*Work undertaken by:* Museum of London Archaeology Service

Evaluation test pits revealed post-medieval features associated with drainage of the Moorfields Marsh, within which the site is situated. The ceramic assemblage consisted entirely of post-medieval domestic pottery dating from the 17th century. Mitigation of the development in this case will be adequately served by a watching and stopping brief, on excavations associated with the development in the area to the rear of the building. [Au(abr)] *SMR primary record number:* 19/253

Three trenches were excavated within the site. Within the northernmost trench, a single feature was identified and is likely to have been caused by animal activity and contained a single piece of 17th century residual pottery. Identified in the southernmost trench was a single post, set in a posthole containing 17th century pottery and a sub-circular feature also containing 17th century pottery and a high quality of brick and tile fragments, likely to be a refuse pit.
