*Work undertaken by:* GSB Prospection

A gradiometer survey was carried out on the site. The site contained too much magnetic interference to provide an accurate representation of archaeological remains. A band of anomalous material was thought to represent kiln waste, but later turned out to be modern. [Au(adp)]

*Work undertaken by:* English Heritage

A geophysical survey using magnetometer and resistivity techniques was carried out on the site. The results showed a complex of structures interpreted as a Roman villa. Linear features were identified around the villa. A platform identified in an earlier survey of the site, was found to be associated with possible quarrying activity. Possible prehistoric ring ditches were also identified on the site. The results of the survey led to the site being scheduled. [Au(abr)]

*Archaeological periods represented:* PR, RO, UD
