*Work undertaken by:* GSB Prospection

All the detailed gradiometer survey datasets contained evidence for past ploughing, some of which can be firmly attributed to extant ridge and furrow. Detailed survey detected two groups of linear and pit-type anomalies and area of increased magnetic response, which appear to form part of former field systems. One of the groups has been severely disturbed by ploughing. In contrast, the other group seems undisturbed and may, therefore, be more recent, perhaps even modern.
