
42 some participants, and it became clear that our participants would trust information provided
43
44 in such a manner more than they would information provided by staff. It was commented
45
46 that such information provision would make them more confident in their choices, would
47
48 make it easier for them to eat-out and consequently make them more likely to patronise
49
50 establishments offering such functionality.
51
52
53

54
55
56 One group member questioned how the provision of enhanced dish information might make
57
58 dining in a restaurant or canteen ~~intolerably~~ inefficient, commenting that:
59
60

1
2
3
4
5
6 *“[...] it will take up ages though to start ordering what you actually want.”*
7
8
9

10 However, through discussion, the notion that the information provided could be tailored to
11 each consumer providing each with only the information that was of salience to them was
12 outlined. Through this, it was thought that such information provision might actually make it
13 quicker for diners to be able to identify dishes that meet their dietary requirements and
14 preferences and avoid concerns of ‘information overload’. The need for the personalised
15 provision of information was very clear to a number of participants, with one commenting:
16
17
18
19
20
21
22
23
24
25

26 *“Surely to be able to give you accurate information they need to know your details.*

27
28 *The reason why I don’t like those things is because I don’t think it represents the*
29 *person. So if I ever was going to be interested in that it would have to be*
30 *personalised.”*
31
32
33
34
35
36
37

38 The opportunity to consider a menu in advance of the dining occasion was discussed. Several
39 participants commented, for example, that they could consider their workplace canteen menu
40 before leaving home, providing them with the opportunity to proactively take a packed lunch
41 with them if the offered dishes were not suitable to their needs.
42
43
44
45

46 In spite of positive discussions around the concept of a smartphone app providing
47 personalised enhanced dish information, the notion was not universally liked, with one
48 participant commenting:
49
50
51
52
53
54
55

56 *“I use my phone a lot to buy things but I wouldn’t want to go to a restaurant and do*

57 *it. If I’m going out for dinner I want to put my phone in my bag and that’s it.”*
58
59
60

1
2
3
4
5 While this did seem to be an isolated view, a small number of other participants suggested
6 that they were simply not interested in understanding more about the food they were eating.
7
8
9

10
11
12 *“Like obviously you want to be healthy, but if not that bothered [...] I don’t think so. I*
13 *have never ever looked what is in something before I eat it.”*
14
15
16
17

18
19 Those who were keen to understand the composition or nutrient profile of dishes asserted that
20 any dynamic menu should still display all dishes available rather than just those which fit the
21 profile of the user, possibly in a less prominent manner, thus enabling the user to ‘disobey’
22 their usual choice criteria depending on their mood or situation. This was thought to
23 particularly apply to any elective calorie limit that had been selected with one participant
24 commenting that they
25
26
27
28
29
30
31
32
33
34

35 *“reserve the right to be naughty”.*
36
37
38
39
40

41 **Discussion**

42
43 This study has shown that consumers are aware of the need to consider the constituents and
44 nature of the food that we eat, and many have a keen interest in learning more about what
45 they consume. This confirms the findings of previous studies, which have also commented
46 on growing awareness and interest in information on food eaten out of home (Banterle *et al.*,
47 2012). It is notable however that the level of interest is not equal for all consumers; for some
48 it is considered a fundamental right to know what they are eating, while other participants
49 suggested that they would rather not know or be informed, and the presence of nutritional
50 information could even dissuade them from dining in a particular venue altogether.
51
52
53
54
55
56
57
58
59
60

1
2
3
4
5 For those who are keenly interested in the composition and properties of the food they
6 consume there is currently frustration when information is not available. These consumers
7 speak of a need to access detailed dish information in order to gain control and trust in what
8 they are eating. The role of trust in food is mainly influenced by humanistic understandings
9 of trust and can be categorised as interpersonal trust between individuals and institutions.
10
11 Consumers do not only value the literal message of food information but also the nuance of
12 that message; menu labelling can be seen as a key communication tool between foodservice
13 operator and consumer. Hereby, consumers make judgements about the trustworthiness of the
14 food operator in the absence of face-to-face contact (Tonkin, 2015).
15
16
17
18
19
20
21
22
23
24
25
26
27

28 This study has found that trust does not just exist between individuals and institutions, but
29 also between individual diners and their respective foodservice hosts. Waiting staff were not
30 always trusted to be able, or caring enough, to provide accurate information on food items.
31
32 This suggests that secondary and objective means of data presentation are required for
33 consumers to feel that they can control their food choice. Further, the information needs to
34 be available to the consumer on-demand and in an easily accessible format. Previous studies
35 have highlighted the efficacy of digital menus, citing their ability to present extended product
36 information (Hartwell *et al.*, 2016), however, if this information is not presented carefully it
37 can 'overload' the consumer (Mai, 2013). Ruževičius and Gedminaitė (2007) suggest that if
38 data is presented in a generic manner diners can struggle to assess its value and usefulness
39 which naturally impacts engagement and effectiveness.
40
41
42
43
44
45
46
47
48
49
50
51
52
53
54
55

56 In parallel with other studies, most recently Price *et al.* (2016), the research conducted here
57 has highlighted that not all consumers wish to receive the same information. Consequently,
58
59
60

1
2
3 for information to influence actions it must be relevant and salient to each individual
4
5 consumer. Through this study, it has emerged that the required customisation of information
6
7 provision could be most effectively facilitated through personal ICT solutions. The concept
8
9 of using a smartphone app to access personalised information on the nutrients, ingredients
10
11 and allergens was viewed positively by many participants. It would appear to offer
12
13 consumers the control that they seek over what they eat, and would deliver the information
14
15 through a medium and process that they trust.
16
17
18
19
20

21
22 The findings from this research confirm the applicability of communication theory to the
23
24 eating out context. A key negative factor discussed by participants was the perceived lack of
25
26 control and insufficient information about, dish ingredients and nutrients. There is a clear
27
28 need to provide greater communication to address this, but any such communication needs to
29
30 be considered carefully to ensure that it is well understood and salient to each consumer. The
31
32 AIDA model (Hanlon, 2013) provides a clear framework for communication, and the
33
34 research presented here confirms the usefulness of the additional elements proposed in **figure**
35
36 I. Further, the data presented provides a clear guide to the key considerations at each stage of
37
38 the communication process when applied to an eating out of home context.
39
40
41
42
43
44

45 Within AIDA, *awareness* in this context links to consumer familiarisation with nutritional
46
47 information in the retail sector while *interest* is driven by consumers' dietary requirements
48
49 and motivations to select the most healthy or appropriate dish. From the primary research,
50
51 some consumers have a clear *desire* to receive additional dish information. Studies in food
52
53 selection have highlighted the challenges of clearly communicating the potentially complex
54
55 array of food data in an accessible manner (Nocella *et al.*, 2014), and as such *accessibility*
56
57 and the need for individual *relevance* and saliency are underscored and proposed as essential
58
59
60

1
2
3 additions to the communication model in this context (figure II). Specifically, *accessibility*
4 highlights the need to make information quickly, easily and clearly available. *Relevance* and
5
6 saliency stress the necessity for personalized information delivered through a tangible,
7
8 objective and thus trustworthy medium. When delivered in an *accessible* and *relevant*
9
10 manner, consumers are more likely to act upon the data presented to make more informed
11
12 choices, leading to more confident *actions*, and for some, making the eating out process
13
14 easier, more enjoyable and potentially healthier.
15
16
17
18
19
20
21

22 {Insert Figure II about here}
23
24
25
26

27 **Conclusion**

28
29 Studies have clearly demonstrated that consumers have a strong desire to be more informed
30
31 about what they are eating (Banterle *et al.*, 2012), and through enabling this, diners will be
32
33 more confident in the choices that they make, and eating out will, for those who have
34
35 particular dietary needs become a lot easier. Industry should seek to develop such solutions to
36
37 ensure that it is possible for consumers to be confident about provision. Further, for some
38
39 consumers, enhanced information delivery is likely to increase their dining enjoyment, and
40
41 increase their likelihood to patronise establishments which provide such communication.
42
43
44
45
46
47

48 This study is the first of its kind to consider both a theoretical conceptual framework as it
49
50 relates to food messaging and the needs of an increasingly discerning consumer in a real life
51
52 eating out context. Through uniquely applying marketing communication theory to the
53
54 context of eating out and food choice a greater understanding is brought to best practice
55
56 within the hospitality industry. It is argued that electronic provision is most suited to meeting
57
58 the challenges of providing relevant and salient food information to each individual
59
60

1
2
3 consumer. Participants in this research demonstrate a clear willingness and desire to embrace
4 such provision if it was customized to their own individual needs. The insights identified can
5
6 be realistically and viably accomplished by operators providing clear consumer benefits and
7
8 thus competitive advantage. The potential impact of practical advances in this field are
9
10 broad, not only influencing consumers' enjoyment, sense of control and trust but also helping
11
12 the sector to improve accountability and effective communication.
13
14
15
16
17
18

19 *Limitations and directions for future research*

20
21 A limitation of qualitative research is the inherent small sample sizes. While the data
22
23 presented here is saturated, no claims of generalisability can be made. Notwithstanding, the
24
25 hearts and minds of the participants have been represented providing clear guidance to the
26
27 sector. The research was conducted in the UK on a highly dynamic topic. Future studies
28
29 should replicate this work to maintain currency and investigate the applicability of the
30
31 findings presented here to other territories. Further, additional research could usefully
32
33 elucidate the caterers perspective.
