RPS Oxford Abingdon : RPS Consultants, 2007, 10pp, colour pls, figs, tabs, refs

Work undertaken by: Hertfordshire County Archaeologist

The site did not include any locally-designated Areas of Archaeological Significance and was located well to the south of known settlement activity in the Saxon, medieval and post-medieval periods. For these reasons and because of pre-existing development impacts, there was considered to be only a low potential for the presence of archaeological remains of more than local or regional importance within the site. Land at Bittering nr. Dereham, Norfolk. Proposed Extraction of Sand and Gravel with Restoration to Agriculture and Nature Conservation Uses. Environmental Statement

Josephs, A Wiltshire : A. Josephs, 2007, 397pp, colour pls, figs, tab

Work undertaken by: tarmac

The application area was deemed to have a low level of archaeological activity, although of some significance at a local and regional level. However, the presence of prehistoric activity was noted, possibly industrial use and/or occupation, in the southern area of the proposed extension. This area may also have seen some limited use in the Roman period. Additionally, there was as yet undatable use of the site further to the east and north, including a probable enclosure complex. Archaeological features identified in Field 1 by a desk-based assessment and geophysical survey also remain undated. In part, this evidence accords with the pattern of known archaeological and historic remains for the wider area. The detailed assessment work carried out to date has identified the main foci of archaeological interest within the application area. This has allowed a mitigation scheme to be proposed with confidence. Nevertheless, it is possible that other sites and features of archaeological interest will be encountered during the development, and archaeological supervision of soil stripping will ensure that any such sites will be investigated and recorded. Work undertaken by: Royal Haskoning

The archaeological desk-based assessment found that over 100 archaeological sites were Listed on the Norfolk Historical Environment Records database within the survey area, dating from the prehistoric, Iron Age, Roman, medieval and WWI and WWII time periods. These included two Scheduled Monuments, several Listed Buildings, two Registered Parks and Gardens, earthworks, cropmarks and a variety of finds such as pottery remains, coins and jewellery. Most of the known sites could be avoided, but some finds or features may not have been. However, mitigation strategies would be implemented in order to protect archaeological remains. No archaeological sites were identified in the area of the proposed sub-station. [Au(adp)]

Although the potential for buried archaeological remains within the footprint of the development site was low, the magnitude of change on any such resources was deemed as substantially negative. Any buried archaeology was believed to be of low value and the effect on this resource, before mitigation, had a significance of moderate to slightly adverse. The development would have a substantial to intermediate negative impact on remains relating to a military airfield within the footprint of the development site. This resource was considered to be of low importance and the significance of the effect of the development was deemed to be moderate. [Au(abr)]

"RIVERBANK HOUSE", 2 SWAN LANE

Riverbank House Environmental Statement 12/03/07 Non-technical Summary

Pace Investments (City) Limited London : Pace Investments (City) Limited, 2007, 17pp, figs

Work undertaken by: Museum of London Archaeology Service

An archaeological assessment of the impact of the Riverbank House Development on the potential archaeological resources present at the site was undertaken. This considered the archaeological potential of the site and the likely impact on this of the proposed redevelopment. The site was in an area of archaeological potential of all periods from Roman to post-medieval. Although much of the site was deeply basemented it was likely that there was a degree of archaeological survival outside the current basement footprints and below 19th century basement truncation. The site was the subject of archaeological excavation and a major watching brief in 1981 prior to the construction of the present building. [Au(abr)]

Askew, P & Burton, E & Dawson, H & Sankey, D London : Waterman Environe, 2007, 154pp, Colour pls, figs, tabs, refs

Work undertaken by: Museum of London Archaeology Service

The site lay in an area of archaeological potential for remains dated from the Roman to the post-medieval period. Given that a double basement extended under the footprint of the whole site, limited horizontal stratigraphy was expected. There was also potential for deep cut features, such as wells and pits, across the site as a whole. It was recommended that any geotechnical works carried out were monitored by an archaeologist to establish the extent of any archaeological deposits surviving on the site. It was also suggested that field evaluation was necessary, in order to provide further information on the nature and levels of deposits beneath the existing subbasement slab. The results of the evaluations would enable an appropriate mitigation strategy to be recommended by the local planning authority, if required. [Au(abr)]

Environmental Statement Leamouth Peninsula North First Issue

Harris, PLondon : Waterman Environmental, 2007, 17pp, colour pls, figs

Work undertaken by: Waterman Environmental

Site surveys together with a review of various historical information sources and consultation with English Heritage was undertaken to determine the effect of the development upon potential archaeological deposits present at the site and buildings and structures of heritage value. Historical reclamation of the site may have preserved earlier land surfaces. Consequently deep deposits in peat and alluvium were anticipated to have survived at some depth beneath the made ground associated with the development evolution of the site. Conversely, whilst the site was located within the LBTH designated Lea Valley Area of archaeological importance, foundations and basements of successive large scale buildings were likely to have caused substantial and extensive disturbance and destruction

of archaeological deposits and features from all periods. As such there may have been low potential for foundations and sub-foundations to exist, although these were likely to have been severely disturbed by later development. With regards to built heritage the site did not contain any buildings or structures of any built heritage value. However, there were two Grade II Listed Buildings nearby. [Au]

TROW QUARRY, SOUTH SHIELDS

Remediation and Protection of the Coastal Margin at Trow Quarry, South Shields. Non-Technical Summary

Nicholson, A London : Royal Haskoning, 2007, 21pp, colour pls, figs, tabs, refs

Work undertaken by: Royal Haskoning

An Environmental Impact Assessment was carried out at the site. The construction phase of the scheme had the potential to affect the historic environment through damaging, disturbing or unearthing archaeological remains. Excavation and disturbance would however, be limited to the infill material which was not of archaeological interest itself. In addition the engineering solution proposed would leave the summits of Trow Point, Target Rock and the quarry perimeter undisturbed. This would preserve any archaeological remains that these areas may have contained. As such with the adherence to suitable mitigation there was considered to be negligible impact on this receptor. It was expected that there would be no impact during the operational phase. [Au(adp)]

Naylor V Leeds : Spawforths, 2007, 91pp, colour pls, figs, tabs, refs

Work undertaken by:

It was considered that cumulative impact could potentially occur as a result of the development of the area. These impacts were associated with the loss of medieval ridge and furrow that was identified across the wider development area. However, it was considered that the cumulative impacts would be minor in significance due to a Written Scheme of Investigation, which was a condition on the outline planning permission of the wider area, and included field walking, earthwork survey and historic building assessment. Therefore all potential archaeology in the area would be assessed and recorded as appropriate to minimise and mitigate any potential impacts. [Au(abr)]

CAISTRON QUARRY

Periodic Review of Caistron Quarry. Environment Statement

Wardell Armstrong Newcastle under Lyme : Wardell Armstrong, 2007, 188pp, colour pls, figs, tabs, refs, CD

Work undertaken by: Wardell Armstrong

An Environmental Statement was carried out concerning the proposed extraction of sand and gravel at the site. A scheduled oval mound containing a Bronze Age cist burial (SAM number ND389) was

present approximately 525m west of the site boundary. The monument was visible from the access track of the site. The track was already in use by quarry vehicles. Therefore the proposed continuation of sand and gravel extraction will have an impact of neutral significance upon the setting of the Scheduled Ancient Monument. There were no recorded buried archaeological remains recorded within the site boundary, however, the SMR recorded an Iron Age enclosure approximately 270m west of the site boundary and a number of later medieval deserted settlements surrounding the site in the wider search area. These

demonstrated a potential for archaeological remains to be present within the site boundary dating to these periods in particular. In addition aerial photographic analysis demonstrated the survival of ridge and furrow within the site boundary which was likely to date to the medieval period. Furthermore an enclosure with evidence for internal activity was visible within the site boundary on aerial photographs, predating the commencement of quarrying which had subsequently disturbed this feature. The impact of the proposed commencement of quarrying upon potential buried archaeological remains would have an adverse impact of up to moderate significance. Mitigation measures were suggested. Cemex UK Thorpe : Cemex UK, 2007, 23pp, colour pls, figs, refs

Work undertaken by: Cemex UK

An archaeological assessment was prepared that found records spanning the prehistoric to post-medieval period. There were also extensive records of prehistoric occupation and widespread earthwork remains of medieval activity around local villages. No known sites lay within the boundary of the site. It was concluded that the development would not affect any known archaeological sites either directly or indirectly. However, it was concluded that given the evidence of remains within the wider area there was potential for the survival of previously unrecorded features within the un-worked area of the quarry. It was likely that further archaeological evaluation may be necessary to determine any archaeological potential and should form part of an agreed archaeological investigation scheme. [Au(abr)]

Work undertaken by: GSB Prospection

The site was located within the buffer zone of Hadrian's Wall World Heritage Site. The impact of the commencement of quarrying upon the setting of the World Heritage Site, which was also designated as a Scheduled Monument, was assessed. It concluded that the significance of the impact ranged from neutral to minor adverse. Due to the archaeological sensitivity of the site, detailed geophysical survey was carried out within the boundary of the site and along part of a proposed route of a haul road. A number of anomalies were identified, although none of these were thought to represent nationally

significant archaeological remains. However, further evaluation of features was recommended prior to the commencement of quarrying. [Au(abr)]

Ove Arup & Partners Ltd London : Ove Arup & Partners Ltd, 2007, 30pp, figs, tabs

Work undertaken by: Ove Arup & Partners Ltd

An environmental statement was carried out at the site. The application site lay within a landscape of non-intensive historic activity, the main interest for which would probably have been utilisation of the land for wetland resources and summer grazing until the land was enclosed in 1814. One possible archaeological site may extend beneath the proposed location of turbine 2 and any impact on this site would be mitigated by archaeological investigation and recording. A remote chance of archaeological discoveries during other parts of the construction hypothetically existed and this would have been managed through archaeological monitoring of groundwork. A total of 12 other sites and Grade II Listed Buildings have been identified as lying within a 2km radius. [Au(adp)]

THE ROCK TRIANGLE, BURY***Environmental Statement Volume 1. The Rock Triangle, Bury. Detailed Planning Application July 2007***

Waterman Environmental Consulting Engineers & Scientists London : Waterman Environmental Consulting Engineers & Scientists, 2007, 182pp, figs, tabs, refs

Work undertaken by: WCPM

An environmental assessment was carried out and revealed that there was potential for limited medieval archaeology to survive on the site. It was, however, likely to be within the restricted geographical area and possibly rather disturbed and truncated. 18th century archaeology associated with the industrial development of the town survived across much of the site. Built heritage resources were sparse and of no greater than local importance. The older buildings were of limited architectural merit and had been extensively altered up to the present time. The minor adverse impacts that the clearance and development of the rock triangular development site would have on archaeological and built heritage resources would be adequately mitigated by the execution of the agreed programme of investigation and recording. Once completed this development was unlikely to give rise to any negative effects on archaeological or built heritage resources. [Au(adp)]

MARLOW FOOTBALL CLUB RELOCATION TO LAND AT WESTHORPE FARM EAST OF A404, MARLOW

Marlow Football Club Relocation Environmental Statement Volume 2. Non-Technical Summary

Thomas, N Cirencester : Waterman Environmental, 2007, 11pp, figs, CD

Work undertaken by: Waterman Environmental

A thorough assessment was undertaken of the potential environmental impacts of the development in terms of its design and construction and the ongoing effects once it was completed. Mitigation measures were incorporated into all phases of the development to reduce potential adverse impacts. however, despite the implementation of best practice measures, some degree of disruption would inevitably be caused during construction. As such, some temporary adverse impacts were expected in relation to noise, transport, landscape and visual quality. No impact assessment of archaeological or built heritage was undertaken. White Young Green Birmingham : White Young Green, 2007, 214pp, colour pls, figs, tabs

Work undertaken by: White Young Green

An environmental impact assessment was carried out at the site and the proposed activity would involve the construction of two new buildings, however, it was thought this development would have

no impact on the archaeological designations and no impact upon any buildings of architectural significance. The risk to archaeological or architectural heritage from the proposed development was therefore considered to be negligible with no short or long term impacts and no irreversible impact. [Au(adp)]

Bird In Eye Farm South, Uckfield, East Sussex. Desk Study Report January 2007

Wood, L & Reuter, R Newcastle under Lyme : Wardell Armstrong, 2007, 112pp, colour pls, figs, tabs

Work undertaken by: Wardell Armstrong

A desk-based assessment was carried out as part of an Environmental Impact Assessment. The preliminary assessment consisted of an assessment of ground conditions and to identify potential constraints in respect of a proposed residential development at the Bird In Eye Farm. The archaeological setting of the site is beyond the scope of this report. However, it may have been considered prudent to consult with the appropriate authorities (county and local) to assess their requests in the future. [Au(adp)]

Land to the East of Shepham Lane, Polegate. Environmental Statement Non-Technical Summary

George Wimpey Uk Ltd Wycombe : George Wimpey UK Ltd, 2007, 6pp

Work undertaken by: George Wimpey Uk Ltd

An environmental impact assessment was carried out and revealed that the site contained no known archaeology and there are no known sites or monuments close to the site. Intensive archaeological work associated with the construction of the A 27 Polegate Bypass suggested that the area was not of notable archaeological potential. On this basis there was no reason to believe that important

archaeological remains exist within the site and that no further assessment or evaluation was needed.

BIDDENDEN TO STUBBS CROSS MAIN LAY

Biddenden to Stubbs Cross Main Lay, Environmental Statement

EJW Crawley : Halcrow Group Ltd., 2007, 300pp, colour pls, figs, tabs, refs

Work undertaken by: Halcrow Group Ltd.

An environmental impact assessment was carried out for the site of the Biddenden to Stubbs cross main lay. There are no Scheduled Ancient Monuments or World Heritage site, there are three Registered Historic Parks and Gardens that lie in the proximity of the pipeline and 56 Listed structures (one Grade I Building of national value, one Grade II* Building of regional importance and the remainder being Grade II Buildings of local importance). There would be no impact on any known archaeological sites. However, during the construction period there may be temporary adverse moderate impacts on the setting of up to 20 Listed Buildings of local value that lie within the edge of the zone of visual influence of the proposed scheme. A programme of preliminary fieldwalking, and/or geophysical surveys and a strip, map and sample/record will be undertaken along the entire scheme prior to construction in 2008. [Au(adp)]

O'Kelly, D Surrey : JE Jacobs, 2007, 310pp, colour pls, figs, tabs, refs

Work undertaken by: JE Jacobs

An environmental impact assessment was carried out for the site and revealed that within the study area a wide range of periods from the Neolithic to the modern era are present. The sites within the proposed footprint range from the Roman to modern (AD43-present). It was thought that a Scheduled Monument and Listed Building may be subject to an indirect impact during the construction process. There were some find spots but the main archaeological sites which will have possible direct physical impact and direct impact are a curvilinear feature with possible pits to the west, pits and a possible occupation area, side ditches of metalled Roman road with building, possible lynchet identified during a field survey, a hollow way identified during field survey, Mystde House which was a Conservation Area and Mystole House Park, a Register of Parks and Gardens. Reeder, A London : WSP Environmental Ltd., 2007, 51pp, colour pls, figs, tabs, refs

Work undertaken by: WSP Environmental Ltd

An environmental impact assessment was carried out for the site and is required as part of the proposed redevelopment of the site, to assist with the planning process. Historical maps indicate that the site is a vacant plot of land that has not been developed since the first historic OS map dated 1874. Surrounding landuses include residential properties, a vehicle maintenance garage, a cemetery and a hospital. A historic landfill has been noted to the east of the site, the Land Authority Contaminated Land Officer indicated that the landfill was identified as gassing and that perimeter gas monitoring may be required prior to development. The site is considered to be of low/moderate sensitivity due to the residential properties in the area, the underlying unprotected Minor aquifer and the proximity of the area of unadopted green belt and the AONB (High Weald). Atkins Consultants Limited Leeds : Atkins Heritage, 2007, 22pp, figs, tabs

Work undertaken by: Atkins Heritage

An environmental impact assessment was carried out and a desk top assessment revealed that within 1km of the site there are a total of 134 statutorily Listed Buildings, comprising much of the historic core of Chipping Norton, plus 31 other assets of cultural heritage interest of which 11 are archaeological find spots and 20 are earthworks or sites of buried archaeological remains. Of these, three were Scheduled Ancient Monuments (Chipping Norton Motte and Bailey Castle and Fishpond-SM 21808 (which accounts for two in the HER) and Over Norton Round Barrow-SM21844). The site also lied on the eastern boundary but outside of the Chipping Norton Conservation Area. Based on current information the proposed development would have a neutral effect on known cultural heritage

assets within the proposed development area and no further investigation or mitigation works were proposed. [Au(adp)]

LAND AT EYNSHAM

Proposed Sand and Gravel extraction, Land at Eynsham, Environmental Statement

Corylus Planning & Environmental Cheltenham : Corylus Planning and Environmental, 2007, 468pp, colour pls, figs, tabs, refs, index

Work undertaken by: Oxford Archaeology

The site was within an area rich in archaeological remains and although it appeared to be in a gap in the distribution of crop marks, fieldwalking and trenching demonstrated that it contained a number of areas of archaeological interest. These included a complete late Bronze Age settlement, a Bronze Age ring ditch and associated satellite burials. Also late Bronze Age pottery, of regional significance. The archaeological assessment considered that the loss of these deposits without further recording would constitute a significant archaeological impact. However, it was concluded that this effect could be substantially mitigated through the implementation of a programme of investigation as agreed with the Oxfordshire County Archaeological Service. The assessment noted that there was a significant opportunity for the recovery of environmental evidence which would help to fill a gap in current knowledge of the contemporary landscape between Yarnton and the lower Windrush. Planning Application & Environmental Statement for an Extension to Lower Pit Freshfield Lane Brickworks, Danehill

SLR Consulting Limited Shrewsbury : SLR Consulting Limited, 2007, 256pp, figs, tabs, refs

Work undertaken by: SLR Consulting Limited

An environmental impact assessment was carried out at the site. The assessment identified a number of potential features of interest to the cultural heritage of the area. These would seem to relate mostly to the historic social and economic importance of iron working within the area, and included buried archaeological deposits, earthwork features and coppiced woodland. A further dimension might include remains of a different type from an earlier period, perhaps evidence for prehistoric settlement and cultivation. Although there was insufficient evidence as yet to assess the significance of the potential cultural heritage resource, the impact will be severe as clay extraction will involve total removal of the deposits and features in question. A mitigation strategy has therefore been designed to adequately investigate and record these features in a timely and expedient manner. This would lead to a residual impact of a net gain for archaeological knowledge within the area and of the iron working heritage in particular. The indirect impact of the proposed application to the settings of Listed Buildings has also been undertaken, and this demonstrated that any impact would be negligible. [Au(adp)]

GRACE ROAD***Proposed Energy From Waste Plant, Grace Road South Exeter Environmental Statement***

RPS Consultants Abingdon : RPS Consultants, 2007, 38pp, colour pls, figs, tabs

Work undertaken by: RPS Consultants

The assessment of the impact archaeology identified only one known archaeological feature within the proposed development site, a post-medieval field boundary. This was considered to be of local importance. Previous findings nearby, however, suggested that there was potential for other archaeological remains to be present. The existence of a timber trackway close by indicated the potential for timber structures of prehistoric or later date to be preserved beneath deposits and to be present under the site. A circular crop mark recorded 200 metres to the east might have represented the surviving below-ground "ring ditch" of a prehistoric barrow. There was also the potential for former watercourses to be present, these could contain palaeoenvironmental material. Most of the site was covered by concrete, but the depth of the slab and therefore the degree of truncation of the original ground surface was unknown. There was likely to be localised ground disturbance, however, as a number of service runs were visible on the site. Should archaeological deposits survived on the site then the principal impact from construction would be from the groundwork for the foundations of the new building, for associated service trenches and the excavation of a waste bunker. With a good level of mitigation, the overall effects of the development on the archaeological resource were likely to be minimal. [Au(abr)]

BERKELEY NUCLEAR POWER STATION***Berkeley Nuclear Power Station. Environmental Statement***

British Nuclear Group Gloucester : British Nuclear Group, 2007, 200pp, figs, refs

Work undertaken by: Terence O'Rourke

The construction of the power station in the late-1950s/early-1960s would probably have destroyed any significant archaeological features or deposits that may have been present within the pre-existing burial environment of the study area. It is possible, however, that some deeply-buried features or deposits, e.g. ancient land-surfaces may have survived in some areas, it is not uncommon within estuarine environments to encounter archaeological features and deposits buried at considerable depths. The proposed store was located in areas outside the footprint of former deep structures such as the turbine hall. It was possible, albeit unlikely, that deeply-buried features or deposits of archaeological interest were present within the existing burial environment in the area of the proposed new structure. LAND AT INNSWORTH***Land at Innsworth. Environmental Statement***

Pegasus Environmental Cirencester : Pegasus Environmental, 2007, 486pp, colour pls, figs, tabs, refs

Work undertaken by: CgMs

Evidence in the County Sites and Monuments Record, supplemented by site specific desk and field studies, have shown that a Romano-British farmstead formed by a series of ditched enclosures occurred in the western part of the study area. Evidence from field evaluation trenching suggested that the remains of this farmstead were considered to be of less than national importance. In these circumstances, the central and local government planning policy framework set out in Planning Policy Guidance 16 and development plans provided for mitigation by archaeological excavation ahead of development on the study area. The environmental impact assessment anticipated that to mitigate against adverse impacts to the sub-surface archaeological resource identified at the study area, planning permission for development on the study area would incorporate a condition relating to archaeology requiring a programme of archaeological investigations phased ahead of development. SALISBURY PLAIN TRAINING AREA, EAST***Salisbury Plain Training Area, East Infrastructure Project***

Enviros Consulting Ltd Shrewsbury : Enviro Consulting Ltd, 2007, 18pp, colour pls, figs, tabs, refs, index

Work undertaken by: Wessex Archaeology

The majority of impacts were deemed likely to occur during the construction phase. In terms of construction impacts on known archaeological features ranged from between slight positive and

moderate adverse significance, with the majority of effects being neutral or slightly adverse only. Impacts on several features were identified as being of moderate significance. These comprised a Roman/British burial; various linear (ditch/bank) features, prehistoric pits, World War I practice trenches, other military remains, sedimentary deposits, post holes/stake holes, field systems, a derelict barracks site, a tramway, historic hedgerows and two Scheduled Monuments (The Devil's Ditch and Brigmerston Down boundary bank and ditch). Impacts in general ranged from slight effects on the setting of features through to damage to or removal of specific features. Most impacts were related to the construction of a track with construction of hard standings and a training feature generally not resulting in significant impacts. In terms of operations any training activities which may involve deviating from the track will have the potential to affect the archaeological features and Scheduled Monuments close by through digging or vehicle damage. However, such training activities already occurred on the Plain. [Au(abr)]

Terence O' Rourke Bournemouth : Terence O'Rourke, 2007, 186pp, colour pls, figs, tabs, index

Work undertaken by: Oxford Archaeology

There were no further updates to the 2003 Environmental statement text. The conclusion set out in the 2006 report that the proposed development would not significantly affect the setting of Listed Buildings and was not altered by the inclusion of an element mixed use development in the master plan. The proposed building heights and densities in the Listed Buildings' 'setting area' remain unchanged from the 2006 master plan. [Au(abr)]

Quantum Property Partnership London : Quantum Property Partnership, 2007, 11pp, colour pls, figs

Work undertaken by: Quantum Property Partnership

An environmental impact assessment was carried out and revealed that cultural and archaeological heritage was represented by a range of features both visible and buried which resulted from past human use of the landscape. These included standing buildings both in use and derelict, sub-surface archaeological remains and artefact scatters. It also included earthwork monuments as well as landscape features such as boundaries and the remains of previous industrial activities. The historic fabric and setting of Newlands Farm would be preserved and enhanced where possible, in order to fully elucidate and record the Grade II Listed Building prior to any refurbishment works. A building recording exercise was required by the conservation officer. A comprehensive programme of archaeological investigation and recording was also required to mitigate the destruction of previously identified and potential archaeological features and deposits, and would be enacted pre-construction in accordance with a agreed brief. The programme involved area excavation recording and analysis of designated areas in addition to a general archaeological watching brief designated to monitor construction stage ground works elsewhere on the site. PROPOSED ASDA STORE AT PLOT C1 SOLSTICE PARK, AMESBURY

Environmental Statement Non-Technical Summary Proposed Store at Plot C1 Solstice Park

Jones Lang LaSalle London : Jones Lang LaSalle, 2007, 11pp, colour pls

Work undertaken by: Jones Lang LaSalle

An intensive programme of archaeological assessment, evaluation and mitigation had been carried out within the Solstice Park development since 1992 including the present application site. Following the evaluation by trial trenching, none of the areas were identified as having significant archaeological potential fall within or adjacent to the ASDA site, and only one archaeological feature of modern date could be shown to be affected. The possibility that archaeological deposits survived within the development could not be wholly excluded, however, and a programme of archaeological observation and recording during the preliminary phases of site stripping and other groundwork was proposed which would allow the recovery of information which might be present. The development was assessed as having a neutral to minor adverse effect on the cultural heritage overall. [Au]

SIXPENNY WOOD WIND FARM

Sixpenny Wood Wind Farm. Environmental Statement Non-technical Summary

Sixpenny Wood Wind Farm London : Sixpenny Wood Wind Farm, 2007, 26pp, colour pls, figs, tabs, refs, CD

Work undertaken by: Your Energy Ltd, Jorvik Wind Development Ltd

Effects on archaeology could occur as a result of direct ground disturbance during the nine-month construction phase to create turbine and crane pad foundations and to install tracks and underground cables. There were no known archaeological sites or findspots on, or in the immediate vicinity of any of the proposed turbine locations. The results of a baseline and walkover assessment were taken into account in development of the layout of the 10 turbines across the proposal site, as well as positioning the control building, anemometry mast, construction compound and access tracks, in order to avoid areas of known interest. The occurrence of palaeoenvironmental deposits at the proposal site had not been ruled out during the research for this assessment. Their presence should not be viewed as a constraint, but as an opportunity to comment on the former prehistoric landscape on the site, the overall integrity of which would remain unaffected by the construction of the proposal. If remains were uncovered as a consequence of the works for the sections of the new access tracks, turbines and crane pads, it was envisaged that the removal or alteration to these features and elements would not significantly affect the integrity of the archaeological site as a whole. Any additions to current knowledge and awareness of the site's true historical origins would be a beneficial effect of the proposal. Buildings in the area of the site would be temporarily affected by the development, but there were not thought to be any permanent impacts to built heritage in the vicinity. [Au(adp)]

May, R Sheffield : ARCUS, 2007, 118pp, colour pls, figs, tabs, refs

Work undertaken by: ARCUS

An Environmental Impact Assessment was carried out for the site and revealed five known archaeological sites within the application area. These comprised the late 19th century/early 20th century standing buildings of Love Street Works, a former steel works with crucible furnace recorded in 1896, and the site of the Britannia Works, Love Street. The mid 19th century Britannia metal and electro plate manufactory [which later became confectionary works] was demolished in 2002. The other sites included the site of the Soho Grinding Wheel, a steam powered grinding workshop, mainly demolished but with some standing remains incorporated into the later buildings. Also noted was the site of Don Confectionary Works, previously a steel and cutlery works with cementation and crucible furnaces shown in the 1820s replaced by an engineering works in the 1950s. The remains of 18th and 19th century housing were found during elevations in advance of the construction of the Family Court House. [Au(adp)]

Environmental Impact Assessment, Archaeological and Cultural Heritage. Holly Bank Farm Extension, Allerton Park Quarry, North Yorkshire

Fraser, M Barnard Castle : Northern Archaeological Associates, 2007, 92pp, colour pls, figs, tabs, refs

Work undertaken by: Northern Archaeological Associates

No designated sites or undesignated sites of national importance would be affected by the development. Sub-surface archaeological remains of Roman and possibly Iron Age occupation and agriculture were present throughout the southern and western parts of the proposed extension area. Peat deposits associated with a former watercourse were also present within the central and eastern areas. The potential for unrecorded remains of early prehistoric to late Roman date was considered high, although it was accepted that all remains would have suffered plough damage and should the development not proceed, ongoing agricultural activities would continue to degrade the archaeology. The proposed works would completely destroy all archaeological remains in the vicinity. The remains were not thought to be of sufficient importance to require preservation in situ, although appropriate mitigation was required. [Au(adp)]

RACECOURSE PARK, DERBY*An Archaeological Evaluation and Watching Brief at Racecourse Park, Derby*

Lewis, B Nottingham : Trent & Peak Archaeological Unit, 2007, 25pp, colour pls, figs, tabs, refs

Work undertaken by: Trent & Peak Archaeological Unit

The site was 200m south of a Roman road, the focus of a Scheduled Ancient Monument. An earlier desk-based assessment had identified the importance of the site in terms of this nearby Roman activity, including funerary and industrial activity considered by earlier researchers to be of National Importance. An evaluation was carried out, and a pit alignment was revealed running east to west through the northern part of the site, thought to be of Iron Age date. A watching brief after this evaluation revealed a further pit and post-medieval features, including a probable rubbish-filled field boundary. [Au(adp)]

ALL SAINTS CHURCH, ELTON
All Saints Church, Elton, Derbyshire. Report on a Watching Brief undertaken on Drainage Works

Shakarian, J Bakewell : Archaeological Research Services, 2007, 28pp, colour pls, figs, refs

Work undertaken by: Archaeological Research Services

The watching brief took place during the month of January 2007 and comprised the observing all ground works in relation to the installation of a new drainage system. The drainage system included four soakaways with related trenches and one French drain. During the work the remains of four articulated burials were encountered which had not been marked by headstones. Each burial was recorded and left in situ. Where necessary, the construction of a wooden box over the remains enabled them to be further protected. A sandstone wall was uncovered on the west side of the tower. The wall, believed to be an exterior wall, could possibly date from the previous church which was demolished in 1805 after the spire collapsed. [Au(abr)]

GREAT WILNE

Archaeological Excavation on the Site of Proposed Flood Banks, Great Wilne, Derbyshire. Interim Report

Kinsley, G Nottingham : Trent & Peak Archaeological Unit, 2007, 21pp, colour pls, figs, refs

Work undertaken by: Trent & Peak Archaeological Unit

An archaeological excavation was carried out relating to the construction of three new flood banks, pits to located buried services, and the levelling of existing flood banks. Area one contained at its northern end a dump of clay and coal including significant quantities of medieval pottery; in the centre and south end of the trench alluvial deposits contained abraded Roman finds including pottery but chiefly ceramic tile and stone tile. Two features were identified but neither produced dating evidence.

Subsequent construction revealed a widespread sequence of sands and gravels, some of which contained medieval pottery. No archaeological features were identified in Trench Two and the subsequent monitoring of construction. No archaeological features were identified in Trench Three, but in the subsequent monitoring of construction, two substantial depressions were located in the gravel floor of the trench. These were orientated east/west and might have been field boundary ditches, though of unknown age. Pottery, chiefly from area one, was largely medieval in date but close dating was not possible. QUARRY ROAD, SOMERCOTES

An Archaeological Watching Brief on Land at Quarry Road, Somercotes, Derbyshire

Hunt, L Leicester : University of Leicester Archaeological Services, 2008, A4 Spiral Bound

Work undertaken by: Hunt, L

An archaeological watching brief was undertaken by ULAS during groundworks at Quarry Road, Somercotes, Derbyshire (SK442 353). The site previously contained a large factory and had been developed throughout the 20th century, but is situated in an area, which may have been attractive to prehistoric settlers and is also near known post-medieval remains. The watching brief revealed that the site had been heavily disturbed by previous development and no archaeological remains or finds were revealed during the watching brief. The archive for this work will be deposited with Derby Museums and Art Gallery with accession number DBYMU2007-326. [OASIS(Au)]

1 MOOR LANE

1 Moor Lane, Old Bolsover

Thornton, A & Chatterton, R Bakewell : Archaeological Research Services Ltd, 2007, 17 page, printed and bound A4 report.

Work undertaken by: Archaeological Research Services Ltd

Archaeological Research Services Ltd (ARS Ltd) were commissioned by Mr and Mrs Pembleton to carry out a watching brief at 1 Moor Lane, Old Bolsover in May 2006 and January 2007. The work involved monitoring the excavation of foundation trenches for a proposed residential building and garage. The site is located in close proximity to the probable medieval embankments associated with the fortification of Bolsover Castle and the town. The brief supplied by Derbyshire County Council (DCC) required the observation of the removal of earth by a mechanical excavator in order to identify any significant archaeological features, deposits or finds. The area which was excavated displayed no evidence of archaeological remains. [OASIS(Au)]

 Work undertaken by: University of Leicester Archaeological Services
 An archaeological watching brief was undertaken by University of Leicester Archaeological Services (ULAS) on land to the north of St. Mary's School, Sandhills Avenue, North Hamilton, Leicester (SK 636 071) during ground-works associated with the building of new houses. The site lies within an area evaluated and excavated by Leicestershire Archaeological Unit in 1985-7 and 1994 and more recently by ULAS in 2000 and 2002, which revealed Iron Age and Roman archaeology. The site, therefore, had a high archaeological potential. However, no archaeological remains were observed. The archive will be deposited with Leicester City Museums with accession number A1.2007. Richards, G Leicester : University of Leicester Archaeological Services, 2007, 32pp, colour pls, figs, tabs, refs

Work undertaken by: University of Leicester Archaeological Services

The King William Bridge appeared to date from the late 17th century, and was mainly rubble build with two rounded arches, having also been subjected to widening on the downstream using brick. This widening was widely accepted to have taken place for the visit of King William III in 1696. As expected there had been extensive maintenance and repair making the identification of phases and repair extremely difficult. There was a possibility that some of the cobbled surface was original.  University of Leicester Archaeological Services Leicester : University of Leicester Archaeological Services, 2008, 47pp, colour pls, figs, tabs, refs
Work undertaken by: University of Leicester Archaeological Services
 The site was located close to the medieval core of Groby. Following a previous evaluation in January 2007, two extra trenches were examined. One contained a spread of rubble and stone land drains, while

the other had a large silt and clay filled cut, perhaps indicative of fish ponds or an outer castle ditch. This appeared to have been backfilled by the 12th or early/mid 13th century. A watching brief confirmed the presence of two walls and two ditches, and improved the understanding of the extents of the probable fish ponds identified in the evaluation. [Au(adp)]

LAND OFF WINDSOR STREET, MELTON MOWBRAY*Excavation on Land off Windsor Street, Melton Mowbray, Leicestershire*

Patenall, M Northampton : Northamptonshire Archaeology, 2008, 14pp, colour pls, figs, tabs, refs

Work undertaken by: Northamptonshire Archaeology

The excavation was carried out prior to residential and commercial development, and revealed a large medieval boundary ditch aligned east-west. This had been maintained by re-cutting at least three times. Internal plot divisions were suggested by a handful of post holes and shallow gullies. Finds recovered included one sherd of residual Roman pottery, one sherd of Saxon pottery from the boundary ditch and a small amount of medieval and post-medieval sherds. The later quarry pits contained a small amount of residual Iron Age, medieval and post-medieval pottery. [Au(adp)]

HALL FARM, 2 MAIN STREET, STONESBY, SPROXTON***An Historic Building Assessment (level 2 survey) at Hall Farm, 2 Main Street, Stonesby, Sproxton, Melton, Leicestershire***

Hyam, A Leicester : University of Leicester Archaeological Services, 2007, A4, 29 pages, 6 Figs., 8 plates.

Work undertaken by: University of Leicester Archaeological Services

An historic building assessment (level 2 survey) was undertaken at Hall Farm, 2 Main Street, Stonesby in the parish of Sproxton, Melton, Leicestershire. The survey encompassed two barns set within a larger complex which were to be converted into small residential units and an office. Because of the historic interest and because they are located within the curtilage of a listed building the Senior Planning Archaeologist recommended that a building assessment take place prior to any building work. An Historic Building Assessment is equivalent to a Level 2 survey as defined by English Heritage in: *Understanding Historic Buildings, A Guide to good recording practice*. The building assessment took place on the 9th of February 2007 and was carried out by A R Hyam. Black and white photographs were taken in 35mm format along with colour digital images. The report will be deposited with the Historic and Natural Environment Team, Leicestershire County Council under Accession number XA25.2007. [OASIS(Au)]

LAND ADJACENT TO NO. 3, THE TOFT, MILL LANE, BELTON

Land adjacent to No. 3, The Toft, Mill Lane, Belton, Leicestershire. An Archaeological Watching Brief

Benchmark Archaeology Birmingham : Benchmark Archaeology , 2007, 20pp, colour pls, figs, tabs, refs

Work undertaken by: Benchmark Archaeology

During October 2007, an archaeological watching brief was carried out on land adjacent to No. 3, The Toft, Mill Lane, Belton, during soil stripping and groundwork associated with the construction of new buildings on the site. The application site was identified as an area of archaeological potential from records held by the Leicestershire and Rutland Sites and Monuments Record. Archaeological monitoring consisted of the observation of ground reduction to formation level and foundation trenching in two areas of the site (A and B). The work identified activity on the site dating from the Early Bronze Age, Roman, Late Anglo-Saxon and medieval periods. The reduced-level dig in Area A revealed elements of a pit containing Late Anglo-Saxon pottery (Torksey and Stamford wares) likely to date to the 10th century. The location of the pit on sloping ground falling away from the level area of the historic core of Belton would suggest a domestic refuse pit located towards the edge of the settlement. The presence of the pit strongly suggested that there had been an Anglo-Saxon settlement at Belton for some time prior to the Norman Conquest. The discovery of the pit comprised the first recorded Anglo-Saxon remains in the parish of Belton. No features or deposits of archaeological significance were identified in Area B. The monitoring of soil stripping and the rapid scanning of generated spoil led to the recovery of a range of unstratified finds. These included a small thumbnail scraper of probable Early Bronze Age date, four sherds of Romano-British pottery, and six sherds of medieval pottery dating to the period 1200-1550 AD. [Au(abr)]

4-6 CHURCH STREET
4-6 Church Street, Oakham. A Historic Building Record
 Capon, L Twickenham : AOC Archaeology, 2007, A4, 25 pages plus 7 plans and 25 plates
 Work undertaken by: AOC Archaeology
 4-6, Church Street, Oakham is a range of buildings most recently and historically used as a bakery. The site developed behind two cottages fronting Church Street, one of which is Grade II listed. The buildings include a flour store, a bakehouse, a possible stable and a cart shed arranged around a narrow central courtyard. The evolution of the bakery complex involved link buildings, repairs and modifications. The earliest part of 4, Church Street appears to be of mid 18th century date with 19th century modifications, whereas the thatched cottage at 6, Church Street is earlier, and retains much of its original materials and may date from the 17th century (with a 19th century shopfront). Work undertaken by: Witham Archaeology

The watching brief resulted in the discovery of a number of medieval features, including ditches and a possible pit. Associated pottery indicated a date of the 12th to 14th centuries, although this may have been broader. It was thought likely that the remains related to the shrunken medieval settlement of Wyberton. This would be consistent with the evidence of earthwork house platforms on land to the east. [Au(adp)]

PARK FARM, TATTERSHALL THORPE***Park Farm, Tattershall Thorpe, Lincolnshire. Fieldwalking Survey***

Cudlip, D Cirencester : Cotswold Archaeology, 2007, 10pp, figs, tabs, refs

Work undertaken by: Cotswold Archaeology

The fieldwalking exercise revealed one concentration of Late Neolithic/Bronze Age worked flint, comprising some twelve flakes and core fragments. A low level of artefactual material dating to the prehistoric, Roman and post-medieval periods was recovered across the rest of the site. This was thought to represent "background noise". [Au(adp)]

WOODFIELD AVENUE, BIRCHWOOD***Archaeological Watching Brief at Woodfield Avenue, Birchwood, Lincoln, Lincolnshire***

Cope-Faulkner, PSleaford : Archaeological Project Services, 2007, 27pp, pls, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Project Services

A watching brief was undertaken during groundwork at Woodfield Avenue, Birchwood, Lincoln. The watching brief monitored the excavation of five trenches as the development had already proceeded without archaeological supervision. The site lay to the south-west of Lincoln and was formerly in the parish of Skellingthorpe. The site appeared to have been largely marginal land and was probably a principal source of wood for fuel for activities in the city and neighbouring areas since the Romano-British period (AD 42-410). More recently, the site lay within a Second World War airfield. The watching brief revealed a sequence of natural and modern deposits. A concrete foundation was revealed that may relate to the former airfield along with two field drains. No archaeological features were identified and no artefacts recorded. [Au(abr)]

Allen, M Branston : Allen Archaeological Associates, 2007, 11pp, pls, colour pls, figs, tabs, refs

Work undertaken by: Allen Archaeological Associates

An archaeological watching brief was undertaken during the groundwork for a new dwelling at 200-212 Burton Road in Lincoln. The site was situated within a landscape that contained a number of post-medieval windmills, including the former Ward's Mill that was known to have existed immediately to the north-west. The development area was probably utilised as allotments during the 20th century. The watching brief did not expose any significant archaeological deposits or features. The shallow topsoil was found to have sealed the natural limestone geology. [Au(abr)]

Work undertaken by: Archaeological Project Services

The watching brief revealed undated ditches, a pit, a post hole and a subsoil. Medieval remains included a network of ditches, as well as pits, a pond, a post hole and a subsoil that possibly originated as a flood deposit. The nature of these remains suggested settlement in the vicinity, although this may have shifted in the 14th-15th centuries when it was thought that the site came under an agricultural regime, indicated by ridge and furrow at the site. Post-medieval remains included ditches, a gully, pits, and a ploughsoil. These dated to the later part of the period. [Au(adp)]

Cover and contents pages 6 pages text (including location map) 2 pages illustrations Appendix 1: Colour photographs Appendix 2: Context descriptio

Work undertaken by: Pre-Construct Archaeology (Lincoln)

Pre-Construct Archaeology (Lincoln) was commissioned by TCC Developments to undertake an archaeological watching brief on land at 51-53 North Street, Gainsborough, Lincolnshire prior to development of the land for residential purposes. The objectives of this watching brief were to monitor the footing trenches for six house plots. All archaeological deposits identified during the excavations were subject to limited investigation, in order to assess their nature, dimensions and to facilitate the retrieval of datable finds. As a result of this work 4 phases of activity were identified ranging from medieval to early modern in date. Key features include a possible medieval wall; several made ground deposits, pits, foundations and cobble and brick floor surfaces. The archaeology present is entirely common to urban deposits and indicates practices and land use in keeping with the rear of street fronted dwellings that have been constantly evolving since the late medieval period. PROPOSED WEST BURTON GAS PIPELINE AT KNAITH PARK***Proposed West Burton Gas Pipeline: Results of Fieldwalking Survey at Knaith Park, Lincolnshire***

AC archaeology Chicklade : AC archaeology, 2007, 11pp, colour pls, figs, refs, CD

Work undertaken by: AC archaeology

A fieldwalking survey of the proposed West Burton Gas Pipeline route at Knaith Park was undertaken in April 2007 principally to assess the likely presence of archaeological deposits associated with the Heynings Priory site to the south of the route. Aerial photographs showed the presence of various

cropmarks in the area. A geophysical survey, by gradiometer, was also undertaken in parallel with the fieldwalking. A localised area of magnetic anomalies was identified by the geophysical survey and included features believed to be associated with burning and possibly the site of kilns. Fieldwalking was restricted to a length of c. 380m of the pipeline route due to the presence of dense ground vegetation elsewhere, but included the area of magnetic anomalies. Small quantities of worked flint, Romano-British and medieval pottery were recovered, along with later material, but of such low densities that it was not possible at this stage to provide any firm assessment of any archaeological activity in the area. All may have been derived from manuring. It was not possible to ascertain whether the cropmark features were of medieval origin or associated with the Priory. [Au]

HEALTHLINC HOUSE, CLIFF ROAD, WELTON

Archaeological Investigation at Healthlinc House, Cliff Road, Welton, Lincolnshire

Failes, A Sleaford : Archaeological Project Services, 2007, 40pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Project Services

The investigation revealed a sequence of late Saxon, medieval and post-medieval deposits. In Area 1, medieval features included two pits and a ditch cut into a medieval subsoil layer and sealed by a topsoil deposit. In Area 2 a late Saxon ditch was cut into natural deposits and sealed by an early medieval topsoil. The late Saxon remains illustrated that a significant area of the landscape was being occupied and utilised at this time, and that this population may have represented a precursor to the prebendal manor of West Hall. The medieval remains were thought to represent medieval activity within the manor itself. [Au(adp)]

PROPOSED PROCESSING PLANT, ELTON ESTATE

Proposed Processing Plant, Elton Estate, Northamptonshire A 'Strip. Map & Sample' Archaeological Excavation Interim Site Narrative

Barlow, G Hertford : Archaeological Solutions, 2008, 40pp, tabs, refs

Work undertaken by: Archaeological Solutions

An archaeological excavation at the proposed processing plant on the Elton Estate occupied c.3 hectares of land proposed for a new minerals processing plant associated with the construction of an adjacent agricultural reservoir. The site contained cropmarks (recorded on the Northamptonshire SMR) interpreted as prehistoric trackways, boundaries and enclosures. It was anticipated that these features might have proved to be part of a significant prehistoric landscape. Struck flint suggestive of flint tool preparation or knapping in the Neolithic and Bronze Age periods were found during a field walking survey at the site. A geophysical survey confirmed the presence of features shown on aerial photographs, and revealed further features some of which indicated two phases of possible agricultural activity (Stratascan 2006). The evaluation revealed a series of ditches forming an Iron Age field system with evidence for associated structures. Evidence suggestive of a ploughed out barrow and several periglacial channels were also present. The excavation revealed a total of 83 features across the site consisting of 1 inhumation, 1 cremation, 10 ditches, 47 pits and post holes, 14 furrows, 7 field drains, a palaeochannel, and a sediment-filled depression. Some 44 of the features remain undated. The archaeology yielded evidence of four periods of activity; late Neolithic/Early Bronze Age (Phase 1), Iron Age through to the 1st century AD (Phase 2), medieval (Phase 3) and post-medieval activity (Phase 4). GRANGE PARK***Watching Brief at Grange Park, Desborough***

Jones, C Northampton : Northamptonshire Archaeology, 2007, 14pp, Colour pls, figs, tabs, refs.

Work undertaken by: Northamptonshire Archaeology

A watching brief during the initial stages of a development was undertaken. Extensive areas of the site had been quarried for ironstone in the nineteenth and twentieth centuries, so only undisturbed areas were investigated. Observation concentrated on the west side of the development close to the general location of a Saxon cemetery discovered before 1757. However, no archaeological features or artefacts were found during the work. [Au(adp)]

AREAS AT PINEHAM BARN, UPTON***The Industrial Infrastructure Strip, Map and Sample Areas at Pineham Barn, Upton, Northampton***

Brown, J Northampton : Northamptonshire Archaeology, 2007, 43pp, colour pls, figs, tabs, refs

Work undertaken by: Northamptonshire Archaeology

A process of archaeological strip, map and sample investigation was undertaken in advance of a light industrial and distribution development. The archaeology present in the development area was known to comprise three main settlement areas. Settlements 1, 2 and 3, with areas of less concentrated activity between them, were designated for SMS. The industrial infrastructure SMS comprised of areas SMS 1 and 2. SMS 1 was situated to search for evidence of a former Second World War bomb decoy installation. SMS 2 lay between two known settlement sites, Settlements 1 (Middle Iron Age) and 2 (early to middle Roman), seeking to understand their interrelationship, if any. Two smaller areas of site access were also monitored during initial development work. The investigation formed one part of an ongoing programme of mitigation works. Little datable evidence survived within SMS 1 for any period. The features comprised a small group of Iron Age pits and several undated field boundaries. No features could be positively attributed to the Second World War, although patches of burning were evident. Features within SMS 2 were more extensive and generally better preserved. Five early Bronze Age pits produced pottery and worked flint. Funerary remains comprised a possible barrow and a Bronze Age cremation cemetery associated with a post alignment. Iron Age activity was present in the north-east part of SMS 2 forming an extension to the previously known limits of Settlement 1. The morphology of the settlement comprised a number of roundhouses set within a ditched enclosure, together with postholes, pits, gullies and associated field systems. At least two phases of roundhouse development were apparent. There was no evidence for Roman activity at or near Settlement 1. Roman

ditches were located in the west of SMS 2, peripheral to Settlement 2. Medieval ridge and furrow was encountered throughout the SMS areas associated with the open field system of Kislingbury. [Au(abr)]

QUINTON HOUSE SCHOOL, UPTON

Archaeological Excavation at Quinton House School, Upton, Northampton

Foard-Colby, A & Walker, C Northampton : Northamptonshire Archaeology, 2007, 63pp, colour pls, figs, tabs, refs

Work undertaken by: Northamptonshire Archaeology

An archaeological excavation was undertaken of land within a walled garden, prior to development for a sports hall, at Quinton House School. A small group of pits or post holes, perhaps part of a circular structure, contained pottery dated to the late Bronze Age/early Iron Age. The continuation of a pit alignment seen in previous excavations to the east was confirmed, although only a single pit lay within the site. Most of a small Iron Age enclosure, probably dating to the later middle Iron Age, was excavated. It may have contained a single roundhouse and two further structures set within small sub-rectangular enclosures, with pit groups around the margins close to the enclosure ditch. A medieval ditch system may have been the north-eastern boundary of Upton deserted medieval village and it dated to between the thirteenth to sixteenth centuries. A later medieval stone structure had an internal stone-lined pit and adjacent wall, which had been constructed over the earlier ditch. An associated hollow-way showed evidence of wheel ruts. A number of quarry pits were identified at the west end of the site which produced pottery, clay pipes and glass bottles dating from the late seventeenth century to nineteenth century. [Au(abr)]

COLLEGE PLACE, BRACKLEY

Excavation of Medieval and Later Features at College Place, Brackley, Northamptonshire

Carlyle, S Northampton : Northamptonshire Archaeology, 2007, 39pp, colour pls, figs, tabs, refs

Work undertaken by: Northamptonshire Archaeology

In March 2007, prior to the development of the site for housing, an archaeological excavation was carried out. A watching brief was maintained during subsequent groundwork associated with the development. The earliest feature encountered was a medieval ditch with a possible bank, which probably predated the foundation of the planned medieval town in the mid-12th century. Medieval pits were evident across the southern and eastern part of the site and in the area to the rear of the existing street frontage. They related to 'backyard' activity, probably to the rear of medieval tenements that once fronted onto Market Place. A 16th century, large clay-lined pit, was excavated close to the southern edge of the site. This was subsequently buried beneath a layer of made-ground, up to 0.5m thick, later in the century. In the late 17th century, a timber-lined pit or tank was constructed and two other pits were used to dispose of domestic refuse. In the mid-18th century, two boundary walls were built, possibly along the line of earlier hedges or fences that may have demarcated earlier medieval burgage plots. The majority of the buildings on the site, most of which have now been demolished, were built in the mid-19th century. [Au(abr)]

MOTTE AND BAILEY CASTLE AT BURY MOUNT, TOWCESTER*Excavation of a Motte and Bailey Castle at Bury Mount, Towcester, Northamptonshire*

Brown, J & Soden, I Northampton : Northamptonshire Archaeology, 2007, 54pp, colour pls, figs, tabs, refs

Work undertaken by: Northamptonshire Archaeology

Bury Mount was the site of a Norman motte and bailey castle, which had been the subject of enquiry into the town's Roman and (particularly) its medieval past. The earliest features and deposits preserved beneath Bury Mount were probably of Roman origin. Two substantial pits were excavated which were sealed by buried soils. These began a sequence of deposits which continued through the post-Roman period. They were continually disturbed whilst accumulating new material. New interventions comprised ditches which were allowed to silt naturally during their period of use, being redefined on at least one occasion. They were deliberately backfilled in the late 11th century. Following this a stone building was constructed on top of the soil accumulation. It was probably short-lived since a Norman motte was constructed soon after the Conquest, by mounding up a circular ring of embanked earth which formed the base. The motte was raised using sandy clay and gravels excavated partly from an encircling defensive ditch and other material from further afield. It was tipped onto the ring of earth, raising its height and allowed to spread down into the centre to create a gigantic cone. This was then capped. By the later medieval period the motte was probably disused and it was likely that it remained so until modified during the Civil War. During the 19th century, the Mount was planted with trees. Two cottages were cut into the south side and widespread horticulture was in evidence well into the 20th century. The surrounding ditch survived as a 19th century watercourse which was intermittently maintained through the 20th century. The cottages were abandoned and demolished soon after. [Au]

SYWELL RUNWAY, SYWELL*Archaeological Watching Brief at Sywell Runway, Sywell, Northamptonshire*

Foard-Colby, A Northampton : Northamptonshire Archaeology, 2007, 24pp, colour pls, figs, tabs, refs

Work undertaken by: Northamptonshire Archaeology

An archaeological watching brief was carried out during the removal of topsoil prior to the infilling of land to the west of runway 5/31 at Sywell Aerodrome. For the most part, any archaeological remains were sealed beneath subsoil and therefore not visible during the work. However, in small areas where the subsoil was shallow, a number of exposed features were identified including a Roman oven with associated pitched stone surface, a ditch and two pits. A small assemblage of 1st to 2nd-century Roman pottery was recovered from the oven and ditch. A small number of residual flint artefacts and a few sherds of medieval pottery were recovered from the subsoil. [Au(abr)]

Archaeological Watching Brief at All Hallows Hall, Ordsall, Nottinghamshire
 Bradley-Lovekin, T Sleaford : Archaeological Project Services, 2007, 25pp, colour pls, figs, tabs, refs
Work undertaken by: Archaeological Project Services

The watching brief revealed undated deposits, including the fill of a possible palaeochannel as well as post-medieval and recent remains associated with Doulton House. The ground level was shown to have been raised considerably in the recent past, probably through importing of material onto the site. A small assemblage of 19th to 20th century pottery was recovered. BISHOP ALEXANDER PRIMARY SCHOOL, NEWARK-ON-TRENT***An Archaeological Watching-brief and Excavation at Bishop Alexander Primary School, Newark-on-Trent, Nottinghamshire. Interim Report***

Kinsley, G & Platt, L. Nottingham : Trent & Peak Archaeological Unit, 2007, 11pp, colour pls, figs, tabs, refs

Work undertaken by: Trent & Peak Archaeological Unit

The watching brief identified a linear feature identified by its location and orientation as the Civil War ditch. A single clay pipe stem in its fill remained to have its dating confirmed by a specialist. Two small pits east of the main feature proved to be small pits or post holes of recent date. The ditch was located on the north edge of the stripped area but it could not be traced over the remaining area of the watching brief. It was also shallower than in a section excavated in 1958, 300m north-west of the development site. These two observations suggested that the site had been truncated, probably during the original construction of the primary school; this was consistent with ground levels on site and it was hoped that further enquiries may confirm this. LAND AT DAIRY FARM, LYNDON ROAD, MANTON

An Archaeological Excavation on Land at Dairy Farm, Lyndon Road, Manton, Rutland

Tate, J BLeicester : University of Leicester Archaeological Services, 2007, 37pp, colour pls, figs, tabs, refs

Work undertaken by: University of Leicester Archaeological Services

The excavation revealed sparse evidence for activity in the prehistoric, Roman and Late Saxon periods through residual and unstratified finds, with later periods represented by occupation evidence. Medieval quarrying activity, post holes, walls, cobbled surfaces and wells were encountered, with post-medieval and modern periods represented by a change in land use to a more agricultural function. This was demonstrated by the construction of large "hay barn" structures, later demolished by the end of the early modern period. [Au(adp)]

An Archaeological Strip, Plan and Sample Excavation for a Proposed Development at Main Street, Market Overton, Rutland

Shore, M D Leicester : University of Leicester Archaeological Services, 2007, 61pp, colour pls, figs, tabs, refs

Work undertaken by: University of Leicester Archaeological Services

An archaeological strip plan and sample excavation was carried out at the site, located on the edge of the medieval village of Market Overton. Initially, four exploratory trenches revealed some deposits and Roman pottery. In view of this the remainder of the development area was stripped. Although Roman pottery have been encountered, the majority of the site had been extensively quarried for ironstone in the middle part of the 20th century. In areas that had not been quarried, a network of ditches and gullies, two probable structures, and pits and post holes of Iron Age and Roman date were recorded. In the north-eastern part of the site a Mesolithic flint scatter was noted. Roman wall plaster and flue tile suggested the presence of a villa nearby. [Au(adp)]

LAND AT SANFOIN FARM, PAVENHAM***Land at Sanfoin Farm, Pavenham: A Programme of Archaeological Investigation***

Meckseper, C & Bell, A Bedford : Albion Archaeology , 2007, A4 Bound client report

Work undertaken by: Albion Archaeology

Bedford Borough Council has granted planning permission for the construction of a riding arena on land at Sanfoin Farm, Pavenham, Bedfordshire. Because the development lies in an archaeological sensitive area, a condition was attached to the planning permission that required a programme of archaeological investigation to be carried out during soil stripping in advance of the construction of the riding arena. Albion Archaeology was commissioned to undertake a programme of archaeological observation, recording, analysis and publication of the site, in accordance with the Brief issued by Bedfordshire County Council's Archaeological Officer. During the watching brief buried remains of two furrows were recorded, which were interpreted as the ploughed out remnants of a medieval ridge and furrow field system. The alignment of the furrows corresponds with several of the cropmarks to the south and west of the development area. Such remains of ridge and furrow are considered to be of local significance. 17th- or 18th-century pottery recovered from the furrows may indicate that the strip fields were still cultivated in the post-medieval period, although it is also possible that the artefacts were derived from material filling the furrows after they went out of use. As the depth of the development impact at the southern end of the site was limited to the removal of the topsoil only, any archaeological remains existing within the southern part of the site are considered to have been unaffected by the development and were therefore preserved in situ. Mason, P Northampton : Northamptonshire Archaeology , 2007, 31pp, colour pls, figs, tabs, refs

Work undertaken by: Northamptonshire Archaeology

A watching brief was undertaken over the route of a new water pipeline from Clapham to Ravensden. As a result of the watching brief, parts of two previously undiscovered sites, one late Iron Age the other Romano-British, were excavated and recorded. There was no overt evidence for structures but modest assemblages of pottery were indicative of nearby domestic activity. At the Roman site evidence for gravel extraction was found in the form of a series of closely spaced ditches or elongated pits where small quantities of later 3rd/4th century coins were found. A few isolated pockets of archaeological features were also recorded along the route. [Au(abr)]

The Roost, Wick End, Stagsden

Smith Matthew Bedford : Albion Archaeology , 2007,

Work undertaken by: Albion Archaeology

Albion Archaeology was commissioned to carry out the archaeological observation and prepare a report on the results. The development site is centred on NGR SP 9881 5004. It is located to the east of Wick End Farm, at 60m OD within the valley of the River Great Ouse. The proposed barn lies within an area covered in hardcore used for the parking of vehicle. The land was formerly pasture. No previous archaeological investigation had taken place in the development area. No significant archaeological features or artefacts were revealed during the works. Topsoil and subsoil had clearly been previously removed down to the underlying drift geology (boulder clay) during the creation of the vehicle parking area. [OASIS(Au)]

MOX HILL TO SANDY WATER MAIN*Mox Hill to Sandy Water-Main, Bedfordshire*

Carlyle, S Northampton : Northamptonshire Archaeology, 2007, 18pp, colour pls, figs, tabs, refs

Work undertaken by: Northamptonshire Archaeology

Following an initial stage of evaluation, an archaeological investigation was carried out in four areas along a proposed route of a water-main, between a small wood to the south-east of Moggerhanger and the western outskirts of Sandy. Two gullies, probably related to an area of cropmarks that have been interpreted as the remains of an Iron age/Romano-British farming settlement, were revealed in the area near the small wood. The presence of a Roman road, previously identified from cropmarks shown on aerial photographs, was confirmed. The ploughed out remains of the road lay to the west of Sandy and comprised a sand and gravel bank c.8-10m wide, with attendant side ditches. In the area at the eastern end of the route the road had been cut by two undated gullies and had been disturbed by modern activity. [Au(abr)]

Excavation of a Romano-British Ditch at Shefford Lower School, Shefford, Bedfordshire

Walker, C Northampton : Northamptonshire Archaeology, 2007, 18pp, colour pls, figs, tabs, refs

Work undertaken by: Northamptonshire Archaeology

A small archaeological excavation was undertaken on a playing field prior to the proposed construction of a pre-school. The work was carried out subsequent to an earlier evaluation, during which a Romano-British ditch was found. The excavation area was positioned over the trial trench and uncovered a longer length of the ditch, which continued on the same north-east to south-west alignment. The ditch was possibly a field boundary or enclosure ditch located some distance from any settlement. Finds from the ditch fills from both the evaluation and excavation included a small quantity of Roman tile and an opaque blue glass globule, possibly a fragment of decoration from a 1st century AD glass vessel. A medieval bronze buckle was recovered from the subsoil. [Au(abr)]

ALL SAINTS CHURCH

Historic Building Recording and Watching Brief. All Saints Church, Chalgrave, Bedfordshire

Semmelmann, K Milton Keynes : Archaeological Services & Consultancy Ltd., 2007, Bound A4 report

Work undertaken by: Archaeological Services & Consultancy Ltd.

Between August 2006 and April 2007 Archaeological Services and Consultancy Ltd (ASC) carried out historic building recording and a watching brief of All Saints Church, Chalgrave, Bedfordshire in response to proposals for the restoration of the north and south aisle roofs and improvements to the existing drainage system. All Saints is a Grade 1 listed building, which was dedicated in 1219 and comprises a chancel, nave, north and south aisles, west tower and south porch. The chancel dates from c.1300 and the wall paintings are thought to be some 10 years later. The upper part of the west tower collapsed in 1889 causing severe damage to the nave and north aisle roofs. After many years of neglect, the church underwent a series of restoration and repair programmes from the 1930s. As a result a detailed chronology of the timbers is rendered uncertain, but the appearance if not the actuality of most the timbers is of late medieval date. The groundwork revealed little other than the shallowness of the foundations and a modern drainage gully. [OASIS(Au)]

THE DOWNS RELAY PROJECT, DUNSTABLE

The Downs Relay Project, Dunstable, Bedfordshire. Archaeological Observation Investigation and Recording

Albion Archaeology Bedford : Albion Archaeology, 2008, 21pp, colour pls, figs, tabs, refs

Work undertaken by: Albion Archaeology

The Dunstable Downs were rich in archaeological remains dating from the Palaeolithic period through to the 20th century. Two Scheduled Ancient Monuments lay at the north end of the scarp. The archaeological observation of the construction groundwork at one of the two tie-in points identified evidence of Romano-British agricultural and quarrying activity along with probable wheel ruts of uncertain date. The remains were found to be well preserved and their distribution and density suggested more extensive remains were present in the immediate vicinity. The nature of the finds recovered from the features suggested domestic activity and the possible presence of structure in the area. [Au(abr)]

LAND SOUTH OF TUNBRIDGE HALL, TUNBRIDGE LANE, BOTTISHAM

Area 1, Land South of Tunbridge Hall, Tunbridge Lane, Bottisham, Cambridgeshie. Archaeological Excavation Interim Report

McConnell, D & Woolhouse, T Hertford : Archaeological Solutions, 2007, 223pp, figs, tabs, refs

Work undertaken by: Archaeological Solutions

The excavation revealed three phases of later Roman activity, spanning the 3rd and 4th centuries AD. In Phase 1 (mid to late 3rd century), a possible droveway ran across the northern portion of the site, with part of a field system to the south. The corner of a stone building in the far southwest of the site could represent the edge of a villa range. In Phase 2 (late 3rd to early 4th century), the boundaries on site were reorganised; several new enclosures were established, including a large rectilinear field/paddock with a small rectangular timber building in its centre. During Phase 3, land use on the site changed, with several large chalk quarry pits and numerous scattered rubbish pits suggesting an area of peripheral wasteland. The site also appears to have been more 'open' by this time, with few formal land divisions. A small group of 'industrial' features, comprising a malting oven/ corn drier and a second less complex oven, were also identified. The moderately-large quantity of finds from the site suggests that it lay adjacent to areas of occupation during all three phases, but there are few indications of high-status settlement. [Au(abr)]

STONALD FIELD*Archaeological Excavation on land at Stonald Field, Whittlesey, Cambridgeshire*

Murphy, K Sleaford : Archaeological Project Services, 2008, A4 Spiral Bound

Work undertaken by: Archaeological Project Services

An archaeological excavation was carried out prior to the construction of a housing estate on land at Stonald Field, Whittlesey, Cambridgeshire. The archaeological investigations at Stonald Field, Whittlesey were undertaken as part of a PPG16 planning condition. In the first instance geophysical survey and plotting of cropmarks from aerial photographs was undertaken. This was followed by a programme of trial trenching, resulting in the excavation which is the subject of this report. Evidence of Bronze Age funerary activity was uncovered in the form of a small pit with Beaker pottery and flints, and a partially preserved ring ditch with putative associated barrow. No human remains were recovered from these features, which were noted to be damaged by later land use. Overlying the Bronze Age features, middle Iron Age remains were uncovered. The major elements of these were a ditched rectilinear enclosure surrounding a smaller internal area defined by a curvilinear ditch. Various pits, gullies and a small number of post holes, including a group characteristic of a 'four-post structure',

were also identified. These remains appeared to be settlement related, with relatively large amounts of pottery, animal bone and fired clay, characteristic elements of occupation detritus. The middle Iron Age remains appeared, in common with the Bronze Age features, to have been quite badly damaged by later land use. Both the Bronze Age ring ditch and the Iron Age remains appeared to extend beyond the western boundary of the site. Medieval and post-medieval features were observed to truncate earlier remains. HEMINGFORD FLOOD ALLEVIATION SCHEME

Hemingfords Flood Alleviation Scheme, St. Ives, Cambridgeshire. Watching Brief Report

Sims, M Oxford : Oxford Archaeology, 2007, A4, plastic spiral bound

Work undertaken by: Oxford Archaeology

September 2006 to May 2007. Oxford Archaeology carried out an Archaeological watching brief between Hemingford Abbots and St Ives, Cambridgeshire in advance of the construction of flood defenses. The watching brief revealed evidence of the former North Eastern Railway timber trestle causeway crossing alongside Town Bridge, St Ives, an unrecorded non-conformist cemetery north of Hemingford Grey and an earlier churchyard boundary wall alongside St James Church at Hemingford Grey. The remainder of the route traversed alluvial flood plains and no evidence of significant archaeology was observed. [OASIS(Au)]

LAND ADJACENT TO 79 HIGH STREET, OFFORD D'ARCY

Land Adjacent to 79 High Street, Offord D'Arcy, Cambridgeshire. Archaeological Excavation

Birbeck, V & Reeves, P Salisbury : Wessex Archaeology, 2007, 26pp, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

An excavation was carried out following an archaeological evaluation. The excavation produced a small finds assemblage, dating from the prehistoric to post-medieval periods. Medieval remains at the site comprised a single curvilinear ditch, possibly an enclosure ditch, dated on the basis of a single pottery sherd. Fifteen sub-rectangular ditches and some linear features demonstrated the use of the site

in the post-medieval period, and many of these features respected earlier deposits. The results were of limited archaeological importance. [Au(adp)]

BARRINGTON CEMENT QUARRY

Barrington Cement Quarry. Excavation on the edge of a Roman Settlement at Wilsmere Down Farm, Cambridgeshire

Collins, M & Knight, M Cambridge : Cambridge Archaeological Unit, 2007, 18pp, colour pls, figs, tabs, refs

Work undertaken by: Cambridge Archaeological Unit

The excavations investigated a series of boundary ditches belonging to a small Roman farmstead as well as the remains of two Roman clunch quarries. The ditches had been re-cut several times, demonstrating an enduring boundary that appeared to delineate the northern and easternmost extent of a settlement focus previously identified in 2005. A series of "offshoot" gullies pointed to the focus of activity. Tool marks were found preserved in the quarry faces. The density of archaeological features increased towards the bottom of the slope, coinciding with the extent of hillwash deposits. [Au(adp)]

IRON AGE AND SAXON ACTIVITY AT BASSINGBOURN VILLAGE COLLEGE, BASSINGBOURN

Iron Age and Saxon Activity at Bassingbourn Village College, Bassingbourn, Cambridgeshire. Excavation Report

Phillips, T Cambridge : Oxford Archaeology East, 2009, 69pp, colour pls, figs, tabs, refs

Work undertaken by: Oxford Archaeology East

Excavation of approximately 0.5ha revealed a series of boundary ditches provisionally dated to the Iron Age. They may be shifting boundaries or may form a trackway perhaps over several phases. There was also a Saxon SFB (sunken featured building) and a pit of possible Saxon date. Later activity comprised post-medieval field systems. [Au(abr)]

St. Mary's Church, Church Lane, Comberton, Cambridgeshire. An Archaeological Monitoring and Recording Brief

Weston, P Hertford : Archaeological Solutions, 2007, 23pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Solutions

The observation of the excavation of the footing trench at the medieval church exposed the clunch stone foundations of the northern aisle, its associated construction cut the buried graveyard soil and subsoil, seven east-west burials, a made ground deposit and a Victorian/modern storm drain. Human bone from five of the burials was retained at the church for re-interment at a later date. Four of the individuals were adults, but the fifth was a child. The foundation trench disturbed the lower legs of the deceased and an unfused tibia. The remains of two burials were located within the construction cut of the northern aisle, suggesting they were intentionally placed under the church foundations. [Au(abr)]

LONGS TANTON WESTERN BYPASS EXCAVATIONS

Longstanton Western Bypass Excavations, Cambridgeshire, 2007: Archaeological post-Excavation Assessment

Paul, S & Cuttler, R Edgbaston : Birmingham Archaeology, 2008, Grey. A4 spiral bound

Work undertaken by: Birmingham Archaeology

Birmingham Archaeology was commissioned by West Longstanton Limited to undertake a programme of excavation in advance of the construction of a bypass located to the west and north of Longstanton, Cambridgeshire, Planning Application Number S/0682/95/0). The route of the bypass was previously the subject of a desk based assessment, fieldwalking and geophysical survey. The geophysical survey identified a possible enclosure ditch which was confirmed by trial trenching. The trial trenching also identified two further areas which were subject to full open area excavation. A total of three open areas were excavated along the route of the bypass between January and March 2007 which revealed archaeological features mostly dating to the Neolithic and Iron Age periods. Neolithic features were excavated within two areas (7 and 8), which for the most part were in the form of discreet pits, postholes and gullies. Iron Age activity was mostly associated with a single enclosure (Area 6). Several almost whole pots were found within an enclosure ditch and could be the result of deliberate deposition, and the large collection of burnt clay found within a small internal gully, also appeared to have been deposited in one deliberate event. 1 HIGH STREET***Anglo-Saxon Settlement and Medieval Pits at 1 High Street, Willingham, Cambridgeshire***

Fletcher, T Bar Hill : Cambridge Archaeological Unit, 2008, Excavation report, 97 pages, 6 appendices, 4 figures, 10 plates.

Work undertaken by: Cambridge Archaeological Unit

In August 2007, CAM ARC (formally the Archaeological Field Unit) of Cambridgeshire County Council) conducted an archaeological excavation on land at 1 High Street, Willingham, Cambridgeshire (TL 4040 7037). The work was carried out on behalf of Murfet Developments in advance of the construction of six new residential dwellings. Several phases of activity were identified during the excavation, ranging from the Iron Age to the early 20th century. Archaeological remains included a segmented ditch or track and a possible four-post structure dated to the Iron Age, the terminus of a Romano-British ditch and a building of Middle Saxon date as well as pits, ditches and other postholes. The site was dominated by early Medieval quarry or "borrow" pits and a large boundary or enclosure ditch in the northeast corner of the site. Post-Medieval activity was represented by more quarry pits and rectangular pits which may be associated with the medieval close of Berrycroft. [OASIS(Au)]

ST. GILES' CHURCH, GREAT MAPLESTEAD

Report on a Watching Brief: CAT Report 410

Orr, K Colchester : Colchester Archaeological Trust, 2007, 6pp, colour pls, figs, tabs, refs

Work undertaken by: Colchester Archaeological Trust

The church authorities received faculty consent for various works including the excavation of foundation pads to support posts in the tower and the cutting of beam bearings in the tower walls. To the south of the church, in the churchyard, trenching was carried out for various services. Where possible, these services were cut under existing pathways where the likelihood of burials was low, and therefore they were not monitored archaeologically. A short length of foundation trench was also dug in order to convert the store by the south porch into a toilet. Ground reduction in the tower exposed the flint foundations to the tower, but no earlier foundations. The holes made in the tower wall exposed the medieval flint and mortar fabric and holes made for scaffolding. The foundation trench for the toilet was 500mm deep and exposed a concentration of disarticulated human remains at 440mm below ground level. Removal of part of the eastern wall of the south porch exposed a medieval window. [Au(abr)]

Allen, P T Chelmsford : Essex County Council Field Archaeology Unit, 2007, Bound copy, grey cover

Work undertaken by: Essex County Council Field Archaeology Unit

Archaeological monitoring was carried out on machine-stripping of topsoil for the construction of a barn at the north-western edge of the farmyard to the rear of Little Maplestead Hall. The Hall was originally 14th century, but was rebuilt in the 17th century, with later additions. The site was thought to lie within the medieval preceptory of the Knights Hospitaller, first documented in 1186 and dissolved in 1540. However, the only features within the stripped area were tree boles and a modern drain. [OASIS(Au)]

3 CHURCH STREET, COLCHESTER

Report on a Watching Brief: CAT Report 411

Brooks, H Colchester : Colchester Archaeological Trust, 2007, 5pp, figs, tabs, refs

Work undertaken by: Colchester Archaeological Trust

The stratigraphical sequence seen outside the building was: down to 1.2m, modern soils and modern drains; from 1.2m to 2.4m, a layer of dumped brown Roman clay; at 2.4m down, a Boudican horizon; below 2.4m, a sandy clay mixture. Inside the building, stratification was clearer. Here, a 10cm thick, pale brown mortar floor with a burnt surface was seen at a depth equivalent to the Boudican material outside the building. A further 0.15m below the mortar floor was a clean clay layer which, at this depth, must be a fortress-period clay floor. A very stiff brown clay layer seen in one of the external holes may be an equivalent layer. Below the fortress-period clay floor, the layer of dumped sand—with the equivalent layer seen outside—may have been fortress-period make-up for the clay floor above. [Au]

Shimmin, D Colchester : Colchester Archaeological Trust, 2007, 17pp, figs, tabs, refs

Work undertaken by: Colchester Archaeological Trust

A borehole was drilled to a depth of 7m on the south side of Osborne Street. A thick deposit of post-Roman topsoil or 'dark earth' sealed an undated peaty layer just above undisturbed natural sand and gravel. Samples were taken for pollen, palaeoenvironmental and geological analyses, and for radiocarbon dating. A test pit near the junction of Stanwell Street and Southway revealed a modern service trench and other obstructions at a depth of 0.5m. [Au]

ON THE PUTTING GREEN AND IN THE NURSERY, UPPER CASTLE PARK, COLCHESTER

An Archaeological Evaluation by Test-pitting on the Putting Green and in the Nursery, Upper Castle Park, Colchester, Essex April 2007

Orr, K Colchester : Colchester Archaeological Trust, 2007, 14pp, figs, tabs, refs

Work undertaken by: Colchester Archaeological Trust

Five test-pits were excavated by hand on the putting green and in the nursery of Upper Castle Park in April 2007. Those on the putting green did not encounter any Roman deposits or features, being dug through topsoil and post-Roman dark earth. The two test-pits dug in the nursery did reach Roman

archaeology, i.e. a late Roman demolition layer starting at between 820mm and 950mm below ground level. [Au]

ST. HELENA SCHOOL CAR PARK, SHEEPEN ROAD COLCHESTER

An Archaeological Watching Brief at St. Helena School Car Park, Sheepen Road Colchester, Essex July-August 2007

Orr, K Colchester : Colchester Archaeological Trust, 2007, 8pp, figs, tabs, refs

Work undertaken by: Colchester Archaeological Trust

A watching brief was carried out on groundwork to reconstruct the car-park on the eastern side of the school grounds. This involved removing the old tarmac surface, creating a new path and cycle storage compound, and digging trenches for lighting cables. The groundwork largely only affected modern and post-medieval layers and therefore did not expose any archaeological features. In one lighting cable trench, the Roman ground-surface was exposed but no archaeological features were observed. [Au]

An Archaeological Watching Brief at Lexden Grange, 127 Lexden Road, Colchester, Essex July 2006-February 2007

Orr, K Colchester : Colchester Archaeological Trust, 2007, 21pp, figs, tabs, refs

Work undertaken by: Colchester Archaeological Trust

Groundwork for a small residential development at Lexden Grange were archaeologically monitored. Part of a Late Iron Age pedestal urn was likely to be the remains of a disturbed cremation burial. Other pits found and Roman pottery from spoil heaps may have also been burial related. A crucible and possible metal working debris pointed to metal working on the site in the Roman period. NETHER HALL***Nether Hall, Moreton, Ongar, Essex. Archaeological Monitoring***

Pocock, M Chelmsford : Essex County Council Field Archaeology Unit, 2007, A4 Blue Spine

Work undertaken by: Essex County Council Field Archaeology Unit

No archaeological remains were encountered during monitoring works. Topsoil was stripped using a mechanical excavator fitted with a toothless ditching bucket. Clean natural geology was encountered between 0.20 and 0.30m below the existing ground surface and consisted of a yellow chalky clay in the southern part of the site, and an orangey-brown silty clay to the north. Field and mole drains criss-crossed the northern half of the proposed development, while plough scars and converging wheel ruts marked both the silt and clay. The shallow depth at which undisturbed clay was encountered, coupled with a lack of subsoil build-up, means that any shallow archaeological remains are likely to have been disturbed by ploughing and it seems likely that only deeper features would survive if present in the immediate vicinity. A small number of finds were recovered from the interface between the topsoil and the clay, comprising a residual prehistoric flint scraper, a fragment of peg tile and a small abraded sherd of pottery. In addition to the above, scattered across the surface of the ploughed field were large quantities of abraded tile of undetermined date, which were not recovered. [OASIS(Au)]

71 MILL ROAD, STOCK***71 Mill Road, Stock, Essex: Archaeological Monitoring and Recording***

Ennis, T Braintree : Essex County Council Field Archaeology Unit, 2007, Blue spine, A4, 15 pages

Work undertaken by: Essex County Council Field Archaeology Unit

An archaeological trench was excavated around the east and south sides of the former bungalow at 71 Mill Road, Stock. The trench was located in an area of garden to be subsumed within the enlarged footprint of the new house. A small number of archaeological remains were identified, ranging in date from the prehistoric period to the 20th century. The earliest feature was a Late Bronze Age or Early Iron Age gully that continued beneath the footprint of the former bungalow. Although no other remains of a similar prehistoric date were encountered the gully does attest to probable farming and/or settlement in the vicinity at this time. No features relating to the medieval and post-medieval development of Stock were identified. The only evidence of the Stock pottery industry was one small sherd of pottery that may be residual in a later feature. Two pits and a ditch were probably modern and associated with 20th-century garden activity. [OASIS(Au)]

FORMER CROXLEY WORKS SITE, CHURCH STREET, MALDON***Former Croxley Works Site, Church Street, Maldon, Essex. Archaeological Evaluation and Excavation***

Ennis, T Chelmsford : Essex County Council Field Archaeology Unit, 2009, 57pp, colour pls, figs, tabs, refs

Work undertaken by: Essex County Council

A trench-based evaluation was undertaken within the footprint of three new buildings at the former Croxley Works. Residual sherds of Late Iron Age pottery were recorded in all three trenches indicating that there was probable activity in the vicinity in the Late Iron Age. Similarly, residual fragments of Roman brick and tile and building stone were recovered that may have been imported at a later date for reuse as building material. At least two phases of Middle Saxon occupation were identified, comprising a ditch subsequently backfilled and cut by a series of pits and post-holes. The presence of near-by structures was suggested by the recovery of numerous fragments of baked clay with wattle/wicker impressions. Evidence for craft activities was represented by 18 loom weights and a spindle whorl, plus possible metal-working slag and spheroidal hammerscale. Faunal evidence indicates that pigs and sheep were the predominant food animals supplemented by domestic fowl, oysters and fish, while cereals such as wheat and barley were brought to the site as processed grain. These remains are significant as they are the earliest Saxon stratified remains so far discovered in Maldon and suggest that the town originated in the Hythe area in the Mid Saxon period. Activity in the Late Saxon period appeared to be less intense with only one gully containing a bone comb firmly dated to the 11th century. Several features were more broadly dated to the Late Saxon/early medieval period including a pit and gully that contained further metal-working debris. A number of undated post-holes, possibly part of structures fronting onto Church Street, may also have been contemporary. Medieval (12th-14th century) features included a boundary ditch and a series of intercutting pits that probably represent rubbish disposal to the rear of properties fronting the street. Few remains of late medieval or early post-medieval date were noted and the considerable depth of buried topsoil suggested most of the site may have been in horticultural use prior to redevelopment in the 18th/19th century. QUEST MOTORS, 127-129 HIGH STREET

Quest Motors, 127-129 High Street, Maldon, Essex . An Archaeological Archive Report

Carew, T Twickenham : AOC Archaeology Group, 2007, 102pp, figs, tabs, refs

Work undertaken by: AOC Archaeology Group

Archaeological investigations were undertaken in advance of groundwork on a housing development at the former Quest Motors site. A six-trench evaluation in February 2007 confirmed that remains of the medieval town were present in the south-west part of the site, towards the High Street, which had been an important feature of Maldon since the Saxon period. An open area excavation of the land affected was undertaken in April and May 2007. Significant medieval and post-medieval remains were excavated. Initial work on the documentary archive and the finds was undertaken, and an assessment report on the results of this excavation was produced in September 2007, with assessments of the stratigraphy, the significance of the results, the archive, and the assessment reports for the different classes of finds recovered. 75A HIGH ROAD

75a High Road, Rayleigh. Archaeological monitoring

Allen, P T Chelmsford : Essex County Council Field Archaeology Unit, 2007, Bound copy

Work undertaken by: Essex County Council Field Archaeology Unit

Archaeological monitoring was carried out on machine-excavation of foundation trenches for a conservatory to the rear of the existing 75a High Road, Rayleigh, thought to be on the site of a possible late medieval pottery manufacture site. Trenches excavated in 1974 when the present house was built recovered 20kg of late medieval pottery dating to c. 1350-1500, including possible pottery waters and kiln props. A possible kiln flue and a cobbled area were also recorded. The monitoring did not recover any medieval pottery or record any further features. The ground had been disturbed during construction of the present house. Only modern pottery and building materials were found. [OASIS(Au)]

FEN FARM, ELMSTEAD MARKET

Fen Farm, Elmstead Market, Essex. Archaeological Excavation

Ennis, T Chelmsford : Essex County Council Field Archaeology Unit, 2008, 42pp, figs, tabs, refs

Work undertaken by: Essex County Council Field Archaeology Unit

Excavation was limited to the southern half of the development area. No further Bronze Age remains were identified. This confirmed that the barrow cemetery was restricted to the southeast of the development area. The earliest excavated remains dated to the Early Iron Age and of particular note was a scatter of seven pits, located in the south of the area, that all contained burnt material including charcoal and hearth waste. Similarities in the range of pottery suggested deliberate indicative of ceremonial or ritual behaviour. The majority of the excavated features date to the Late Iron Age and were part of a small isolated settlement. One curving boundary ditch was identified and a number of other features including two hearths and two four-post timber structures, the latter interpreted as probable granaries. No specific dwelling remains were identified though domestic refuse such as pottery, loom weights and briquetage pointed to their likely existence in the near vicinity. Although settlement did not continue into the early Roman period, the presence of a few tentatively dated later Roman features indicated limited agricultural activity. [Au(abr)]

WEST CLACTON RESERVOIR AND PUMPING STATION, DEAD LANE, GREAT BENTLEY***An Archaeological Excavation on the Site of the West Clacton Reservoir and Pumping Station, Dead Lane, Great Bentley, Essex April-May 2007***

Brooks, H & Holloway, B Colchester : Colchester Archaeological Trust, 2007, 24pp, figs, tabs, refs
Work undertaken by: Colchester Archaeological Trust

An aerial survey revealed the cropmarks of unexcavated and undated field systems on either side of this site. An evaluation in 2006 uncovered a number of field ditches, as well as evidence of prehistoric and Roman activity. The 2007 excavation was located in the southern half of the evaluated field. Two field systems were revealed. The first was aligned north-south, and was undated. The second was aligned north-west to south-east, and was dated to the Late Iron Age or early Roman period. Earlier occupation was indicated by the presence of residual Neolithic flints and Bronze Age pottery in the ditch fills. The results of the excavation differed in two ways from those of the evaluation. First, the evaluation indicated that there were medieval and post-medieval ditches here, but none of those in the excavated area were dated later than 1st century Roman, although some were undated and may be medieval or later. Second, the northern part of the evaluation site produced fragments of loom weights which were evidence of a mixed farming economy in the Late Iron Age and Roman periods, but the excavation (in the southern part of the evaluation site) produced few finds of this date. One interpretation of this would be that the excavated area coincided with the farmed fields rather than the settlement centre, which lies to the north in the area unaffected by the construction of the reservoir. The most remarkable find was a group of small fragments of Roman coloured glass – the raw materials of enamelling – from the fill of an early Roman ditch. The circumstances of discovery indicated that these were in a cloth or leather bag dropped or placed in the ditch. This discovery has implications for the knowledge of for local enamelling and metal working. [Au(abr)]

THE TITHE BARN ROAD DIVERSION TO ABBOT'S TOWER, ST. OSYTH'S PRIORY, ST. OSYTH***The Tithe Barn Road Diversion to Abbot's Tower, St. Osyth's Priory, St. Osyth, Essex. Archaeological Monitoring and Recording***

Brogan, G, Hogan, S & Wotherspoon, M Hertford : Archaeological Solutions, 2007, 19pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Solutions

An archaeological watching and recording brief was carried out for the site along with a desk-based assessment. The site was located within the Scheduled Ancient Monument of St. Osyth's Priory, which dated to the early 12th and 13th centuries. The priory had been elevated to the status of an Augustine Abbey, and had been dissolved in 1539. By 1558, it had been acquired by Lord Thomas Darcy. The construction of the barn was indicative of a later 16th century date and could most likely be attributed to the period of modification and rebuilding by Lord Darcy. Its size suggested that it was used for the collection of tithes and much of the building survived remarkably intact. A wall of faced cobbles and clunch stone, similar to existing priory remains, was located within a corridor for a new access road to the north of the priory. Within the barn the make up for the brick floor was revealed within two test pits. [Au(adp)]

Ennis, T Chelmsford : Essex County Council Field Archaeology Unit, 2007, 34pp, colour pls, figs, tabs, refs

Work undertaken by: Essex County Council Field Archaeology Unit

The monitoring of extensive building works revealed the presence of below ground remains dating to the Saxon, medieval and post-medieval periods. Part of the flint foundations of the late Saxon building were revealed during alterations to the drawing room, as was a post hole of possible 14th to 15th century date. In the yard to the west of the house, a 13th century pit and a probable linear medieval feature containing oyster shell and charcoal flecks were excavated. In the garden area, later medieval pottery sherds and numerous fragments of tile were recovered from mixed soil layers that may be contemporary with construction work on an adjacent 15th-16th century outbuilding. Remains of the demolished 17th-18th century wing of an outbuilding were recorded. Additional recording and photography was undertaken on numerous features of the standing building revealing during the works including a Saxon doorway, a Tudor mullion window and the remains of 18th century and later timber framing. POND CLEARANCE, CHESHUNT PARK, FLAMSTEAD ROAD*Watching Brief: Pond Clearance, Cheshunt Park, Flamstead Road, Hertfordshire*

Wilson, N Milton Keynes : Archaeological Services & Consultancy Ltd., 2007, 21pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Services & Consultancy Ltd.

An archaeological watching brief was maintained during the de-silting and restoration of the pond in Cheshunt Park. It seemed that the pond was last cleared in 1947, probably using a dragline. No artefacts other than modern steel gate, cast iron fire hearth, metal cable duct and a car tyre were found. [Au(adp)]

Watching Brief, 10 Castle Hill Avenue, Berkhamsted, Hertfordshire

Richards, J Milton Keynes : Archaeological Services & Consultancy Ltd., 2007, 19pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Services & Consultancy Ltd.

A watching brief was carried out at 10 Castle Hill Avenue, Berkhamsted, during the initial groundwork for an extension. Archaeological remains of Iron Age, Roman and medieval date had been recorded in the area, but on this occasion the only archaeological remains observed comprised a cut filled with modern bricks, interpreted as possible wall footings, dating from the early 20th century. The archaeological impact of the development was considered negligible [Au(abr)]

Watching Brief: 3 South Park Gardens, Berkhamsted, Hertfordshire

Rouse, C & Hunn, J Milton Keynes : Archaeological Services & Consultancy Ltd., 2007, 6pp, colour pls, figs, refs

Work undertaken by: Archaeological Services & Consultancy Ltd.

One visit was made to the site, during which the excavation of the footing trenches was observed. The extension measured 4m x 9.2m. The ground within the area to be extended had already been reduced by 0.3m, but was too churned up for anything to be seen. The footings were c.0.5m wide x 1.5m deep below the reduced ground level. The topsoil varied between 0.25m and 0.3m in depth. Below this was a yellowish brown flinty clay mixed with chalk fragments, and below that was the natural pure chalk. Apart from an existing brick filled soakaway situated at the southern end of the extension, no pre-modern archaeological finds or features were observed. [Au(adp)]

Fletcher, T Cambridge : Cambridgeshire Archaeology, 2007, 34pp, pls, figs, refs

Work undertaken by: Cambridgeshire Archaeology

Archaeological monitoring in advance of the redevelopment of an existing standing building and the erection of an additional dwelling consisting of housing and associated services. The existing buildings were to undergo renovation as part of the development process.

The work was carried out as alterations were taking place within number 39 and prior to redevelopment of land between number 35 and 39. The historic building survey, together with consultation of cartographic sources dated the earliest phase of the building sometime between 1843 and 1878. Two test pits were excavated on land between numbers 35 and 39 to look for any evidence of an earlier building on the site or any other archaeological remains. Both test pits revealed layers of garden soil and made up ground, but no archaeological remains were recorded. Whilst monitoring the removal of the late 20th century extension at the rear of number 39, a well and foundations were recorded. These features were 19th century in date, and may be associated with the earliest phase of construction. [Au(abr)]

Nicholson, K Hertford : Archaeological Solutions, 2007, 6pp, tabs, refs

Work undertaken by: Archaeological Solutions Ltd

An archaeological excavation was carried out at the site and revealed that the site had only limited findings. Two phases of activity were identified dating to the 12th to 15th and 17th to 19th century, the dates refined through post-excavation finds analysis. Features encountered were medieval in date and included a pit or possible well adjacent to a large pit which was cut by a smaller pit. Also present was a group of four intercutting features. In the northernmost part of the site, small portions of two coaxial ditches thought to abut one another were present. The only feature in the southern part of the site was a truncated post hole, but residual medieval pottery was present throughout the site. Post-medieval features to early modern features include a group of 22 post holes forming two parallel south-west/north-east lines. Also of this date were two sets of right angled wall foundations, one the re-cut of the other, aligned parallel/perpendicular to the post hole alignments. Two isolated pits were also of this date. CATHERINE WHEEL PUBLIC HOUSE, GRAVESEND, ALBURY

Former Catherine Wheel Public House, Gravesend, Albury, Hertfordshire. An Archaeological Watching Brief

Cherrington, R Birmingham : Benchmark Archaeology , 2007, 24pp, colour pls, figs, tabs, refs

Work undertaken by: Benchmark Archaeology

An archaeological watching brief was undertaken on the site of the former Catherine Wheel Public House, Gravesend. The site lay close to an Area of Archaeological Significance. The hamlet of Gravesend had early post-medieval or medieval origins. The site itself was located in the core of the historic settlement, and was until recently occupied by a 17th century Grade II Listed public house and outbuildings, destroyed by fire in 2005. The earliest fabric of the cellar appeared to be an original component of the Public House although due to the destruction of the above ground elements of the building, the exact relationship between the cellar fabric and the former building could not be established. Brick sizes suggested a 17th century date for the cellar as indicated by the Listed description. No evidence for barn structures were identified. Topsoil deposits contained very occasional 19th and 20th Century ceramic material. Much of the site appeared to have been formerly reduced in level to facilitate access and car parking, negating the survival of any significant archaeological deposits. [Au(abr)]

R. RIB, FORD BRIDGE, BRAUGHING

Remedial Excavation: R. Rib, Ford Bridge, Braughing, Hertfordshire

Hunn, J Milton Keynes : Archaeological Services & Consultancy Ltd., 2007, 23pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Services & Consultancy Ltd.

In early May 2007 a limited programme of excavation and remedial restoration was undertaken on a site adjacent to the river Rib at Braughing, Hertfordshire. The work was undertaken as a result of river bank erosion which had exposed the presence of coin mould debris in an area scheduled as an ancient monument (no. 75). The objective of the exercise was to assist in the stabilisation of the bank and if possible to establish a context for the coin mould finds. Limited excavation demonstrated the presence of a deposit of dark, charcoal rich soil containing early Roman domestic waste and late Iron Age coin moulds. This overlay a pit and a probable timber slot both of which cut through a fairly compact floor foundation. The study of the objects and soil samples awaits further specialist analysis. [Au]

Work undertaken by: Heritage Network

An archaeological evaluation, desk-based assessment and subsequent watching brief was carried out at the site. The desk-based assessment indicated that there was a high potential overall that archaeological remains dating from the later prehistoric period to the post-medieval would be damaged destroyed or otherwise affected by its development. The archaeological fieldwork showed that the land between the river and the house had been built up probable to prevent flooding and therefore no archaeological cut features or deposits were encountered. Two post-medieval structures were encountered. These consisted of a well on the eastern side of the house which has been dated to the mid to late 19th century and a brick wall on the western side which was originally constructed in the early to mid 18th century and was consequently altered in the mid to late 19th century. Hawtin, T & Semmelmann, K Milton Keynes : Archaeological Services & Consultancy Ltd., 2007, 51pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Services & Consultancy Ltd.

An archaeological excavation and watching brief was carried out at the site. Ten foundation pits were excavated and a watching brief maintained during subsequent ground reduction and related works around the tower. The whole or partial remains of nearly 50 individuals, probably all of 18th to 20th century date, were revealed. Evidence was recovered of coffin construction and fittings of vault construction and of stacked burials. It was possible to assign names to a small number of individual burials. Demonstrably modern burials were reburied as soon as possible along with any associated artefacts, while other burials were subject to rapid osteological assessment on site. This revealed instances of a number of pathological conditions such as osteoporosis, porosities and hyperostosis frontalis interna. A range of dental conditions were also observed including dental caries, calculus and abscesses. One individual had a groove in his teeth, probably caused by smoking a clay pipe. Observations made in the tower generally confirmed existing ideas regarding the dating and function of the structure. An area of possible green paint in the southwest corner of the tower was found to be copper staining. Excavations to the west of the tower revealed evidence for three construction phases. [Au(adp)]

AMWELL VIEW SCHOOL, AMWELL***Amwell View School, Amwell, Hertfordshire. Archaeological Monitoring & Recording***

Doyle, K, Newton, AAS & Williamson, I Hertford : Archaeological Solutions, 2007, 23pp, figs, tabs, refs

Work undertaken by: Archaeological Solutions

Archaeological monitoring and recording was carried out at the site during 2006 and 2007 and revealed modern disturbance. This disturbance in part was mainly due to the construction of manholes. The footings of a modern north south wall were revealed towards the centre of the phase 2 site. No archaeological features or artefacts were revealed in either the excavated footings or from the spoil heaps. [Au(adp)]

43 CHURCH END, WALKERN***43 Church End, Walkern, Hertfordshire. Archaeological Monitoring Report***

Winter, M & Ashworth,, H Letchworth : Heritage Network, 2008, 32pp, colour pls, figs, tabs, refs

Work undertaken by: Network Archaeology, Heritage Network

In response to a condition on the planning permission for construction of a single storey extension and associated drainage works at 43 Church End, Walkern, a photographic record of the buildings as existing and the archaeological monitoring of the development

groundworks was undertaken. The present house was formerly the village school and was converted to residential use in the 1960s. The original building on the site, which dated to at least the early 19th century, was demolished as part of the conversion works, leaving an extension dated to 1852 and the free-standing Infants' School block and porch of later 19th century date. The photographic record, in conjunction with plans and photographs supplied by the clients, has demonstrated the development of the building. The monitoring of the groundworks revealed a 12th-14th century gully, three modern linear features and a series of walls associated with a later 19th century lavatory block for the school. [Au(abr)]

Capon, L Twickenham : AOC Archaeology Group, 2007, 45pp, colour pls, figs, tabs, refs

Work undertaken by: AOC Archaeology Group

An archaeological evaluation and building recording were carried out at the site, in advance of demolition and redevelopment. The property was originally a villa with an impressive frontage and a coach house and a greenhouse to the rear. Alterations to the house towards the end of the 19th century and in the 1970s had removed much of the potential historic fabric, reducing its value as a heritage resource. The archaeological evaluation identified a ditch of prehistoric character but with no firm dating evidence a precise date was difficult to determine. [Au(adp)]

CHURCH OF ST. NICHOLAS, NORTON**Archaeological Summary of the Church of St. Nicholas, Norton, Hertfordshire**

Hudson, A Letchworth : Heritage Network, 2007, 7pp, Colour pls, figs, tabs

Work undertaken by: Heritage Network

Excavation of a new drainage channel and soakaway at St. Nicholas Church, Norton, was monitored. Archaeological evaluation during the underpinning of the northern and eastern walls of the chancel in 1995 revealed that the eastern wall was built on disturbed ground. Although no dateable artefacts were recovered, the report suggested that the presence of a layer of clunch adjacent to the northern wall of

the chancel indicated a post-Norman date of construction. The drainage channel was excavated by hand. The channel crossed a paved area directly in front of the porch entrance below which was a make-up layer of sand and shingle. Some modern brick rubble and CBM were observed within this layer but not collected. The rectangular soak away was also excavated by hand. Some root activity was observed within this layer. Three burials were encountered in the soak away at the depth of 1m. The grave cuts could not be identified in the subsoil but the remains in Graves 1 and 2 were oriented north west to south-east. Grave 3 was disturbed and contained disarticulated remains. Wooden coffin fragments were identified around Grave 2. The burials were recorded and, the human remains were re-interred. No other archaeological cut features or deposits were observed during these works. The spoil from the excavation was inspected and fragments of post-medieval tile, modern brick and CBM were noted but not collected. No other datable artefacts were observed or recorded. [Au(abr)]

Work undertaken by: Heritage Network

Excavation prior to the installation of a new gas main exposed a Roman ditch and a masonry building foundation, an undated layer of alluvial silting and a modern pit. With the exception of the modern pit all remains appeared to have been heavily truncated by later activity. A number of concrete structures were noted at the southern end of the site. They are believed to be associated with modern services. The Roman features may be associated with structures identified in an excavation undertaken approximately 20m to the north in 1968. [Au(adp)]

 Bell, A Bedford : Albion Archaeology, 2007, 18pp, colour pls, figs, refs
Work undertaken by: Albion Archaeology
 The site lay within an area of archaeological significance, the land having been the location of a brick
 works in the early part of the 19th century. The archaeological works were occasioned by the
 construction of a housing development which involved the removal of an area of turf and topsoil and
 the excavation of a soakaway trench and housing foundations. Observations of the groundworks
 revealed disturbance, probably associated with the brick works, in the form of large backfilled pits and
 footings for a terrace of cottages believed to have housed the workers of the brick works. These
 buildings were demolished in the 1960s. [Au(abr)]

165-167 High Street, Rickmansworth

Saunders, G Letchworth : Heritage Network, 2007, 6pp, figs, tabs, refs

Work undertaken by: Heritage Network

A total of two site visits were made to inspect the excavation of a small geological test pit, and to monitor the excavation of a single foundation pad. The site stratigraphy comprised a thin layer of shingle over modern brick rubble. This sealed a firm, dark greyish brown, silty clay layer which yielded fragments of modern brick and glass. Beneath this lay a firm, brown, silty clay layer which yielded fragments of peg tile and glass of late post-medieval date. Under this was a firm, greyish brown, silty clay with gravel layer which yielded a sherd of late medieval green glazed pottery, an undiagnostic body sherd of late medieval pottery, and a fragment of handmade post-medieval tile. This sealed a firm, black, silty clay layer which yielded a pottery base-sherd dating to the 12th-14th century, a fragment of cement mortar with an impression from a frogged brick, and a fragment of post-medieval peg tile. Beneath this lay the natural stony gravel. No archaeological features or deposits definitively predating the late post-medieval/modern period had been observed in the course of the groundwork on

the site, but given the constraints of the investigation, contamination of earlier deposits by later material could not be ruled out. [Au(adp)]

HATFIELD BUSINESS PARK, HATFIELD***Plot 1500 Hatfield Business Park, County of Hertfordshire. An Archaeological Watching Brief Report***

Davies, S London : Museum of London Archaeology Service, 2007, 33pp, colour pls, figs, tabs, refs

Work undertaken by: Museum of London Archaeology Service

A topsoil strip was monitored. During this topsoil removal, three flint flakes of probable Bronze Age date were recovered from the freshly stripped area. Due to the proposed formation levels of the car park, it was concluded that the excavations would not be sufficiently deep enough to impact on any potential archaeological features within the area. The excavation of a drainage trench within the eastern side of the watching brief area revealed contaminated natural soil deposits that were probably associated with the former aerodrome factory buildings. Natural deposits of mid brown clay-silt were observed. No archaeological deposits were observed during this phase of work. [Au(abr)]

THE MARDYKE VALLEY

Reedbed Creation and Other Landscaping Work within The Mardyke Valley, Thurrock

Heppell, E Chelmsford : Essex County Council Field Archaeology Unit, 2007, 16pp, colour pls, figs, tabs, refs

Work undertaken by: Essex County Council Field Archaeology Unit

Monitoring of the construction of three reedbeds confirmed the presence of a peat deposit in each of these reedbeds. This was thought to be the same peat deposit that was identified during the construction of the A13. A single feature was identified, an infilled ditch running across Reedbed 11. This ditch was shown on the 1st to 4th editions of the Ordnance Survey. No artefacts, other than modern glass and nails were recovered from this feature. [Au(abr)]

THE CHURCH OF ST. MARY, BEESTON NEXT MILEHAM

An Archaeological Watching Brief at the Church of St. Mary, Beeston next Mileham

Hobbs, B Norwich : NAU Archaeology, 2007, 9pp, figs, tabs, refs

Work undertaken by: NAU Archaeology

The watching brief revealed several sherds of medieval and post-medieval pottery from the spoil of trenches near the church, as well as from the topsoil. One fragment of medieval stained glass was encountered. The foundations of the church were partially exposed. Other than this, no archaeological features were recovered. [Au(adp)]

AREA 1, AREA 2 AND SUBSOIL BUND 2, HONEYPOTS QUARRY NORTHERN EXTENSION, SHROPHAM

Honeypots Quarry Northern Extension, Shropham, Norfolk, Area 1, Area 2 and Subsoil Bund 2, Archaeological Monitoring and Recording

Hogan, S, Woolhouse, T, Barlow, G & Grassam, A Hertford : Archaeological Solutions, 2007, 40pp, figs, tabs, refs

Work undertaken by: Archaeological Solutions LTD

An archaeological watching brief and recording of land at Honeypots Plantation was carried out in 2006 and 2007. The desk-based assessment found there to be very high potential for the site to yield Neolithic to Roman remains, likely a continuation of the ceremonial activity located during excavations of Honeypots Plantation to the immediate south of the present site (HER 36218). The monitoring and recording was undertaken in Area 1, Area 2 and Subsoil Bund 2. 42 archaeological features comprising pits, post holes and two linear features were encountered. Two pits produced Beaker period pottery and deliberate deposits of burnt material. Several other undated pits and post holes yielded similar deposits and thus maybe contemporary, however, the adjacent excavation identified an increase in activity during the Iron Age and it is likely some of the features here are also associated with this period of activity. No evidence for settlement was recorded and the site likely represented the continuation of the ritual activity previously recorded on the hilltop to the south. [Au(adp)]

Honeypots Plantation, Shropham, Norfolk: An Archaeological Evaluation

Hogan, S, Woolhouse, T, Barlow, G & Grassam, A Hertford : Archaeological Solutions, 2007, A4 ringbound document

Work undertaken by: Archaeological Solutions

In September 2006 and September 2007, Archaeological Solutions Ltd (AS) undertook archaeological monitoring and recording of land at Honeyopts Plantation, Shropham, Norfolk (TL 9835 9470). The monitoring was undertaken in advance of mineral extraction. The desk-based assessment found there to be very high potential for the site to yield Neolithic to Roman remains, likely a continuation of the ceremonial activity located during excavation of Honeyopts plantation to the immediate south of the present site (HER 36218). The monitoring and recording was undertaken in Area 1, Area 2 and Subsoil Bund 2. Forty-two archaeological features comprising pits, postholes and two linear features were encountered. Two pits produced Beaker period pottery and deliberate deposits of burnt material. Several other undated pits and postholes yielded similar deposits, and thus maybe contemporary, however, the adjacent excavation identified an increase in activity during the Iron Age and it is likely some of the features here are also associated with this period of activity. No evidence for settlement was recorded and the site likely represents the continuation of the ritual activity previously recorded on the hilltop to the south. [OASIS(Au)]

Muldowny, M & Punchard, W Cambridge : Cambridgeshire Archaeology, 2007, 24pp, colour pls, figs, tabs, refs

Work undertaken by: Cambridgeshire Archaeology

The watching brief determined that no medieval sediments were identified within the pond and that these had probably been removed during a previous cleaning out phase, probably in the early 20th century. The drainage trench was positioned along the line of the southern arm of the moat. No medieval moat deposits were identified during the monitoring of this trench, but three medieval cess pits and during the monitoring of this trench, but three medieval cess pits and the possible location of a pathway leading to St. Mary's Church, were. A single sherd of pottery indicated that the pits may be as early as the 13th century, which strongly suggested that activity predating the present manor house was present. [Au(abr)]

PHASE 4A FOSTERS END, EAST WINCH, NORFOLK

Phase 4A Fosters End, East Winch, Norfolk. Archaeological Excavation Interim Report

Jon House, Chris Pole Hertford : Archaeological Solutions, 2007, A4 ring bound document

Work undertaken by: Archaeological Solutions

During March 2007, Archaeological Solutions Ltd (AS) carried out Phase 4 of an archaeological 'strip, map and sample' exercise on land intended for mineral extraction at Fosters End, East Winch, near Kings Lynn, Norfolk (NGR TF 000 093). Phase 4 followed three previous phases of excavation (Wilkins and Roberts 2003, Grant et al 2003, and McConnell 2005) directly to the south and west of the site. Phases 1 and 3 revealed evidence for Roman activity dating to the late 2nd to mid 4th century AD, with limited additional middle Iron Age and post-medieval activity. The current archaeological excavation revealed activity of the middle Iron Age, ?medieval, post-medieval and potentially the Romano-British periods. The Iron Age and ?medieval archaeology consisted of two isolated pits. Five tree throws were tentatively assigned to the Romano-British period as were several similar features identified in the Phase 2 excavation. Post-medieval parliamentary enclosure ditches, previously identified, were seen to continue to the northeast. [OASIS(Au)]

Work undertaken by: NAU Archaeology

A single visit was made to the proposed tree-planting site at Tilney, with the course and character of the former sea banks observed. The slight remains of two banks were present, both nearly flattened and widely spread, standing along the west and south edges of a long narrow field, still defined by the dykes that ran along the main bank. To the immediate south, a small plantation had been in existence for some time, and part of the sea bank, much flattened, lay in this area. [Au(adp)]

Boyle, M Norwich : NAU Archaeology , 2008, 8pp, colour pls, figs, tabs, refs

Work undertaken by: NAU Archaeology

The existing 17th century hall was built on the foundations of an earlier medieval hall. The cellar associated with the medieval hall survived and extended from underneath the present hall to underneath a gravel yard to the south. Three phases of drains were recorded, ranging in date from the 17th century to modern times. A chalk marl layer was found to be an attempt at providing a watertight seal for the roof of the cellar and appeared to have been punctured by a modern drain. [Au(abr)]

WATTON ROAD, LITTLE MELTON***Archaeological Watching Brief at the Water Treatment Works, Watton Road, Little Melton, Norfolk***

Cope-Faulkner, PSleaford : Archaeological Project Services, 2008, 23pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Project Services

A watching brief was undertaken during groundwork on the site of a new water treatment plant. The site lay close to Late Bronze Age (1000-800 BC) features that were exposed during the construction of the adjacent bypass. Earlier Bronze Age features were also identified and a probable round barrow lies to the northwest. A Neolithic (4000-2250 BC) hammerstone had also been retrieved from the vicinity. The watching brief revealed a sequence of natural, undated, medieval and recent deposits. Undated deposits comprised of two ditches that may be prehistoric in origin. A medieval pit was also identified. Finds include pottery, prehistoric flint and burnt stone. [Au(abr)]

Archaeological monitoring and recorded five features. There were probably post-medieval or modern in date. The largest feature was a ditch aligned closely with a field boundary depicted on the 1st Edition Ordnance Survey. Two shallower aligned ditches ran broadly at right angles to this boundary and may have been sub-divisions within a contemporary field. A 10m wide gap between the ditches was probably used as a trackway. One large pit contained tile and coal and was likely of 19th century or later in date. [Au(abr)]

CLEMENTS PARK***Clements Park, Southend-on-Sea, Essex. Post-excavation Assessment Report on Archaeological Excavations for B&Q/Link Road and Comet and Updated Project Design***

Wakeham, G Salisbury : Wessex Archaeology, 2007, 59pp, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

Excavations found extensive evidence for occupation dating from the Mesolithic through to the modern period. Two main phases of activity were identified, later prehistoric (mainly Mid to Late Bronze Age) and Saxon. Limited evidence was identified prior to the Mid/Late Bronze Age, and a small quantity of worked flint and pottery was recovered from later features. No features of this date were identified. There seemed to have been little activity on the site during the Iron Age and Roman periods. The first main phase of activity comprised an extensive enclosure system with tramways and quarry complexes of later prehistoric date. A rectangular structure, pits, post holes and other features were also assigned to this phase. The Saxon settlement revealed comprised a sub-rectangular Saxon enclosure formed of intercutting gullies which were later redefined by having domestic rubbish and cess pits cut through them. Further ditches, fine lines and ovens extended north and south of this enclosure and indicated an organised settlement. Post-built rectangular structures and sunken featured buildings were identified. A possible Saxon-Norman field was cut by three later, possibly medieval, ditches. [Au(abr)]

Excavation report

Work undertaken by: Suffolk County Council Archaeological Service

An archaeological excavation was carried out on land at Churchfield Road, Chilton, in advance of light industrial development. The site, which lay adjacent to the medieval Church of St Mary's and a former medieval green, identified evidence of settlement in the 11th - 14th centuries. Despite the limited size of the site and probable heavy truncation a scatter of features indicated that the area had been subdivided into smaller plots or yards and may have contained one or two post and beam structures together with associated rubbish pits. The finds assemblage clearly demonstrated the presence of settlement during the early medieval and medieval periods. No evidence was seen of any activity contemporary with the Late Bronze or Early Iron Age enclosure, CHT 009/015, which lies immediately to the west. [OASIS(Au)]

Atfield, R Ipswich : Suffolk County Council Archaeological Service, 2007, Short, negative, archaeological monitoring report (unpublished)

Work undertaken by: Suffolk County Council Archaeological Service

A single visit was made when it was possible to examine a deep footing trench dug in the area of garden at the south-east corner of the existing house. Unfortunately, a combination of factors created considerable problems in terms of archaeological visibility. Weather conditions were severe, with drifting snow and poor light, while within the actual trench an extensive period of previous drain leakage had caused a general staining of the ground deposits, obscuring any potential definition of archaeological features. No archaeological features or finds were located as a result of the monitoring. [OASIS(Au)]

39 KINGS STREET, SUDBURY

Archaeological monitoring report. Rear of 39 Kings Street, Sudbury

Gill, D J Bury St. Edmunds : Suffolk County Council Archaeological Service, 2007, unbound A4 report

Work undertaken by: Suffolk County Council Archaeological Service

An infilled brick built cellar and a bonded flint wall, the remains of a previous building, were recorded during ground works for an extension to the rear of 39, High Street, Sudbury. The brick size suggested that the cellar dated to late 15th/early 16th century and was an addition to an earlier building that had fronted the High Street. The flint wall, part of the front range, included roof tile within its construction and whilst earlier than the cellar, was thought to be either late medieval or early post-medieval in date. The results of the monitoring show that although the shops occupying the site are modern they respect much earlier plot divisions. [OASIS(Au)]

NEW CAR PARK ADJACENT TO BUILDING 439, RAF LAKENHEATH

New car park adjacent to Building 439, RAF Lakenheath

Caruth, J Bury St. Edmunds : Suffolk County Council Archaeological Service, 2007, Standard SCCAS A4 minor report, unbound with illustrations and maps

Work undertaken by: Suffolk County Council Archaeological Service

Archaeological monitoring carried out during repairs to a car park did not identify archaeological finds or deposits despite its location within a known area of Early Roman activity. Only very small parts of the development were excavated deep enough to penetrate modern surfaces and deposits, and where subsoil was seen it appeared to have been truncated, suggesting that the likelihood of archaeological deposits surviving in this immediate area is low. RAF LAKENHEATH, NEW ROUNDABOUT AND CAR PARK***Archaeological monitoring report. New roundabout and car park at Norwich Road, RAF Lakenheath***

Caruth, J Bury St. Edmunds : Suffolk County Council Archaeological Service, 2007, Standard SCCAS A4 spiral bound report including maps and illustrations

Work undertaken by: Suffolk County Council Archaeological Service

Archaeological evaluation and monitoring in advance of the construction of a new roundabout and car park at the junction of Norwich and Richmond Roads at RAF Lakenheath revealed further evidence of the Roman settlement in the form of ditches and pits containing some Roman pottery and animal bone fragments. Unfortunately the site had suffered a lot of modern disturbance and in addition, where archaeological levels survived they were well below the development levels. However, evidence that appears to support existing theories about the presence of a band of enclosure ditches on the east and north edges of the settlement was found. [OASIS(Au)]

HOLYWELLS PARK***Archaeological Monitoring Report. Holywells Park, Moated Enclosure***

Sommers, M Ipswich : Suffolk County Council Archaeological Service, 2007, printed sheets of A4 paper, stapled

Work undertaken by: Suffolk County Council Archaeological Service

Archaeological monitoring of the moat desilting at Holywells Park, Ipswich, was undertaken during December 2006. During these operations four lengths of tree trunk that had been bored through

longitudinally were recovered. Each had a tapered end which fitted in to the opposite end of its neighbour and together they formed a pipe. They were recovered underneath a dam across one arm of the moat and would have allowed water to flow from one side to the other in a presumably controlled manner although this is believed to be a secondary use as they appear to have been designed to withstand substantial internal pressure such as that required in an ornamental fountain. An independent timber expert, Richard Darrah, was commissioned to undertake an assessment of the pipes and samples were taken for identification of the species which was confirmed as elm by Rowena Gale (both Darrah's and Gale's reports are included as appendices in this report). THE PIGGERY NO.3, MOAT FARM BARN, BARKING TYE, BARKING

Archaeological Monitoring Report The Piggery No. 3 Moat Farm Barns, Barking Tye

Atfield, R Ipswich : Suffolk County Council Archaeological Service, 2007, Short unpublished negative monitoring report

Work undertaken by: Suffolk County Council Archaeological Service

Planning permission to erect a double garage and cartlodge. The development lies within the curtilage of a Grade II listed former stable range dating to the early or mid-seventeenth century which formed part a complex of structures associated with Moat Farm to the immediate north-east of the site. Moat Farm house has been dated to the mid-seventeenth century and is situated beside the remains of an incomplete medieval moat. Around thirty linear metres of building footings were dug to a depth of up to 0.90m and were monitored. The only feature observed during the monitoring was a thin remnant of a rammed chalk surface, or layer, which survived below the topsoil within the western footing trenches. This feature is most likely to be relatively recent in date, although no artefactual evidence could be associated with it. No other archaeological features or finds were located as a result of the monitoring. [OASIS(Au)]

WOODWARDS LANE, HIGH STREET, NEEDHAM MARKET***Archaeological Monitoring Report Woodward's Lane, High Street, Needham Market. A Report on the Archaeological Monitoring***

Everett, L Ipswich : Suffolk County Council Archaeological Service, 2007, 5pp, figs

Work undertaken by: Suffolk County Council Archaeological Service

Planning permission for the construction of a bungalow on land at Woodward's Lane, Needham Market, required a programme of archaeological works. Monitoring of the site was carried out on 2nd November 2007. Despite the site's location within an area of medieval settlement and to the rear of medieval buildings, where evidence of domestic activity might be expected, no archaeological deposits were observed. MONEYPOT HILL FARM***Archaeological Excavation Report. Moneypot Hill Farm***

Gill, D Ipswich : Suffolk County Council Archaeological Service, 2007, 38pp, colour pls, figs, tabs, refs

Work undertaken by: Suffolk County Council Archaeological Service

An archaeological excavation was carried out at the Grade II Listed Moneypot Hill Farm, Redgrave on the site of the former timber-framed cottage that was irreparably damaged by fire in February 2006. The building was modest, constructed in two main stages in the mid and late 16th century, probably by tenant farmers. A chimney was inserted in the 17th century and the building extended in the 18th century. Around the turn of the 19th century part of the original mid 16th century building was demolished. All of the archaeological evidence of the mid-late 16th century range was ephemeral, and without prior knowledge of the building, would have been probably impossible to interpret. All of the building evidence occurred within the depth of the 16th century topsoil and would be expected to be lost to any agricultural activity or reworking of the soil and therefore would have been invisible in the course of most archaeological excavations. The house constructed in the 16th century had been built on a fresh site with no evidence of a medieval building or earlier activity. [Au(abr)]

Birbeck, V Salisbury : Wessex Archaeology, 2007, 20pp, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

An evaluation, followed by a watching brief, was carried out in advance of, and during, improvements at a notorious accident black spot on the A14. Two Late Iron Age or early Roman features were recorded, possibly relating to a small farmstead or settlement in the general area. These features were preserved in situ. A small assemblage of prehistoric flintwork and pottery, residual Early Neolithic and Beaker pottery and two sherds of Saxon pottery were recovered from the topsoil. [Au(adp)]

85 HIGH STREET

85 High Street (formerly Ward's Garage), Aldeburgh. Archaeological Monitoring Report

Boulter, S P Ipswich : Suffolk County Council Archaeological Service, 2008, Unbound A4 report

Work undertaken by: Suffolk County Council Archaeological Service

Conditional planning consent for the erection of housing and shops on the former Ward's Garage site at 85 High Street, Aldeburgh required a programme of archaeological works involving the monitoring of groundworks associated with the development. A number of site visits were made during the extensive grubbing out operations undertaken to remove the below ground structures (tanks, contaminated soils, inspection pits etc.) associated with the former garage on the site. The disturbance caused by the tanks extended down to a depth of c.2.5 metres below the existing ground level. Given that naturally occurring sand/gravel subsoil was seen in the sides of the excavation at a depth of 1.3 metres it must be assumed that any archaeological deposits that had been on the site had been truncated during the insertion of the tanks. 8 River Road, Barking IGI I, London Borough of Barking and Dagenham. An Archaeological Watching Brief Report

Cardiff, P London : Museum of London Archaeology Service, 2007, 23pp, colour pls, figs, tabs, refs

Work undertaken by: Museum of London Archaeology Service

An archaeological watching brief was carried out at the site and revealed a number of timbers. The area was subject to tidal inundation and there was limited time to make observations and record timbers. The series of timbers were interpreted as part of a dismantled revetment or river wall dating prior to the 1930s when the later river wall was installed. The remains were part of the 1930s when the later river wall was installed. The remains were part of the Borough of Barking and Dagenham's industrial heritage and were of local significance. THE OLD MILL, BEXLEY HIGH STREET

The Old Mill, Bexley High Street, London Borough of Bexley, Proactive Observation Recording Exercise Report

George, S & Evans G Salisbury : Wessex Archaeology, 2007, 19pp, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

All of the archaeological deposits observed during the watching brief appeared to be modern in origin and almost certainly represented levelling deposits and dumps either dumped from the banks of the river or possibly into a mill pond, perhaps during the construction of the eastern wing of the Mill shown on the earliest Ordnance Survey maps of the area. The report concluded that archaeological remains did not exist within the development area, any remains which may have been present having been disturbed and truncated during previous building work on the Old Mill. WEMBLEY W03, WEMBLEY
Wembley W03, Wembley, London Borough of Brent. An Archaeological Watching Brief Report
 Carew, T & Clarke, C Twickenham : AOC Archaeology Group, 2007, 18pp, figs, tabs, refs
Work undertaken by: AOC Archaeology Group
 An archaeological watching brief was undertaken in association with a programme of geo-technical investigations. The archaeological investigations involved the observation and recording of nine machine excavated geo-technical test pits measuring 3m by 0.6m. The archaeological investigations were commissioned to assess whether former development on the site had disturbed any potential archaeological deposits. Of the nine test pits recorded, the natural ground was encountered in six and made ground was seen to the full depth of the other three. The results suggested that the area has suffered considerable truncation during the 20th century. Although the presence of natural ground means that it is possible that archaeological remains are present on the site, it is more likely that any such remains that were present have been removed during this episode of truncation. Of the deposits observed, none were deemed to possess any significant archaeological value. [Au(abr)]

Wembley W04, Wembley, London Borough of Brent. An Archaeological Watching Brief Report
 Clarke, C Twickenham : AOC Archaeology Group, 2007, 17pp, figs, tabs, refs
Work undertaken by: AOC Archaeology Group
 An archaeological watching brief recorded all five test pits and found that they contained sequences of made ground overlying London clay. It was thought that horizontal truncation took place prior to the deposition of made ground, removing any previously existing subsoil deposits. The horizontal

truncation of deposits was thought to have occurred during the development of the site during the 20th century. Of the deposits observed none were deemed to possess any significant archaeological value. [Au(adp)]

KING'S CROSS CENTRAL-PANCRAS ROAD REALIGNMENT, CAMDEN***An Archaeological Watching Brief at King's Cross Central-Pancras Road Realignment, London Borough of Camden***

Fairman, A Brockley : Pre-Construct Archaeology Ltd., 2007, 29pp, colour pls, figs, tabs, refs

Work undertaken by: Pre-Construct Archaeology Ltd.

An archaeological watching brief was carried out on a road realignment at the site. This was one of a series of watching briefs to support the redesign of King's Cross Central. Natural geology was recorded across the site consisting of a blue grey/orange brown gravelly clay. This was heavily truncated by late 19th century and modern 20th century redevelopments to the study site. A 19th century culvert plus contemporary footings and external wall were observed in close proximity to the still extant German Gymnasium. The external wall was believed to demarcate the original frontage of this construction. All deposits were sealed by 20th century made ground and resurfacing layers. All recorded deposits suggested large scale redevelopment of the area during the 19th and 20th centuries. [Au(adp)]

THE GRANARY COMPLEX, KING'S CROSS CENTRAL, CAMDEN***An Archaeological Watching Brief at The Granary Complex, King's Cross Central, London Borough of Camden***

Fairman, A Brockley : Pre-Construct Archaeology Ltd., 2007, 54pp, colour pls, figs, tabs, refs

Work undertaken by: Pre-Construct Archaeology Ltd.

An archaeological watching brief was carried out at the site and revealed natural deposits in trial pits 4,6 and 9 consisting of clean silty clay. In all pits, barring TP15 this was sealed by a series of 19th century made ground layers. The 19th century footings for still extant walls were recorded in pits 3,4,5,6,9,10 and 13. In addition 19th century subterranean structures were observed in pits 1,2 and 5 relating to the former canal basin. Extensive evidence was also revealed relating to late 19th century services. Large numbers of pipes were recorded in trial pits 1,5 and 9. Sealing all pits was a further series of 20th century made ground/levelling deposits. All recorded deposits indicate large scale redevelopment of the area during 19th and 20th centuries, thereby supporting both past observations and historical documentation related to the extensive railway lands of the Great Northern Railway and Midland Railway. 35 BASINGHALL STREET***35 Basinghall Street, London, EC2, City of London. An Archaeological Post-Excavation Assessment and Updated Project Design, February 2007***

McKenzie, M & Wardle, A London : Museum of London Archaeology Service, 2007, 143pp, colour pls, figs, tabs, refs

Work undertaken by: Museum of London Archaeology Service

An archaeological excavation took place in the basement of the pre-existing building and in the adjacent car park which was relatively undisturbed. Roman occupation of the site which lay north of the main settled area consisted of several timber buildings along with timber lined wells, rubbish and quarry pits and a single infant burial within open areas defined by a series of ditches. The most significant findings from the site was evidence for Roman glass working and pottery production in the 2nd century AD with very large quantities (over 70kg or 10,000 fragments) of glass production waste. A possible Saxon-Norman clay and timber building was recorded at the eastern end of the site, while the rest of the site was used for pitting and dumping into the 13th century. Possible workshops or cook shops to the rear of buildings fronting on Basinghall Street and dated to the 14th century with the ground level at 11.6m OD were recorded along the southern half of the site. Cellars and cesspits dated to the 17th and 18th century are likely to be associated with the Bear Inn which is known to have stood on this site from the late 15th century. [Au(adp)]

NEW STREET, LONDON EC2***New Street, London EC2. An Archaeological Watching Brief Report***

Taylor, J London : Museum of London Archaeology Service, 2008, 22pp, colour pls, figs, tabs, refs

Work undertaken by: Museum of London Archaeology Service

The watching brief revealed a series of external Roman layers, dating from the early 2nd century. A small quantity of human bone, including a skull, was retrieved. This suggested the site was in use as part of the northern Roman cemetery, which extended from immediately outside the City wall towards the modern Spitalfields area. Thirteenth century dumping and pitting and post-medieval cellar walls were also recorded, reflecting the post-Great Fire development of the site. The archaeological remains were of local significance and would serve to widen the understanding of the area. [Au(adp)]

16-18 FINSBURY CIRCUS, 18-31 ELDON STREET***16-18 Finsbury Circus, 18-31 Eldon Street, EC2 City of London. An Archaeological Post-Excavation Assessment***

Harward, R London : Museum of London Archaeology Service, 2007, 138pp, colour pls, figs, tabs, refs

Work undertaken by: Museum of London Archaeology Service

An archaeological evaluation was carried out at the site and the principal archaeological findings from the site were from the Roman period when the site was used as a cemetery. Original Pre-Roman or Early Roman streams were infilled and after AD 120, an east-west road previously excavated at 6 Broad Street Place was laid out sealing some burials. The road had a ditch on the northern side and marked an area of quarrying later used for further burials at the north west of the site. Across the north of the site ran a manmade water channel the Eldon Street Channel which was at least 5.9m wide and flowed east towards the Walbrook. Alongside and sometimes within the channel lay at least 40 inhumations, some buried in coffins. One adult male burial was buried with his hands crossed behind his back and iron shackles on his ankles. A further grave contained a prone burial whilst a pit contained disarticulated human bones. A complete horse had been carefully laid out within the grave on the side of the stream. Several graves contained grave goods most commonly ceramic vessels, some dating to the late 3rd century AD but also items of personal jewellery. Approximately 70 inhumations were excavated on the site and a further 20 possible cremation burials although some of these may be merely pits or hollows filled with pyre debris. Artefacts in the Museum of London collections indicates that there were many more burials and cremations in the immediate area of the site, including some excavated by Frank Lambert in the early 20th century during the construction of the previous buildings. RIVERBANK HOUSE, UPPER THAMES STREET***Riverbank House, Upper Thames Street, London EC4, City of London. Geoarchaeological Assessment of the Northern Boreholes***

Mills, W London : Museum of London Archaeology Service, 2007, 9pp, figs, tabs, refs

Work undertaken by: Museum of London Archaeology Service

A geoarchaeological assessment was carried out at the site in order to cross-reference the stratigraphic sequence data with previous borehole data from the evaluation work carried out in December 2006. Boreholes ABH2, ABH3b and ABH4 had very good palaeoenvironmental potential in addition to good

radiocarbon dating potential from the organic deposits. These boreholes also had the characteristics of Roman foreshore deposits. The Roman and medieval dump deposits were found between -0.5m OD and 2.5m OD. However, these results corresponded to the 2006 and 2007 evaluations at Mondial House. A chalk wall or foundation was found in ABH3b and ABH4, which according to its structure was suspected to be of medieval date. BH3b was characterised by the quantity of building material and had been interpreted as made ground and medieval or post-medieval dumping. A 3m brick wall was found in the upper part of ABH2, ABH3b and ABH4 between 2.5m and 4.5m OD and was likely to relate to a post-medieval structure. [Au(adp)]

Turner, S London : Museum of London Archaeology Service, 2007, 40pp, colour pls, figs, tabs, refs

Work undertaken by: Museum of London Archaeology Service
An archaeological watching brief was carried out at the site. Several archaeological features were observed during the works consisting of a possible Roman ploughed soil horizon, a pit and a posthole, a post-medieval quarrying pit and a 19th century soakaway. A geoarchaeological survey was also carried out on the natural quaternary deposits which existed below the basement slab. [Au(adp)]

St. Bartholomew's Hospital Preliminary Works, New Drainage Connections, London EC1, City of London. An Archaeological Watching Brief Report

North, CLondon : Museum of London Archaeology Service, 2007, 25pp, figs, tabs, refs
Work undertaken by: Museum of London Archaeology Service
An archaeological watching brief was carried out at the site. Archaeological deposits and features were recorded in section in four interventions for the purpose of drainage connections. Truncated natural deposits were observed between 12.70m OD and 11.14m OD. The highest survival of archaeological deposits occurred at 13.75 OD at the southern end of the site. It was concluded that there is limited archaeological survival at the northern end of the site and at the southern end of the site there was strong evidence to have suggested that the medieval city ditch survives in the south-east corner of the site at least; this feature is considered to be of regional significance. 14 BRIGHTON ROAD, PURLEY***14 Brighton Road, Purley, CR 8. London Borough of Croydon. An Archaeological Watching Brief***

Compass Archaeology London : Compass Archaeology, 2007, 20pp, colour pls, figs, refs

Work undertaken by: Compass Archaeology

The watching brief involved the observation and recording of a single L-shaped trench for the contractors' groundwork within the proposed development footprint. However, the excavations revealed that the central area of the site has been extensively built up with modern brick, tile and concrete rubble relating to the demolition of 14 Brighton Road. This demolition rubble extended to a depth of c. 1.8m below the current ground surface on the southern perimeter of the site. As a result of this, the groundworks were put on hold owing to the unforeseen discovery of these adverse ground conditions and this necessitated the redesign of the foundations for the development. The watching brief revealed no archaeological finds or features to date. [Au(abr)]

Bishop Ramsey School, Ruislip, London Borough of Hillingdon. An Archaeological Evaluation and Watching Brief Report

Brooks, S Twickenham : AOC Archaeology Group, 2007, 35pp, figs, tabs, refs

Work undertaken by: AOC Archaeology Group

An archaeological evaluation and watching brief was undertaken at Bishop Ramsey School, Ruislip. This was followed by a watching brief, conducted on the northern area of the site during the intrusive groundwork. The watching brief comprised the excavation of an open area within the footprint of the new drama barn and the "wedge building". The programme of archaeological work revealed a linear ditch containing middle to late Iron Age pottery. Natural clay and silt were recorded in the north part of the site, while the natural clay in the south was contaminated with hydrocarbons and was sealed by a 20th century made ground layer of rubble, over 1m thick. Work undertaken by: Museum of London Archaeology Service

The investigations recorded evidence for late post-medieval rubbish pits across the site, truncated by the later 19th century Zion chapel and commercial buildings that once occupied the site. Earlier post-medieval activity consisted of garden features and rubbish pits. The partial remains of an east-west aligned wall constructed from chalk fragments were recorded. This was horizontally and vertically truncated by 18th/19th century pits and could either be the remains of the "Pardon Churchyard" boundary wall, the Pardon Chapel or a previously unknown structure. An archaeological watching brief was undertaken between 4th January and 8th January 2007 at 178-182 New Cross Road, following on from earlier building recording of the properties. All properties save the front of No. 182 and an adjoining arched entrance were demolished and a scheme of ground reduction to set formation levels for the new builds was observed. Other than 19th and 20th century service runs and foundations for the previously demolished buildings, no archaeology was observed. [Au(abr)]

Compass Archaeology London : Compass Archaeology, 2007, 44pp, colour pls, figs, refs

Work undertaken by: Compass Archaeology

Archaeological monitoring was undertaken on contractors groundwork and refurbishment in two areas – the forecourt to the west of the church (including the paved area beneath the existing portico) and the porch on the south side of the Church. A scaled drawing record of the existing paving beneath the portico, including identification of possible re-used grave slabs, was carried out prior to the

commencement of groundwork. Drainage installation works in the tarmac forecourt were observed, exposing shallow made-ground layers and natural clay and gravels. Reduction of the tarmac forecourt exposed the same sequence, with modern made ground layers stripped to a depth of some 250mm, exposing the natural clay in places. Lifting of the slab-paving beneath the portico was observed in full. To the north, a section of red-brick, lightly mortared wall foundation was exposed and considered to be the remains of the boundary wall contemporary with the 1805 – 1837 phase of the church. A further section of wall foundation was observed to the south, representing a continuation of the existing boundary wall. This observation suggested that the existing wall continued beyond its current limits at some point, and was cut short to create a wider opening across the front of the portico. The lifting of a large 1.9m by 0.9m slab, situated immediately outside the southern most entrance exposed a brick-built vaulted burial vault with solid brick steps leading to a bricked up archway entrance. Using modern and contemporary sources, the vault was identified as belonging to a Hobbs family, with the earliest definite burial belonging to a Mrs Mary Hobbs in 1813. Refurbishment of the south porch involved the excavation of two trenches for a new retaining wall either side of a central pathway. These excavations produced a moderate quantity of disarticulated human remains within a mixed cemetery soil, and one area of in situ remains in the form of lower legs, ankles and feet of an adult protruding from the east facing section of the western trench. All human remains were re-interred in the same trenches. Examples of re-used worked stone were recovered from the existing retaining wall, three pieces showed obvious evidence of carving although their original use was unclear. [Au(abr)]

ARROWHEAD QUAY, MARSH WALL, TOWER HAMLETS

Arrowhead Quay, Marsh Wall, London Borough of Tower Hamlets. Report on Archaeological Watching Brief

Wessex Archaeology London : Wessex Archaeology, 2008, A4 comb-bound spiral report, including colour plans and photographs of the work carried out, within clear plastic covers.

Work undertaken by: Wessex Archaeology

Wessex Archaeology carried out a watching brief during which the remains of a late 19th century cellar and two circular brick-built structures, thought to be for oil storage, were recorded. The cellar was within the footprint of a building shown on a map of 1881. Truncation associated with the construction of the adjacent West India Dock (1866 - 1870) and post-war reconstruction in the 20th century had removed all potential archaeological deposits. HOUSEHOLD CAVALRY MUSEUM, HORSE GUARDS, WHITEHALL

Household Cavalry Museum, Horse Guards, Whitehall, London. An Archaeological Watching Brief Report and Standing Building Report

Howell, I & Westman, A London : Museum of London Archaeology Service, 2007, 17pp, colour pls, figs, tabs, refs

Work undertaken by: Museum of London Archaeology Service

The watching brief revealed several red brick foundations and drain that formed part of the construction of the standing building. Of significance was an earlier yellow brick drain which a later red brick drain had re-used at its terminus. This was constructed of reused Dutch paving bricks, probably from the stable floor of the first Horse Guards. The standing building survey recorded evidence for a mixture of construction methods, reminiscent of those used in 18th century warehouses. [Au(adp)]

LANGLEY WIND FARM

Langley Wind Farm, County Durham. Archaeological Monitoring

Robinson, L Durham : University of Durham, Archaeological Services, 2007, 14pp, colour pls, figs, tabs, refs, CD

Work undertaken by: University of Durham, Archaeological Services

A visual inspection of the site, prior to the commencement of groundwork, noted two large oval-shaped mounds and a track running south-north across the site. Groundwork revealed that the track comprised a single course of re-used red bricks, most of which were fragmented. The bricks were laid on 0.5m of

made ground, which had been used to create a level platform. A number of the bricks were stamped with "Washington Station 1922". Grooves were worn into the bricks intermittently along the southwest side of the track. It was

probable that this track related to the Pheasant Drift Mine. The western mound was the only one to be affected by the groundwork. It ran alongside the track and was composed of hard sandy gravel, which was probably a product of the Pheasant Drift Mine. A small gully, running south-west to north-east, was present halfway down the access route to the crane pad. No artefacts were recovered from the fill. [Au(abr)]

VINDOMORA VILLAS, EBCHESTER

Vindomora Villas, Ebchester, County Durham. Archaeological Watching Brief

Dougherty, E P Newcastle-upon-Tyne : Tyne & Wears Museum Archaeology Department, 2007, 21pp, colour pls, figs, tabs, refs

Work undertaken by: Tyne & Wears Museum Archaeology Department

The watching brief was required because of the proximity of the works to the Roman Fort of Vindomara, Scheduled Monument 32. Site A lay 150m to the north-east of the Scheduled Area. Site B lay 15m to the north of the fort. No Roman deposits were identified at either site, with post-Roman soils directly overlying the natural subsoil at both locations. At Site B, a fragment of a Roman roof tile was recovered from a post-medieval layer. [Au(abr)]

WEST DURHAM WIND FARM

West Durham Wind Farm. Archaeological Geophysics Survey

Hurst, M J South Shields : Tyne and Wear Museums Archaeology, 2007, Laminated and bound TWM Archaeology standard geophysics report including all relevant text and figures. Digital pdf version also available.

Work undertaken by: Tyne and Wear Museums Archaeology

TWM Archaeology carried out a geophysical survey, commissioned by Banks Developments, on farmland 2.5km north-west of Tow Law and 2 km south-west of Satley, County Durham. This survey was required in advance of wind turbine and associated trackway construction and development on the site. A close interpretation of the geophysical data gained in this survey has been made. Although a number of geophysical anomalies were identified, the survey does not show the presence of significant archaeological remains in the development area. [OASIS(Au)]

Railton, M & Wooler, F Nenthead : North Pennines Archaeology Ltd, 2008, Clear plastic cover, green spine, bound report, plus CD

Work undertaken by: North Pennines Archaeology Ltd

Archaeological excavation of coking works at Framwellgate Moor Colliery, County Durham, carried out by North Pennines Archaeology Ltd in November 2007. The excavation formed part of the mitigation strategy for a proposed residential development. The excavation confirmed the presence of a late 19th century coking works at Framwellgate Moor Colliery, and identified the form of twelve coking ovens at the site. At least two wagon ways were also identified. No artefacts were recovered with which excavated features could be dated. [OASIS(Au)]

EBENEZER METHODIST CHAPEL, WEST RAINTON

Ebenezer Methodist Chapel, West Rainton, County Durham. Archaeological Assessment and Recording

Robinson, L Durham : University of Durham, Archaeological Services, 2007, 26pp, colour pls, figs, tabs, refs, CD

Work undertaken by: University of Durham, Archaeological Services

There were no indications that the proposed development area was occupied during the prehistoric or Romano-British periods. West Rainton had its roots in the medieval period, and the village grew significantly after the development of the coal mining industry. During the medieval period it was probable that the core of the settlement, lying a little way to the north of the study area, consisted of a series of tenements stretching back from the edge of the former street or green. The Ebenezer Chapel was erected for the local Wesleyan Methodists in 1822, and was remodelled about fifty years later, perhaps because of the growth of the local population. The land in the immediate vicinity had been greatly disturbed by the construction of a housing estate. It was recommended that the interior of the building should be photographed when the floor had been removed, and before the new leaves were built inside the walls. This would provide a record of the interior as a single space. [Au(adp)]

BUTCHERS RACE, SPENNYMOOR***Butchers Race, Spennymoor, County Durham. The Results of Archaeological Trial Trenching and Excavation***

Rose, M Morley : Archaeological Services WYAS, 2008, 38pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Services WYAS

2nd-3rd century remains were recorded within the north-east corner of the proposed development site. These consisted mainly of gullies that had become very truncated due to medieval and later ploughing. The archaeological remains seemed to form enclosures, although the limited excavation of the features made it difficult to establish a function for the excavated features. Trial trenching found a continuation of the ploughing regimes over the entirety of the area but the only feature revealed was an old field boundary in the form of a double ditch. [Au(adp)]

Adams, J Durham : University of Durham, Archaeological Services, 2007, 17pp, colour pls, figs, tabs, refs

Work undertaken by: University of Durham, Archaeological Services

Disturbance was minimal to the existing deposits during the extraction of the concrete foundations. A layer of black-brown stone and hardcore aggregate material overlay deposits that formed a probable cobbled surface. A date could not be assigned to the cobbled surface during the monitoring work as no new areas were disturbed or exposed. The building did, however, stand on the line of the Roman Road, Dere Street, that ran through the centre of the fort. Two sherds of Roman pottery were recovered from this layer. Finds from unstratified contexts included a fragment of worked animal bone, possibly used in weaving. Burnt animal bone, 19th -century pottery fragments and a fragment of naturally-occurring iron pyrites were also recovered. [Au(abr)]

52 Denhill Park, West Road, Newcastle-Upon-Tyne. Report for an Archaeological Watching Brief

Ian Farmer Associates Gateshead : Ian Farmer Associates, 2007, 44pp, pls, colour pls, figs, tabs, refs

Work undertaken by: Ian Farmer Associates

The watching brief encountered one Roman stone structure of uncertain function, together with two Roman building walls. One of the stones built into lowest course had a crude carving of a phallus on its east face. The evidence suggested that these walls had been previously uncovered during earlier excavations prior to the building of the housing estate. The backfill of the excavations contained fragments of Roman pottery, ceramic building material and animal bones. One post-medieval wall fragment was uncovered which may be associated with the use of the area as a park in the 18th and 19th centuries. The limitations of trench sizes meant that little further information could be added to what was already known about the fort. [Au(adp)]

LIVE THEATRE, NOS 27-29 BROAD CHARE

Live Theatre, Nos 27-29 Broad Chare, Newcastle Upon Tyne. Building Recording, Archaeological Evaluation and Archaeological Watching Brief Draft

Mabbitt, J, McKelvey, J, Agnew, J & Stobbs, G Newcastle-upon-Tyne : Tyne & Wears Museum Archaeology Department, 2007, 68pp, colour pls, figs, tabs, refs

Work undertaken by: Tyne & Wears Museum Archaeology Department

A building recording was carried out in advance of the refurbishment as part of the Live Theatre redevelopment. The evaluation encountered post-medieval walls, after consultation with the County Archaeologist the area was excavated to the depth required for the construction of a lift shaft. The earliest extant fabric of the building appeared to date from the late medieval period. A watching brief was carried out and showed that few archaeological deposits of significance were disturbed but revealed further details of the construction of the Dobson Warehouses. [Au(adp)]

HANCOCK MUSEUM, BARRAS BRIDGE, NEWCASTLE-UPON-TYNE*Hancock Museum, Barras Bridge, Newcastle-upon-Tyne, Tyne and Wear. Archaeological Monitoring*

Beveridge, J Durham : University of Durham, Archaeological Services, 2007, 21pp, colour pls, figs, tabs, refs, CD

Work undertaken by: University of Durham, Archaeological Services

Two stone-filled gullies in rooms 1 and 2 were identical in construction and were either drainage channels or robbed out foundations of an earlier building. They were probably foundation trenches from either St. James's Chapel or St James's House. A stone surface found in room 2 was from an earlier phase of occupation on the site which predated the foundation trench. This surface was similar to the cobbles found in room 3. The sandstone footings for the brick foundations of the Museum were all reused blocks of masonry. The reuse of masonry in the fabric of the Museum was also seen in room 4 in the construction of underfloor ventilation ducts. This masonry probably originated from St James's House. [Au(abr)]

Parker, JH Newcastle-upon-Tyne : Tyne & Wears Museum Archaeology Department, 2007, 26pp, colour pls, figs, tabs, refs

Work undertaken by: Tyne & Wears Museum Archaeology Department

A watching brief and photographic survey were carried out at the site. During the watching brief a number of stone walls which formed the walls of St. Peter's Church were observed at a depth of 1.10m to 1.25m below the ground surface. An arch found in one of the test pits suggested that this church had vaulted cellars. Brick walls which post dated the stone walls were also found during the watching brief, probably the remains of the electrical engineering company which was shown on the site on the Fourth Edition Ordnance Survey Map of 1955. The west retaining wall which was part of the photographic survey probably formed the east wall of the school shown on the Second Edition Ordnance Survey Map of 1898. The sills within the wall would have been for windows in the school building. [Au(adp)]

Drewett's Park, Jarrow, Tyne & Wear. Geophysical Surveys and Archaeological Excavation

Adams, J & Hale, D Durham : University of Durham, Archaeological Services, 2007, 28pp, colour pls, figs, tabs, refs, CD

Work undertaken by: University of Durham, Archaeological Services

The geophysical surveys identified a number of potential archaeological features which probably related to the raising of the ground level in the later 19th and early 20th century, and the subsequent use of the area. The trenches identified evidence for the landscaping of the area, comprising the raising of the ground level. It was thought possible that unidentified significant archaeological deposits survived at greater depth. Significant quantities of finds were recovered of 17th to 20th century date, along with three sherds of medieval pottery. [Au(abr)]

FORMER DONNISON SCHOOL, CHURCH WALK, BISHOPWEARMOUTH***Former Donnison School, Church Walk, Bishopwearmouth. Archaeological Watching Brief***

Frain, T Newcastle-upon-Tyne : Tyne & Wears Museum Archaeology Department, 2007, 23pp, colour pls, figs, tabs, refs

Work undertaken by: Tyne & Wears Museum Archaeology Department

An archaeological watching brief was carried out as human remains were found during restoration of the school. As the remains had clearly once been buried in the consecrated ground of the churchyard, it was decided to carry out further groundwork under archaeological supervision. The loose material behind the revetment wall at the western end of the site consisted of dark loamy material with a high proportion of disarticulated human bone. This appeared to be a deposit of graveyard soil deriving entirely from inhumations disturbed by subsequent burials. This had built up to a depth of around 1.2m. Elsewhere, yellow clay subsoil was visible and archaeological intervention consisted of a sweep of standing sections and surfaces for human remains and cultural material. There was a copper pin through a skull and cut marks on a tibia, which was attributed to previous excavation. [Au(adp)]

TOWN PARK, SUNDERLAND***An Archaeological Watching Brief at Town Park, Sunderland***

Carey, CBakewell : Archaeological Research Services, 2007, 22pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Research Services

A watching brief was carried out during groundwork for the removal and replacement of a retaining wall around the south-west corner of the Green. The study area lay within the former extent of Bishopwearmouth medieval village which was founded as early as 930 AD. There was potential for medieval, post-medieval and even prehistoric archaeology to exist on the site. Developments which raised the ground level and re-landscaped the site in 1980 had truncated the undisturbed ground level. Any archaeology that may have been present on the site was probably removed by these developments. [Au(adp)]

41 TOWN WALL, HARTLEPOOL

41 Town Wall, Hartlepool. Archaeological Watching Brief

Green, G Hartlepool : Tees Archaeology, 2007, 9pp, colour pls, figs, tabs, refs

Work undertaken by: Tees Archaeology

A watching brief took place following the excavation of trenched foundations for a sizeable domestic extension to the rear of 41 Town Wall. The sections and bases of the trenches were inspected. Two features were noted. These comprised limestone rubble walls, bonded with mortar and post-medieval in date, probably at least 18th century in date and overlain but the more recent house. THE MALTINGS AND BOLAMS MILL, ALNWICK

The Maltings and Bolams Mill, Alnwick. Archaeological Monitoring

Swann, N Durham : University of Durham, Archaeological Services, 2007, 20pp, colour pls, figs, tabs, refs, CD

Work undertaken by: University of Durham, Archaeological Services

A soil of earlier medieval date was recorded, which may have related to agricultural activity. Two wells, probably constructed for use by The Maltings, were discovered. One lay in the north-west of the site beneath a modern extension to The Maltings, and another in the east of the site beneath the access road between the two buildings. A stone culvert adjoining the Bolams Mill building was discovered. This was probably constructed at the same time as the well, and used to divert the course of the Bow Burn for use by the mill. A full record of the archaeological resource had been made, and no further work was recommended. [Au(abr)]

HOLYSTONE***Land at Holystone, Harbottle, Northumberland. Geophysical Surveys***

Hale, D N Durham : University of Durham, Archaeological Services, 2007, A4, wirebound, grey covers

Work undertaken by: University of Durham, Archaeological Services

Second programme of survey with the Holystone History and Archaeology Group, this time hoping to detect remains associated with Holystone Priory, amongst other things. Several small areas surveyed around existing church and elsewhere. Whilst the remains of a number of walls have been detected to the south and probably west of the church, these can be accounted for by reference to 18th and 19th century plans which show former cottages and garden boundaries. None of the geophysical anomalies detected in these surveys is thought likely to reflect features associated with Holystone Priory. [OASIS(Au)]

Bamburgh Research Project Bamburgh : Bamburgh Research Project, 2007, 36pp, colour pls, figs, tabs, refs

Work undertaken by: Bamburgh Research Project

Excavation within the development area revealed a substantial north to south oriented ditch, extending on past the crosswall in the northern part of the development through to the later 18th century wall of the walled garden. The pottery recovered suggested that it was a long-lived boundary, opened between the 12th and 15th centuries and later perpetuated by the brick wall. Two substantial probable pits were also recorded, and dated to around the 13th century. [Au(adp)]

CHILLINGHAM WILD CATTLE PARK

An Archaeological Survey of Chillingham Wild Cattle Park, Northumberland

Johnson, B, Carey, C & Stafford, L, Bakewell : Archaeological Research Services, 2007, 75pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Research Services

The survey found no evidence for pre-Iron Age archaeology at the site. The Iron Age itself was represented by Ros Castle, a hillfort of substantial earthworks, and a previously unrecorded Late Iron Age/Roman ditched enclosure. Two other enclosures, one univallate and one multivallate, were also located. Hollow ways were present throughout the park, most over 1.5m deep, and were thought to have origins dating to the Iron Age. The Chillingham Estate was founded in the 13th century, and since then had its boundaries built, reworked and removed. The survey also recorded a post-medieval deer hemmel and around 20 sandstone pads of an unexplained nature. Nine sandstone culverts/bridges were surveyed, and two Jacobean rifle butts were found. The First World War saw mill survived as a concrete plinth with an excavated part of the hillside to the north. [Au(adp)]

CASTLE TERRACE, BERWICK-UPON-TWEED***Castle Terrace, Berwick-upon-Tweed, Northumberland. Results of an Archaeological Excavation Area 1***

Jones, E Edinburgh : Headland Archaeology, 2007, Unpublished grey literature- client report

Work undertaken by: Headland Archaeology

Headland Archaeology Ltd was commissioned by Hudson Homes to undertake an archaeological excavation at Castle Terrace, Berwick-upon-Tweed, Northumberland. The site lies adjacent to Cheviot House, the recorded site of the medieval church of St Lawrence's and is within the general area of the abandoned medieval settlement of Bondington. Previous evaluation of the site in 2004 had identified a concentration of features thought to be associated with the remains of the medieval settlement or with the church itself in the areas immediately west of Cheviot House. A number of undated features spread across the site were also recorded. The excavation was undertaken to the west of the area of structural remains, which were preserved in situ. The site comprised a series of ditches, thought to demarcate plot boundaries and a number of isolated features thought to be associated with backlands activities. A number of possible robbed out stone structures were identified, one associated with a well-made stone culvert. The final phase of the site saw a series of drystone wall foundations built on top of hillwash that had developed over the site. The earliest phases of the site date to the 12th-14th centuries, corresponding with the proposed origin of Bondington in the 12th century and its abandonment in the 14th. There is a lack of finds from the 15th-17th centuries, when the site was abandoned and it appears to have been reoccupied by the 18th century when the stone field walls may have been established. The similarity of orientation of the walls and the ditches may merely reflect alignment with the road rather than continuity of occupation. [OASIS(Au)]

CASTLE TERRACE, BERWICK-UPON-TWEED
Castle Terrace, Berwick-upon-Tweed, Northumberland. Results of an Archaeological Watching Brief

Atkinson, D & Jones, E Edinburgh : Headland Archaeology Ltd., 2007, 40pp, colour pls, figs, tabs, refs

Work undertaken by: Headland Archaeology Ltd.

An archaeological watchingbrief and excavation were carried out over two areas of the site. In Area 2, no archaeological remains were recorded. An excavation in Area 1 revealed a series of ditches demarcating plot boundaries, features demonstrating backlands activities and a number of possible robbed-out stone structures, one possibly relating to a well-made stone culvert. A series of drystone wall foundations were later built on top of hillwash that had developed over the site. The site was thought to date from the 12th-14th centuries, was then abandoned and later reoccupied in the 18th century. [Au(adp)]

The north side of the Vallum ditch, an earthwork which marked the southern extent of the Hadrian's Wall corridor, was exposed across the south side of the site. The upper layers of this feature were visible, although it was only excavated at the very west end of the new construction. Part of the north edge of the Vallum was visible near the south boundary of the site, although this was not fully exposed. To the east of the site, the line of the north edge of the Vallum was just visible, but was not disturbed by any foundation excavations. Nothing of archaeological interest was exposed at the north of the site. [Au(abr)]

FORMER RED CROSS HALL SITE, ST. HELEN'S STREET***An Archaeological Excavation at the Former Red Cross Hall Site, St. Helen's Street, Corbridge, Tynedale District, Northumberland***

Goode, A & Taylor-Wilson, R Durham : Pre-Construct Archaeology (Lincoln), 2008, A4 sheets of paper, with card covers, heat bound within integrated plastis spine/acetate covers.

Work undertaken by: Pre-Construct Archaeology (Lincoln)

A programme of archaeological investigations included: an initial open area excavation in two areas on the street frontage prior to demolition of standing buildings; followed by archaeological monitoring and recording during bulk ground reduction and localised deeper excavations across the remainder of the site at the onset of construction. A linear feature in the central northern portion of the site was of probable Roman origin. Medieval (probably 13th century) refuse pits, postholes, linear features, stone surfaces and substantial possible 'robbed-out' building were the earliest definitively dated remains to be recorded. Street frontage flagstone surfaces and other structural remains, such as a stone-lined drain, of post-medieval date, were also recorded. [OASIS(Au)]

North Pennines Archaeology Ltd Alston : North Pennines Archaeology Ltd., 2007, 68pp, colour pls, figs, tabs, refs

Work undertaken by: North Pennines Archaeology Ltd.

The watching brief uncovered human remains and part of a medieval structure. As a result a contingency clause of the original Specification of Work was invoked, and an excavation carried out. This uncovered a further human skeleton and the remains of five medieval buildings, a small 12th-15th century horticultural plot and numerous areas of metalworking of copper and bronze, the latter considered to be of national importance owing to the scarcity of similar sites in the UK. The western boundary wall was removed and revealed evidence for medieval industrial activity below the depth of the development. [Au(adp)]

LAND TO THE REAR OF SMITHS GORE, MAIN STREET, CORBRIDGE***Archaeological Watching Brief on Land to the Rear of Smiths Gore, Main Street, Corbridge, Northumberland***

Beaty, J & Peters, C Alston : North Pennines Archaeology Ltd., 2007, 23pp, colour pls, figs, tabs, refs

Work undertaken by: North Pennines Archaeology Ltd.

The site was located within an area of high archaeological potential relating to medieval and post-medieval settlement within the historic town of Corbridge. The works involved the excavation by hand of a foundation trench for the footings for the replacement building. The trench was split into four for recording purposes and in the corner of Trenches 1 and 2 were the dumped remains of a nearby furnace. No dating evidence was recovered from the kiln fragments themselves, but pottery of a medieval date was recovered from the same context. A stone built, corn-drying kiln, was excavated. The finds recovered from the trenches ranged from a single Roman coin dated to the later 3rd century to post-medieval pottery. In addition, waste products indicative of a nearby ironworking furnace were recovered, corroborated by the environmental samples of the deposit. It may be of medieval origin. The medieval subsoil deposit continued for 3 of the 4 trenches producing pottery all of similar date. [Au(abr)]

NEW WATER MAIN, WALL MILE 26, LOW BRUNTON***New Water Main, Wall Mile 26, Low Brunton, Northumberland. Archaeological Excavation and Recording***

Telford, A Newcastle-upon-Tyne : Tyne & Wears Museum Archaeology Department, 2007, 28pp, colour pls, figs, tabs, refs

Work undertaken by: Tyne & Wears Museum Archaeology Department

The watching brief was carried out during Scheduled Monument Consent for the excavation of a water pipeline. The excavation of the Military Way revealed that the surface revealed in Trench Four of the earlier evaluation was original, and not resurfaced. No dating evidence was forthcoming. To the south west limit of the Military Way, a gully was identified but was not thought to bear any relation to Hadrian's Wall. The vallum ditch was hand excavated where the pipeline crossed it to the required depth of the pipe. A metallised surface reflected the possible use of the vallum as a hollow-way after the ditch had silted. [Au(adp)]

WINDY HAUSE DESERTED SETTLEMENTS, OTTERBURN ATE

Topographic Earthwork Survey. Windy Hause Deserted Settlements, Otterburn ATE, Northumberland

Tabor, J Barnard Castle : Northern Archaeological Associates, 2007, 88pp, colour pls, figs, tabs, refs

Work undertaken by: Northern Archaeological Associates

The site as a whole comprised three recorded areas of settlement, Windy Hause East, West and South. The settlements were located to the south of Riddlees Burn on a platform with a broad meander in the watercourse. The archaeological remains represented three of four farmsteads, likely to have exploited

the uplands with cattle and sheep farming. Traces of ridge and furrow also indicated cultivation of the area. The nature of the remains was hard to interpret and phase, and may have belonged to a broad period stretching from the 12th to the 19th centuries. In general the condition of the features was at best fair and at worst poor and in decline. Very few features had been unaffected by impact craters. Although damaged, the remains at Windy Hause were an important example of upland settlement. [Au(adp)]

Edwards, B Durham : University of Durham, Archaeological Services, 2007, 16pp, colour pls, figs, tabs, refs

Work undertaken by: University of Durham, Archaeological Services

The report presented the preliminary results of the 2007 field season of excavation at the site, a monument believed to be a long barrow/cairn of Early Neolithic date. No burials were located, however, significant structural traces were recovered and it was proved that the mound was at least of human origin. The form of the monument suggested an Early Neolithic date. [Au(adp)]

THE SWAN PUBLIC HOUSE, ASTLEY GATE, BLACKBURN***The Swan Public House, Astley Gate, Blackburn, Lancashire. Rapid Desk-based Assessment, Archaeological Building Investigation and Watching Brief***

Taylor, K Lancaster : Oxford Archaeology North, 2007, 50pp, colour pls, figs, tabs, refs

Work undertaken by: Oxford Archaeology North

Demolition of the Swan Hotel was due to be carried out following the building investigation. Unfortunately, demolition of building had commenced early, which resulted in the curtailment of the building survey after only two days. Instructions from the demolition contractor forbade all access to the building due to health and safety restrictions. This resulted in a very limited building investigation record and the full extent of the required survey could not be carried out.

Despite this, the investigations the site revealed that the building was probably constructed towards the end of the eighteenth century. The results of the rapid desk-based assessment to trace the history of the Swan Public House from c1796 to 1935. The cartographic evidence suggested that the area became built over by about 1795. It appeared that one Thomas Sharples owned the Swan Public House in c.1796 when he was listed as also owning the Sun Inn, which was situated next door. Watching brief investigations following demolition of the Swan failed to uncover any evidence for the presence of any previous structure on the site. [Au(abr)]

Frost, P Pontesbury : Castlering Archaeology, 2007, 11pp, colour pls, figs, refs

Work undertaken by: Castlering Archaeology

No archaeological features were revealed. The subsoil had been cut only by the insertion of a metal water pipe and the more recent blue water pipe which ran in a north-south direction. A minimal amount of mainly post-medieval ceramic material was recovered together with the heavily abraded small bowl of a mid-17th century pipe. Most of the metal recovered related to agricultural use, for example, nails, bolts and hinges. A 1938 silver florin and an undatable heavily corroded halfpenny were also recovered. [Au(adp)]

37-41 WHITE FRIARS, CHESTER

37-41 White Friars, Chester. Archaeological Watching Brief

Webster, T Chester : Gifford & Partners, 2007, 37pp, colour pls, figs, refs

Work undertaken by: Gifford & Partners

In total, eighteen test pits were observed and recorded. All of the upper deposits in the investigations comprised disturbance from the existing buildings, which had been present on the site from at least 1833. Undisturbed deposits were encountered in a number of pits. A small pit, which coincided with a depression in the underlying bedrock, suggested the presence of a ditch running east to west. The only artefacts recovered in this area were bone, late medieval pottery and a single copper alloy object. The artefactual material recovered from the backfill of the cut feature dated from as late as the 18th century.

It was notable, however, that while the White Friars street frontage was always lain within the limits of the Roman legionary fortress, to its south-western corner tower at the entrance to Weaver Street from Nicholas Street, in fact clipping the rear end of No. 41 White Friars in the location of Test Pit 13. Cellaring in the post-medieval period was responsible for the truncation of deposits. [Au(adp)]

Frost, P Pontesbury : Castling Archaeology , 2007, 15pp, colour pls, figs, tabs, refs

Work undertaken by: Castling Archaeology

The monitoring of works revealed evidence for post-medieval activity dating from the alterations of the 16th, 17th and 18th centuries. Two areas contained archaeologically significant material which was mechanically excavated through in order to reach a level of firm ground. A pit, presumably excavated to bury rubbish, was located immediately behind the street frontage store. The pit appeared to have gone out of use during the 17th century, after which it was levelled and a cobbled surface laid. Material trodden into the upper surface of this area dated to the post-medieval period. The cobbled surface uncovered was similar in composition to the cobbled visible on the west side of the medieval market cross base. In the 19th century, a cellar below the street frontage show resulted in the deposition of brashy material across the suite. [Au(adp)]

THE VICARAGE, MARKET PLACE

Dalton-in-Furness. The Vicarage, Market Place

Bates, ALancaster : Oxford Archaeology North, 2008, 1p

Work undertaken by: Oxford Archaeology North

A rapid desk-based assessment and the recording of human remains were undertaken following the discovery of a burial during construction works. The Vicarage was an early 19th century Grade II Listed Building, constructed on the site of an earlier vicarage documented in 1699, and situated to the north-east of St. Mary's church. The burial was found to be that of a middle-aged/older female, of medieval or earlier post-medieval date. No further archaeological evidence was discovered during the groundwork. [Sec]

Bates, ALancaster : Oxford Archaeology North, 2008, 1p

Work undertaken by: Oxford Archaeology North

An excavation was undertaken at the site of a steam power plant, which was relatively well preserved below ground. It was possible to identify the engine house, boiler house, flue and chimney. The design of the structures showed that a Lancashire Boiler was used at the site to power a beam engine. No economiser, or water feed heater, which would have used hot air from the furnace to pre-heat water entering the boiler, was located, although this structure may have been lost during demolition. Mounsey, K, Railton, M, Shaw, T, Sowerby, M & Wooler, F Nenthead : North Pennines Archaeology Ltd, 2008, Clear plastic cover, green spine, A4 bound report

Work undertaken by: North Pennines Archaeology Ltd

A watching brief was conducted during groundworks for an extension of the existing post-medieval house. The earliest feature found was an east-west aligned ditch measuring 0.7m deep. A Roman left nailed leather shoe was recovered from its primary fill, and the ditch was interpreted as a probable defensive ditch associated with Hadrian's Wall. Environmental analysis showed the ditch had remained open for a time. An overlying wall and cobbled surface were dated to the post-medieval period based on cartographic evidence. [OASIS(Au)]

Work undertaken by: Oxford Archaeology North

An archaeological watching brief revealed two of the rooms were laid down in local cobbles with no internal features visible. Two further rooms were laid down to flagstones of varying sizes, together with areas of brick and cobble patching and repair. It was clear that these rooms contained the most evidence for industrial processes within the complex. Two large sandstone blocks were buried into the floor within Room 5, which may have supported either a large item of equipment or a tank. Room 7 contained a semi-circular pit or tank with a flagstone lid which may have been used for soaking or washing wool. A possible padstone was also recorded which possibly supported a column relating to a roof truss. [Au(adp)]

Kendal: Bridge End Tannery, Nether Bridge

North Pennines Archaeology Ltd Alston : North Pennines Archaeology Ltd., 2008, 1p

Work undertaken by: North Pennines Archaeology Ltd.

An excavation took place to assess the buried remains of the former tannery. Of nine tanning pits recorded, the earliest were found to have been used for tanning of sheep hides, whereas three large pits from the tannery's later phases of leather production were for the tanning of cattle hides. The remains of the tannery were backfilled and sealed beneath made ground in the early 19th century. A series of parallel ridges and furrows, believed to be of 17th and 18th century date, indicated an earlier agricultural use of the site. [Sec(abr)]

Whitehead, S Ulverston : Greenlane Archaeology Ltd, 2007, 45pp, colour pls, figs, tabs, refs, CD

Work undertaken by: Greenlane Archaeology Ltd

An archaeological evaluation and a watching brief revealed that the site contained walls, floor surfaces and drains which were cut into the natural geology and buried under 19th and 20th century overburden. These findings tied in well with a desk-based assessment which showed that a brewery occupied the site from the early 19th century onwards. Unfortunately, due to the landscaping required to remove the

upslope to the rear of the plot, the construction of the brewery had truncated any earlier archaeological deposits that may have existed on the site. [Au(adp)]

HIGHFIELD SERVICE RESERVOIR TO POAKA BECK WWTW PIPELINE

Dalton-in-Furness. Highfield Service Reservoir to Poaka Beck WWTW Pipeline

Wearing, N & Clarke, S Lancaster : Oxford Archaeology North, 2007, 1p

Work undertaken by: Oxford Archaeology North

A photographic survey and watching brief was maintained along the route of a new water pipeline, following a desk-based assessment in 2005. A number of new features relating to post-medieval agricultural and industrial activity were noted, including the extent of former field boundaries, iron mine works and limestone quarrying. The remains of the mill race at Scale Bank Farm were also recorded. [Au(abr)]

Work undertaken by: J. M. Trippier

A watching brief was carried out during excavations for a toilet block and access track for a proposed caravan site. The watching brief was occasioned by the proximity of the site to the line of the Roman Road from Manchester to Ribchester shown on the 1st edition OS map of 1849. A feature which may possibly have been a side-ditch for the road was noted but this was not particularly convincing. There were no associated finds and the feature could just as easily be associated with 19th century colliery workings in the area. [Au(abr)]

DEVELOPMENT AT DAMSIDE STREET TO THE REAR OF 54-56 CHURCH STREET, LANCASTER***Development at Damside Street to the rear of 54-56 Church Street, Lancaster, Lancashire.******Archaeological Desk-based Assessment, Watching Brief and Evaluation***

Bullock, V Lancaster : Oxford Archaeology North, 2008, 92pp, colour pls, figs, tabs, refs, CD

Work undertaken by: Oxford Archaeology North

The development site lay towards the centre of Lancaster, just south of the River Lune. Previous fieldwork at Damside Street had indicated the presence of possible nearby Roman riverside settlement, relating to the fact that the contemporary course of the Lune in this area ran slightly to the south and west of its present course. The gradual movement of the river channel left much of the area very marshy, forming the Green Ayre. This area was not thought to have been developed until the eighteenth century, when it was consolidated with large amounts of refuse and other redeposited material. The proposed development site lay to the rear of plots on Church Street and was used as a car park. During the assessment, 31 sites of cultural heritage interest were identified within the wider area, mostly historic buildings. Two sites were likely to be directly affected by the development, Site 8, the regionally significant remains of Roman and medieval remains identified on the site (15 Damside Street) during an evaluation undertaken in 1990, and Site 18, a series of locally significant post-medieval buildings identified from cartographic sources as occupying the site from at least the later eighteenth century. The watching brief of geotechnical boreholing and test-pitting was conducted in order to assess the presence of any archaeological and palaeoecologically significant remains on site. The coring, which extracted loose samples, revealed mudstone at a depth of 5m. This was overlain by approximately 3m of apparently riverine deposits, in turn overlain by about 2m of more mixed deposits, some of which, near the street frontage, potentially related to backfilling of cellars, whilst other deposits could be archaeological in origin. The geotechnical test pits excavated through the embankment within the rear portion of the site revealed the presence of a number of structural remains likely to relate to the different phases of building associated with Site 18, together with a large amount of demolition debris likely to relate to the destruction of the same buildings. HIGHER MILL, RAWTENSTALL

Higher Mill, Rawtenstall, Lancashire. Documentary Research, Building Assessment, Watching Brief and Excavation Report

Bates, A Lancaster : Oxford Archaeology North, 2008, 57pp, colour pls, figs, tabs, refs

Work undertaken by: Oxford Archaeology North

Historical research of the site demonstrated that Higher Mill operated both the spinning and weaving of cotton, and was constructed at some point during the latter half of the 19th century. The physical arrangement of the mill did not seem to have undergone any significant alterations. The watching brief revealed structural remains of the engine house, chimney, loading bay and possible economiser

building to be compiled. The boiler house appeared to have been located within the long covered shed. Further watching briefs were recommended for all ground disturbance within this building. [Au(adp)]

M1 BROUGHTON BROOK OUTFALL***M1 Broughton Brook Outfall, Bedfordshire***

Turner, I Bedford : Albion Archaeology, 2007,

Work undertaken by: Albion Archaeology

A programme of archaeological observation, investigation and recording was undertaken by Albion Archaeology on engineering works at the M1 Broughton Brook outfall, Bedfordshire. The site lies within an area of archaeological potential, in the vicinity of cropmarks possibly dating to the later prehistoric or Roman periods. Other significant archaeological remains are also located in the surrounding landscape. The engineering works comprised the excavation of a foundation trench for a penstock, and the re-profiling of a length of drainage ditch. No archaeological features, deposits or artefact were revealed during the engineering works. Deep excavations were only carried out for the penstock foundation trench where only geological deposits were encountered. Any potential remains present in the vicinity of the drainage ditch were unlikely to be revealed due to the limited nature of the works in that area. [OASIS(Au)]

Santer, W & Funnell, J Brighton : Brighton & Hove Archaeological Society Field Unit, 2007, 1p

Work undertaken by: Brighton & Hove Archaeological Society Field Unit

The area was flattened and large quantities of demolition debris was deposited over the whole site. It was immediately noted that a large percentage of the site had been largely terraced in the past, with even deeper sections in the south which were probably the old gardens. A number of garden retaining walls were noted. The north face and east sides of the site had been recently quarried out with clean chalk cuts made by excavating equipment. The north-east quadrant of the development site, about 25%, would have had potential for archaeological remains, but these had been removed. An examination of the north and east faces produced only features, including pits and ditches, that were associated with modern development, with cables and pipes still in situ. [Au(adp)]

Archaeological Excavation on the Site of the Sleeping Parlour at Sowe Landscape Gardens, Buckinghamshire

Marshall, G & Pentice, J Northampton : Northamptonshire Archaeology , 2007, 23pp, Colour pls, figs, tabs, refs

Work undertaken by: Northamptonshire Archaeology

An excavation was undertaken to establish the location, size and shape of the sleeping parlour, Stowe, which was demolished in the 1760s, prior to restoration of a series of paths around the site of the former garden buildings. A programme of trial trenching had previously been carried out in the area close to the site of the former building. As a consequence of this work one corner of the building was identified. Wessex Archaeology Salisbury : Wessex Archaeology, 2007, 20pp, figs, refs

Work undertaken by: Wessex Archaeology

Between 2006 and 2007, archaeological work consisting of a metal detector survey of the whole site, an intermittent watching brief of access roads and a strip, map and record excavation targeted on earlier work was carried out. Finds from the Neolithic to the post-medieval periods were recovered, however, the archaeological features identified mainly related to the occupation of later prehistoric and Roman date. Medieval agriculture, presumably related to the nearby deserted medieval settlement, was noted in the furrows that truncated all earlier archaeological features. There appeared to have been a hiatus in activity in the Middle/Late Iron Age, after which the north of the site was divided into a complex of probable agricultural enclosures. Two roundhouses, an oven and a group of pits were identified in this locality. A Roman double-ditched enclosure was also located, with an internal ditch that may have been a beam slot, an oven for drying malt and a stone-lined pit with outflow drains. This was significant in that many other sites involved with malt drying had little evidence for the structures involved. It was suggested that the results of the work would form the subject of post-excavation analysis. [Au(adp)]

TAPLOW QUARRY

Taplow Quarry, Taplow, Buckinghamshire. Archaeological Excavations Report [Phases 1 & 2]

Ellis, C & Evans, G Salisbury : Wessex Archaeology, 2007, 44pp, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

The 2006-07 excavations produced fragmentary remains of later Neolithic/Bronze Age activity on the site, comprising pottery sherds and undiagnostic flint flakes and tools. The west and south-west corner was characterised by a series of Late Bronze Age/Middle Iron Age north-east to south-west running ditches, almost certainly part of a field system. This was modified in the Late Iron Age/Roman period, with the addition of a droveway on the same alignment, suggesting continuity of use. Pits, wells and a possible waterhole/dewpond, coupled with the relative paucity of finds, suggested that the site was agricultural in nature. Later activity on the site was illustrated in a rectilinear pattern of post-medieval field boundaries, the orientation of which was maintained in the present site boundaries. [Au(adp)]

Castle Square Sewer Works, Brighton

Whittaker, D Portslade : Archaeology South East, 2007, A4 Spiral Bound, Card Backed, Word Processed Ariel 12

Work undertaken by: Archaeology South-East

An archaeological watching brief of sewage works in Castle Square, Brighton, East Sussex, (NGR: 531238 104078) took place between 30th January and 6th February 2007. During the monitoring of a 20m trench excavation along Castle Square made ground was encountered to a depth of 500mm with no further intrusive groundworks required. The majority of the trench exposed existing services and redeposits of modern material. No archaeological deposit or undisturbed geological layers were found. Excavation of a 900mm deep pit for a pumping station, revealed 600mm of concrete and 300mm of undisturbed natural chalk, with no Pleistocene deposits present. [OASIS(Au)]

4 WINDING STREET

A watching brief at 4 Winding Street, Hastings, East Sussex

Riccoboni, P Portslade : Archaeology South East, 2007, Bound, formatted report

Work undertaken by: Archaeology South East

An archaeological watching brief was maintained on the 10th and 11th September 2007 during groundworks associated with the construction of a new dwelling on land at 4 Winding Street, Hastings, East Sussex (Planning Reference: HS/FA/06/00968). Foundation trenches for four walls were excavated to depths of approximately 0.7m. Trench 1 revealed the north facing section of the Hastings Town Wall thought to be 14th Century in origin. Trench 2 revealed the remains of an adjoining wall which butted up against the Town Wall (at a right angle) and is thought to be remains of a Post medieval dwelling. The watching brief was successful in proving the Town Wall survived to a width of 2.5-2.8m and was in good condition. [OASIS(Au)]

Greatorex, C Polegate : C.G. Archaeology , 2007, 23pp, figs, tabs, refs

Work undertaken by: C.G. Archaeology

An archaeological watching brief was maintained on the cutting of a new gas pipe trench at St. Anne's Church, High Street, Lewes. No in situ funerary remains, cut features, structures, or archaeologically significant deposits were discovered during the fieldwork. However, a small assemblage of disarticulated human bone was gleaned from the excavated topsoil. The number of individuals represented within this collection, their respective ages at death, sex and pathology was not established. The investigation also yielded three oyster shells, three iron nails, three short segments of post-medieval clay tobacco pipe stem, one piece of 19th/20th century brown glazed earthenware and an iron coffin fixing. All of the recovered human skeletal remains were to be returned to the church for re-interment. [Au]

THE WORKSHOP, PIPE PASSAGE, LEWES***An Archaeological Watching Brief***

Thorne, A Portslade : Archaeology South-East, 2007, Grey Literature Report

Work undertaken by: Archaeology South-East

An archaeological watching brief was maintained during groundwork for an extension to the property on land at The Workshop, Pipe Passage, Lewes, East Sussex. A substantial deposit of imported garden soil was found across the site, indicating that the ground level had been built up, probably at the time a mid nineteenth century row of cottages were constructed to the north. Below this a nineteenth brick wall foundation and an 18th century buried soil deposit were identified. To the north of the site two late nineteenth century -modern wall footings were revealed, most probably relating to the use of the site for allotment gardens and greenhouses. [OASIS(Au)]

Work undertaken by: East Sussex County Council

A watching brief was maintained on groundwork associated with the construction of a rear extension. Limited excavations and fieldwork in the 1960s prior to the development of this area of downland had recorded evidence of Neolithic, Bronze Age, Iron Age, Romano-British and early medieval settlement and burial areas. The area of the extension had previously been terraced for a paved patio area thus potentially removing any archaeological features that may have existed. It was also found that the western section of the foundation trench had been heavily disturbed by a modern sewer pipe and the existing house foundations. The southern section of the foundation trench was found to contain below the patio structure a surviving layer of former plough soil sitting on top of the natural chalk geology. Below this plough soil and cut into the chalk natural, three cuts were recorded, all of which were likely to be periglacial features. Examination of the spoil failed to recover any archaeological artefacts. It was observed that the remaining area of this property's garden did not appear to have been terraced or landscaped, thus raising the possibility of in situ archaeological deposits in this area. CORSICA HALL*An Archaeological Watching Brief On Land at Corsica Hall, College Road, Seaford, East Sussex*

Thorne, A & Whittaker, DPortslade : Archaeology South-East, 2007, A4 Wp Card Back spiral bound

Work undertaken by: Archaeology South-East

An archaeological watching brief was maintained during groundwork associated with the refurbishment and renovation of Corsica Hall, College road, Seaford. Corsica Hall has undergone various structural changes and alterations, and has fulfilled a variety of different functions during its period of use. No archaeological finds or features were identified during the watching brief, suggesting that the top of the knoll may have undergone landscaping or disturbance associated with the construction of, or renovation to, the building itself. To the east of the site, deposits of made ground and hardcore have extended a level terrace for the building of a late post-medieval property now being redeveloped. [OASIS(Au)]

ST. PETER & ST. PAUL'S CHURCH, HELLINGLY

St. Peter & St. Paul's Church, Hellingly

Chuter, G Lewes : East Sussex County Council Archaeology Team, 2007, 3pp, colour pls, figs

Work undertaken by: East Sussex County Council

A watching brief was maintained during the groundwork associated with the laying of a new path around the south-west corner of the church. Topsoil along a 1m wide corridor was removed by a mini digger with toothless bucket to a depth of 200mm. The corridor was aligned to avoid known graves. The topsoil (Context 1) was found to be c. 100mm in depth and contained fragments of ceramic building material (CBM) and greensand chips. Below the topsoil was a redeposited sandy clay (Context 2) containing numerous fragments of CBM, greensand chips and a single fragment of green window glass. A modern electricity cable was observed running westwards along the corridor from the church porch and a possible drain, consisting of a section of terracotta pipe running from the eastern junction of the church wall and associated buttress to the west of the church porch. Between this buttress and the church porch an area of concentrated CBM, greensand chips and mortar was observed (Context 3) running roughly northwards from the brick and stone caped tomb (see fig 1). This feature may have represented a dump of material during a construction phase of the church, or alternatively a foundation. A single fragment of red glazed floor tile was recovered from this feature, suggesting a post medieval deposition date. No evidence was recorded for the foundation trench for the main church wall. The base of the eastern buttress was exposed and found to consist of a greensand plinth sitting on two courses of dressed greens and blocks (170mm thick) sitting on top of a rough stone and mortar foundation (130mm thick). OLD FORGE, FORGE LANE, HORNEY COMMON

Old Forge, Forge Lane, Horney Common

Chuter, G Lewes : East Sussex County Council Archaeology Team, 2007, 6pp, colour pls, figs

Work undertaken by: East Sussex County Council Archaeology Team

This comprised the excavation of a 3.5m long and 1m wide foundation trench. Monitoring recorded a layer of modern building rubble c.200mm thick with a thin lens of rubble crush at its base c. 50mm thick, beneath which was a c.200mm layer of redeposited grey clay. This sealed a c.400mm thick layer of yellow silty clay, below which was a charcoal rich grey silty clay containing fragments of oak. Cut into this layer was a c.250mm wide cut containing a hollowed oak trunk, forming a channel or sluice. The oak channel comprised a single hollowed out oak log with walls c.30mm thick, with a flat bottom 260mm wide and angled straight sides c.270mm high, but no top. The span at the top was c.400mm wide. There was slight evidence that the cut this wooden structure sat in also cut through the yellow clay layer. Below the grey clay lay the natural sandstone geology which sloped slightly downwards in a westerly direction. The finding of a wooden sluice was very important as they rarely survived. This sluice was undoubtedly associated with the 16th century forge and would have carried water from the

pond bay which was located to the north of this property, through the dam wall and onto the water wheel that powered the forge and machinery. No artefacts or bloomery slag were recovered by the builders or observed on the spoil heap. A selection of wood recovered from Context 8 was retained, including what appeared to be the point of a stake or post. The wooden sluice was left in situ, filled with pea gravel and bridged with a concrete plinth which would carry the wall foundation in this section of the wall to ensure it remained intact for the future. THE CUTTING OF A CABLE TRENCH AT BOREHAM STREET

An Archaeological Watching Brief Maintained on the Cutting of a Cable Trench at Boreham Street, East Sussex

Seager Thomas, M Polegate : C.G. Archaeology , 2007, 35pp, figs, tabs, refs

Work undertaken by: C.G. Archaeology

An archaeological watching brief was maintained on the cutting of a new electricity cable trench at Boreham Street. Fieldwalking undertaken in advance of the groundwork gleaned small assemblages of humanly – struck flint and medieval pottery. Three of the recovered flint artefact were of possible Mesolithic or Early Neolithic origin, with the remainder being assigned to the Bronze Age. It would appear that these artefacts represented the first evidence recorded for the prehistoric exploitation of the immediate area. The medieval pottery dated from the mid 12th-mid 13th century to mid 15th-mid 16th century and was almost certainly indicative of manuring. Just one cut feature of archaeological significance was revealed within the actual cable trench. This 0.40m diameter and 70mm thick lens of charcoal

and burnt stone was interpreted as a hearth, but sadly remained undated. [Au]

24 RATTLE ROAD, WESTHAM, PEVENSEY

24 Rattle Road, Westham, Pevensey, East Sussex

Riccoboni P Portslade : Archaeology South-East, 2008, hard bound copy

Work undertaken by: Archaeology South-East

An archaeological watching brief was carried out on land at 24 Rattle Rd, Pevensey, East Sussex (NGR 563517 104551). The site lies c. 800m east of the Scheduled Ancient Monument (SAM 27013) of Pevensey Castle. A previous archaeological evaluation had been conducted at the site (Riccoboni 2007) which had discovered the remains of a gully containing Roman and medieval pottery. The watching brief recorded the remains of a further six archaeological features. Two pits (104 and 105), two post holes (107 and 114) and two linear features (109 and 112) were recorded across the site mostly within the newly excavated wall footing trenches. The Roman archaeological features are likely associated with a Roman settlement which existed in this area, but unfortunately mostly destroyed during a 1960's housing development. Other finds from the Roman period through to the post medieval period suggest that this land had been used for pasture/and or agricultural use throughout the ages. The site occupies a position of higher ground (c. 2m) above the levels of the marshes and was likely always used for either settlement or agricultural use. A confidence rating is high that the best possible results were achieved. [OASIS(Au)]

5A RECTORY ROAD, OAKLEY

5a Rectory Road, Oakley, Hampshire. Post-excavation Report

Oxford Archaeology Oxford : Oxford Archaeology, 2007, 11pp, colour pls, figs, tabs, refs

Work undertaken by: Oxford Archaeology

In February 2007, an excavation was undertaken at 5a Rectory Road. The work revealed a finds rich middle Iron Age pit and ditch, indicative of a nearby settlement. A late Iron Age ditch and three early Roman ditches were also observed. Several undated postholes were observed in close proximity to an early Roman pit, and were probably contemporary. The late Iron Age ditches were re-cut and backfilled in the 2nd century, after which there was no evidence for further activity on the site. The ditches probably formed field boundaries at the edge of a settlement to the south, which was occupied between the middle Iron Age and 2nd century AD. [Au(abr)]

LAND ADJACENT TO THE COTTAGE, IBTHORPE

Land adjacent to the Cottage, Ibthorpe, Hampshire. Archaeological Watching Brief

Ellis, C Salisbury : Wessex Archaeology, 2007, 9pp, colour pls, figs, refs

Work undertaken by: Wessex Archaeology

During a watching brief, a small area in the north-east of the site revealed a sequence of deposits and features suggesting predominantly medieval activity of 11th-14th century but with residual prehistoric and Romano-British finds also being present. The medieval deposits, comprising a pit, a wall and possible chalk floor, suggested settlement represented by the remains of a possible domestic dwelling or agricultural building. The sherds of 15th-16th century pottery from the wall foundation suggested a possible long lifespan for the building. [Au(abr)]

Somborne Park Farm, Little Somborne, Stockbridge, Hampshire, Results of an Archaeological Watching Brief

Harding, P Salisbury : Wessex Archaeology, 2007, 33pp, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

An archaeological watching brief was undertaken on land at Somborne Park Farm, during ground works prior to construction of a new grain store. The site lay in an area of extensive Bronze Age, Iron Age and Romano-British field systems and enclosures that made up a complex distribution of settlement across much of this area. A previously unrecorded D-shaped enclosure, defined by a ditch 138 m long, that enclosed an area of 0.14ha, formed the principal feature recorded during the watching brief. It was dated by pottery to the Iron Age period. A series of quarry pits and a tree throw containing an assemblage of worked flint were also revealed during the course of the works. The principal phase of activity related to the construction of a small Late Iron Age farmstead within the enclosure. However, the most significant contribution made by the work was the discovery of the enclosure, its position in the landscape and its relationship with other similar enclosures in the area. The watching brief produced an important set of data that related to prehistoric activity and settlement on the Hampshire Chalk. [Au(abr)]

SOUTH WINCHESTER PARK AND RIDE SITE*South Winchester Park and Ride Site, Hampshire. Archaeological Evaluation and Watching brief Report*

Armstrong, A Salisbury : Wessex Archaeology, 2007, 31pp, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

A total of seven geotechnical trial pits were excavated. No archaeological features were revealed. A total of 17 trial trenches were excavated. Seven of these were located in the north of the site. The trenches revealed that the extent of truncation in the northern field was not as extensive as anticipated from the geophysical results and post holes and ditches of late Iron Age-Romano-British date were investigated. The southern trenches which targeted anomalies from the geophysical survey confirmed the presence of Romano-British ditched enclosure next to a surfaced route way at the southern end of

the site. Occupation debris recorded from the enclosure ditch suggested settlement activity. Other archaeological features included a possible Neolithic pit. [Au(abr)]

McDonald, EL Southampton : Southampton City Council Archaeology Unit, 2007, 16pp, colour pls, figs, tabs, refs

Work undertaken by: Southampton City Council Archaeology Unit

An archaeological watching brief was carried out at the site and revealed three post holes of undetermined age. They were in close proximity and may have been part of a structure. The topsoil contained finds including worked flint of possibly prehistoric date, burnt flint, fragments of brick dated to the 17th/18th century and fragments of china dated to the 19th/20th century. The evidence suggested that the site was outside the main area of Roman and Saxon activity, and that prehistoric activity was perhaps more widespread than that of later periods. The more recent finds were perhaps due to later ploughing and manuring. The absence of any artefacts for the Roman, Saxon or medieval periods indicated that the area was pasture in this period. EAST HOE MANOR, HAMBLEDON

East Hoe Manor, Hambledon, Hampshire. Archaeological Watching Brief

Samuel, M Ramsgate : Architectural Archaeology, 2007, 43pp, colour pls, figs, tabs, refs

Work undertaken by: Architectural Archaeology

An archaeological watching brief was carried out at the site and revealed evidence for medieval masonry structures recognised under the cottage and the yard. The former may have been the precursor of the farmyard perimeter wall, while the latter could have been a remnant of an early seigniorial structure. In contrast, most of the site the yard north of the house preserved evidence for a succession of structures. This included a late medieval or Tudor brick-floored semi basement destroyed by fire. A substantial flint and mortar foundation may have represented the south wall of a pre-1730 manor house east of the sunken chamber. The flint and mortar building was demolished and sealed by yard gravels when the 18th century building was completed. Brick and flint ancillary buildings/garden walls were cut into the gravel. Pre-1850 finds other than building material eluded recovery. Preservation of archaeology tailed off rapidly as investigation moved away from the yard area (where the deposition of successive metallings had a protective effect on the archaeology). The existing double pile farmhouse was built de novo on the site, probably in the 1730s, and had no earlier fabric. [Au(adp)]

Hawtin, T Portslade : Archaeology South-East, 2008, 68pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeology South-East

Archaeological features dating to the Iron Age, Roman and medieval periods were revealed during the investigations. The Iron Age features included a large ditch, a probable grain storage pit (containing the remains of three foetal or neonatal dogs), part of a large, probably circular, post-built structure and several other postholes and pits. A small rectangular enclosure and infant burial were also uncovered, whose spatial association suggest an Iron Age date, but were not dated by artefacts. The postbuilt structure appears to have been much larger than similar structures of this period interpreted as roundhouses and may have served a communal purpose. A medieval track-way also ran across the site. The Iron Age features appear to be contemporary with other similar features found during previous archaeological investigations nearby, suggesting that the Iron Age occupation encompasses a much larger area than has currently been investigated. The medieval trackway also continued beyond the area excavated in both directions, with similar tracks having been recorded during investigations both to the south-west and to the north-east of the site. Teague, S Oxford : Oxford Archaeology, 2007, 30pp, pls, figs, tabs, refs

Work undertaken by: Oxford Archaeology

An archaeological excavation was carried out at the site in advance of the installation of a subterranean water tank and sprinkler system. Much of the horizontal stratigraphy that probably survived in the area of the trench had been removed by modern levelling along the northern half of the trench possibly during the demolition of the former public toilet block that recently stood on this part of the site to the south the pre-Roman subsoil survived which was partially overlain by the primary deposits of the Roman street. Additionally two manholes/soakaways, two modern pits and the remains of an air raid shelter had further removed archaeological deposits. [Au(adp)]

Whitehead, B Southampton : Southern Archaeological Services, 2007, 17pp, colour pls, figs, tabs, refs

Work undertaken by: Southern Archaeological Services

Six features were recorded during the groundwork, including four that contained Roman material. Two very shallow and truncated intercutting features towards the rear of the property may be Roman, as well as two pits (although one contained only one fragment of Roman tile). Nearer the front of the property were two large features (or possibly the same features), one of which contained Roman brick and tile fragments, but this area had been disturbed by both a land drain and soakaway and at least one former pod, so the full extent of these features could not be established. Finds included sherds of Late Iron Age/Early Roman pottery and Roman pottery and building material. [Au(abr)]

WICKHAM HOLT, WICKHAM***Summary Report on an Archaeological Watching Brief at Wickham Holt, Wickham, Hampshire***

Whitehead, B Southampton : Southern Archaeological Services, 2007, 22pp, colour pls, figs, tabs, refs

Work undertaken by: Southern Archaeological Services

The watching brief recorded six layers (two natural, one Roman and three modern) and nine features, of which, one was undated one modern and the remaining seven Roman including a ditch that may be related to the road system known to exist on the adjoining golf course. Many of the Roman finds are from the earlier part of the Roman period, which was consistent with other finds at Wickham, but limited amount of later Roman material was also recovered from the upper levels of the ditch. Clarke, C Twickenham : AOC Archaeology Group, 2007, 17pp, figs, tabs, refs

Work undertaken by: AOC Archaeology Group

An archaeological watching brief was carried out during a programme of grounds reduction. The single trench, of 10m by 3.5m, revealed that natural deposits were overlaid by subsoil, with the earliest feature being a drainage channel cut into the subsoil. It was subsequently sealed by further soil accumulation and made-ground deposition. None of the deposits were deemed to be of archaeological significance. [Au(adp)]

Archaeological Watching and Recording Brief at Northgate Alfa Romeo Garage, Canterbury. Assessment Report

Helm, R Canterbury : Canterbury Archaeological Trust, 2008, 13pp, colour pls, figs, tabs, refs

Work undertaken by: Canterbury Archaeological Trust

An archaeological watching and recording brief was carried out at the site and revealed that no significant archaeological remains were encountered apart from soil horizons associated with late post-medieval/ early modern market gardening. These were truncated by a brick wall foundation associated with later 19th century terraced housing as shown on the First Edition Ordnance Survey Map of 1874. Other deposits included a crushed mortar and brick rubble levelling or floor consolidation deposit and a compacted clay and gravel surface forming an external yard. Both deposits were associated with the later 19th century tenement building. [Au(adp)]

ASTOR AVENUE

Dover, 2007, Astor Avenue Diversion Pipeline. Watching Brief Report

Parfitt, K Canterbury : Canterbury Archaeological Trust, 2007, 3pp, refs

Work undertaken by: Canterbury Archaeological Trust

During a watching brief the excavations inspected provided an opportunity to archaeologically examine an area of high chalk downland above Dover town. Such high ground seemed to have been regularly occupied by ancient settlers but no features or deposits of archaeological interest were noted in this particular locality. This was consistent with previous findings in this area. A few pieces of flintwork recovered indicated that some casual prehistoric activity may have taken place in the area. [Au(abr)]

DOVER CASTLE NEW ADMISSIONS BUILDING, DOVER

An Archaeological Desk-Based Assessment, Walkover Survey and Watching Brief of Land at Dover Castle New Admissions Building, Dover, Kent

Thorne, A Portslade : Archaeology South-East, 2007, 77pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeology South-East

A review of the existing archaeological information suggested that archaeological remains deriving from the early land use of the site and castle were likely to have been significantly truncated as a result of medieval and post-medieval groundwork within the development area. However, the development site was considered to have high potential for the survival of archaeological features and deposits relating to the medieval and post-medieval fortifications and landscaping of the castle grounds. Due to the very limited scale and nature of the excavations, the information which can be extrapolated from the results needed to be treated with caution. It was not known if the obstacles encountered in bore holes 1 and 2 represented archaeological or geological material. A possible brick structure or brick rich deposit was encountered within BH 2A at a depth of 1.65 to 1.85 m below the ground surface. The process of geotechnical boreholing has given some insight into the geological and stratigraphic make

up off the site however. All holes suggested an initial surface deposit of between 200-300mm. Borehole 1A was fully chalk above a sand and silty sand deposit to a depth of 4 meters below current ground surface. The soft and pliable nature of the deposit was thought to indicate a redeposited material, and may possibly result from the process of building up the southern face of the terrace. Bore Hole 2A was fully excavated and encountered chalk bedrock at a depth of 1.95 meters below the ground surface. This may have represented the rise on the northern edge of the encircling ditch. RINGWOULD CHURCH

Report on a Watching Brief at Ringwould Church

Parfitt, K Canterbury : Canterbury Archaeological Trust, 2007, 7pp, figs, tabs, refs
Work undertaken by: Canterbury Archaeological Trust

Inspection of groundwork associated with service trenches provided few useful details concerning the structure of the extant building, but there were no signs of any earlier structures here and no features of archaeological significance were revealed. [Au(adp)]

LAND AT COLDHARBOUR ROAD/WROTHAM ROAD, GRAVESEND

Land at Colharbour Road/Wrotham Road, Gravesend, Kent. Archaeological Desk-based Assessment

Valler, H Salisbury : Wessex Archaeology, 2007, 23pp, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

The site was thought to have a moderate to high archaeological potential, owing to the lack of development. The land within the study area had been under arable cultivation, and there was the possibility that prehistoric remains could exist below ground. If any remains did exist, their preservation was likely to be good, and as a result further archaeological work was recommended. [Au(adp)]

45-49 TONTINE STREET AND MILL BAY, FOLKSTONE, SHEPWAY

An Archaeological Watching Brief during mains Drainage Diversion at 45-49 Tontine Street and Mill Bay, Folkstone, Shepway, Kent

Linklater, A Canterbury : Canterbury Archaeological Trust, 2007, 15pp, figs, tabs, refs

Work undertaken by: Canterbury Archaeological Trust

The watching brief recorded elements of the inlet's gradual development, with the lowest levels of the laminated silts and peats overlain and intercut with the deeply sloping sides of the eroded valley. These had been cut into with the formation of the terrace and its associated retaining wall, which contained and series of compacted road gravels to the south-west. North-east of the wall the remains of cellars associated with buildings fronting Tontine Street were encountered. The road surface was later sealed by the modern bedding of Mill Bay, whilst the headquarters of Danks was constructed fronting Tontine Street. [Au(adp)]

CHURCHLANDS ESTATE, NEW ROMNEY AND PROPOSED SITE COMPOUND, IMMEDIATELY SOUTH WEST OF CHURCH LANE

An Archaeological Watching Brief at Churchlands Estate, New Romney, Kent and the Proposed Site Compound, Immediately South West of Church Lane, New Romney, Kent. Phase 2

Beck, R Portslade : Archaeology South-East, 2007, 27pp, colour pls, figs, refs

Work undertaken by: Archaeology South-East

An archaeological watching brief was maintained during groundworks at the site compound [Phase 2] and at the Churchlands Estate [Phase 3]. The Scheme involved the replacement of the drainage system in that area. The compound was stripped of topsoil and occasionally subsoil, to a depth of approximately 150mm. Artefacts, of 17th – 20th century date, including fragments of pottery and clay pipe were found. The trenches for the Churchlands Estate were cut, in the main, through concrete road surfaces. Sheet piling was used to stabilise the trenches, which were excavated to a depth of about 3m. All the excavations cut through marine deposits. Some isolated examples of rolled wood were occasionally noted. No structural remains were found. One possible drainage ditch was recorded. [Au]

2-4 LYONS CRESCENT, TONBRIDGE***An Archaeological Watching Brief during Groundworks Associated with the Development of 24 Lyons Crescent, Tonbridge, Kent***

Linklater, A Canterbury : Canterbury Archaeological Trust, 2007, 10pp, figs

Work undertaken by: Canterbury Archaeological Trust

The archaeological watching brief carried out between 2006 and 2007 revealed that the site had largely been terraced into the rising ground to the north, the removal and replacing of the western and the upgrading of the northern retaining walls afforded the opportunity to examine sections of undisturbed deposits continuing beneath adjacent properties. Intact soil horizons and a possible ditch feature suggestively associated with one of the major medieval construction phases of the town certainly extend from beneath the neighbouring properties and across the area of this development. The discovery of structural remains beneath the line of the present Lyons Crescent could be perceived as unusual until the history of the formation of the thoroughfare is considered. Prior to the later post-medieval period commercial and domestic properties only appeared to line the frontages of the High Street and sections of East Street with each building possessing an elongated garden plot. Though a narrow space between the buildings on the High Street was indicated prior to the mid 19th century it was not until c.1880 that a secondary access road providing an alternative route to East Street from the High Street and the riverside was proposed. Despite this initial scheme it was not until at least 1895 that Lyons Crescent as a thoroughfare was actually created opening up the northern river bank to commercial development east of the great bridge. In the process of forming the junction of Lyons Crescent with the High Street the pre-existing opening between the buildings required widening. It was assumed that the brick rubble base foundation revealed in the new service connection trench related to part of a structure that once abutted the southern side of 91 High Street. [Au(adp)]

NO.1 SMITHERY HISTORIC DOCKYARD, CHATHAM

An Archaeological Watching Brief at No.1 Smithery Historic Dockyard, Chatham

Ward, A Canterbury : Alan Ward, 2007, 24pp, figs, tabs, refs

Work undertaken by: Alan Ward

An archaeological watching brief was carried out from 2006 to 2007. From the excavation of the internal pits undertaken earlier in 2006 and the watching brief pits adjacent to the west wall it could be seen that substantial well preserved industrial archaeological remains survive. The overall layout and the undoubted and undocumented additions and repairs to the wind drains and other structural features could not be understood by the excavation of small trenches. It was thought that it would only be by open area excavation that such phasing and overall layout could be understood in detail. [Au(adp)]

**THE PROPOSED NEW MID KENT COLLEGE CAMPUS ON THE LOWER LINES,
BROMPTON**

An Archaeological Walkover Survey of the Site of the Proposed New Mid Kent College Campus on the Lower Lines, Brompton, Kent

Found, B Canterbury : Canterbury Archaeological Trust, 2007, 36pp, colour pls, figs, tabs, refs

Work undertaken by: Canterbury Archaeological Trust

The walkover survey identified a number of features associated with the military use of the site over the past 200 years, the vast majority of these relating to the post-war use of the site. The identification of two sets of 19th century in situ lines of gabions was significant, with such remains and their association with other military features considered unique and unlikely to be repeated elsewhere. A World War II defensive boundary line consisting of a Vshaped ditch and corrugated iron revetment that connected from a line of concrete "dragons teeth" pimples adjacent to Medway Road to the brick-lined ditch of the Lower Lines was also observed. FORMER ANCASTER GARAGE STATION ROAD, STROOD***Former Ancaster Garage, Station Road, Strood, Kent. Results of an Archaeological Watching Brief***

Capon, L Twickenham : AOC Archaeology Group, 2007, 33pp, figs, tabs, refs

Work undertaken by: AOC Archaeology Group

An archaeological watching brief was carried out at the site recently occupied by a car showroom and garage. Concrete foundations and obstacles to piling were removed by mechanical excavator. Evidence for previous buildings on the site were recorded, dating from the 19th century to the present day. There was the potential for environmental evidence and significant alluvial deposits to be present. Those areas of alluvial deposits exposed showed no archaeological features. However, sampling of these deposits revealed archaeobotanical evidence indicative of the local environment. Peat was identified at a few locations but was patchy and did not form a regular horizon. STROOD RIVERSIDE***Strood Riverside, Geoarchaeological Watching Brief and Walkover Survey***

Russell, J Salisbury : Wessex Archaeology, 2007, 23pp, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

The study comprised the recording and archaeological description of sediments contained within seven boreholes and six test pits. A walkover survey of the riverside was also undertaken during the archaeological watching brief. Seventeen elements of archaeological interest were identified. On the basis of the geoarchaeological recording and walkover survey the archaeological impact of the

proposed development can be summarised as follows. The sedimentary sequence recorded from the test pits and boreholes contained four major units, Coombe rock (Unit 1), Pleistocene fluvial gravels (Unit 2), peat and alluvial layers (Unit 3) and made ground (Unit 4). Units 3 and 4 were noted to contain worked wood, some of which may have been prehistoric in origin. The depth of the proposed development would impact upon these layers. Built heritage elements and shipwrecks of nineteenth and twentieth century in date were recorded in the walkover survey. This included Strood Pier, Second World War defences, the Thames and Medway canal entrance and a Thames sailing barge, all of which were in the area of the proposed development. [Au(adp)]

Work undertaken by: Northamptonshire Archaeology

An archaeological watching brief was undertaken at Tattenhoe Bare Farm, Tattenhoe Park, Milton Keynes. The only archaeological feature observed was a ditch whose position and alignment suggested that it was an easterly continuation of a substantial boundary ditch previously investigated during the excavation of an adjacent Iron Age settlement in 2005. McNicol, D Oxford : Oxford Archaeology , 2007, 28pp, colour pls, figs, tabs, refs

Work undertaken by: Oxford Archaeology

The evaluation failed to reveal any remnants of the Radcliff Arms, though a well possibly associated with the public house was revealed during the watching brief. This demonstrated that the area had been reduced and completely cleared in the 18th or 19th century, prior to the construction of the football pitch and associated Velodrome. Field drains associated with the football pitch were revealed. Work in the vicinity of the Rail Bridge exposed brick walls and cast-iron beams associated with the earliest phase of the bridge and identified the parts of the structure that were extended in 1889. A photographic study of parts of the Royal Train Shed and Velodrome and sports ground was made. The sports ground dated from 1885 and included an earlier example of a football grandstand. The Royal Train Shed was built in 1889. [Au(abr)]

Work undertaken by: John Moore Heritage Services

An archaeological watching brief encountered a relatively high density of pottery ranging from the 13th to 14th centuries as well as a ditch. Finds of Early Iron Age pottery immediately south of the moated site indicated activity of that date. Roman pottery suggested occupation in that time period. Within the easement, located west of the Chequers Inn, stone surfaces with complex intercutting ditches, gullies and pits dating to the Early Iron Age indicated a probable settlement. Pottery of Late Iron Age and early Roman date suggested that the site was re-occupied. A medieval pit and an assemblage of pottery indicated activity of that date. [Au(abr)]

ST. JOHN'S COLLEGE CHAPEL, OXFORD

St. John's College Chapel, Oxford. Archaeological Watching Brief

Dean, B & Hiller, J Oxford : Oxford Archaeology , 2007, 16pp, figs, tabs, refs

Work undertaken by: Oxford Archaeology

An archaeological watching brief at the Chapel of St. John's College, Oxford, was undertaken prior to the installation of foundations for a new organ. Excavation of the foundation pits for the new structure revealed six brick built burial vaults containing human remains, probably of late 17th or 18th century date. Two of the vault roofs had been disturbed during the installation of stone heating ducts in the 19th century. As a result of the discoveries, the design of the foundation pads was altered to accommodate the preservation of the burial vaults in situ. [Au(abr)]

Work undertaken by: John Matthews

During machining for the construction of a new house, a Roman ground surface cut by a Roman boundary ditch and evidence of settlement activity was observed, planned, recorded and target-excavated. The site was thought to have been in use from the Late Iron Age/early Roman period until the 3rd century AD. The settlement comprised several post-built structures, gullies and pits as well as ditches dating from AD 120-250. The final phase evidenced later Roman pottery in the final backfill of the boundary ditch. [Au(adp)]

ASTON UPTHORPE THE SMITHY*The Smithy, Thorpe Street, Aston Upthorpe, Oxfordshire. Archaeological Watching Brief Report*

Sims, M Oxford : Oxford Archaeology, 2007, A4 Plastic bound copy

Work undertaken by: Oxford Archaeology

In March 2007, Oxford Archaeology (OA) carried out an archaeological watching brief at The Smithy, Thorpe Street, Aston Upthorpe, Oxfordshire (NGR: SU 55337 86194). The work was commissioned by Mr and Mrs N. Marks in advance of the construction of a swimming pool and water features and the stripping of an access road. The watching brief revealed large deposits of post-medieval garden soil and the post-medieval backfilling of part of the spring valley but no other significant archaeology was observed. [OASIS(Au)]

THE SMITHY, THORPE STREET, ASTON UPTHORPE

The Smithy, Thorpe Street, Aston Upthorpe, Oxfordshire. Archaeological Watching Brief Report

Sims, M Oxford : Oxford Archaeology , 2008, 15pp, colour pls, figs, tabs, refs

Work undertaken by: Oxford Archaeology

A watching brief was commissioned in advance of the construction of a swimming pool and water features and the stripping of an access road. The watching brief revealed large deposits of post-medieval garden soil and the post-medieval backfilling of part of the spring valley but no other significant archaeology was observed. [Au(abr)]

MANOR FARM, CHURCH ROAD, CHOLSEY*Watching Brief: Manor Farm, Church Road, Cholsey, Oxfordshire*

Wilson, N Milton Keynes : Archaeological Services & Consultancy Ltd., 2007, 47pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Services & Consultancy Ltd.

An archaeological watching brief was carried out at the site and revealed that there was no evidence for the grange belonging to Reading Abbey. The only features exposed within the farmyard were a number of compacted post-medieval yard surfaces, a brick lined well which later in its life had been converted to pump use by capping the top and inserting a metal pipe, and a short length of southeast to northwest wall footing in one of the service runs. This footing was constructed of modern frogged bricks and older handmade bricks. The presence of older reused bricks may have indicated that there had been older buildings predating the current farm building on the site. Five 85m trenches for a geothermal heating system were excavated in the field between Manor Farm and the church. Other than modern services the only features exposed were a number of irregular pits which might have been excavated for sand and gravel extraction. [Au(adp)]

John Moore Heritage Services Beckley : John Moore Heritage Services, 2007, 17pp, figs, tabs, refs

Work undertaken by: John Moore Heritage Services

A watching brief involved the monitoring of the excavation for additional foundations, new services and new floors. Late 1st and 2nd century Roman activity was shown by the presence of pits. At least part of the site was ploughed in the mid to late 2nd century. Medieval activity was shown by a pit group and a possible boundary ditch. Evidence of a medieval building was found in the structure of "The Cottage" fronting High Street. [Au(abr)]

GATEHAMPTON***An Archaeological Watching Brief at Gatehampton Farm, Goring, Oxfordshire***

Helen Noakes Oxford : John Moore Heritage Services, 2007, A4 format

Work undertaken by: John Moore Heritage Services

A watching brief was conducted by John Moore Heritage Services during the excavation for a new pipeline as phase one of improvement works to existing operations for Thames Water supplies at Gatehampton, Goring. The two known palaeochannels were found along with a possible posthole. Artefacts recovered from the excavated material included a Palaeolithic flint long blade, sherds of late Iron Age and Roman pottery. The long blade within a ploughsoil suggests that further knapping deposits are present west of those previously found. The Iron Age pottery indicates that more activity of this date occurred on the site than previously believed. [OASIS(Au)]

ST. MARY'S CHURCH

St. Mary's Church, Longworth, Oxfordshire, Archaeological Investigation Report

Sims, M Oxford : Oxford Archaeology, 2007, A4, plastic spiral bound

Work undertaken by: Oxford Archaeology

January to June 2007. Oxford Archaeology carried out an archaeological watching brief and excavation at St Mary's Church, Longworth in advance of the excavation of 2 soakaway pits and service trenching and the construction of an extension. The excavation revealed the presence of 60 inhumations within the footprint of the extension of which 51 were exhumed for later reburial. Little evidence was recovered to enable dating of these inhumations. No evidence for earlier church structures was observed during the course of the watching brief. [OASIS(Au)]

BOWLING GREEN FARM QUARRY, CHINHAM FARM, FARINGDON***The Excavation of an Early Bronze Age Ring Ditch at Bowling Green Farm Quarry, Chinham Farm, Faringdon, Oxfordshire***

Pine, J Reading: Thames Valley Archaeological Services, 2008, 33pp, figs, tabs, refs

Work undertaken by: Thames Valley Archaeological Services

Excavations in advance of mineral extraction revealed a small causewayed ring ditch and two ditches of Iron Age and Roman date. The ring ditch was probably dug at the end of the Early Bronze Age date with radiocarbon determination of 1691-1530 cal BC on charcoal from the lower fill of the ditch. Middle Bronze Age re-use of the monument took place with a crouched inhumation burial providing a radiocarbon determination of 1413-1290 cal BC. Inhumation burials of Middle Bronze Age date are most unusual at a time when cremation burial urns was the norm. Finds included Early and Middle Bronze Age pottery and a deliberately broken rapier blade. A residual later Mesolithic microlith was recovered pointing to some earlier use of the landscape. [Au]

ST NICHOLAS' CHURCH, CHADLINGTON

St Nicholas' Church, Chadlington. Archaeological Watching Brief Report

Webb, H Oxford : Oxford Archaeology, 2008, 37pp, colour pls, figs, tabs, refs

Work undertaken by: Oxford Archaeology

The watching brief within the church revealed a series of limestone footings for wooden beam floor supports of Victorian or earlier date. A tunnel of unknown function was revealed at the eastern end of the central aisle, running below the chancel and down to the crypt/current boiler room. This had been used during the Victorian period as a heating pipe conduit. The service trench on the eastern side of the churchyard revealed no in situ archaeology, but within the service trench on the western side of the church, 14 medieval earth-cut graves were revealed. From these, 11 skeletons (5 adults and 6 subadults) were excavated. In addition, a probable post-medieval, earth cut grave and an 18th early 19th century stone lined shaft grave were revealed. Although not excavated, adult skeletal remains and the remains of a coffin were visible within the shaft grave. [Au(abr)]

Work undertaken by: Southampton City Council Archaeology Unit

A total of 27 trenches were excavated. The earliest archaeological evidence was from the 16th-17th century and consisted of two pits situated near the centre of the site. Other 18th century rubbish pits were found. 19th century pottery, a stoneware bottle, bricks and cellars suggested the site was built-up in that period. [Au(abr)]

PORTSMOUTH NORTHERN QUARTER

Archaeological Monitoring of Geotechnical Borehole Findings at Portsmouth Northern Quarter, Portsmouth, Hampshire

Collings, M Portslade : Archaeology South-East, 2007, 104pp, colour pls, figs, tabs
 Work undertaken by: Archaeology South-East

Archaeological monitoring was undertaken during geotechnical work at Portsmouth Northern Quarter. Soil samples were taken from geotechnical boreholes stored for archaeological inspection. The samples were taken at random depths. The deposits were archaeologically recorded and then studied in tandem with geotechnical results. They provided an indication of the stratigraphic sequences across the site. Artefacts were recovered from eight of the archaeological samples. These were predominantly post-medieval to modern ceramic building material (CBM). No artefacts of archaeological significance were recovered. [Au(abr)]

READING GREEN PARK VILLAGE

Reading Green Park Village. Archaeological Watching Brief Report

Bashford, R Oxford : Oxford Archaeology , 2007, 12pp, colour pls, figs, tabs, refs

Work undertaken by: Oxford Archaeology

The deposits encountered within the test pits indicated that across the area natural gravels had been significantly truncated. Some truncation was clearly due to modern activity (borrow pits for the construction of the railway, and impacts related to the Clembins remediation site). Some evidence of truncation was undated and may have represented archaeological feature fills. [Au(abr)]

Milbank, D & Pine, J Reading: Thames Valley Archaeological Services, 2007, A4 comb-bound client report

Work undertaken by: Thames Valley Archaeological Services

Disarticulated human bone from at least five bodies was recovered from a mass grave or charnel pit, probably medieval, just beyond the modern graveyard. Two undated pits were also noted. The medieval graveyard may have originally been more extensive (before it was enclosed in 1225) or the mass grave may have been in unconsecrated ground for other reasons. Dating unfortunately is provided only by five sherds of medieval pottery, none absolutely conclusively from within the grave, but associated only with a deposit of what was almost certainly grave fill with displaced disarticulated bone, on the spoil heap. HOLBURY INFANTS SCHOOL, HOLBURY, SOUTHAMPTON

An Archaeological Watching Brief at Holbury Infants School, Holbury, Southampton, Hampshire

Collings, M Portslade : Archaeology South-East, 2008, 67pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeology South-East

The watching brief was undertaken in an area totalling 1947 square meters. It was stripped to allow for the excavation of foundation trenches for an extension to the existing school buildings. In addition a drainage trench extending across the access roadway into the school grounds to the southeast corner of the development site was monitored during the latter stages of fieldwork. Eleven features were recorded, most notably three large probable quarry pits and two possible hearths, with three smaller discreet features comprising a pit and two

smaller pits or post holes located to the immediate east of the hearths. All nine discreet features appeared to be partly 'enclosed' by two linear features, the full extents of which were not visible but the revealed plan shows that they possibly intersected just outside the area excavated forming part of an enclosed or a partially enclosed area. A quantity of Roman pottery and Ceramic Building Material (CBM) was recovered from the excavated features; the pottery dating to AD 270 – 325/350. The drainage trench revealed depths of made ground and no archaeological features were observed. It is likely that former ground reduction and development has had a detrimental effect on the survival of archaeological remains within this area. Whilst a relatively small area was investigated the results of the watching brief

provided significant evidence for Roman activity further suggesting the likely presence of a fairly developed settlement within the immediate vicinity. The SMR data and results of the fieldwork indicate that the site formed part of a more complex Romano-British landscape in association with sites in the immediate surrounding area. [Au(abr)]

CASTLE WALL, WESTERN ESPLANADE

Archaeological Excavation at Castle Wall, Western Esplanade, Southampton

Smith, M P Southampton : Southampton City Council Archaeology Unit, 2007, 75pp, colour pls, figs, tabs, refs

Work undertaken by: Southampton City Council Archaeology Unit

The excavation was limited to four small trenches on the site of footings for a new walkway through the hall. The southern end of the Castle Hall had been previously excavated but undisturbed archaeological levels were still present to the north. These consisted of the construction levels for Castle Hall and internal floor levels. The Hall was probably built in the late 12th century. The floor levels dated from the medieval into the post-medieval periods. A number of features represented internal elements, though it was difficult to define what these were, given the limited nature of the excavation. [Au(abr)]

COBHAM PARK, COBHAM***Earthworks at Cobham Park, Cobham, Surrey. An Archaeological Survey***

English, J & Taylor, D Guildford : Surrey Archaeological Society, 2007, 35pp, figs, refs

Work undertaken by: Surrey Archaeological Society

An analytical survey of earthworks at Cobham Park indicated that the boundaries of at least two phases of field systems and a series of gravel quarries were preserved. Whilst no dating evidence was recovered it was considered that a medieval or post-medieval genesis was likely. Excavation across the putative line of a road predating the imparkment proved inconclusive but a test pit in the area of post-medieval dwelling indicated dating from the late 14th to early 15th centuries to the present day. EDEN VALE WATER TREATMENT WORKS NR. EAST GRINSTEAD*A Watching Brief at Eden Vale Water Treatment Works nr. East Grinstead, Surrey*

Whittaker, D Portslade : Archaeology South-East, 2007, 16pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeology South-East

Thirteen test pits, four trenches totalling 18 metres, two topsoil strips and a ten metre square area of ground reduction revealed consistently truncated Upper Tunbridge Wells Sand natural, with subsequent deposits of redeposited material, concrete slabs and other modern structures associated with the site's

development. Pits containing modern debris were found in two consecutive sealed layers suggesting two prior phases of development. No archaeological features, deposits or artefacts were found. [Au(abr)]

KINGS FARM, TILBURSTOW ROAD, SOUTH GODSTONE

Archaeological Observations During the Construction of a Wellsite and Access Track at Kings Farm, Tilburstow Road, South Godstone, Surrey

Robinson, S Chicklade : AC archaeology , 2008, 10pp, colour pls, figs, refs, CD

Work undertaken by: AC archaeology

An archaeological watching brief was carried out during groundwork associated with the construction of an appraisal well site and access track at Kings Farm. This work followed an archaeological trench evaluation of the proposed well site only, undertaken in 2007, which identified some limited evidence for prehistoric activity in this area of the site. Ground disturbance, comprising the machine-excavation of a 4m wide access track and its associated drainage trenches, was monitored, along with the reduction in ground level across the proposed well site. Two possible archaeological features were noted, one only observed in section and possibly representing a former ditch, the other a well-defined short linear feature comprised almost solely of charcoal. A single piece of clay pipe was recovered from the stripped topsoil on the access track. Other artefacts noted comprised modern brick or roof tile fragments and occasional 19th/20th century pottery sherds, none of which were retained. [Au]

HOLY TRINITY CHURCH, BRAMLEY

Holy Trinity Church, Bramley, Surrey, an Archaeological Watching Brief Report

Collie, T Portslade : Archaeology South-East, 2007, 27pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeology South-East

An archaeological watching brief was undertaken within the graveyard of Holy Trinity Church. The work was undertaken during the alteration and extension of the existing church hall on the east side of the church, the creation of a ramped path in the graveyard and also the creation of a soak-away to the south of the church. The watching brief revealed the presence of two brick-built vaults along with the remains of an articulated skeleton in the area directly east of the Church. The construction of the soakaway and the ramped and patio surfaces yielded disarticulated human remains and modern archaeology. All human remains were reburied respectfully in areas close-by to where they were discovered. [Au (Abr)]

Work undertaken by: Archaeology South-East

An archaeological watching brief was maintained on land at Beech Cottage during the excavation of approximately 39 square metres of ground down to natural deposits. The site was anticipated as having a high potential for the recovery of medieval archaeology. Two extensions to an extant building, one 10m x 3m, the other approximately 3m x 3m, were monitored. The larger area was found to contain no archaeological remains, the smaller having already been reduced at least 0.5 metres, below any surviving archaeological horizon. [Au(abr)]

An Archaeological Watching Brief at New Barn, Michelgrove, Patching, West Sussex

Dunkin, D Portslade : Archaeology South-East, 2008, 24pp, colour pls, figs, refs

Work undertaken by: Archaeology South-East

Ground reduction within the footprint of the barn conversion building revealed no archaeological features or significant finds. The 'natural' chalk was uncovered chiefly on the east side of the development where the structure was terraced into the adjacent field. Seven soakaways were excavated (approx 2 metres square and 1-2 metres deep). Soakaway 7 on the north-west side of the development provided evidence for a possible former hedge line on the west side of the building. This may have been removed at the time of the building's construction. A possible lynchet seen in the section on the east side of the structure suggested the proximity of a former field boundary at this location. [Au]

Initially, two geo-technical test pits were monitored on 16th October 2006. No archaeological features were discovered during this exercise. Natural clay was encountered in Test Pit 2 c. 1.1m beneath the present ground surface. This clay was in good condition and had not been truncated by any modern intrusions. One trial trench was excavated to a length of 5 metres in April 2007. Three features were recorded at the base of this trench, beneath a series of post-medieval made ground deposits (cut into natural clay). These features were likely dated to the post-medieval period. THE VICARAGE GARDEN, CAUSEWAY, HORSHAM

Archaeological Investigations at the Vicarage Garden, Causeway, Horsham, West Sussex. Post-excavation Assessment and Project Design for Publication

Stevens, S Portslade : Archaeology South-East, 2007, 39pp, figs, tabs, refs

Work undertaken by: Archaeology South-East

Following the archaeological evaluation of the vicarage garden, an open area was excavated and recorded and a subsequent watching brief was maintained during groundwork elsewhere at the site. Encountered features included medieval and early post-medieval ditches and medieval and post-

medieval pits and possible quarry pits. Finds included pottery, ceramic building material, stone and a range of other artefacts including worked bone used in the production of pins. [Au(adp)]

PHILPOTS CAMP

Philpots Camp Geoarchaeological Report. Augering and Palaeoenvironmental Assessment

Allen, M J Codford: Allen Environmental Archaeology, 2007, 23pp, colour pls, figs, tabs, refs

Work undertaken by: Allen Environmental Archaeology

Fieldwork was carried out, and determined that the site had the potential to contain remains preserved under a layer of colluvium that may have dated as far back as the Mesolithic period. Other factors were determined, for example the extent of the archaeological horizon and the vulnerability of the landscape to human agency. [Au(adp)]

West Hoathly Brickworks, Sharpthorne, West Sussex. Programme of Archaeological Recording for Phase 2 Extraction

Hart, J Cirencester: Cotswold Archaeology, 2007, 29pp, figs, tabs, refs

Work undertaken by: Cotswold Archaeology

A programme of archaeological recording was carried out, and encountered a large number of quarry pits, likely to have been the result of medieval iron ore extraction within the former extent of Mare Pit Wood. Beyond and north of the wood, the foundations of a building along with several pits likely to have been associated with medieval iron ore processing and smelting were also present. Post-medieval features were identified within the former woodland and comprised two large clay extraction pits and several short drainage ditches. [Au(abr)]

 Collings, M Portslade : Archaeology South-East, 2007, 18pp, colour pls, figs, tabs, refs
 Work undertaken by: Archaeology South-East
 An archaeological watching brief was carried out and 14 trial pits were excavated. No archaeological features were observed them. The trial pits were excavated through the footprints of trenches from an evaluation undertaken on the site in 2005. Five trial pits and excavated outside the footprints of past evaluation trenches did not reveal significant archaeological remains. Two possible features were investigated in trial pit No.105, however, these were both fairly ephemeral and the full extent was not visible within the trench, making detailed interpretation difficult. Valley View, St. Leonard's Hill, Royal Borough of Windsor and Maidenhead. An Archaeological Watching Brief Report

Clarke, C Twickenham : AOC Archaeology Group, 2007, 15pp, figs, tabs, refs

Work undertaken by: AOC Archaeology Group

A watching brief was carried out on a programme of ground reductions. This involved landscaping of the rear garden area and the excavation of a construction trench for an extension to the existing building. The majority of the deposits related to the construction of the current property and subsequent landscaping of the garden. Undisturbed soil profiles did survive in the southern part of the site. No finds or features of archaeological significance were identified during the course of the watching brief. [Au(abr)]

Work undertaken by: Glamorgan Gwent Archaeological Trust Ltd.

The watching brief noted archaeological deposits of a post-medieval and modern date, including a bank and rean. No features or artefacts associated with the known prehistoric site of Little Googs were noted, although the horizons potentially associated with prehistoric and Roman settlement were noted during the deeper groundwork. Plot 9, Cabot Park, Avonmouth, Bristol. An Archaeological Watching Brief
 Museum of London Archaeology Service London : Museum of London Archaeology Service, 2007,
 3pp, colour pls, figs
Work undertaken by: Museum of London Archaeology Service
 Plot 9 lies in the south-eastern part of the Cabot site. It covers some 7 acres of open grassland.
 Following a geophysical survey four pits were dug in order to locate possible buried ordnance. Pit 4 cut
 extended a maximum of 0.3m deep, within the topsoil. It was filled with a disarticulated clay
 containing fragments of ferrous wire that had been recorded by the survey. The base of the 'cut' was
 formed by a 0.01m thick fibrous deposit that may have been the base of a feature such as a hedgerow.
 The feature appeared on the aerial photograph as a straight length that turns to the south-west at its
 northern end. As such, it appeared to be an anthropogenic feature though it predated the adjacent ridge.
 It remains undated though its course suggests a fairly recent origin. It is perhaps unlikely therefore that
 the feature figured as one of the 'palaeochannels' recorded in an evaluation of 1998. [Au(adp)]

Archaeological Building Recording and Watching Brief at No.39 Cooperage Road, St. George, Bristol

Bristol & Region Archaeological Services Bristol : Bristol & Region Archaeological Services, 2007, 16pp, colour pls, figs, tabs, refs

Work undertaken by: Bristol & Region Archaeological Services

The recorded structure was a two-storey house, originally of single-depth plan but later extended to form a double-depth structure with double-pile roof. The earliest part of the structure was a rubble boundary wall that had been incorporated into the west end of the building. Ground reduction prior to the excavation of strip-foundation trenches revealed the remains of a previously unknown 17th century building. [Au(adp)]

Tongue, J Cirencester : Cotswold Archaeology, 2007, 15pp, figs, tabs, refs

Work undertaken by: Cotswold Archaeology

An archaeological watching brief found the western portion of the site had been heavily truncated by modern buildings and drainage works, such that no archaeological remains survived in this part of the site. To the east, large sub-rectangular pits cut into alluvial clay were recorded during the course of the works. The pits were later used for industrial and domestic waste disposal indicated by quantities of brick, tile, ash and glass slag. Pottery retrieved from the fills of the pits was 18th century in date. A cultivation soil was cut by substantial sandstone foundations, which were likely to be from the building of the Avonside Engine Works. The Sandstone walls were truncated by modern concrete structures probably associated with the development of the site as a paper works in the early 20th century. [Au(abr)]

Work undertaken by: Cotswold Archaeology

The only archaeological feature observed during the watching brief was a concrete surface encountered at a depth of 2.4m below the present ground level. The depth at which this surface was encountered would suggest that it represented the floor of a cellar. The remaining deposits encountered during the watching brief represented the modern backfilling of cellars or modern dumping and ground make-up in areas that had been truncated during the development of the area in the 19th-20th century. No artefactual material predating the modern period was recovered. [Au(abr)]

TEMPLE BACK, BRISTOL

Temple Back, Bristol. Archaeological Watching Brief Report

Armstrong, A & Foster, WSalisbury : Wessex Archaeology, 2007, 15pp, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

Despite the limited space and confined nature of the site, a number of archaeological features dating to the post-medieval/modern periods were recorded at the south end of the site. These included a possible 17th century cobbled surface or slipway running south-west to north-east, a waterfront retaining wall, a drain associated with the 17th century cellar structure, and a post-medieval or modern culvert. The former Central Electric Lighting Station had previously occupied the majority of the site. [Au(adp)]

Monitoring of groundwork revealed the foundations of 18th/19th century and later farm buildings. A deposit of 19th century blue and white transfer ware pottery wasters and kiln furniture probably represented dumped material that originated in central Bristol [most likely the Bristol Pottery] and did not indicate pottery production on the site. STANNRIDGE, GUNNISLAKE

Building Survey and Archaeological Watching Brief of a Brick Kiln at Stannridge, Gunnislake, Cornwall

Wakeham, C S Exeter : Exeter Archaeology, 2007, 7pp, refs

Work undertaken by: Exeter Archaeology

A watching brief and historic building recording was carried out. The site appeared to be a good example of a late 19th century Cornish brick-making site. The significance of a beehive kiln may have proved to be relevant to lost examples at other sites in Cornwall. Any future clearance of vegetation within the kiln may provide further detail of how the kiln operated, although it appeared unlikely that any earlier phase of activity would be revealed. [Au(abr)]

Thorpe, C Truro : Historic Environment Service Projects. Cornwall County Council, 2007, 11pp, colour pls, figs, refs

Work undertaken by: Historic Environment Service Projects. Cornwall County Council

On lifting the tarmac made ground was revealed. No archaeological features were observed. One granite slab appeared to have a hole cut into its centre that had been plugged with a tapered granite bung. When the bung was removed it was seen that the hole gave access to a drop shaft which had water at the base. Below the capstone, was a chamber. This well may have been closed after a cholera epidemic in the nineteenth century. [Au(adp)]

Hughes, S D Exeter : Exeter Archaeology, 2007, 10pp, tabs, refs

Work undertaken by: Exeter Archaeology

An archaeological watching brief was maintained during groundwork. Apart from a modern pit, the only archaeological features disturbed by the cable trench were five field boundaries. Two of these, including one that was previously unrecorded, were considered to be part of a field system associated with a settlement on Calvadnack Moor of supposed prehistoric date. The alignment of a number of major linear field boundaries in the area was shared with elements of these fields, and remains of a widespread system of this date appeared to survive. [Au(abr)]

ST. MARY'S CHURCH, AYLESBEARE

Archaeological Monitoring and Recording of New Drainage at St. Mary's Church, Aylesbeare, Devon

Dyer, M Exeter : Exeter Archaeology, 2007, 11pp, refs

Work undertaken by: Exeter Archaeology

Archaeological monitoring work was undertaken during the installation of a new drainage channel. It was successful in establishing the date and relationship of the north aisle wall and buttresses. This was previously unclear, with conflicting information coming from the documentary sources and the listing description. Observations made during the work demonstrated that the north aisle was substantially original, apart from some possible localised rebuilding at the west end. Three windows at the east end of the north wall appeared to be original and unrestored. The western window, which had glazing bars

of later type and was associated with an apparent change in the surrounding wall fabric, may have been rebuilt. It was also established that the three buttresses were later additions, probably made during the 1897-9 restoration. No evidence of burials was found during the excavations. No definite date was obtained for a hedge bank. The fragments of roof slate in the primary mound showed there was already a building on the site, or building activity had taken place, when the boundary was established. [Au(abr)]

 South West Archaeology Kentisbury : South West Archaeology, 2007, 32pp, colour pls, figs, refs
 Work undertaken by: South West Archaeology
 The site revealed no evidence of occupation before the 19th century and yielded little in terms of finds. The 19th century site was agricultural in function but from the mid-20th century it was converted for light industrial use, the works for which entailed considerable disturbance to below ground deposits. The barn appeared to have been built in the mid-19th century as a single store building with a pine tie-beam and kingpost roof structure, and two large opposed, centrally placed doorways. An extension was added shortly after this date but there was little change until the mid-20th century when the building was modified for use associated firstly with a garage and then an engineering works. CATHEDRAL GREEN
Archaeological Recording of Works around the Cathedral Green, 2005-7
 Goodwin, N Exeter : Exeter Archaeology, 2007, 7pp, refs
 Work undertaken by: Exeter Archaeology
 A trench for a bike rack was fortunately positioned, as it exposed the junction of three walls. These probably represented the fronts of the former Audit House and the Song School. The observations on the removal of trees revealed mostly modern disturbed topsoil, however, below one of the roots of tree six was a deposit which was probably Roman. There was likely to be only a limited spread of this material due to the large number of burials in the area. The material observed around the statue of Richard Hooker probably formed part of the fill of the construction trench for the plinth and therefore dated from the early 20th century. Observations from four pits showed that portions of the buildings

survived immediately below the grass. The observed walls were built of brick and probably dated from the 18th or 19th century but the buildings probably originated in the late medieval period. [Au(abr)]

Archaeological Recording during Building Work at St. Nicholas Priory, Exeter, Devon

Goodwin, N Exeter : Exeter Archaeology, 2007, 5pp

Work undertaken by: Exeter Archaeology

Excavations for the evaluation trench, the service trenches and the general ground reduction exposed mainly 20th century levelling/makeup material at the rather shallow depths required for the works. In the western trench of the undercroft a surface of grey-brown lime mortar was observed. The purpose of this deposit was not apparent within the limited range of the excavation. The nature and colour of the mortar indicated a likely post-medieval period for this deposit. [Au(abr)]

94A/94B SIDWELL STREET, EXETER

Archaeological Recording Work and Building Recording at 94A/94B Sidwell Street, Exeter, Devon

Collings, A & Parker, R & Pearce, P Exeter : Exeter Archaeology, 2007, 17pp, refs

Work undertaken by: Exeter Archaeology

Archaeological recording at the site was undertaken prior to and during the redevelopment of the site. The work comprised a desk-based study, building recording, the machine-excavation of six evaluation trenches and a watching brief. The earliest historic maps indicated that buildings were present on the site during the late 16th century, although these may have been cleared along with other buildings during the Civil War. The site had been rebuilt by the mid-18th century and continued to be occupied until the present day by a building probably incorporating parts of those constructed following the Civil War. Terracing associated with later changes to the building had removed any deposits of earlier date

from the site area. No cut features other than those associated with the building were present. [Au (abr)]

Archaeological Recording at 38 Gordon Road, Topsham

Best, J & Farnell, A Exeter : Exeter Archaeology, 2007, 7pp, tabs, refs

Work undertaken by: Exeter Archaeology

An archaeological watching brief was undertaken from January to July 2007. The work comprised monitoring the machine-excavation of foundation and service trenches. A number of Roman features, including a well, a ditch and pits filled with domestic waste, were recorded on site. These appeared to form part of the general pattern of Roman civil occupation previously recorded in the vicinity of the site. The pottery assemblage included both local fabrics and imported pottery, such as Samian and Terra Nigra. [Au(abr)]

PLOT ADJACENT TO COBBLESTONE COURT***Plot Adjacent to Cobblestone Court***

C. Preece Exeter : Devon County Council Historic Environment Record, 2007, A4 sheet

Work undertaken by: Devon County Council Historic Environment Record

Archaeological recording associated with the near complete construction of a dwelling to the south of 'Cobblestone Court', Chittlehamholt was conducted by South West Archaeology. This consisted of cleaning and recording the section to the rear (west) of the dwelling where the rising ground had been terraced; secondly, the recording of hedge-banks, and examination for finds and the collecting of pottery from the site. Most of the spoil had been removed from site, enough sherds were collected from topsoil, sections and surrounds to aid analysis, all were post-medieval or modern in date. The only features found were interpreted as a field drain or soakaway and a modern cut for a lead pipe. [OASIS(Au)]

YEO BARTON, MARIANSLEIGH***Report in the Archaeological Monitoring of an Extension to Yeo Barton, Mariansleigh, Devon***

Wakeham, C S & West, A|Exeter : Exeter Archaeology, 2007, 6pp, refs

Work undertaken by: Exeter Archaeology

Few archaeological remains were found, primarily because an extension was constructed prior to a watching brief. The features that were observed within the existing wing of the house appeared to have shown three different phases of archaeological activity. Although the exact nature of a post hole could not be determined, it appeared to predate the laying of a cobbled floor. Both a post hole and a ditch appeared to represent medieval features, based on pottery evidence. It was unclear whether a cobbled surface originally covered the whole floor of the north-east wing, although it seemed likely that it was a contemporary feature and formerly did so. It also remained unclear as to the reason for a shallow surface drain. No finds were evident within spoil examined in relation to the construction of the new extension itself, though this was not conclusive negative evidence. The impact of the construction work on any potential archaeological deposits in this vicinity could not realistically be assessed in this

context, but the presence of medieval pottery close by suggested that similar material may have been present here. [Au(abr)]

Monitoring was carried out during excavation of foundation trenches for an extension at the rear of the property. The site lies within the general area of the Saxon and medieval town defences. A broadly consistent deposit sequence was exposed comprising garden soil overlying a cultivation soil, which in turn overlay natural ground. Post-medieval pottery was recovered from these layers. The heavily truncated remains of a wall foundation was exposed, sealed by the cultivation soil. This was undated. [OASIS(Au)]

LAND AT CROSSLANDS, DANTON, ELMS CROSS, NEAR IPPLEPEN*Archaeological Investigations on Land at Crosslands, Elms Cross, near Ipplepen, Devon*

Farnell, A Exeter : Exeter Archaeology, 2007, 8pp, refs

Work undertaken by: Exeter Archaeology

The archaeological work initially comprised the monitoring of topsoil removal. This was not to a sufficient depth where archaeological features or deposits could be confirmed. Consequently, six deeper trenches were excavated, one of which revealed a large probable quarry pit of late Romano-British date [3rd- to 4th-century AD]. This feature contained a quantity of Roman native and imported pottery, together with animal bone, a copper alloy coin and an iron object. Elsewhere across the site a series of linear and curvilinear features was recorded, none of which provided any dating evidence. The curvilinear features might represent evidence for prehistoric funerary or settlement activity, while the linear examples were likely to be either drainage gullies or truncated larger field divisions. These could have dated from any time from the prehistoric through to the post-medieval period. [Au(abr)]

JETTY MARSH AREA 3, NEWTON ABBOT***An Archaeological Evaluation, Strip, Map and Record Exercise and Jetty Marsh Area 3, Newton Abbot***

Hughes, S Exeter : Exeter Archaeology , 2008,

Work undertaken by: Exeter Archaeology

An archaeological evaluation, strip map and sample excavation and watching brief on land at The Grove, Area 3, Jetty Marsh, Newton Abbot, Devon, (NGR SX 8562 7247) was undertaken by Exeter Archaeology between August and October 2007. The site is located adjacent to the hamlet of Sandford Orleigh and lies in an area where prehistoric and Romano-British activity has been previously identified. Investigations comprised the excavation of twelve trenches, totalling 575m in length, with a subsequent targeted strip, map and sample excavation. A separate series of test pits were observed as a watching brief. The evaluation trenches exposed a series of small-scale agricultural ditch features, some of which were present on the 1840 parish tithe map. The ditches were largely undated but the majority are likely to be post-medieval in date. A small portion of an 18th -to 19th-century stone structure was also exposed. The strip map and sample excavation exposed a series of wide, shallow profile ditch features of uncertain, but possibly Romano-British date. On the whole, the ditches exposed in the excavation area were relatively wide with distinctive shallow, flat-based profiles and gradual to moderately sloping sides. The function of these features is not known, although the fills were generally largely sterile and contained few finds, indicating that they were not closely associated with settlement activity. Many of the fills, however, contained patches of heat-affected clay, the presence of which suggesting some form of localised burning activity. [OASIS(Au)]

REDUNDANT BARNs, TACKBEAR MANOR, BRIDGERULE

Redundant Barns, Tackbear Manor, Bridgerule, Devon. An Archaeological Programme of Works. Historic Building Recording and Watching Brief

McConnell R, Matthews K & Tizzard A Wincanton : Context One Archaeological Services, 2008, 54pp, colour pls, figs, tabs, refs, CD

Work undertaken by: Context One Archaeological Services

The archaeological work recovered evidence for a small area of cobbling to the west of one of the barns on the site, Barn B. However, no further archaeological features and no finds were found during the course of the watching brief. It should be noted that all groundwork took place outside of the barns. The barns predated 1844, with remnants of cob walling surviving in each, including an original window with splayed jambs in the cob walling of Barn C. This suggested that further cobbing survived, however, the barns underwent complete restoration during the early 20th century, during which time the walls were rebuilt or refaced in coursed random rubble. Windows and doorways were reused, many of which were Jacobean in style and may have been derived from the south-east wing of the manor house demolished in 1858. Later modernisation and repair included the insertion of brick and concrete blocks. [Au(abr)]

HENDERBARROW FARM

Watching Brief of Development at Henderbarrow Farm, Halwill

Freeman, J Barnstaple : South West Archaeology , 2007, A4 sheet

Work undertaken by: South West Archaeology

Part of the groundworks associated with the development of a green field site for a single dwelling at Henderbarrow Farm, Hallwill Junction were monitored and recorded by South West Archaeology. The groundworks consisted of the terracing of a building platform into the slope of the hillside, the digging of foundation trenches and associated service trenching. The platform and foundations had already been excavated before the commencement of archaeological monitoring. The spoil heap from this earlier groundwork was spread out and thoroughly examined for finds, none were found. No archaeological features were revealed during any of the service trenching. Only two pottery sherds were recovered, both from the topsoil and were of 19th century date. [OASIS(Au)]

TERMINUS BUILDING DEVELOPMENT, HENGISTBURY HEAD*Terminus Building Development, Hengistbury Head*

Tatler, S Dorchester : The Dorset Natural History and Archaeological Society, 2008, 1p

Work undertaken by: Terrain Archaeology

An archaeological watching brief was carried out at the site during groundwork associated with the development of the area around the terminus building at Hengistbury Head. A small undated east to west linear feature, possibly a boundary ditch was observed at the southern end of the site. Another much larger, L-shaped feature was also exposed. No dating evidence was recovered from this feature but the character of the redeposited natural sand and gravel fill suggested a relatively recent date. This feature may possibly have been associated with World War II activity in the area. [Sec(adp)]

BLANDFORD CAMP, BLANDFORD FORUM*Blandford Camp, Blandford Forum*

Haines, T & Biddulph, E Dorchester : The Dorset Natural History and Archaeological Society, 2008, 1p

Work undertaken by: Bournemouth Archaeology

A watching brief and trenched evaluation was carried out at the site and revealed well-defined linear features, ditches and a tunnel that had been cut into chalk and rapidly backfilled. These were likely to be shallow ditches or practice trenches constructed during the First or Second World War. One practice trench showed evidence of a possible fire step cut into its eastern side. Artefacts recovered included barbed wire and a single .303 cartridge case from another practice trench. The case was produced between 1897-1903 after which this type of hollow point round was banned by the Hague Convention. The round would have been retained as stock and used for target shooting. More practice trenches dug in the surrounding area of the camp still survived as recognisable earthworks. [Sec(adp)]

 A field walking and metal detecting survey was carried out on two fields in 2007 to the north of Corfe Castle on Norden Farm, in order to further explore the site of a hoard of Late Iron Age staters and a Roman patera of the 1st century AD, discovered by metal detectorists in 2004. The survey across the discovery sites was designated to map plough zone finds exposed and disturbed by the ploughing of the pasture after a long ley. Late Iron Age coins and Roman coins and pottery and Romano-British building material and wall footing just below the plough zone. [Sec(adp)]

 Tatler, S & Bellamy, P Dorchester : Terrain Archaeology, 2007, 9pp, colour pls, figs, tabs, refs

Work undertaken by: Terrain Archaeology

An archaeological watching brief was undertaken during topsoil stripping for a new quarry. No archaeological features other than stone-filled field drains of probable 18th-19th century date were revealed, however, a significant quantity of worked flint and late Iron Age/Roman pottery was found in the topsoil. The character of the flint assemblage suggested a late Neolithic/Early Bronze Age date. [Au(abr)]

QUARRY EXTENSION, BLACKLANDS FIELD, ACTON, LANGTON MATRAVERS

Quarry Extension, Blacklands Field, Acton, Langton Matravers

Tatler, S/Dorchester : The Dorset Natural History and Archaeological Society, 2008, 1p

Work undertaken by: Terrain Archaeology

An archaeological watching brief was carried out at the site during topsoil stripping for an extension to a quarry in the south-east part of Blacklands field to the south of Acton. Two stone-filled field drains were revealed but no other features or deposits of archaeological interest were found. The results of this watching brief suggested that the Iron Age and Roman activity discovered in the late 1940s was confined to the western part of the field. [Sec(adp)]

TWO RING DITCHES EAST OF MILLER'S FARM, CHARBOROUGH

Two Ring Ditches East of Miller's Farm, Charborough, Dorset

AC archaeology Chicklade : AC archaeology, 2007, 9pp, figs, refs, CD

Work undertaken by: AC archaeology

Groundwork revealed two adjacent ring ditches. Ring Ditch 1 had a diameter of some 13m and comprised a small ditch or gully encircling a shallow linear ditch, but no other features. The arc of its eastern side had apparently been adjusted to avoid the adjacent Ring Ditch 2, which had an external diameter of 9m, a more substantial ditch but no internal features. No finds were recovered from either feature, and any interpretation of date and function therefore depended on a consideration of their morphology. The dimensions of Ring Ditch 2 was consistent with that of a small Bronze Age round barrow, whilst Ring Ditch 1 was more reminiscent of gullies surrounding late Bronze Age or Iron Age timber structures. SHERBORNE LANE, LYME REGIS

Sherborne Lane, Lyme Regis

Draper, J Dorchester : The Dorset Natural History and Archaeological Society, 2008, 1p

Work undertaken by: Lyme Regis Museum

In May 2007 Guy Ottewell let Lyme Regis Museum know that garden works at 2 Sherborne Lane were revealing structures. No.2 was the manse to the adjacent Baptist Chapel and was built in 1927 back from the original building line of this very narrow part of Sherborne Lane. A trench, to the front of the present house, revealed lias paving beneath garden soils, almost certainly the floor of one of the rooms in the earlier house. At the back of the present house were parts of lias walls probably representing terracing and steps associated with the earlier house. No pottery or other artefacts were recovered. Photographs and notes are at Lyme Regis Museum. [Sec(adp)]

Thomas, A Cirencester : Archaeology & Planning Solutions, 2007, 12pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeology & Planning Solutions

The watching brief found stone walls aligned both north-east to south-west and north-west to south-east. These were thought to be of recent origin, perhaps associated with extensions to the 1829 house, although they were on a similar orientation to Roman walling found immediately to the south. This may have suggested that some of the walling encountered may have constituted re-used Roman material. [Au(adp)]

Work undertaken by: 110 Archaeology

The watching brief revealed the robbed-out remains of a former house, the size of which would suggest a small cottage, with the remains of a stone well in the backyard. Residual pottery suggested occupation of this house during the 18th century, and map evidence demonstrated its destruction by 1925. Medieval pottery was the only indication of occupation prior to the building of the house. [Au(adp)]

CONSTRUCTION OF GLOUCESTER SOUTH WEST BYPASS, NETHERIDGE SECTION

Archaeological monitoring during the construction of the Gloucester South West Bypass, Netheridge Section.

Heaton, R & Macpherson Barrett, R

Gloucester : Gloucestershire County Council Archaeology

Service, 2007, 18pp, figs, tabs, refs

Work undertaken by: Gloucestershire County Council Archaeology Service

A programme of archaeological monitoring was undertaken during groundwork associated with the construction of a new road link between the junction of Bristol Road and Cole Avenue and the southern end of Secunda Way, commonly known as the Gloucester South West Bypass, Netheridge Section. The works included alterations to the Gloucester and Sharpness Canal, which was bridged by the Bypass. The archaeological monitoring recorded a very limited number of archaeological features given the extent of the groundwork undertaken for this scheme, with a total of six archaeological features being recorded. The features comprised undated small furrows, a backfilled brook, three post-medieval ditches and a spread of post-medieval building rubble. [Au(abr)]

ALL SAINTS' CHURCH, BISLEY*Archaeological Watching Brief at All Saints' Church, Bisley, Gloucestershire*

Williams, P Worcester : Mercian Archaeology, 2007, 33pp, colour pls, figs, tabs, refs

Work undertaken by: Mercian Archaeology

A watching brief was carried out during groundwork associated with the insertion of a new WC. No evidence of a pre-13th century church was revealed. Seven burials were identified during the work, along with a quantity of disarticulated human bone. One burial was located directly beneath the north wall of the north aisle, suggesting it to be earlier than the 14th century. Two cist graves were also identified, and whilst these could not be accurately dated, they were also likely to have been medieval in date. Buried deposits included a dump of fire-reddened stone, perhaps adding weight to the theory of an earlier Norman church destroyed by fire. [Au(adp)]

BRINSCOMBE PORT*A Programme of Archaeological Monitoring at Brinscombe Port, Gloucestershire*

Stratford, E Gloucester : Gloucestershire County Council Archaeology Service, 2007, 8pp, colour pls, figs, tabs, refs

Work undertaken by: Gloucestershire County Council Archaeology Service

The monitoring exercise revealed a number of features and deposits relating to the former canal and port within the monitored test pits. These included walls and a swingbridge and part of the boat-weighting machine. The investigation highlighted the limited usefulness of trial trenching when

attempting to record deep features or deposits in unstable, contaminated or waterlogged conditions.

PARK MILL DAM, WOODCHESTER PARK

Park Mill Dam, Woodchester Park, Gloucestershire. Archaeological Watching brief

Lang, A & Aston, K Cirencester : Cotswold Archaeology , 2007, 22pp, figs, tabs, refs

Work undertaken by: Cotswold Archaeology

An archaeological watching brief was undertaken during the construction of a new spillway. The remains of a building and associated surfaces were uncovered, relating to at least one phase of a former mill identified from late 18th century and early 19th century maps. The features uncovered fitted most closely with features relating to a later phase of the mill depicted on a Tithe map of 1838. [Au(abr)]

BATH, SOUTHGATE REDEVELOPMENT***Bath, Southgate Redevelopment***

Barber, B, Bluer, R, Eaton, B, Halsey, C, Lewcun, M, Lyons, N & B Watson London : Museum of London Archaeology Service, 2007, 1p

Work undertaken by: Museum of London Archaeology Service

The Southgate redevelopment site covers an approximate area of 35,500m², lying immediately south of the City Wall and north of the River Avon. It is bounded by Southgate Street to the west, Manvers Street to the east, New Orchard Street/Henry Street to the North and Dorchester Street to the south. Parts of the site were evaluated by Bath Archaeological Trust in 1997 and the remainder by Museum of London Archaeology Service from December 2006 to March 2007. A phased program of controlled

excavation and watching brief began in June 2007, and is likely to continue until August 2008. Geoarchaeological investigations have focused on understanding the sequence of Late Devensian/Late Glacial river terrace deposits on the site, and modelling the early Holocene land surface. The terrace gravels were cut by a later channel, whose bedded sand and silt fills produced preliminary Optically Stimulated Luminescence (OSL) dates of c17,000 BP (base) and 14,000 BP (top), \pm 1,000 BP, indicating that these deposits date to the Late Devonian/Early Holocene interface. To date no Palaeolithic artefacts have been identified on the site. It is hoped to date the terrace gravels during work planned for 2008 and as work progresses, the project is expected to make a significant contribution to knowledge of the development of the Avon river system and the local Late Glacial/Early Holocene environment. In the south-west of the site, the channel deposits were overlain by a soil horizon containing flint-working debris of probable Mesolithic date (principally evidence of small blade and bladelet production). The flint scatter examined in 2007 was diffuse and disturbed, as the soil horizon had remained exposed until sealed by overbank flooding from the Roman period onwards. It is thought that further, better preserved flint scatters exist in the area to be investigated in 2008, particularly towards the south-east corner of the site. Evidence of later prehistoric activity currently consists of a single gully which produced sherds of Iron Age pottery. There is no evidence for significant Romano-British activity on the site, a Roman predecessor of the medieval Southgate, or for any of the postulated southern roads out of the town. The site was low lying and prone to flooding and may have been suitable for little other than grazing, but the lack of any visible form of suburban activity has implications for the nature of the town and its civic/religious nucleus. Only small quantities of residual Roman pottery and building material occur in later features. A large ditch some 10m south of, and parallel with, the known line of the medieval and presumably Roman town wall may represent a Roman defence cleared in the Late Saxon period, or a newly dug feature, part of Alfred's refortification of Bath. A peat layer in the primary filling of this ditch produced a 14C date of 770-970 cal AD. The Southgate suburb was developed after the Norman Conquest. Extensive reclamation dumps raised ground levels above the contemporary floodplain in advance of construction. A sequence of limestone cobble road surfaces was recorded along a c70m long section of Southgate Street. Localized gravel quarrying took place to provide additional raw materials. Several ditches and pit alignments indicate setting out of burgage plots running east from the street to a north-south aligned stream, which formed the rear boundary of the Southgate properties. Contemporary with the earliest road surface was the stone setting for a lead pipe which brought water from the south side of the river across the medieval bridge to a fountain or conduit house beside St James church, just inside the South Gate. Parts of several stone-built houses fronted onto the east side of the road. The backlands of these houses contain a range of cesspits, wells and ditches, but little in the way of refuse pits. The stream was revetted in stone and wattle and was presumably used for the disposal of most household waste. Its western edge was progressively reclaimed, with evidence that it became increasingly slow flowing and foul- known from documentary records as the 'Bum Ditch'. Part of a masonry structure close to the northern site boundary is thought to have been part of the head race or wheel pit of the documented Isabelle mill. Further work on the finds assemblage is needed to resolve the dating of the medieval phases. While it is possible that the development of the Southgate suburb will prove to be directly related to the Norman development of the cathedral in the south-eastern part of the walled area, initial indications suggest a slightly later date, perhaps in the later 12th or 13th century. Post-medieval developments include: the progressive narrowing and culverting of the 'Bum Ditch'; a 17th century watermill which probably powered a fulling operation; evidence for iron-working, as well as clay tobacco pipe and pin manufacture, and several phases of 18th- and 19th-century domestic, industrial and commercial buildings. Processing of finds and environmental samples will continue through 2008, while further evaluation and excavation will focus on the flint scatters in the eastern part of the site. [Sec(abr)]

LAND OFF SHAPTERS WAY, CATTEDOWN

Land Off Shapters Way, Cattedown, City Of Plymouth Archaeological Watching Brief

Harding, P Salisbury : Wessex Archaeology, 2007, 17pp, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

An archaeological watching brief was undertaken in a backfilled former quarry off Shapters Way, Cattedown, Plymouth as works required to meet a planning condition for the construction of a concrete batching plant with ancillary facilities. The Site lay 70m to the east of Worth's Cattedown Bone Cave, a Scheduled Ancient Monument known to contain deposits, in the cave and in associated fissures, of the Devensian Glacial (110,000-12,000 BP) with human and faunal remains of Middle to Late Upper Palaeolithic date. All deep foundations of the batching plant that impacted on the limestone bedrock were monitored to ensure that any additional archaeological deposits of similar importance encountered in any previously unrecorded fissures could be preserved in situ or, as a last resort, recorded and

removed for appropriate analysis. A pair of parallel, clay-filled fissures, aligned North-South and approximately 0.50 m apart, was observed in the side and the floor of a receiving hopper pit, which covered an area of approximately 25 sq m, 5 m below the modern surface. No artefacts were noted. Elsewhere an area of 202 sq m of limestone bedrock exposed to construct foundations for the plant revealed only undisturbed bedrock. Due to the negative results from the watching brief it was proposed to confine dissemination to placing a note about the watching brief in an appropriate journal. [Au(abr)]

ASHWICK, BEACON HILL WOOD

Ashwick, Beacon Hill Wood

Leach, P Ashill : Peter Leach, 2008, 1p

Work undertaken by: Peter Leach

In continuation of research into the archaeology of Beacon Hill Wood, near Shepton Mallet, excavations were focussed upon two earthwork mounds near the north-western end of the wood. In addition to its objectives of involving local people with their archaeology, the project has developed to investigate the character and survival of a wide range of remains surviving within the wood, to enhance their appreciation and management, and that of the wood as a whole. A 2m wide trench (Trench Four) was cut for 18m south from the centre of a flattened circular mound, approximately 18m in diameter and 1m high. This was heavily scored by forestry plantation ploughing and old animal burrows but is identified as the remains of a prehistoric round barrow (Somerset HER 23062; Ashwick 5 in Grinsell's 1973 Somerset Barrows catalogue). A partially dug section identified the outer edge of a truncated turf built mound and a buried soil below, rested upon natural weathered sand. There was no evidence of an outer surrounding ditch or other features in the 8m of trench extending beyond the southern edge of the mound. At the centre of the barrow was the base of a truncated pit cut into the turf mound, more than 2m across and containing many tumbled blocks of the local Devonian Beacon Hill sandstone. These sealed a larger slab placed horizontally above a complete, coarse pottery cinerary urn, stood upright within a small cut in the base of the pit. Analysis of the urn and its contents identified a 220mm high jar with applied cordons of Middle Bronze Age, Deverell Rimbury type. Cremated bone contained within the vessel was identified as the remains of a young woman, aged 18-25, with no other accompaniments surviving apart from remains of the pyre charcoal (principally oak). The urn appeared to represent a secondary burial within the body of the mound, and the remains of a suspected Early Bronze Age primary interment may well still survive at a lower level. Less than 100m to the south a second trench (Trench Five) was excavated 10m long and 2m wide, east-west across a much lower mound, heavily disturbed by forestry ploughing (PRN 23063). Although claimed by some previous researchers as a possible round barrow, excavation revealed part of two sides of a rectangular setting of local sandstone blocks at its centre. These were associated with scattered charcoal, remains of a cobbled surface, occasional sherds of Romano-British coarse pottery, and a few iron nails. These remains appear to represent the southwest corner of a rectangular building, perhaps originally of timber construction with some stone packing to define and support its foundations. Although not closely dated, this may be the first recognised dwelling or working site associated with the evidence of the Roman and Iron Age stone quarrying attested on Beacon Hill and investigated previously by this project. BATCOMBE, SPARGROVE MANOR*Batcombe, Spargrove Manor*

Leach, P Ashill : Peter Leach, 2008, 1p

Work undertaken by: Peter Leach

A watching brief was required during building alterations and conversion of a mid 18th century stables, located within the northeast corner of the moat enclosing Spargrove Manor, part of a Scheduled Monument (Somerset no. 438, HER 23098). Removal of existing floor levels and service trench excavations revealed the substantial foundations of a similarly aligned stone building set a few metres west of the stables built in 1749. The demolition levels of the earlier building contained some 17th-18th century ceramics, glass and other domestic refuse. Although incompletely exposed, its form and location suggested that this earlier building may have been a forerunner to the present stables. Part of an extensive spread of re-deposited clay with some stone beneath both buildings incorporated occasional 13th-14th century pottery sherds. This probably represents the truncated base of an inner bank that originally fronted the medieval moat surrounding Spargrove Manor, the date of which was suggested by a dendrochronological date of around AD 1289 from timber belonging to its earliest bridge crossing found in 2000. Barber, A Worcester : University of Worcester, 2008, 1p

Work undertaken by: University of Worcester

In August 2007 excavations were undertaken by the University of Worcester at an oval mound in a field at Old Down. The site has variously been suggested to be a long barrow, two round barrows and a modern spoil heap. The excavations revealed the mound to be two round barrows, with a complex sequence of activity, which included enlarging the mounds. Primary cremated burials were found in both barrows and a secondary cremated burial in one of them. Grave goods, including pots, metalwork, flint artefacts and beads, were also found. The barrows preserved the old Bronze Age land surface, which has been sampled for environmental analysis. Work at the site is ongoing. [Sec]

WRAXALL VILLAGE CROSS*Wraxall Village Cross*

Broomhead, R A Croscombe : R.A. Broomhead, 2008, 1p

Work undertaken by: R.A. Broomhead

Archaeological observations were made during the dismantling and re-erection of Wraxall Village Cross also known as The Tree Cross, located at the junction of Wraxall Hill with the B3130 in the parish of Wraxall and Failand. Despite uncovering minimal stratigraphy, secure evidence was located indicating that the structure as it currently exists probably dates from the early 18th century and can be no earlier than 1699. Additional documentary evidence, mortar samples and a recovered coin show that much of the structure was rebuilt in the early 20th century. Although the capping stones are well weathered and may be derived from an earlier structure, no evidence of such a structure could be determined. [Sec]

Hemington, Blacklands

Lawes, JBath : Bath & Camerton Archaeological Society, 2008, 1p, pls

Work undertaken by: Bath and Camerton Archaeological Society

Bath and Camerton Archaeological Society have continued with the training excavations at Blacklands. In 2007 two new trenches were investigated. Trench 2900 was located to investigate some magnetic anomalies, seen on the geophysical survey, at the end of the previously excavated track leading to the gatehouse and villa. Surprisingly, these proved to be Bronze Age storage pits which had been sealed with a deposit of small stones, apparently the remnants of a yard, possibly associated with farm activities. The yard may have been enclosed by a shallow ditch containing late Roman-British finds. The pits were filled with a dark brown silty deposit which, after sieving, was found to include environmental evidence including bread wheat, apple pips and hazel nuts. Only one small body sherd of possibly late Bronze Age pottery was recovered along with a few flakes of worked flint. The main area of excavation was in Trench 3000, located next to the previous year's excavation to help understand the complex sequence of occupation in this area. A narrow extension was also dug to the east to investigate the ditches shown on the geophysical survey. The timber slot building found in 2006 was found to continue into the new area, although its full extent was not clarified, as neither the west side nor the south walls were clearly seen. The building had been truncated by a later Romano-British ditch that had completely destroyed its southwest corner. It would appear that the rectangular building could not be later than the 3rd century AD and was probably part of the farm buildings related to the villa, as little domestic rubbish seems to be associated with it. A dating sequence was enabled by the fact that the building overlay a large roundhouse and was cut by this later ditch. The roundhouse was difficult to interpret because of later activity on the site, but it appeared to have a double ditch and at least two hearth or oven areas were found within. Dating the occupation of this building remains difficult as few finds have been clearly identified with its construction; further work is needed to establish a secure chronology. The trench extension to the east provided an opportunity to investigate what appeared to be the main access road to the occupation area enclosed by a sub-circular ditch. The

road had a ditch on the eastern side, but this appeared to be much earlier. Other ditches were found to the east, possibly belonging to earlier features that did not show clearly on the geophysical survey due to the strong signals of later features. The south-west corner and a section of the southern ditch of the trapezoidal enclosure were found in this trench. The enclosure had a stone and timber revetted bank, the ditch survived to a depth of about 1.5m. A newborn infant, in a crouched position orientated and north to south, had been buried in the very top of the ditch beneath a few stones. Evidence of a second infant burial was also found in this area, but the bones had been scattered by later activity. These are the first human burials identified on the site.

The excavations have shown that this complex site was probably used for many hundreds of years from the prehistoric site through into the Romano-British period. [Sec]

Kilmersdon, Babington, Babington House

Law, M Bristol : Bristol & Region Archaeological Services, 2008, 1p

Work undertaken by: Bristol & Region Archaeological Services

A watching brief was carried out by Bristol and Region Archaeological Services at Babington House. Medieval activity was recorded in the north-eastern corner of the walled garden. A colluvial deposit, containing sherds of Roman and medieval pottery, extended across the area and had been cut by several features of post-medieval date, and by an isolated pit containing cattle bones and several sherds of medieval pottery. Also revealed were the remains of a network of blue lias dry stone culverts predating the building of the garden wall in the late 18th century, as well as the foundations of several later structures and associated garden soils. STREET, HOLY TRINITY CHURCH

Street, Holy Trinity Church

Graham, A Seavington : Alan Graham, 2008, 1p

Work undertaken by: Alan Graham

The site of Street church can be identified with land at Lantocai granted by Winchester to Glastonbury in 680. The name is probably derived from the Welsh or Cornish prefix for an enclosed burial ground, combined with the name of St. Kea. The site is potentially, therefore, one of great antiquity. The present church comprises a nave and chancel, with a north aisle, south porch and west tower. Much of the fabric appears to be 15th century and it is clear that the church was refurbished at that time, though the aisle is known to be an addition of the 1830s. The complete re-flooring of the nave, north aisle and

chancel of the church in summer 2003 gave an opportunity for the cleaning and recording of the exposed archaeological strata. Though all areas had been truncated by the voids beneath the existing suspended timber floors, and disturbed by trenches for heating pipes, areas of intact stratigraphy did survive. These were cleaned and recorded though no formal excavation of the deposits was undertaken as the proposed floor was designed to leave all earlier deposits intact. The work was supported by the Parish Council and the County Council and a full report, together with the field archive, has been deposited in the Somerset Record Office. The work revealed the massive foundations of the original north wall of the nave, beneath the present arcade, together with the foundations of the chancel arch and west wall. All the masonry was substantial, with an externally stepped footing 1.40m wide and at least 1m deep into the natural clay that underlies the site. The nave was just under 50 feet long (c.15m) and 20 feet wide (c.6m). The foundation for the chancel arch suggested a narrow opening of between 6 and 7 feet (c.2m) compared to the present opening of 10 feet (c.3m). The date of this church could easily be Norman, which is the likely stylistic date of the tall narrow north door into the nave, shown in a sketch by the Rev. J. Skinner dated 1829, prior to the addition of the aisle.

It is significant that the foundation trench for this early north wall had been cut through pre-existing archaeological deposits. The nature of these is unclear as they were recorded only in the side of a later vault. They do, however, indicate clearly the use of the site prior to the foundation of the present church. Within the nave, areas of earth and mortar floors remained in situ, evidently contemporary with the use of the early church. They were overlain by traces of stone sleeper walls which predated the building of the north aisle in the 1830s and appeared to have supported box pews set on either side of a central, stone-paved gangway up the nave. A number of brick-lined vaults in the east end of the nave appeared contemporary with these pews. Following the addition of the north aisle, further sleeper walls were added which supported the wooden platforms for the bench pews that subsequently filled the church. [Sec]

THE GARDEN HOUSE, NEW STREET, WELLS***The Garden House, New Street, Wells. An Archaeological Watching Brief***

Leach, P Ashill : Peter Leach, 2007, 10pp, figs, refs

Work undertaken by: Peter Leach

Archaeological monitoring of buildings works observed a simple stratigraphic succession of modern garden soil or makeup deposits above an extensive earlier subsoil horizon sealing natural gravel and clay deposits. Evidence of earlier structural or other activity was almost exclusively of later 19th and 20th century date, including numerous animal burials associated with the former occupancy of the premises by a veterinary practice. The presence of later medieval pottery (mainly 13th-15th century date) and other material within the subsoil deposits was noted. [Au(abr)]

WELLS, 66 HIGH STREET***Wells, 66 High Street***

Broomhead, R A Croscombe : R.A. Broomhead, 2008, 1p

Work undertaken by: R.A. Broomhead

Archaeological observations were made during the excavation of drainage and service trenches for a new build to the rear of 66 High Street. Prior evaluation had demonstrated the presence of demolition rubble, derived from a medieval building, together with a series of medieval pits, a wall and cobbling (Somerset HER 16265). The recent work identified a wall noted on early maps of the area and a possible medieval culvert. However, it also demonstrated that the site is dominated by disturbed made-ground of the post-medieval period lying directly upon underlying natural gravels. The made-ground produced no conclusive evidence regarding the origins or the possible existence of earlier occupation upon the site. [Sec]

WELLS, CATHEDRAL CHURCH OF ST. ANDREW, MARY MITCHELL GARDEN***Wells, Cathedral Church of St. Andrew, Mary Mitchell Garden***

Hollinrake, C & Hollinrake, N Glastonbury : C. & N. Hollinrake Ltd., 2008, 1p

Work undertaken by: C. & N. Hollinrake Ltd.

A watching brief was maintained during the construction of a new visitor centre and restaurant within the Mary Mitchell Garden, situated immediately south-west of the West Cloister. The garden contains the ruin of the 15th century Choristers' House, formerly part of the Cathedral School, which was demolished during the 1870s. Historically the garden had been terraced into an upper to the north and a lower level to the south. Supervised removal of the garden soil was undertaken down to the level of the archaeological horizon, above which the new foundation slab was to rest. Within the south half of the garden a medieval culvert that runs from St. Andrew's Well into the town was revealed and recorded, as were fragmentary wall foundations and several small, medieval drains associated with the old school. Several 19th and 20th century drains were also revealed, some of which emptied into the medieval culvert. Much of this culvert appears to have been rebuilt during the 19th century, probably associated with landscaping works, and two inspection chambers of that date were found. Archaeological deposits within the northern half of the garden were better preserved than in the south. Two phases of a cobbled courtyard were recorded, the latest dating to the 13th century and later whilst the earliest appeared to date to the later-Anglo-Saxon period. A line of probable post-pads, dating from between the 10th and 13th centuries, was recorded immediately south of the north wall of the garden; these appeared to be associated with wall stubs, the whole possibly representing a lean-to structure associated with the masons working on the West Front construction. No masons' waste was seen within the garden, which implies that there was a wall on the line of the existing, north wall prior to construction of the West Front during the 12th and 13th centuries. Fragments of worked stone were recovered from re-deposited, clay make-up layers. These included fragments of worked Douling stone from various construction and repair episodes on the West Front and a fragment of carved Bath Stone, probably of late-Saxon date and which had been converted into a bird bath or trough at a later date. Two almost complete, but broken, spandrels, probably of 13th century date, were recovered below a post-medieval cobbled path in front of the original West Porch in the West Cloister. These appear to be part of the series of spandrels recorded during the 1980s. Occasional prehistoric flint flakes were found within redeposited clays and pottery recovered during the excavations included some residual Romano-British sherds although most sherds were dateable from the 10th century onwards. A photogrammetric survey of the West Cloister wall was carried out and has been enhanced by coloured plans showing stone types, building phases and other details. [Sec]

Bridgwater, Albert Street

Brigers, J Ashcott : James L Brigers, 2008, 1p

Work undertaken by: James Brigers

A watching brief was conducted during the excavation of groundwork in advance of the construction of a number of bungalows and detached houses during June and July 2007. Throughout the site natural alluvium and Mercia Mudstone bedrock were found to be overlain by an uninterrupted sequence of apparent cultivation soils, one of which contained abraded sherds of medieval pottery. This sequence was subsequently sealed by up to 1.50m of dumped material of 19th century and later date, presumably the result of dredging of the mid-19th century extension to the Bridgwater & Taunton Canal (Somerset HER 15009) which formed the eastern boundary of the site. No evidence of previous direct habitation was revealed and it appears that site may have been used throughout the medieval period as gardens within the precinct of the Franciscan friary (Somerset HER 12435), which was most probably centred in Friarn Meadow some 250m to the east. ST. JOHN'S AMBULANCE DIVISIONAL HEADQUARTERS, ALBERT STREET, BRIDGWATER*St. John's Ambulance Divisional Headquarters, Albert Street, Bridgwater, Somerset. An Archaeological Watching Brief*

Milby, SWincanton : Context One Archaeological Services, 2007, 25pp, figs, tabs, refs

Work undertaken by: Context One Archaeological Services

The site lay within the precinct of the Franciscan Friary of Greyfriars. A series of large gravel extraction pits were observed at various points across the site, the largest of which were seen towards the centre of the site. Structural remains dating to the late 19th/early 20th century were observed in the southern corner of the site and likely to be associated with domestic outbuildings in the back gardens of the houses that once fronted Albert Street. A foundation and wall of a terraced house from this phase was observed c. 1.5m west of the eastern edge of the site. A further wall was observed abutting a wall of a terraced house. [Au(abr)]

Brigers, J Ashcott : James L Brigers, 2008, 1p

Work undertaken by: James L Brigers

A watching brief was conducted during groundwork prior to the erection of a block of flats at the above location. The natural gravel was sealed by a substantial build-up of cultivation soil, which contained abraded fragments of 13th-15th century pottery. Towards the Market Street frontage of the site the cultivation soil was cut by night soil pits of late 18th century date, which in turn were sealed by the sandstone foundations of a building which appeared to have been rebuilt on the same foundations later in the 19th century. BRIDGWATER, CHURCH OF ST. MARY*Bridgwater, Church of St. Mary*

Brigers, J Ashcott : James L Brigers, 2008, 1p

Work undertaken by: James L Brigers

A watching brief was undertaken in August 2007 when trenches were excavated for the installation of drainage to serve proposed new WC facilities in the west tower of the church. Features revealed by the excavations included a large vault and stone culvert, both of the 18th or 19th century and both of which were left undamaged. The excavation west from the tower revealed the full elevation of the medieval tower foundation and exposed its base where it cut into the natural gravel. A third and final trench largely followed the line of early 20th century drainage to the north of the church. This produced little of archaeological interest, apart from a stone and brick foundation at the eastern end which probably represented the remains of a 19th century wall defining an entrance passage to the churchyard, as

shown on the 1886 Ordnance Survey. In order to run a pipe out of the tower, a hole was drilled through its northern wall, cores from which indicated that the internal structure of the 14th century wall was a lias, slate and sandstone rubble. [Sec]

CHEDDAR, BATH STREET

Cheddar, Bath Street

Leach, P Ashill : Peter Leach, 2008, 1p

Work undertaken by: Peter Leach

An evaluation by trial trenching was required for a site proposed for residential development at Saxon Place, behind premises on the south side of Bath Street. The plot is bordered to the west by the grounds of the Kings of Wessex School, occupying the site of the royal Anglo-Saxon and medieval palace at Cheddar, and less than 100m north of St. Andrews church and vicarage – site of a suspected Roman villa. Both sites are protected as a Scheduled Monument (no. 29673). The eastern end of the site was crossed by a series of ditches, a stone rubble spread, and occasional postholes, sealed beneath almost 1m of garden soil and deep hardcore makeup for an existing car park. Most of the buried features were associated with 2nd-3rd or 4th century AD Roman pottery, relatively abundant animal bone, charcoal, burnt stone and occasional iron objects. These remains are interpreted as a continuation north of the Romano-British 'villa' settlement focus identified within the vicarage garden. The western half of the site was sealed beneath over 1m of 20th century landfill, capped by a modern hardcore and car park

surface. This also buried an 18th century stone wall foundation aligned with still existing property boundaries extending south from the Bath Street frontage. At one point the wall abutted deep foundations for a small rectangular stone building of slightly earlier 17th/18th century construction, possibly part of an outhouse set towards the rear of the plot on the east side of the boundary wall. The latter was found at two locations to be set into the fills of a 2m wide ditch on a similar alignment, the bottom of which was not reached due to considerations of site safety and a high water table. Occasional sherds of 11th and 12th-13th century pottery, with a little animal bone, were recovered from the excavated ditch fills. This long established boundary, apparently of medieval origin, was interpreted as marking the eastern boundary ditch to the later medieval palace site, separating it from the contemporary village properties of Cheddar. Brigers, J Ashcott : James L Brigers, 2008, 1p

Work undertaken by: James L Brigers

Evaluation and subsequent excavation on the proposed site for a single dwelling revealed the presence of a large number of features dating from the 13th to 19th centuries. Features of probable medieval date included large pits and an alignment of post holes that may have defined the location of a timber structure, although evidence of immediate occupation in the form of contemporary artefacts was scarce. In the 16th century the site was dominated by two large pits, one of which in excess of 17m long, which were probably created for the extraction of sand for building or other uses. Following the gradual in-filling of the larger of these, which occupied the entire eastern portion of the site, an extensive surface of pitched lias was laid, probably during the latter part of the 16th century, which gradually subsided into the soft material beneath forming a broad depression into which considerable quantities of material came to be deposited during the early part of the 17th century. The deposits within the depression produced a wide array of items including large amounts of pottery, including imported stonewares, clay tobacco pipes, metal tools, fittings and utensils, and, importantly, glass table ware and fragments of decorated floor tiles. The quantity, and more significantly the quality, of the finds was strongly suggestive of occupation by persons of some social standing with, presumably, a dwelling equal to their status, the remains of which were still to be located. In the mid 18th century the deposits in the hollow were sealed by a single final dump of material seemingly derived from the destruction of a nearby building and contained glazed floor tiles and high quality glass table ware. Also during the 18th century ditches aligned to Front Street were created forming elements of the pattern of property boundaries still visible surrounding the existing houses to the north-east and south-west of the site. Robinson, F & McConnell, R Wincanton : Context One Archaeological Services, 2008, 1p

Work undertaken by: Context One Archaeological Services

Context One Archaeological Services Ltd undertook a watching brief on land at the rear of North Petherton Junior School. The archaeological features identified by the watching brief comprised two 18th century ditches - one a field drain, and the other a probable field boundary ditch. Neither feature yielded any datable artefacts. The vast majority of the features and deposits revealed were associated with the former Board School, which was constructed on the site from the 1870s. These consisted of a brick wall foundation, a stone-lined culvert and a series of thirteen large cess pits (utilised for outdoor earth closets or privies at the rear of the Board School prior to the installation of mains sewerage and drainage). OTHERY, FORE STREET, LAND TO THE EAST OF "THE FIRS"*Othery, Fore Street, Land to the east of 'The Firs'*

Brigers, J Ashcott : James L Brigers, 2008, 1p

Work undertaken by: James L Brigers

A single trench was excavated as a condition of planning consent to erect a single dwelling on the site. The excavation revealed a number of features, many of which were found to contain 19th & 20th century land drains, modern services and concrete foundations. Features of potential archaeological interest were limited to the remains of a single, truncated and un-dated post hole and a narrow slot which was probably the foundation for a fence of 19th century date. A section of narrow gully was also excavated but appeared to be the result of the action of a large root. At the eastern end of the trench the remains of a surface of pitched stone was investigated. Although no conclusive dating evidence was found in association with this, it probably represents a yard surface relating to an existing farm building of probable 18th or 19th century date to the east. The scarcity of archaeological material and the poor

preservation of the remains appeared to be the result of the recent reduction of the site to accommodate the makeup for a hard-standing. [Sec(abr)]

Pawlett, Walpole Landfill Site - Northern Extension

Hollinrake, C & Hollinrake, N Glastonbury : C. & N. Hollinrake Ltd., 2008, 1p

Work undertaken by: C. & N. Hollinrake Ltd.

Two small areas were excavated to the north and to the south of the 2006 excavation area (Somerset HER 14335), towards the western edge of the buried lias island. The buried soil deposit was present to the south of the 2006 area but was absent to the north. Pottery sherds recovered from this soil ranged from later-Bronze Age through to the Iron Age in date. Several flint flakes and broken tools were recovered, as well as small fragments of fired clay and bone. A 60m-long trench was opened in the adjacent field to the east of the 2006/2007 areas but this immediately flooded and, due to the waterlogged ground, it was never possible to drain it for more than a few hours and was thus abandoned. It will be re-opened after a suitable period of dry weather. There were no construction or excavation works for new landfill cells during 2007. Construction works will re-commence during 2008. [Sec]

WESTONZOYLAND, SEWAGE TREATMENT WORKS

Westonzoyland, Sewage Treatment Works

Robinson, F & McConnell, R Wincanton : Context One Archaeological Services, 2008, 1p

Work undertaken by: Context One Archaeological Services

Context One Archaeological Services Ltd co-ordinated a controlled metal detecting survey on land to the north of Westonzoyland Sewage Treatment Works, where the route of a proposed sewage pipeline passes through the area defined as the site of the Battle of Sedgemoor in 1685. There were a total of 115 metal objects recovered from the survey. These included: 32 lead bullets, 27 horseshoes, 11 buttons, 6 buckles, 5 coins, 4 nails, 2 decorative clothing disks, 1 lead toy, 1 wrist watch, 1 book clasp, 1 key plate cover, 1 stud/cufflink, 4 nails, 7 miscellaneous implement pieces and 16 unidentified objects. Perhaps not surprisingly, the largest category of artefacts comprises lead bullets, most of which are likely to relate to the battle. This assemblage includes case shot, carbine, musket, hailshot and pistol shells. The remaining artefacts largely date to the post-medieval and modern periods although the earliest dateable object was a Saxo-Norman horseshoe. Possible medieval items included two buckles, a book clasp and two late medieval decorative clothing disks. [Sec]

THE OLD SCHOOL HOUSE, ILCHESTER

The Old School House, Ilchester. An Archaeological Watching Brief

Leach, P Ashill : Peter Leach, 2007, 10pp, figs, refs

Work undertaken by: Peter Leach

The excavation of building foundations for a new garage and house extension were monitored. Beneath widespread deposits and disturbances of principally 20th century origin, were encountered several features and deposits of greater archaeological significance. Of these, the most extensive was the southern edge of a deep and broad ditch cut into the underlying levels of alluvium. This appeared to be part of a water channel or leat of medieval origin that was infilled by the early 19th century. Occasional remains of earlier origin probably related to evidence for Roman suburban development alongside the former Fosse Way road here, and recorded in previous excavations. [Au(abr)]

LONG SUTTON, LANGPORT ROAD, LONG SUTTON MOTORS

Long Sutton, Langport Road, Long Sutton Motors

Robinson, F & McConnell, R Wincanton : Context One Archaeological Services, 2008, 1p

Work undertaken by: Context One Archaeological Services

Context One Archaeological Services Ltd. Carried out an evaluation and watching brief at the former Long Sutton Motors. The investigations revealed a limited number of archaeological features. At the south-western end of evaluation Trench 1, a 19th century wall foundation, consisting of uncoursed limestone blocks aligned north-east to south-west, was exposed. Map regression analysis showed no structures on this part of the site from the early 19th century onwards. It is possible that the foundations are of a building constructed and demolished between map editions or are the remnants of minor structures such as a garden building; perhaps relating to the grounds of the mid-19th century house, or the late 19th or early 20th century structures that stood immediately west of the trench. Beneath the foundations a substantial east-west aligned ditch was seen. A single sherd of 17th or 18th century pottery was recovered from the lower fill providing an earliest possible date of construction. A post hole was revealed immediately to the north of the ditch. In the absence of artefactual data and on the basis of its position in the archaeological deposit sequence this feature is likely to be no later than the late 19th century in date. A profile recorded south of Trench One revealed a soil horizon very similar in nature to the ditch fills, suggesting a continuation of the same ditch. A shallower and narrower ditch with similar orientation was also found. Both ditches might represent the vestige of post-medieval boundary ditches or drainage channels. [Sec]

Work undertaken by: Context One Archaeological Services

A watching brief was carried out at Milborne Port County Primary School. Investigation revealed several features including two truncated post holes, the foundations of three walls and two areas previously used to quarry stone. Based on artefactual evidence, the post holes appeared to be the earliest features on site, broadly dated from 11th to 13th century. The relationship between the three walls and their phasing was unclear as they were all on different alignments. It was most likely that the east-west wall and the north-south wall were associated with a building shown on the 1839 Tithe map. Given the location of the structure formed by these walls, it was probably an out-building or small barn. Whatever its function, this building was still visible on the First Edition Ordnance Survey of 1889. Metal, brick and pottery recovered from a fill associated with the earliest phase of disuse of the stone quarry had been dated as post-medieval and was not thought to pre-date the 18th century. Another possible stone quarry was uncovered during the excavation of the soakaway which may have formed part of the same quarry. [Sec]

MUCHELNEY, ALMONRY COTTAGE***Muchelney, Almonry Cottage***

Graham, A Seavington : Alan Graham, 2008, 1p

Work undertaken by: Alan Graham

The cottage lies immediately west of the medieval Priest's House, adjacent to the Langport road on the northern edge of the village of Muchelney. Trenching for the footings of an extension against the north side of the cottage revealed a medieval ditch, aligned NNW-SSE, up to 2.50m wide and 1.20m deep. Its lower infills were laid down in waterlogged conditions and pottery recovered can be dated to the 12th-13th century. Its function is unclear and it was not obviously aligned with either the Priest's House or the likely northern line of the precinct of the Benedictine Abbey. A full report has been deposited with the Somerset Historic Environment Record. [Sec]

Graham, A Seavington : Alan Graham, 2008, 1p

Work undertaken by: Alan Graham

Observations were made during building work in the garden behind the public house in September 2007. The garden sloped up from south to north following the natural slope of the hill to the north of the village. Strip foundations over an area of c. 20m long and 5m along the eastern boundary of the plot revealed a consistent depth of dark garden soil, characterised by coal and cinder fragments throughout and dating to the Victorian period, up to 0.50m thick across the area. This overlay clean Yeovil sands, the surface of which was seen to undulate in the north-south section. The lower part of these hollows was filled with a paler brown loam and it is thought likely these are remnants of earlier gardening or agricultural activity. A single sherd of green-glazed earthenware was found, probably 15th or early 16th century in date but no earlier medieval material was found. A small, struck flake of flint, from the base of the garden soil reflected the prehistoric background of the area. [Sec]

Heaton, M , Graham, A & Pierce, PWarminster : Mike Heaton, Alan Graham and Paul Pierce, 2008, 1p

Work undertaken by: Mike Heaton, Alan Graham and Paul Pierce

Refurbishment of Whitestaunton Manor by new owners was accompanied by building recording and analysis, archaeological investigations and extensive archive research. The work suggested that complex stratified deposits survived beneath the 15th century parts of the house; that the relative chronology of the standing fabric was far more complex than hitherto understood, in part contradicting received chronologies; and that the stables other outbuildings and most of the gardens were redesigned by John Dando Sedding. Circumstantial evidence also suggested that Sedding also designed the water garden at Whitestaunton. If correct, Whitestaunton was one of only three surviving gardens known to have been designed by this influential 'father' of English garden design. [Sec(abr)]

Brigers, J Ashcott : James L Brigers, 2008, 1p

Work undertaken by: James L Brigers

A watching brief was maintained during the removal of stone piers and walling in the stream bank to the north of well-known Romano-British remains. The piers were probably the remains of a sluice of 18th or 19th century date, designed to manage the level of the stream and provide flow into a leat (the entrance to which survived approximately 20m to the south). Further alterations to the profile of the eastern stream bank revealed more of the dump of Romano-British demolition debris, first noted in 2006 (Somerset HER 24555), and produced a fragment of moulded Greensand which appeared to be part of a column base, probably originating from the site of the nearby remains and deposited here during the 19th century clearance of the site. Heaton, M Warminster : Michael Heaton, 2008, 1p

Work undertaken by: Michael Heaton

Refurbishment of Whitestaunton Manor, including extensive repair of the 19th century roofs, has continued throughout 2007, accompanied by archaeological observations and building recording. The work has revealed, inter alia, mortar floor structures c.1m below the present kitchen floor, classic tripartite openings in the kitchen walls at the east end of the medieval range, coffered ceilings over the 17th century wing and dais window corridor, extensive rebuilding an alterations to the walls of the medieval (15th Century) hall and the full extent and form of the hammerbeam roof. The work has also revealed that much of the interior decorative detail including one of the 'baroque' friezes, is of early 20th century installation. Observations will continue throughout 2008, when the refurbishment is planned to conclude. [Sec]

WINCANTON, BALSAM HOUSE

Wincanton, Balsam House

Leach, P Ashill : Peter Leach, 2008, 1p

Work undertaken by: Peter Leach

A watching brief was undertaken in the grounds of Balsam House, a Grade II* Listed Building of early/mid-17th century date on the south-east corner of the town, during the excavation of deep service trenches. This was linked to a residential development of derelict gardens north of the house that were the subject of an evaluation in 2006 (Somerset HER 14325) (1). Details of garden features including walls and terracing were recorded, occasional finds of clay pipes and pottery suggesting that most of the garden layout around the house is probably attributable to the 18th century. Terrace makeup deposits south of the house sealed a buried soil and occupation deposits including spreads of charcoal, animal bone and 12th-13th century coarse pottery sherds. No other associated features were seen but the remains suggest a phase of medieval occupation close to the site of Balsam House, although no supporting evidence was recovered in the earlier evaluation of the adjoining site to the north. SOUTH CADBURY ENVIRONS PROJECT***South Cadbury Environs Project***

Tabor, ROxford : South Cadbury Environs Project, 2008, 1p

Work undertaken by: South Cadbury Environs Project

Fieldwork continued during 2006 and 2007 on the South Cadbury Environs Project. Charlton Horethorne, Sigwells 2006. Five trenches were excavated in Spring 2006 to investigate a roughly rectangular anomaly in the south of the field and nearby, possibly related, linears. The rectangle was a ditch, probably enclosing a small farmstead, dating to the mid or later decades of the 1st century AD. After a period of abandonment a small industrial area developed. This area was accessed by a backfilled causeway and was dated to the second or early 3rd century AD by distinctive sherds of Severn Valley ware, generally rare in the South Cadbury Environs. The other linears provided little datable material but are likely to be roughly contemporary with the enclosure. Yarlinton, Woolston Manor Farm. SCEP survey work in 2006-7 focussed on Woolston Manor Farm. The farm is centred on a basin-shaped combe 1km to the east of North Cadbury. The modern farm buildings and former farmhouse nestle on a rise some 200 to 300m north of a tributary flowing westwards into the River Cam. The farmland comprises slopes of every aspect formed from sandy beds, parenting light soils well suited to cultivation. The very distinct outline of the modern holding is present in a map of 1725 (Fig. 2) and suggests a much earlier estate boundary. Within the holding many of the field boundaries and names are little changed in nearly three centuries. A further indication of conservative regimes in the past are the fine surviving earthworks in two fields. 'Trinities', a 3ha field in the south-west of the farm, has been protected by a Schedule since the identification of the earthworks from the 1947 air photographs in 1977 (Somerset HER 54732). Additional, substantial, earthworks in Great Cowleaze appear to have gone unnoticed by archaeologists. Geophysical survey covered in excess of 59ha and fieldwalking covered 17ha and 51 regular test pits were excavated. In addition a total of 59.5 square metres of targeted test pits were excavated. A further three small trenches were opened for a University of Bristol training excavation in Plain of Slait. The results indicate an Early and Middle Bronze Age phase of linear land use. This appears to have been abandoned by the Late Bronze Age, when there is evidence that ridge top in the south-west of the farm may have been enclosed. The enclosure was respected by a later Iron Age field system that in every other respect was a regular grid, subsequently adapted into a Romano-British system. Remarkably this system appears to form the basis for core settlement and land division on the holding until the 1990s, when the farmhouse was sold. [Sec(abr)]

LOWER FARM, PODIMORE***Lower Farm, Podimore. An Archaeological Watching Brief***

Leach, P Ashill : Peter Leach, 2007, 8pp, figs, refs

Work undertaken by: Peter Leach

An archaeological watching brief was undertaken during topsoil stripping. Earthworks of suspected medieval and post-medieval origin were recorded prior to their burial and artefactual material of those periods was collected from the topsoil and upper horizon underlying deposits. Part of a rectangular ditched platform closest to Lower Farm may have belonged to a set of enclosures interpreted as medieval plots along the west side of the main village street; from which a quantity of mainly 11th-15th century pottery was recovered. Parts of a differently aligned set of enclosures to the west were associated with a larger assemblage of mainly 17th to mid-19th century ceramics and other material. [Au(abr)]

CHEDDON FITZPAINE, HESTERCOMBE GARDENS*Cheddton Fitzpaine, Hestercombe Gardens*

Brigers, J Ashcott : James L Brigers, 2008, 1p

Work undertaken by: James L Brigers

Archaeological investigations continued at Hestercombe as part of the ongoing restoration of the Georgian landscape garden. At the 'West Terrace' (ST 2421 2881) path surfaces first recognised in 2005 were excavated, revealing the extent of the southern terminus of the 18th century terrace. The surfaces consisted of crushed slate and flared to the south to define a trapezoid plan, delineated to the west by landscaping dumps which contained fragments of building debris, pottery and glass of late medieval to 18th century date. This suggested that the soil used in the dumps had been derived from elsewhere on the estate. A rock-cut gully, identified by previous excavations in 2004 & 2005 (PRNs 16980, 19754), was found to curve to the east and appears to represent a planting trench, probably for a hedge, which formed part of an earlier phase of landscaping, tentatively linked with the tenure of Francis Warre in the late 17th century. The earliest features identified were two post holes to the west of the path surface, one of which contained pottery of 12th or 13th century date. The presence of these features strongly suggests that a timber structure stood in the vicinity of the terrace during the early medieval period. An excavation at ST 243 290 in the base of the valley to the north-east of the 'Great Cascade' revealed a considerable quantity of dumped soil and slate rubble presumably forming a stable base for an 18th century landscaped 'lawn' in an area that was naturally marsh. This material sealed an undated pit cut into colluvial deposits. To the east a section was excavated through a large north-south aligned ditch, visible as an earthwork for a considerable distance. The ditch fill suggested that it had been deliberately filled following a prolonged period of silting. No evidence was found to allow the date of either the feature or its contents to be determined. Excavation of three further trenches in the base of the valley to the east of this ditch revealed the remains of surfaces and retaining dumps, possibly the remains of the original path that linked the Cascade area to the 'Box Pond' to the north. Between ST 2433 2928 & 2435 2938, a watching brief was conducted during the construction of a footpath to the west of the 'Box Pond' (PRN 14498). Well preserved and clearly defined linear deposits of crushed slate and clay were identified. These are almost certainly the remains of the original north-south path in the area, although the date at which this was created remains uncertain. Three trenches were excavated along the line of a visible terrace earthwork between ST 2441 2936 & 2454 2945 to the east and north-east of the 'Box Pond'. Here the terrace apparently originated as a 'ha ha' with an internal stone retaining wall. Later the feature was in-filled and a path laid along the surface of the resulting terrace which ran between a probable footbridge to the north and the 'Sybil Temple Platform' to the south. Investigation of a rock-cut alcove towards the southern end of this terrace revealed nothing but undifferentiated rubble backfill. Further excavation was carried-out in the immediate vicinity of the remains of the 'Octagon Summer House' centred on ST 2422 2879. This focussed on the steep slopes surrounding the foundation remains excavated in 2005 (PRN 18684) and revealed evidence of a shallow terrace running from the direction of Hestercombe House and curving around the east and north sides of the remains. It is probable that this represents the remains of a spiral path forming a characteristically indirect access to the 18th century garden building. The excavations here also produced substantial quantities of building rubble which has provided further information as to the nature of the superstructure of the building. [Sec]

Brigers, J Ashcott : James L Brigers, 2007, 1p

Work undertaken by: James L Brigers

A watching brief was maintained during redevelopment works in October 2007. In both of the areas penetrated by the groundwork considerable disturbance to the surviving archaeological remains by recent construction and services was noted. To the east of the building possible undisturbed natural subsoil was overlain by a layer of stiff grey clay and a substantial dump of slate rubble and mortar, both of which were of probable late or post-medieval date. A limited area of archaeological material was exposed to the north of the building which consisted of mixed dumps of clay, gravel and slate rubble sealed by an upper layer of red-brown clay. This latter material contained flecks of blackened sand which may have been the abraded remains of casting waste possibly associated with the industrial site observed in 2000 beneath the former telephone exchange in Whirligig Lane to the east (Somerset HER 44987). DUNSTER, PRIORY GREEN, THE TITHE BARN

Dunster, Priory Green, The Tithe Barn

Brigers, J Ashcott : James L Brigers, 2008, 1p

Work undertaken by: James L Brigers

In January 2007 a watching brief was conducted during groundwork to facilitate a new disabled access and drainage at the recently renovated tithe barn. Two substantial clay-bonded sandstone foundations on north-south and east-west alignments were located immediately to the west of, and beneath, the existing barn. These probably represented the western exterior wall and an internal division of a substantial medieval building of some pretension, probably part of the northern range of the priory. The presence of a decorated floor tile and glazed ridge tile fragments in overlying demolition strengthened this suggestion. To the west a weathered surface, constructed of lias slabs, was revealed, possibly representing an exterior yard surface contemporary with the medieval walls. Further sandstone wall remains and yard surfaces of pitched sandstone cobbles, overlying the medieval walls, probably relate to known post medieval farm ancillary buildings. [Sec]

DUNSTER, DUNSTER CASTLE

Dunster, Dunster Castle

Heaton, M Warminster : Michael Heaton, 2008, 1p

Work undertaken by: Michael Heaton

Detailed recording of the southern roof structures of Dunster Castle, ahead of major repairs and refurbishment (on going), together with dendrochronological analysis, has revealed a multi-phase roof of early 17th – 20th century construction. The earliest phase (c. 1608) was a flat roof covered with lead sheeting that, on the basis of published evidence, appears to be one of the earliest in Britain. It was modified in the early 18th century (c. 1728) by the addition of king posts fixed with forelock bolts, and then again in the 1870s. Observations are continuing. [Sec]

EXMOOR, LANACOMBE

Exmoor, Lanacombe

Gillings, M, Taylor, J & Pollard, J Leicester : University of Leicester Archaeological Services, 2008, 1p

Work undertaken by: University of Leicester

A programme of geophysical survey and small-scale excavation was undertaken in conjunction with Exmoor National Park Authority in advance of the reinstatement of damaged standing stones at two of the later-Neolithic/early Bronze Age stone settings located on Exmoor. In each case, the geophysical survey revealed little in the way of structural information but confirmed a close affinity between setting location and zones of shallower bedrock. At the site of Lanacombe I, a single trench was excavated centred upon the fallen stone (stone H following the coding scheme of Quinnell and Dunn 1992 Ref 1). Directly beneath the turf, to the immediate south-west of H, was a spread of stones that included a line of four notably larger flat stones aligned on the setting. These were conspicuous in terms of size and the linearity of their placement, the latter not corresponding to the east-west bedding/weathering planes evident in the bedrock. Rather than dug in any traditional sense, the settings appear to have been fashioned by the expedient removal of weathered outcropping rock to create a northeast/south-west aligned oval 0.37 x 0.28m in extent and reaching a depth of 0.18m below the current surface. At the base of the resultant hole was a thin layer of relatively clean brown soil upon which were placed small flat stones that served to provide a level base to the otherwise irregular hollow. The stone was then placed hard against the northern edge of outcropping rock, and the resultant void to the south was filled with more of the brown soil. The suggestion is of a rapid, rather than punctuated, process with a single deposit of soil used to prepare and then pack the stone hole. The presence of vertical and sloping stones in this fill, set directly against the southernmost face of the stone, is strongly suggestive of the deliberate use of small packing stones as part of this in-filling process. The only artefactual material to be recovered from the primary fill of the stone hole was an irregularly shaped lump of quartz (0.07 x 0.07 x 0.05m) displaying evidence of deliberate working (removal of flake or chunk) on one edge. This had been pushed down into the top of the packing soil in contact with one end of the standing stone. At the Lanacombe III setting a single 4m² trench was once again centred upon the fallen stone (stone C). Unlike Lanacombe I there was no evidence of any surface settings, and a very different approach appears to have been taken to the erection of this standing stone. In practice a small oval post hole had been dug with an asymmetrical ramped base and the pillar-like stone placed upright against the vertical face. It had then been pushed down and bedded into place (in a manner analogous to the erection of a wooden post). This was then packed into position using carefully selected stones and the upcast from the digging of the stone hole. An upper layer of loose grey silt with further packing stones served to level the stone hole. Aligned north-east to south-west, the stone hole was 0.35 x 0.17m in extent, reaching a depth of 0.25m below the present surface. The contrast with Lanacombe I stone H was striking and the suggestion was of a much more pragmatic and expedient process. No artefactual material was recovered. At the conclusion of the excavations both stones were fully reinstated. [Sec(abr)]

FAIRFIELD HOUSE***Fairfield House. Archaeological Survey & Fieldwork 2007***

Broomhead, R A Croscombe : R.A. Broomhead, 2007, 10pp, colour pls, figs, refs

Work undertaken by: R.A. Broomhead

A small archaeological excavation was undertaken within the grounds of Fairfield House as part of an ongoing archaeological training and research project. The excavation aimed to establish the location and nature of one or two of the several towers which documents showed to have existed upon the wall which encircled the house. No walls or other structural features were located, however, the excavations recovered considerable evidence of post-medieval dumping, most probably associated with late 18th century alterations to the house. IN THE WEST GARDEN , DYRHAM PARK HOUSE, DYRHAM

Further Archaeological Observations in the West Garden, Dyrham Park

Martin, P Chicklade : AC archaeology , 2007, 16pp, figs, tabs, refs, CD

Work undertaken by: AC archaeology

As part of the redesign of the west gardens of Dyrham Park House archaeological monitoring was carried out. Further evidence of a series of probable 18th century cobbled yard surfaces and pathways first uncovered in an earlier exercise (2005/6) was revealed. Other features (walls and paths) identifiable on an engraving of the gardens published by Johannes Kip in 1712 were also recorded. On the lower slopes north of the pond a series of deposits containing Romano-British pottery were sampled, possibly the fill of a ditch. These layers contained small quantities of Romano-British pottery and demolition rubble, the latter perhaps suggesting the presence of a nearby building of Romano-British date. [Au(abr)]

CENTRAL NETWORKS 11KV DISTRIBUTION CABLE TRENCH ON THE A38
A Central Networks 11Kv Distribution Cable Trench on the A38 at Little Abbey Camp, Alveston, South Gloucestershire. Archaeological Watching Brief Project

Young, A Bristol : Avon Archaeological Unit, 2008, 22pp, colour pls, figs, refs

Work undertaken by: Avon Archaeological Unit

Monitoring of the cable trench provided an important transect across the Scheduled Monument that demonstrated two important points: firstly, that significant buried archaeological objects of Romano-British date, including at least one burial, were preserved intact immediately below the substantial modern road formation and secondly, that complex and stratified archaeology of Roman date including varied cut soil features and masonry structures, in combination with stratified artefacts, were almost certainly preserved throughout the footprint of the earthwork and in adjacent areas outside the hillfort. In addition, the presence of another inhumation and a post hole raised the possibility that a extra-burial cemetery was located immediately adjacent to the northeastern side of the monument. LYDIARD HOUSE, REAR COURTYARD RAINWATER DRAINAGE

An Archaeological Watching Brief at Lydiard House, Lydiard Tregoze, Swindon, Wiltshire

Phillips, B Swindon : Bernard Phillips, 2007, 27pp, figs, tabs, refs

Work undertaken by: Bernard Phillips

The cutting of a trench against the mansion's rear walls revealed a narrow brick plinth, probably of 18th century date. A foundation trench cutting a packed stone surface and evidence for an external porch were also encountered. Reddening through heat of the mortar used for the brick foundation indicated that a fireplace had been present on the other side of the wall. Small finds were few but included a Roman terracotta tile fragment, sherds of medieval and post-medieval pottery, pieces of glass and window leading. [Au(adp)]

St. John the Baptist Church, Inglesham, Wiltshire. Archaeological Watching Brief

Harding, P & Davies, B Salisbury : Wessex Archaeology , 2007, 17pp, figs, tabs, refs

Work undertaken by: Wessex Archaeology

The watching brief recovered worked flints from excavated material, suggested that occupation on the site could be traced back to the Mesolithic or Early Neolithic period. The presence of a stone-built Late Saxon church was confirmed by the discovery of wall foundations and finds of reused Roman tile. Traces of stone paved floors relating to the construction of the 12th/13th century nave arcade were preserved on the north side of the nave. Plaster surfaces post-dating the Saxon south wall foundation and possibly relating to the 13th century south aisle floor surface were noted. A small finds assemblage represented all activities and periods noted from the features. [Au(adp)]

SHARPRIDGE FARM, ROCKLEY, MARLBOROUGH
An Archaeological Excavation at Sharpridge Farm, Rockley, Marlborough
John Moore Heritage Services Beckley : John Moore Heritage Services, 2007, 21pp, figs, tabs, refs
Work undertaken by: John Moore Heritage Services

The works consisted of an excavation followed by a watching brief during ground reduction of the area. The site was situated within a Bronze Age landscape between two field systems, and was surrounded by findspots of material from this period. Although the area had been heavily disturbed by recent agriculture, the site produced five hut circles, two rectangular structures and fence lines of post holes. The only dating evidence suggested that the activity was Bronze Age. The site may have represented a short-lived habitation site or could have been part of a larger settlement associated with the monuments around it. [Au(adp)]

LAND AT STATION ROAD, TIDWORTH

Land at Station Road, Tidworth, Wiltshire. Report on an Archaeological Strip and Record

Reeves, P Salisbury : Wessex Archaeology, 2007, 21pp, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

The strip and record exercise focused on two areas identified as having archaeological potential in a previous excavation. 27 undated post holes were recorded in Area 1, while in Area 2 the terminus of a ditch dated by its pottery assemblage to the Late Bronze Age/ Early Iron Age, a cow burial and a crouched human burial were encountered. A very small collection of worked flint and unworked burnt flint was recovered from across the site. [Au(adp)]

EDINGTON TO COULSON WATER SUPPLY MAIN*Edington to Coulson Water Supply Main, Wiltshire. An Archaeological Watching Brief*

Place, C Wincanton : Context One Archaeological Services, 2007, 56pp, colour pls, figs, tabs, refs

Work undertaken by: Context One Archaeological Services

Work undertaken during the watching brief identified a concentration of medieval artefacts, features and deposits in a field immediately to the west of Coulston. The features included shallow ditches, pits and irregular pit-like features interpreted as tree-throws. In addition, two soil spreads containing noteworthy collections of medieval pottery that probably represented refuse. A large, north/south aligned palaeochannel was also identified. [Au(adp)]

Cullen, K Cirencester : Cotswold Archaeology, 2007, 14pp, figs, tabs, refs

Work undertaken by: Cotswold Archaeology

Probable in situ graveyard soils were identified in two areas, but no intact burials were encountered within these deposits. Where small quantities of disarticulated human bone were disturbed, there were re-interred during the course of the groundwork. The only archaeological feature identified during the course of the works was a limestone wall of probable post-medieval date located to the east of the church. This wall may have predated the 19th and 20th century additions and alterations made to the

church and may have been contemporary with the 17th century dwelling, part of which was incorporated into the south transept of the church. [Au(abr)]

Context One Archaeological Services Wincanton : Context One Archaeological Services, 2007, 19pp, figs, tabs, refs

Work undertaken by: Context One Archaeological Services

The watching brief observed a simple vertical sequence of peaty topsoil overlaying natural peat and alluvial sediments, and patches of gravel and sand. A system of water meadows were observed at various points along the pipe trench. At the northern extent, an extensive chalk platform was revealed. Wattle revetments were observed at three separate points. Artefacts included domestic glassware and pottery associated with low level farming and animal husbandry common to the water meadows of Wiltshire from the 17th century onwards. Ceramic building material and Roman and medieval pottery sherds were also recovered. [Au(adp)]

THE SARACEN'S HEAD, KINGS NORTON, BIRMINGHAM

The Saracen's Head, Kings Norton, Birmingham. Building Recording and Watching Brief

Tyler, R Edgbaston : Birmingham Archaeology , 2007, 35pp, colour pls, figs, refs

Work undertaken by: Birmingham Archaeology

An archaeological building recording exercise was carried out in 2005 with a watching brief carried out at the site in 2007. It revealed that a high carriageway entrance, located to the southern end of the east range, originally formed a central access point to the courtyard. There was evidence that a now demolished row of cottages may have originally formed a continuation of the original timber framed east range. [Au(adp)]

Archaeological Strip, Map and Recording Action on Land off Harry Weston Road, Binley

McAree, D

Mc Aree, D Northampton : Northamptonshire Archaeology, 2007, 36pp, colour pls, figs, tabs, refs

Work undertaken by: Northamptonshire Archaeology

Archaeological strip, map and recording action was undertaken on land off Harry Weston Road, Binley. Remnant earthwork remains of a medieval field system and ridge and furrow cultivation were uncovered together with post holes from a fence alignment, a large pond and a number of pits that may have represented the remains of dew ponds. A crude medieval hearth with at least two phases of use, the latter contained a large quantity of charred cereal grains and may have been the remains of a malting oven. [Au(abr)]

Hanna, T Stoke-on-Trent : Stoke-on-Trent Archaeology, 2007, 16pp, colour pls, figs, refs

Work undertaken by: Stoke-on-Trent Archaeology

An archaeological watching brief was carried out at the site. Most of the excavation yielded evidence of 20th century activity connected with the use and demolition of the G. Clancey Ltd Works. Trench Two, however, revealed evidence of two brick walls that may have related to the ironworks which stood on the site during the 19th century. The recording of these structures was severely restricted by the depth of the excavations and the presence of industrial contaminants which prevented access into the cuttings. [Au(adp)]

CROXDEN ABBEY, CROXDEN***Croxden Abbey, Croxden, Staffordshire. An Archaeological Watching Brief***

Charles, M Edgbaston : Birmingham Archaeology, 2007, 13pp, colour pls, figs, refs

Work undertaken by: Birmingham Archaeology

An archaeological watching brief was carried out during July 2007 within the grounds of Croxden Abbey, a Scheduled Ancient Monument. The work was undertaken during the excavation of trenches to accommodate concrete foundations for new display panels. Three hand excavated trenches were monitored by an archaeologist during the watching brief. One trench revealed evidence of possible stone foundations that may either have been associated with the infirmary building, or another structure to the west of the infirmary. Finds of medieval date including sherds of pottery and tile were recovered from the topsoil in all of the trenches. [Au]

FORMER SITE OF ROUNDS TIMBER YARD, HIGH STREET,**TIPTON*****Former site of Rounds Timber Yard, High Street, Tipton, an Archaeological Watching Brief 2006-2007***

Gittins, A & Halsted, J Edgbaston : Birmingham Archaeology, 2007, 35pp, colour pls, figs, refs

Work undertaken by: Birmingham Archaeology

The site was considered to lie within the core of the medieval settlement of Tipton. A possible medieval moated site was thought to have been located in close proximity. The nature of both medieval and post-medieval activity in this area were little understood and a watching brief at the site allowed for the potential for material remains of these periods to contribute to the understanding of its historical development. Insubstantial linear gullies appeared to have formed the earliest features on the site possibly dating to between the late 17th to mid 18th centuries, and were overlain by substantial quantities of industrial waste material representing intensive activity in the 19th and early 20th centuries. Brick built cellaring was recorded together with a number of brick-lined shafts or wells and evidence for industrial activity, including ironworking, in the form of working surfaces, waste material, possible hammer bases and grinding stones. HIMLEY HALL, HIMLEY***Himley Hall, Himley, Staffordshire: Archaeological Watching Brief***

Tyler, R Edgbaston : Birmingham Archaeology, 2007, 19pp, colour pls, figs, refs

Work undertaken by: Birmingham Archaeology

An archaeological watching brief was carried out at the site during groundwork related to the refurbishment of an oil tank shed and boiler room, and the excavation of related service trenches at Himley Hall. The hall was believed to have occupied the site of the former medieval moated manor house. In 1740 it was demolished and replaced by a new mansion in the palladian style. Groundwork within the courtyard to the north of the hall exposed a brick built vault of unknown function. The limited exposure of the structures did not allow any meaningful interpretation of its original function, though it appeared not to relate to the standing 20th century storage sheds within the yard. Excavation of the parkland area of the hall revealed a post medieval culvert running east to west. [Au(adp)]

SHANNON'S MILL AND SURROUNDING AREA, WALSALL***Shannon's Mill and Surrounding Area, Walsall: Post-Excavation Assessment and Research Design***

Ramsey, E Edgbaston : Birmingham Archaeology, 2007, 63pp, pls, colour pls, figs, tabs, refs

Work undertaken by: Birmingham Archaeology

The results of the excavation and watching brief identified an area of historic Walsall occupied and reoccupied over the post medieval period with dramatic changes in use character and fortune mirrored and enhanced by the documentary evidence. The hill itself comprised of layers and deposits relating to limestone quarry backfill, sparsely dated to the 17th century. Pits were identified cutting these layers indicative of industrial activity as the quarrying occurred. After the quarrying had ceased the area was recolonized in the first instance with large affluent houses along the Upper Rushall Street frontage, and in the mid to late 19th century with smaller slum houses crowded in behind these over the hill. These latter properties were eventually demolished during the 1930's. [Au(adp)]

HOGG'S MOUNT STEPS, CASTLE GREEN, HEREFORD*Hogg's Mount Steps, Castle Green, Hereford, Herefordshire: An Archaeological Watching Brief*

Atkinson, C Hereford : Herefordshire Archaeology , 2007, 10pp, figs, refs

Work undertaken by: Herefordshire Archaeology

The investigation centred on the work associated with the reconstruction of existing steps that link Mill Street with a path that ran along the top of the rampart that enclosed the Castle green. It was found that the material employed in the construction of the rampart was of gravel and sand extracted from the defensive ditch that supported the rampart. The small finds excavated from the site consisted of animal bones, most likely sheep and dog. No other artefacts were retrieved to provide an interim date for the archaeology uncovered, though it was unlikely that the material predated the 17th century. [Au(abr)]

HIGH STREET, MUCH WENLOCK***High Street, Much Wenlock: post-excavation assessment***

Lewis, D Fownhope : Archenfield Archaeology, 2008,

Work undertaken by: Archenfield Archaeology

Archenfield Archaeology carried out an excavation and monitoring work in High Street, Much Wenlock. The area of the site was approximately 5,700metres. The site had previously had two phases of evaluation trenching in 2000 (Horton) and 2006 (Lewis), but no important archaeological features were uncovered, due to site truncation. Evidence uncovered during the excavation included pits and ditches with pottery dating to the 12-14th centuries. Other features included a cereal drying oven dating to 12-14th century. Pottery dating suggests that the site was abandoned in the later medieval period. Post-medieval archaeology included a pipe makers kiln with clay pipe bowls marked by John Roberts, who was making pipes in the late 16th and early 17th century was also discovered. This had been truncated by a later telephone exchange. [OASIS(Au)]

LAND OFF BROADWAY, SHIFNAL***Land off Broadway, Shifnal, Shropshire. Archaeological Watching Brief. August 2006 to January 2007***

Frost, P Pontesbury : Castlery Archaeology, 2007, 28pp, colour pls, figs, tabs, refs

Work undertaken by: Castlery archaeology

Between August 2006 and January 2007 a watching brief was undertaken on groundwork associated with a new residential development. It produced evidence of medieval and/or post-medieval agricultural activity. The north-west corner of the site revealed an accumulation of levelling and demolition deposits, below which lay a sandy subsoil containing an assemblage of 13th-14th century (possibly including some slightly earlier) ceramic material of local or regional origin. The ceramics were in good condition and appeared relatively undisturbed, but there were no obvious concentrations, and no associated archaeological features. Elsewhere, topsoil stripping on the south side of the site uncovered a series of plough/cultivation scars together with medieval and post-medieval pottery. [Au(adp)]

ACTIVE LIFESTYLE CENTRE, OSWESTRY***Active Lifestyle Centre, Oswestry, Geophysical Survey, Archaeological Evaluation & Archaeological Watching Brief***

Smith, C E Cambridge : Cambrian Archaeological Projects Ltd., 2007, 42pp, colour pls, figs, tabs, refs

Work undertaken by: Cambrian Archaeological Projects Ltd.

An archaeological evaluation, geophysical survey and watching brief was carried out at the site. The evaluation consisted of six machine-excavated trenches. Three of the trenches (2, 3 & 5) were beated to investigate features identified by the geophysical survey. Features excavated include a visible mound of heat cracked stones in Trench Two, several linear ditch cuts in Trench Four and a pond in Trench Five. No ditch was identified in Trench Three, despite geophysical evidence, and no features of archaeological significance were found in either Trench One or Trench Six. Material recovered included iron objects such as nails, a ceramic assemblage represented mainly by late 19th and early 20th century vessels, a vast amount of glass vessels (many complete) and several clay tobacco pipes. A small pewter or possibly silver thimble was also recovered from the pond backfill. Although a vast amount of material culture was unearthed in Trench Five relatively little was found in the other five trenches. Archaeological geophysical survey was also carried out and showed six separate features. A linear arrangement likely to represent a modern service duct, a circular shape likely to represent a sub-

surface spread/dump of material, a roughly circular magnetic response of potentially significant archaeological value, and an ephemeral linear feature, an ephemeral curvilinear feature, and another ephemeral linear feature were all possibly representative of ditches. An archaeological watching brief was carried out on the excavation of nine geotechnical test pits at various locations across the proposed development area. One test pit revealed evidence for the back fill of the pond, and two other test pits located to the north and south of the previously identified burnt mound, revealed the same heat-cracked stones. OLD OSWESTRY HILLFORT

A Watching Brief at Old Oswestry Hillfort, Shropshire

Hannaford, H R Shrewsbury : Archaeology Service Shropshire County Council, 2007, 6pp, colour pls, figs

Work undertaken by: Archaeology Service Shropshire County Council

In March 2007, seven stiles were replaced with new 'kissing gates' on paths at Old Oswestry Hillfort. The post holes were too small to enable firm conclusions to be made about the nature of the deposits disturbed. Clearly the post holes did intrude into archaeological deposits. In most cases, these probably represented material that had eroded or slipped down from the ramparts. In two cases, Gate C at the inner end of the eastern entrance passage, and Gate E about half was along the southern side of the passage, the post holes appear to have cut into in situ rampart material. This material was characterised by large cobbles and boulders contained in the soil matrix. No other significant archaeological features were seen in the excavation. [Au(abr)]

CONCORD COLLEGE, ACTON BURNELL

Concord College, Acton Burnell, Shropshire. An Archaeological Watching Brief

Cherrington, R Birmingham : Benchmark Archaeology, 2007, 15pp, colour pls, figs, tabs, refs

Work undertaken by: Benchmark Archaeology

The watching brief was maintained during groundwork for the erection of a student common room on the site. The development site was located within an area enclosed by the former 18th century historic walled garden of the landscaped park of Acton Burnell Hall. The park was a Grade II English Heritage Registered Park. A specific aim of the work was to secure the adequate recording of any archaeological remains relating to historic gardening activity on the site. Archaeological monitoring during groundwork identified no significant archaeological features or deposits within the development area. If previously present, features and deposits relating to historic gardening activity on the site would have been severely truncated by the insertion of modern services and later gardening activity. The area had been mechanically ploughed until very recent times (c. 10-15 years from the time of writing). It was possible however, that garden features may have survived around the garden boundary walls in areas unaffected by the present development. [Au(adp)]

Archaeological Investigations at St. Austin Friars and Bridge Street, Shrewsbury, Shropshire

Hannaford, HR Shrewsbury : Archaeology Service Shropshire County Council, 2007, 21pp, colour pls, figs, refs

Work undertaken by: Archaeology Service Shropshire County Council

A watching brief was carried out on the site and revealed on the St. Austin's Friar site a sequence of medieval features and yards, a late medieval sandstone wall and the remains of a post-medieval house; the White House demolished in 1978. On the Bridge Street site a number of medieval and post-medieval pits were revealed the latter possibly associated with the tanning industry. The town wall was shown to have probably followed the line of the northern boundary of the site, where sandstone stonework was incorporated into the current building. [Au(adp)]

Coates, G & Richmond, A Turvey : Phoenix Consulting, 2008, 35pp, colour pls, figs, tabs, refs

Work undertaken by: Phoenix Consulting

A field system and a number of isolated features were identified during the soil strip mapping. The field system was characterised by a number of straight boundary ditches that appeared to define fields. There may have been more than one phase to this field system, but there was little in the way of dating evidence. Only a few sherds of abraded Roman pottery were recovered from the fills of the ditches. It was probable that these represented residual pieces washed down from the area of known Roman activity on the elevated gravel terrace to the west. On present evidence it was thought the field system was of late medieval or easily post-medieval origin. An isolated pit was excavated which contained a number of flint flakes, a core and an awl, all dated to the Neolithic period. It was unrelated to the field system and may rather have been evidence of transitory activity associated with the nearby Catholme ceremonial complex, which was also of Neolithic date. Monitoring of the watching brief areas identified a few additional features. The alluvial deposits observed indicated that the area would have been subject to regular inundation. [Au(abr)]

TUTBURY CASTLE

Tutbury Castle, Staffordshire. Archaeological Work

Edgeworth, M Edgbaston : Birmingham Archaeology, 2007, 29pp, colour pls, figs, tabs, refs

Work undertaken by: Birmingham Archaeology

The fourth season of a training excavation at the castle under the auspices of the present research project was undertaken. Two trenches were opened in the outer bailey. Although these were specifically placed in order to find structural features indicated by a geophysical survey conducted the previous year, there was a marked contrast in the type of evidence from the two trenches. Trench Nine, which was sited near the northern edge of the outer bailey area, revealed a considerable build-up of loamy garden soil deposits of medieval date, with the sloping surface of the natural clay reached directly below these at a depth of 1.5m. Trench Eight was sited near the middle of the outer bailey. Hard compacted surfaces of post medieval date were encountered at the relatively high level of 0.3m from the ground surface. After removal of these and similar medieval layers, a large feature was found at a depth of 0.6m. The feature was nearly 3m wide and well over 3m in length (its full length was not established as it extended beyond the edges of the trench). Partly vitrified sides and a thick layer of charcoal in its base indicate that the feature probably served as some kind of oven or kiln. In plan the feature seems to have the appearance of a complex multi-flued oven, but further excavation would be required to establish its function with certainty. Pottery from the fill of the feature dates it to the late Roman period. The marked difference between the evidence encountered in the two trenches suggests that part of the plateau of the outer bailey predates the medieval castle and was occupied in Roman times. During the 11th/12th century, perhaps as a result of the creation of the castle, the outer bailey area was extended, perhaps as part of a general re-shaping of the middle and outer baileys and the deep cleft or hollow way between them. LAND AT LIGHTMOOR, TELFORD***Land at Lightmoor, Telford, Shropshire. An Archaeological Watching Brief***

Cherrington, R Birmingham : Benchmark Archaeology, 2008, 19pp, colour pls, figs, refs, CD

Work undertaken by: Benchmark Archaeology

An archaeological watching brief was carried out in tandem with a hedge and tree translocation programme ahead of the construction of a primary school, community facilities and a sports pavilion on the site. Previous archaeological work had identified the site as being of archaeological interest, containing hedgerows and boundaries which may have dated to 1772. The watching brief was successful in producing a record of the hedgerows prior to their removal. No deposits of archaeological significance were recorded and no finds were recovered. Although no physical evidence for the date of the hedgerows was identified, cartographic evidence has established that Boundary A almost certainly predated Boundary B. The line of Boundary A was depicted on a map of 1772 and may have been in existence for some time prior to this date. The line of Boundary B was not depicted and was likely to have been created as part of 18th Century (or later) field enclosure. [Au]

Roper, S Ironbridge : Ironbridge Archaeology, 2007, 17pp, colour pls, figs, tabs

Work undertaken by: Ironbridge Archaeology

A watching brief was carried out on ground disturbance associated with redevelopment. Significant work had already taken place on the site before the archaeologists became involved, so it was only possible to make a limited archaeological record. Very few archaeological deposits were seen, except in the south-west corner of the site, where a series of relatively modern (early 20th century) tipping layers was encountered. The temporary dismantling of the 17th century timber framed barn was also monitored: no early ground surfaces were seen, and it was concluded that these had been removed during previous works to the barn. Palmer, S Warwick : Warwickshire Museum Field Services, 2007, 12pp, colour pls, figs, tabs, refs

Work undertaken by: Warwickshire Museum Field Services

Observations of foundation trenching for a new extension revealed the stone foundations of the foreshortened late 15th/early 16th century solar range which had been partly demolished in the mid-19th century. The solar had been constructed over an earlier, otherwise undated ditch of uncertain function. A quantity of glazed floor tiles and window glass recovered from the site suggested it was formerly a high status building, and a small assemblage of coins and dress pins found within the solar suggested the later addition of a wooden floor. Foundation trenches to the rear of the solar range revealed 18th/early 19th century brickwork for a former structure to the south of the solar range. The foundation trenches also revealed a number of brick features of 18th/19th century date including a garden wall, a well and a cistern. [Au(abr)]

Charles, M & Kelleher, S Edgbaston : Birmingham Archaeology, 2007, 19pp, colour pls, figs, refs

Work undertaken by: Birmingham Archaeology

An archaeological watching brief was carried in order to satisfy the archaeological conditions placed on a proposed extension to the existing house. The proposed development involved the demolition of a conservatory, a flat roof extension to farm house, two-storey extensions, alterations, restoration of farm house and conversion of barns to form three single-storey holiday units. All ground disturbance was observed as a watching brief in order to identify deposits or features of archaeological importance. All topsoil, modern overburden, and natural subsoil was removed under direct archaeological supervision, down to the required level as set out in the planning application. Digital photographs of the works were also taken for purpose of illustrating the report. The archaeological watching brief failed to uncover or identify any significant new archaeological deposits or features. [Au]

THE AREA TO THE SOUTH OF BEOLEY CASTLE, REDDITCH***A Rapid Survey of the Area to the South of Beoley Castle, Redditch***

Hancox, E & Mindykowski, A Worcester : Worcestershire County Council Historic Environment & Archaeology Service, 2007, 16pp, colour pls, figs, refs

Work undertaken by: Worcestershire County Council Historic Environment & Archaeology Service

A rapid walkover survey was carried out on to assess the survival and condition of several features noted on the County's Historic Environment Record (HER). The HER recorded that three very large ponds of unknown date survived as earthworks, the largest of which was roughly 415m by 200m. The area was later subsumed into Redditch and large parts of it built on, however, much of the area covered by the alleged ponds had been left as managed woodland and the area of Pond 3 was covered by Church Hill Middle School and associated playing fields. It was thought likely that some of the earthworks visible on the 1st Edition Ordnance Survey map of 1884-7 could survive within these open areas and so a walk-over survey was carried out to look at these features and try to assess whether they were

ponds and if so their date, function and condition. The survey confirmed the existence of Pond 1 and Pond 3, with substantial earthworks surviving. No evidence for Pond 2 was visible on the ground other than a slight depression where it had existed and the presence of a probable species rich hedgerow running where the western boundary was located. Several other features were also noted during the site visit. Following on from the field survey, further documentary research was carried out in an attempt to both build an historic context for the feature assemblage and provide further evidence towards interpreting the nature and function of the features. The observation of three test pits on the bridge surface as well as a core sample determined that there were substantial remains of the medieval bridge encased within the concrete façade of the 20th century. Although the medieval structure was clearly visible across the lower reaches of the bridge arches, the watching brief determined that the upper reaches, including the extant bridge surface, remained encased in concrete and only 0.32m below the road surface. During archaeological monitoring, only pre-modern deposits recorded were humic soils containing pottery and other inclusions. These soils were of natural origin but had been altered by centuries of gardening and rubbish disposal. Pottery and other artefacts suggested that deposition ended in the late 17th century, although the ground probably remained open for another century. The soil was sealed by brick rubble in one area and redeposited marl in another. Several brick walls were cut through these deposits, all of which can be identified with buildings shown on the second edition Ordnance Survey map of 1904. [Au(abr)]

MEADOW FARM, DAGNELL END ROAD, BORDESLEY, REDDITCH

Historic building recording and Watching Brief at Meadow Farm, Dagnell End Road, Bordesley, Redditch, Worcestershire

Williams, P Worcester : Worcestershire County Council Historic Environment & Archaeology Service, 2007, 81pp, colour pls, figs, tabs, refs

Work undertaken by: Worcestershire County Council Historic Environment & Archaeology Service

A historic building recording and watching brief were undertaken at Meadow Farm. The building recording work extended an earlier buildings evaluation, which had been partly completed and which recorded the fabric of the farmhouse, granary and dairy buildings to level 3. Further, and more detailed, recording was subsequently carried out on the main building and the granary. Building analysis and dendrochronology determined that the latter was datable to the end of the 16th century, while parts of the farmhouse were in fact earlier and dated from the early to mid-decades of the 15th century. The granary building was originally a three-bay detached building, most likely a service block, which served the domestic needs of the occupants of the house. The building was later reduced in size when an integral service bay was added to the north end of the farmhouse in the mid-17th century. The fabric of the farmhouse was complex, with evidence for alteration, modification and extension. Interpretation was hindered by the fact that timber from earlier structures appeared to have been re-used within the build, as would have been fairly common practice for buildings whose long life spanned periods of economic prosperity and decline. A watching brief was carried out on groundwork associated with the development and some further building recording undertaken after stripping out work on the inside of the buildings during the same phase of works. There was a complete absence of medieval occupation debris, which was consistent with the results of the trenching carried out during evaluation of the site. This suggested that the earliest structural phases dating to the medieval period may have represented the re-use of earlier buildings moved to a new site, which was most likely to have occurred following the dissolution of Bordesley Abbey. Part of the Meadow Farm structure may, therefore, have represented a surviving remnant of the abbey. [Au(abr)]

Work undertaken by: Worcestershire County Council Historic Environment & Archaeology Service

The watching brief found that although there had been significant disturbance in the area, the site had the potential to contain a number of important archaeological features. A single feature, thought to be a prehistoric ditch, was recorded and had been truncated by a 1st-2nd century ditch. This did not appear to have been part of the main Roman defences. No medieval features were recorded, however, a large quantity of abraded medieval pottery was found. Post-medieval deposits observed related primarily to the use of St. Andrew's graveyard. The remains of 24 articulated individuals were recovered along with an amount of disarticulated remains. The associated dateable artefacts pointed to a 16th-19th century date range. Three brick walls were recorded and related to the graveyard boundary. Modern features, of no archaeological significance, were encountered across the site. [Au(adp)]

Work undertaken by: Worcestershire County Council Historic Environment & Archaeology Service

The area monitored lay to the east of present manor house, covering approximately 236m², which was excavated in two spits. Two associated small sub-oval 14th century pits were identified at the base of the site, although their function was not determined. The area appeared to have been scoured of soils to the level of the natural clay between the late 16th-early 18th centuries. A thick cess-

like layer then built up, conjectured to be the result of horse or cattle corralling. This was cut by a number of pits and ditches, containing a small quantity of residual medieval pottery. Two ditches were recorded which appear to have fed into the pond (the relict of the medieval moat) to the north. One may have been an antecedent or continuation of the ditch or boundary recorded on the 1842 tithe map. In the 18th century the area was consolidated with a layer of cobbles. This was patched with building rubble and clay in the 19th century, after which a soil horizon was allowed to develop, probably as a cultivated garden associated with greenhouses erected in the late 19th-early 20th century. A small assemblage of residual pottery was recovered from later layers and features, including a single Iron Age body sherd, two residual late Saxon sherds (10th-early 11th century) and a number of medieval sherds (generally 12th-early 14th century). BALDWINS FARM, PEBWORTH

Baldwins Farm, Pebworth, Worcestershire. Historic Building Recording and Archaeological Watching Brief

Underdown, S Oxford : Oxford Archaeology, 2007, 73pp, colour pls, figs, tabs, refs

Work undertaken by: Oxford Archaeology

The buildings comprised a range consisting of a c.1700 block that appeared to have been

used as a stable and hayloft, but was listed as a dovecote. This block was of some quality with stone dressings including rusticated ashlar quoins, stone kneelers and a stone coped east gable. The window surrounds and north door surround were also of dressed stone with drip moulds over the lintels. The stable had been built onto the east end of a 17th century timber-framed barn which had been partially rebuilt in brick. The east wall contained timber-framing and wattle and daub infill. Timber framing in the west and north walls contained later brick infill. To the west a second barn perpendicular to the main range also contained elements of timber-framing and had been substantially rebuilt in brick in 1831. Both barns retained sections of blue lias stone plinths. Joining the two was a three bay shelter shed built as infill with a stone rear wall. Many of the timbers in the barn and shed roofs and surviving framing were of reused timber and some of the main timbers were of Elm and the buildings were therefore found to be unsuitable for dendrochronological sampling. The watching brief on the foundation trenches for a new build on the footprint of the "dovecote" and east bay of the barn found natural clay at 0.2m depth. There were no archaeological deposits apart from the barn foundations and a layer of demolition rubble implying that the area was levelled prior to the building of the farm. [Au(abr)]

 The watching brief identified a ditch running through the development site, cut in to the natural clay deposit. The ditch had a U-shaped profile and was oriented almost north-south. No dating evidence was found and it was difficult to interpret the feature, however, its size and alignment suggested that it was unlikely to have represented the course of the former town ditch. It was probable that the ditch represented a medieval or later boundary/division, perhaps associated with former plots running up to the town ditch, or a possible drain. It could also have been a later, post-medieval feature, possibly connected with the gardens of the Hall that formerly occupied the area. [Au(abr)]

Eleven test pits were excavated, with the majority of these revealing little in the way of archaeological deposits apart from Test Pit 2, which demonstrated a complex stratigraphy extending to the top of the natural sand. A number of north-south chalk block wall footings were observed, and some may have been associated with a probable clay floor surface. No dating evidence was forthcoming, but it was assumed that they were medieval in date, perhaps the remains of structures fronting onto the market place. These were later demolished and the ground level raised using silt and sand, over which was a significant deposit of chalk fragments. Later deposits overlaying this were likely to have been associated with the Corn Exchange in 1886. [Au(adp)]

Archaeological Observation, Investigation and Recording at the Methodist Church, Flemingate, Beverley

Adamson, N G Kingston-upon-Hull : Humber Field Archaeology , 2007, 19pp, colour pls, figs, tabs, refs

Work undertaken by: Humber Field Archaeology

Although some archaeological material was uncovered during initial stripping of the site relating to the church itself, no deeper excavations were undertaken and so the precise nature of the deposits remained unclear. The features comprised an undated chalk surface and a medieval pit, along with 12th-14th century finds. Also identified was a fragment of quern stone reused as a hearth and unstratified medieval and post-medieval pottery. No other archaeological finds or features were identified. [Au(adp)]

Monitoring during the development of the construction of a detached dwelling revealed a sequence of medieval and post-medieval activity cutting into the natural boulder clay and underlying the modern topsoil/surface. Linear boundary ditches were recorded, in addition to a series of pits and a later cow burial. Modern structural evidence was also uncovered. Pottery and a clay tobacco pipe were among the artefacts recovered, which dated to between the 12th and 19th centuries. [Au(adp)]

Archaeological Evaluation and Excavation at 69 Market Street, Pocklington, East Riding of Yorkshire

Tibbles, J Kingston-upon-Hull : Humber Field Archaeology, 2008, 29pp, colour pls, figs, tabs, refs

Work undertaken by: Humber Field Archaeology

An evaluation and excavation were carried out in association with the development of two retail units and three dwellings on the site. The earliest dated features were a small group of pits to the rear of the site, dated by pottery to the 11th or 12th centuries. No traces of structures associated with these pits were found. Earlier activity on the site was demonstrated by the discovery of some Late Saxon pottery. A single large pit was recorded close to the Market Street frontage, used for rubbish disposal and containing pottery fragments of 14-15th century date. A pair of deep, circular backfilled pits were encountered partially cutting the group of earlier pits. Fragments of brick flooring, drainage and cellar access of a late 18th century public house known as the Three Horseshoes were recorded. A number of

post holes to the rear were thought to represent a boundary fence. Remnants of a recently demolished 20th century building were encountered. Overall, the two episodes of investigation were thought to have examined all surviving medieval features on the site. [Au(adp)]

Work undertaken by: Humber Field Archaeology

Monitoring was carried out during groundwork associated with the installation of a toilet and kitchen facilities. The substantial windpipe that would have served the church organ up to the 1940s was uncovered during excavations in the churchyard. A compacted chalk layer located beneath the rubble under the floorboards of the north aisle was probably the medieval floor surface in this portion of the church, and may well have dated to the 13th century. No finds were recovered. [Au(adp)]

Rawson, D P Kingston-upon-Hull : Humber Field Archaeology , 2007, 22pp, colour pls, figs, tabs, refs

Work undertaken by: Humber Field Archaeology

The fieldwork showed that though the range of buildings immediately to the east of Croome House were almost entirely clad in brick externally, the interiors presented a more complex picture, with substantial use of roughly coarse chalk rubble. It was probable that the range was reworked in the later 19th century. The limited external groundwork did not reveal any archaeological features and no finds were collected. [Au(adp)]

THE WALLED GARDEN, RED HOUSE, CHURCH STREET, CAWTHORNE

Archaeological Building Recording, Evaluation and Watching Brief in the Walled Garden, Red House, Church Street, Cawthorne, South Yorkshire

Scurfield, C Barnsley : CS Archaeology, 2007, 50pp, colour pls, figs, tabs, refs

Work undertaken by: CS Archaeology

An archaeological building recording, evaluation and watching brief was carried out on the site. The building recording work revealed details of the construction of the garden wall and recorded the

structure prior to and during its partial demolition towards the south-east corner. The evaluation revealed a garden path and two east-west aligned ditches which probably dated to the later post-medieval period. An earlier north-west to south-east trench was also rediscovered, but remained undated. Apart from this ditch, no archaeology was found which predated the later post-medieval period. The watching brief revealed the extent of one of the ditches, as well as a stone lined well at the centre of the walled garden. [Au(adp)]

GRIMESTHORPE ROAD, BURNGREAVE
Grimesthorpe Road, Burngreave, Sheffield, an Archaeological Watching Brief on the "Roman Ridge"
 Shakarian, J Bakewell : Archaeological Research Services, 2007, 15pp, colour pls, figs, tabs, refs
 Work undertaken by: Archaeological Research Services
 An archaeological watching brief was undertaken. The watching brief comprised the observation of all ground works undertaken to improve the safety of the bank on Grimesthorpe Road. The "Roman Ridge", a collective name for a series of dykes running across south west Yorkshire was an important defensive earthwork that was part of a wider series of archaeological features including the Iron Age camp at Wincobank. According to previous excavations undertaken, the ridge ran along the natural bank on Grimesthorpe Road, eventually turning east towards Wilkinson's Spring Wood. The watching brief did not reveal any archaeological remains or evidence that earlier works on the site had truncated or destroyed archaeological features or deposits. [Au(abr)]

BUTCHER'S WHEEL, 72 ARUNDEL STREET, SHEFFIELD*Draft Project Report 869b(1) Volume 1: Report Text and illustrations Butcher's Wheel, 72 Arundel Street, Sheffield, South Yorkshire Historic Building Recording and Investigation (2 vols)*

Duckworth, S Sheffield : ARCUS, 2007, 425pp, colour pls, figs, tabs, refs

Work undertaken by: ARCUS

A building recording was carried out at the site of Butcher's Wheel, 72 Arundel Street during 2005 to 2006 and an intermittent watching brief was maintained during stripping and construction work during 2006 and March 2007. The Butcher's Wheel Works originated as the cutlery, edge tool and file making works of William and Samuel Butcher. The courtyard complex developed from initial works occupying two plots on Eyre Lane in the early part of the 19th century to occupying six plots in the 1870s. The Butcher Works developed a notable exporter in Bowie knives to the USA, where a subsidiary branch of Wade and Butcher operated. William and Samuel Butcher retained and extensively altered a number of earlier buildings whilst replacing others with large purpose built multi-storey workshop ranges to create a works of unusual complexity. Structures relating to the workshops were recorded. [Au(adp)]

Shakarian, J & Marshall, B Bakewell : Archaeological Research Services Ltd, 2007, 20pp, colour pls, figs, refs

Work undertaken by: Archaeological Research Services Ltd

The watching brief was carried out on three rotary boreholes and five trial trenches which were excavated to establish ground conditions for the design of foundations and substructure in the construction of the proposed children's centre. The watching brief had been commissioned because of the proximity of the site to Pot House farm, part of which was a 17th century building which between the 1650s and 1750s operated as Bolsterstone glass works. The farm complex had standing remains of the glasshouse that was protected as a Scheduled Ancient Monument (SM SY1279). Excavations in recent years revealed furnaces and waste deposits that extended beyond the immediate building. [Au(adp)]

Johnson, P Barnard Castle : Northern Archaeological Associates, 2007, 29pp, colour pls, figs, tabs, refs

Work undertaken by: Northern Archaeological Associates

Construction at two sites was monitored. At the Stannington Road site, there was no evidence for archaeological remains. At Bradfield Road, extensive post-medieval remains were encountered and mainly associated with the 19th century Upper Owlerton Wheel, but remnants of a later building [possibly built after the disastrous flood of 1864] were also recorded. The features associated with the Upper Owlerton Wheel primarily consisted of the north-eastern wall of the complex, bisected by a large stone culvert. Numerous fragments of grinding wheels were found, as well as a range of other post-medieval artefacts. [Au(adp)]

LUMB HALL BARN, BACK LANE, DRIFHLINGTON*Metal Detector Survey and Watching Brief at Lumb Hall Barn, Back Lane, Drighlington, West Yorkshire*

Toop, N York : Field Archaeology Specialists Ltd., 2007, 25pp, colour pls, figs, tabs

Work undertaken by: Field Archaeology Specialists Ltd.

A metal detector survey and archaeological watching brief were undertaken at Lumb Hall Barn. The site lay close to the known location of the battle of Adwalton Moor in 1643, and the metal detector survey aimed to identify any archaeological remains dating to this period at the site, in addition to defining the presence, character and date of any archaeological deposits at the site. A metal-detector survey of all areas of soft landscaping produced no finds of archaeological significance. Six geotechnical test pits were monitored, and the resulting spoil heaps were metal-detected. The test pits, which traversed the development site, revealed a sequence of natural clay subsoil, clean buried soil, and modern gravel surfaces. No finds of archaeological significance were recovered, and no features were observed. The excavation of foundation trenches for the new dwellings revealed that this sequence occurred consistently across the site. [Au(abr)]

Signorelli, L & Webb, A Morley : Archaeological Services WYAS, 2007, 56pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Services WYAS

An archaeological evaluation and watching brief was carried out at the site and revealed that the majority of trenches were devoid of features. Other than those associated with modern services. Features were recorded in four trenches. These features were predominantly truncated walls of buildings and boundary divisions shown on the historic mapping. A large pit, assumed to be the result of quarrying, contained a small finds assemblage primarily of 18th and 19th century pottery and clay pipe stems. No direct evidence of medieval activity was seen in any of the evaluation trenches although a few residual sherds of 15th/16th century pottery were found in the fill of the quarry pit. [Au(adp)]

IVESON HOUSE, LEEDS***Iveson House, Leeds, West Yorkshire Archaeological Watching Brief***

Smith, L York : Field Archaeology Specialists Ltd., 2007, 30pp, colour pls, figs

Work undertaken by: Field Archaeology Specialists Ltd.

A watching brief involved monitoring the removal of all existing foundations and services associated with the recently demolished Iveson House, the relocation of a tree, and all groundwork relating to the construction of a new nursing home at the site. Fieldwork took place between the 20th December 2006 and the 2nd April 2007. During fieldwork a buried soil thought to have represented the original woodland ground surface was identified, but had been truncated heavily during the construction of Iveson House and only remained in certain areas. The excavation of foundation trenches cut into the buried soil revealed an old tree bole possibly associated with large stones. Due to the isolated nature of this feature its archaeological significance remained undetermined. Groundwork also encountered a number of services and features associated with the recently demolished Iveson House, including modern drainage and two earlier stone-built culverts. [Au(abr)]

12-14 HILL CREST AVENUE, CASTLEFORD***12-14 Hill Crest Avenue, Castleford. Report on an Archaeological Investigation***

Bruce, G York : On Site Archaeology, 2007, 65pp, colour pls, figs, tabs, refs

Work undertaken by: On Site Archaeology

Archaeological investigations were undertaken on the site during 2006 and 2007. Initially the work comprised a watching brief during the excavation of foundation trenches for five new houses in the south-western part of the site. Further work took the form of a strip and record exercise prior to the construction of the three remaining houses in the central and north-eastern part of the site and a final watching brief during excavation for a large soakaway pit. The investigation revealed evidence for Iron Age settlement including pits, ditches and occasional post holes. Iron age pottery, animal bone and a small quantity of metal working slag were recovered, the latter probably representing metal working in the vicinity rather than on the site itself. A Roman phase of activity, comprising a ditch forming part of a field system was also present. A field system, comprising enclosures and trackways, were known from aerial photographs to be present to the south-west of the site. Single artefacts of Neolithic and Bronze Age date were also found, although these were residual within Iron Age features. [Au(adp)]

CASTLEFORD INTERCHANGE***Archaeological Monitoring of Geotechnical Ground Investigations. Castleford Interchange, West Yorkshire***

Speed, G Barnard Castle : Northern Archaeological Associates, 2007, 35pp, colour pls, figs, tabs, refs

Work undertaken by: Northern Archaeological Associates

Three boreholes, three trial pits and two smaller pits were excavated to locate a gas main, and monitoring of these excavations showed that the raised position of the car park was the result of 19th and 20th century make-up. This material overlay the pre-railway agricultural soil horizon. Just to the north of the car park, this horizon was again encountered, containing sherds of Roman pottery. It sealed a small ditch running from north to south and cut into the natural clay, producing Roman pottery of a probable 2nd century date. The make-up layer was present across the whole site, and this in turn sealed the 19th century ground surface. Victorian cellaring had truncated the site in many areas. [Au(adp)]

LAND AT CITADEL WAY

An Archaeological Excavation on Land at Citadel Way, Kingston-upon-Hull

Tibbles, J Kingston-upon-Hull : Humber Field Archaeology, 2007, 43pp, colour pls, figs, tabs, refs

Work undertaken by: Humber Field Archaeology

The excavation located the alignment of the western moat of the late 17th century Citadel and part of the "base flank battery", a low platform. The Citadel was demolished in the 1860s, and was represented archaeologically by the redeposition of clay from the levelled western rampart across both trenches. The excavation gave insight into the construction of the site. [Au(adp)]

43 SAVILLE STREET

Archaeological Observation, Investigation and Recording at 43 Saville Street, Kingston-upon-Hull

Jobling, D Kingston-upon-Hull : Humber Field Archaeology , 2007, 17pp, colour pls, figs, tabs, refs

Work undertaken by: Humber Field Archaeology

No original Georgian features were observed during the partial inspection of the interior. However, the building did retain a number of internal features dating from the Edwardian remodelling, most notably the staircase. It was not possible to inspect the small excavated area towards the rear of the building, however, it was suspected that large areas of truncation would have impacted upon any archaeological remains. GILCHRIST'S SMOKING HOUSE, SUBWAY STREET*Archaeological and Architectural Observation, Investigation and Recording at Gilchrist's Smoking House, Subway Street, Kingston-upon-Hull*

Rawson, D Kingston-upon-Hull : Humber Field Archaeology, 2007, 14pp, colour pls, figs, tabs, refs, CD

Work undertaken by: Humber Field Archaeology

It was not possible to properly access the interior of the building for reasons of health and safety, however, it was apparent that the fabric of the Grade II Listed smoking house had been little altered since the late 19th or 20th centuries. The smoking house was one of the few surviving fish smoking houses left in Hull, and was built around 1890. It comprised nine kilns in all, the westernmost having been apparently added shortly after the others had been constructed. [Au(adp)]

THE CHURCH OF ST. MICHAEL, LITTLE COATES***The Church of St. Michael, Little Coates, North East Lincolnshire. Archaeological Excavation and Recording***

Glover, G Lincoln : Lindsey Archaeological Services, 2007, 39pp, colour pls, figs, tabs, refs

Work undertaken by: Lindsey Archaeological Services

Archaeological excavation and recording work was carried out at the western end of the old nave during the re-siting of a number of church features, including the font, and prior to the construction of kitchen and toilet facilities. The excavation revealed four graves and a further four possible graves, the burials of which most likely remained in situ below the limits of the excavation and a probable charnel pit. The substantial wall foundations of the west end of the old church cut through the charnel pit, and it was likely that they post-dated the graves. It was also likely that the area of the excavation once formed part of a cemetery external to the church and that either the western end of the old nave had been extended to incorporate this part of the old cemetery or that the cemetery was associated with a church at the site that predated the extant structures. TOWN'S PIECE, KILNSEY***Report on the Excavation of a 17th Century Lime Kiln at Town's Piece, Kilnsey, North Yorkshire***

Johnson, D Ingleton via Carnforth : Ingleborough Archaeological Projects, 2007, 46pp, colour pls, figs, tabs, refs

Work undertaken by: Ingleborough Archaeological Projects

Excavation took place in 2007, after previous investigations in 2003, 2005 and 2006. A well-preserved example of a clamp kiln, clearly a lime kiln, was observed complete with external flue and internal stoke-hole arrangement. Archaeomagnetic dating placed the final firing of the kiln between 1620 and 1670, contemporary with the rebuilding of Kilnsey Old Hall in 1648. A large assemblage of artefacts was recovered from within the primary fill, including glass, metal and animal bone. One horse mandible and some horse teeth were found displaying no butchery marks, perhaps hinting at a connection with ritual horse burials from two kilns from the 2005 excavation season. [Au(adp)]

GRASSINGTON MOOR LEAD MINES***Grassington Moor Lead Mines Assessment***

Roe, M Halifax: Meerstone Archaeological Consultancy, 2007, 68pp, colour pls, figs, tabs, refs

Work undertaken by: Meerstone Archaeological Consultancy

A survey of lead mines on Grassington Moor was carried out. The size of the moor and its surrounding area proved to be an obstacle to its recording, and many remote methods had to be employed to assess it to a satisfactory degree. The level of interpretation of the individual sites was thought to be inconsistent. [Au(adp)]

Martlew, R Skipton : Yorkshire Dales Landscape Research Trust, 2007, 19pp, colour pls, figs, tabs, refs

Work undertaken by: Yorkshire Dales Landscape Research Trust

A detailed survey of the site known as Victoria Camp was carried out as part of a community archaeology project. Past activity including settlement and stock control was deduced from the field evidence, with hitherto unrecorded examples of possible burial mounds. Casual to industrial scales of mining activity were also inferred. Features were more scattered in the southern part of the site, with the cave providing the main focus for activity. The condition of most of the archaeological remains was reasonable, having been preserved rather than damaged by the vegetation. However, in parts where the soil was thinnest, some features were vulnerable to impact. [Au(adp)]

LAND TO THE SOUTH OF FREEMANS WAY, LEEMING BAR***Land to the South of Freemans Way, Leeming Bar, North Yorkshire. Archaeological Excavation***

Robinson, L Durham : University of Durham, Archaeological Services, 2007, 31pp, colour pls, figs, tabs, refs, CD

Work undertaken by: University of Durham, Archaeological Services

The excavation revealed a number of linear ditches, gullies and pits. The close proximity to Dere Street suggested that these could have been parts of a road-side settlement. Three stone features were uncovered in the north-west area of the site. One of these contained a fragment of a Romano-British rotary quern upper stone. This was a standard Roman quern produced in a Pennine factory for local consumption. Sixty-four sherds of pottery were recovered from the site, 11 of which were Samian, a high status material. The date range for the pottery was 2nd to 4th century AD placing the occupation of the site firmly in the Roman period. When coupled with the finds of tile, daub and fired clay it suggested the presence of a high status site, such as a villa, in the area. Plant macrofossil analysis identified evidence of spelt wheat, which was the dominant cereal in the Roman period. A large quantity of animal bone was also recovered. Ground conditions led to the preservation being biased towards the survival of robust elements from the large species, cattle and horse. Gnawing marks on bones indicated the presence of dogs on the site. The ditch fills appeared to contain general domestic waste. The depth of excavation required for the access route and service trenches was established as being above that of the archaeology. As a result of this it was decided to stop work and preserve the archaeology in situ. This resulted in a number of features not being excavated. [Au(abr)]

Aldene, Back Lane, Aldborough, Bouroughbridge, North Yorkshire. Archaeological Watching Brief

JB Archaeological Services Morley : JB Archaeological Services, 2007, 7pp, colour pls

Work undertaken by: JB Archaeological Services

The results of the watching brief were generally negative as the ground had been heavily disturbed for the construction of an earlier, small extension in 1997. As with the earlier watching brief, areas of post-medieval modern ground make-up were observed across most of the area of extension. This make-up contained varying amounts of post-medieval pottery and glass. This make-up overlay the reddish sandy subsoil. A band of finer, less red sediment was observed on the western side of the site which appeared to cut into the subsoil. On investigation this appeared to be a natural, water lain feature. Two small sherds of undecorated Roman Samian pottery were recovered from the back-fill of an earlier service trench. [Au(abr)]

ALLERTON PARK QUARRY

Archaeological Investigation, Specialist Background Information. Allerton Park Quarry, North Yorkshire

Ross, S Barnard Castle : Northern Archaeological Associates, 2008, 91pp, colour pls, figs, tabs, refs

Work undertaken by: Northern Archaeological Associates

The remains of two substantial Roman enclosures were identified with many associated external ditches and gullies that represented outer enclosure ditches and a possible ditched trackway. The earliest feature within the southern enclosure contained multiple fragments of Bronze Age Beaker dating between c.2250-1950 BC. However, the majority of the features dated to the mid 3rd/late 4th centuries and comprised numerous ditches, gullies, pits and post holes. Some of the pits may have represented the remains of a small inhumation cemetery, however, no human remains survived. Within the northern enclosure further linear and pit-type features were associated with possible structural remains. The western area of the site was found to contain more sinuous ditches and gullies than those identified to the east, appearing to be field boundaries and drainage ditches. A metalled surface was also identified that may have acted as a crossing point across wet ground. [Au(adp)]

EXPOSED CULVERT, OLD GANG SMELT MILL, SWALEDALE

Exposed Culvert, Old Gang Smelt Mill, Swaledale, North Yorkshire. Archaeological Watching Brief

Richardson, S & Dennison, E Beverley : Ed Dennison Archaeological Services Ltd., 2007, 12pp, colour pls, figs, tabs, refs

Work undertaken by: Ed Dennison Archaeological Services Ltd.

The watching brief, although limited in extent, confirmed that the collapsed culvert was well-constructed but entirely typical of what might be expected on such a site. It might have been built to take water from a small reservoir to the west, possibly to supply the power for the waterwheel on the adjacent dressing floor via the smaller channel leaving the south side of the main culvert. Some re-used sections of rail had been used to support the sides and roof of the culvert, suggesting repair at least once before this phase of works. Blockage to the west and east of the supposed section suggested that further collapse was likely. [Au(adp)]

Whitewall Quarry, Norton, North Yorkshire. Archaeological Watching Brief

Cavanagh, N & Rickaby, C Malton : MAP Archaeological Consultancy Ltd., 2007, 28pp, colour pls, figs, refs

Work undertaken by: MAP Archaeological Consultancy Ltd.

An archaeological watching brief was carried out at the site and revealed three archaeological features. In the western part of the site two parallel ditches were identified. In the eastern part of the site a substantial rock cut ditch was identified as the continuation of a feature recorded during 1995 and 2004. All three features had previously been identified as crop marks, and the results of the watching brief had confirmed themes being Romano-British in date. No finds were recorded from the western features during the current watching brief but several sherds of Romano-British pottery were recovered from the upper fill of the eastern ditch. [Au(adp)]

Fern, C York : Fern Archaeology, 2007, 45pp, colour pls, figs, tabs, refs

Work undertaken by: Fern Archaeology

An archaeological watching brief was carried out. The works revealed a series of stone walls, of unbonded and partially faced limestone blocks, the footprint of which was proportionate with buildings shown on 19th century historic maps of the area. These structures overlay a series of medieval occupation deposits and features, interpreted as pits, levelling layers, floors and post pads, which combined, indicate direct occupation of the site in the period. It was not possible to fully characterise the archaeology in the circumstances of the watching brief, but the assessment of the associated pottery suggested medieval activity from the late 12th century, with all periods represented thereafter. This assemblage included non-local pottery forms, as well as glazed floor and roof tiles, that were suggestive of a high status presence. [Au(adp)]

Tabor, J & Cooper, O Barnard Castle : Northern Archaeological Associates, 2007, 37pp, colour pls, figs, tabs, refs

Work undertaken by: Northern Archaeological Associates

Trial trenching and archaeological monitoring was carried out at the site. Whilst the trial trenching revealed no archaeological remains, monitoring of soil stripping on the site of the contractors' compound revealed the remains of a farmstead dating to the late Iron Age/early Roman period. The farmstead comprised the remains of a roundhouse with internal pits and post holes situated within a ditched enclosure, which appeared to form part of a wider system of enclosures extending outside of the development area. A limited number of largely undated linear features including ditches associated with former parish boundaries were also identified, as well as post holes, pits and the remains of a probable furnace. The remains were considered to be of regional significance. [Au(adp)]

Tabor, J Barnard Castle : Northern Archaeological Associates, 2007, 42pp, colour pls, figs, tabs, refs

Work undertaken by: Northern Archaeological Associates

The excavation had revealed at least two phases of Neolithic/Early Bronze Age monument located on a site of substantial Mesolithic activity represented by an assemblage of some 3758 worked flints. No sign of inhumations or cremations was found. The monument consisted of a ditch, that after silting up was redefined and rebuild with the construction of a kerb and the addition of cobbles and stones to create a kerbed round cairn. This was remarkably well preserved and, while not yet securely dated, appeared from the pottery assemblage to date from the Middle Neolithic to Early Bronze Age. [Au(adp)]

Wood, PBarnard Castle : Northern Archaeological Associates, 2007, 120pp, colour pls, figs, tabs, refs

Work undertaken by: Northern Archaeological Associates

The excavation discovered an Iron Age or Roman settlement represented by six ring gullies, possibly representing roundhouses, and containing handmade pottery. The number of potential structures and their distribution suggested either an extensive settlement, or several phases of occupation. Six medieval buildings were excavated, all aligned onto substantial, sunken roadways dividing the area into three major zones of features. Within these zones a number of rectangular ditched enclosures were identified, again aligned with the roadways and possibly post-dating the enclosures, suggesting an expansion or reorganization of the settlement. Robinson, T York : On Site Archaeology LTD, 2008, 21pp, colour pls, figs, tabs, refs

Work undertaken by: On Site Archaeology LTD

An archaeological excavation was carried out at the site during development. The presence of archaeological remains of significant interest was highlighted during initial evaluation in 2006. The excavation revealed a substantial width of the 12th century defensive ditch of the new borough of the town, revealing a complex sequence of deposits reflecting the life of this important feature. Dating evidence recovered from its upper fills suggested that the feature remained open until the 17th century. Additionally a second medieval ditch was excavated running parallel to Castle Road, probably as a means of development control. [Au(adp)]

Cook's World, Windsor Terrace, Whitby, North Yorkshire. Archaeological Watching Brief

JB Archaeological Services Morley : JB Archaeological Services, 2007, 11pp, colour pls, refs

Work undertaken by: JB Archaeological Services

An archaeological watching brief was carried out as a result of a condition of a planning application for the redevelopment of former railway land between Windsor Terrace and the railway in Whitby. The former engine shed, which stood towards the northern end of the site, was a Grade II Listed Building. The results of the watching brief were generally negative with the majority of the ground works occurring in previous undisturbed glacial sediments. The only feature encountered was the remains of the stone built railway turntable in the area of the new holiday cottages. The turntable had been abandoned in the second half of the 20th century and backfilled with ceramic building material and other refuse. [Au(adp)]

DARRINGTON QUARRY PIPELINE DIVERSION BYRAM PARK, BROTHERTON
Darrington Quarry Pipeline Diversion Byram Park, Brotherton, North Yorkshire. Archaeological Investigations

Moretti, D Morely : Archaeological Services WYAS, 2008, 51pp, figs, refs

Work undertaken by: Archaeological Services WYAS

Archaeological investigations comprising trial trenching and a strip and record operation commenced prior to and during works to redirect a high pressure gas pipeline at Byram Park. The proposal area was within the former Byram Hall estate and appears to have been part of the deer park from at least the 13th century to the early 20th century. Cropmark evidence indicates that several ditched features survive within and immediately adjacent to the proposed working area. Recent open-area excavations to the west, in advance of quarry extensions, have revealed comprehensive complexes of rectilinear field systems, trackways and enclosures probably dating to the Roman period with likely Late Iron Age origins. As seen from the cropmarks, the redirected pipeline cut through a double-ditched trackway and part of a possible enclosure. A burial with human remains and two possible post-hole alignments were identified within the enclosure. Seven ditches running approximately east-west were also identified along the pipeline easement. One rim sherd of early Bronze Age pottery, two sherds of late prehistoric pottery and two sherds of Roman grey ware were recovered from a trackway ditch, enclosure ditch and discrete features in the southern limits of the easement. From the same area, one struck flint, one broken blade and one flint core were also recovered. The human remains have been radiocarbon dated in the range 80 to 330AD. [Au(abr)]

CAWOOD FLOOD DEFENCE

Cawood Flood Defence Ground investigations. Archaeological Watching Brief Final Report

Hodkin, M Rotherham : Environment Agency, 2007, 11pp, colour pls, figs

Work undertaken by: Environment Agency

An archaeological watching brief was carried out at the site and revealed building stone in association with modern material. It was suggested that this was placed on the riverbank as part of a larger dumping episode in the 19th or 20th century either as an attempt to reinforce the edge of the flood channel or simply as waste disposal. It was possible that this material was redeposited during the 1982-3 flood bank construction. [Au(adp)]

2-4 MILLGATE, SELBY***Watching Brief. 2-4 Millgate, Selby, North Yorkshire***

Toop, N York : Field Archaeology Specialists Ltd., 2007, 23pp, colour pls, figs, tabs, refs

Work undertaken by: Field Archaeology Specialists Ltd.

An archaeological watching brief was carried out at 24 Millgate, Selby. Remains of medieval to modern date were encountered, represented by layers which produced medieval pottery, sealed by a sequence of occupation and made ground. This was followed by the construction of a brick-built outhouse, which was found to have been associated with backyard midden material. The structure had subsequently been demolished, before the insertion of a number of water pipes, which predated the laying down of rubble spreads across the whole area. [Au]

LAND TO THE REAR OF 23 FINKLE STREET, SELBY

Land to the Rear of 23 Finkle Street, Selby. Report on an Archaeological Watching Brief

Robinson, T York : On Site Archaeology , 2007, 12pp, colour pls, figs, tabs

Work undertaken by: On Site Archaeology

An archaeological watching brief was carried out at the site. The only archaeological features recorded were fragments of red brick wall and a stretch of rough hewn masonry, both likely to relate to relatively recent activity on the site. The principle deposits encountered were rubble heavy demolition spreads from the most recent structures on the site. [Au(adp)]

MARRIOTT HOTEL, TADCASTER ROAD*Archaeological watching brief. Marriott Hotel, Tadcaster Road, York*

Field Archaeology Specialists Ltd. York : Field Archaeology Specialists Ltd., 2007,

Work undertaken by: Field Archaeology Specialists Ltd.

An archaeological watching brief was undertaken at the Marriott Hotel, during groundworks associated with the construction of a new pumphouse and water tank, and associated services. A north-south aligned ditch was encountered at a depth of 0.85m below ground level. The feature produced a small assemblage of pottery providing a date in the late 2nd to 3rd century, including a number of conjoining sherds of decorated Samian. [OASIS(Au)]

BLOCK E, HUNGATE DEVELOPMENT, YORK***Block E, Hungate Development, York. A Report on an Archaeological Excavation***

Hunter-Mann, K York : York Archaeological Trust, 2007, 92pp, colour pls, figs, tabs, refs

Work undertaken by: York Archaeological Trust

The earliest deposits encountered were alluvial deposits, indicating that the site lay in the margins of the King's Poll during the medieval period. 17th century lazy beds, a horticultural feature, were interpreted from rows of narrow linear features cut into the soil. The upper part of the soil was cut by larger, mortar filled pits, interpreted as garden features. The site evolved into back gardens and was later subdivided with large brick walls, The gardens were overlain by cindery surfaces, with a well

preserved block of five toilets found in one area. Domestic rubbish occupied the site before it was turned over to industrial use in the 1940s. [Au(adp)]

ROBIN HOOD TOWER, YORK CITY WALLS
Robin Hood Tower, York City Walls. Excavation Report

Dean, G York : York Archaeological Trust, 2007, 35pp, colour pls, figs, tabs, refs
Work undertaken by: York Archaeological Trust
 The excavation involved the removal of 18th and 19th century artefacts to fully expose two sections of masonry exposed during restoration work on the tower. Three small trenches were excavated from which the evidence suggested that stubs of masonry may have formed part of the corner of the Roman fortress, that had been comprehensively robbed, as well as a sequence of post-Roman rampart deposits. Evidence for the disturbed medieval wall was also noted. This wall may have been located directly over the line of the fortress defences with the medieval tower abutting the remains of the outer fence of the Roman wall. 12th or 13th century pottery was recovered. The only other feature encountered was a 17th century pit. The construction of the extant tower in 1888-9 appeared to have involved cutting back into the rampart, perhaps to form a terrace reflected in the archaeology by the way the walls of the tower stepped down from the level of the excavations. THE BELPER PARKS PROJECT***The Belper Parks Project, Belper, Derbyshire***

Baker, S Sheffield : ARCUS, 2007, 115pp, colour pls, figs, tabs, refs

Work undertaken by: ARCUS

A historic landscape survey was carried out by professional archaeologists and local community volunteers at Belper Park, a former medieval deer park within the forest of Driffield Heath. Elements of the former park landscape were investigated, including surviving sections of bank associated with the park pale, a probable fishpond and associated mill leat, and areas of holly-rich Ancient Woodland. The deer park appeared to have lapsed in the 16th century, and in the early post-medieval period a complex of fields and dry stone walls developed within the former park, while areas of woodland were managed by coppicing and exploited for charcoal and white-coal production. This was an important survival of a medieval and early post-medieval landscape, and it was recommended that a management plan be drawn up to enable sensitive conservation of the archaeological features within the Local Nature Reserve. Work undertaken by: Mel Morris Conservation

The Conservation Area's character was predominantly formed by the steep Derwent Valley hillside topography and resulting dramatic views, coupled with the wealth of architectural heritage of the hydropathic industry. The hillside was mainly open fields with sparse development until the 20th century, when John Smedley's hydropathic establishment was established, creating a social infrastructure around the area. BUXTON CONSERVATION AREAS***Buxton Conservation Areas. Character Appraisal***

Mel Morris Conservation Ipstones : Mel Morris Conservation, 2007, 189pp, colour pls, figs, tabs, refs
Work undertaken by: Mel Morris Conservation

An appraisal of Buxton, the highest town in England, was carried out with respect to areas of interest giving distinctive characteristics to the locality. The report documented the rise of the town in the 18th century, with the discovery of warm springs, followed by expansion in the 20th century and the decline of the town in the post-war years. Buxton Conservation Area was defined in 1968. [AIP]

BOURNE MILL, COLCHESTER***Bourne Mill, Colchester. Historical Report***

Thornton, C Maldon : Dr. Chris Thornton, 2007, 87pp, pls, figs, refs

Work undertaken by: Dr. Chris Thornton

A survey was made of Bourne Mill and its environs to develop a greater understanding of the social and historical context of the landscape on behalf of the National Trust. The survey found accounts dating the use of the site as part of an abbey (original documents did not survive) and that a mansion on the site was destroyed during the second civil war of 1648. The site was likely used as a mill since at least the 12th-13th centuries and the most recent mill was of late post-medieval date. [Au(adp)]

KIDNEY WOOD, LUTON*Kidney Wood, Luton*

Simco, A Bedford : Angela Simco, 2007, 24pp, figs

Work undertaken by: Angela Simco

Kidney Wood is a small remnant of ancient woodland on the south-west edge of the town of Luton, surrounded by modern roads and residential or commercial development. While its original form was truncated by the construction of the Luton Southern Bypass, features of historic and archaeological interest survive within the wood. These include wood banks of possibly medieval origin along the east and west boundaries, and extensive quarrying associated with a 19th century brickyard which lay to the north. [Au]

Craven, J Ipswich : Suffolk County Council Archaeological Service, 2007, 12pp, figs, refs

Work undertaken by: Suffolk County Council Archaeological Service

A rapid archaeological earthwork survey was carried out in north-west Suffolk and south Norfolk. This was part of an ongoing program which aimed to identify any earthworks or visible archaeological features surviving within areas managed by the Forestry Commission, and to establish whether any areas would be impacted by various estate management exercises. The sites were not surveyed in detail, and comprised those at Cockley Cley, Didlington, Mundford, Ickburgh, Lynford, Weeting and Hockwold cum Wilton in Norfolk, and Stanton Downham in Suffolk. Other un-named areas were also surveyed. [Au(adp)]

LAKE DISTRICT NATIONAL PARK

Newlands Beck & River Derwent Restoration Project, Lake District National Park, Historic Landscape Analysis

Rushworth, A Newcastle-upon-Tyne : The Archaeological Practice Ltd., 2007, 70pp, colour pls, figs, tabs, refs

Work undertaken by: The Archaeological Practice Ltd.

A historic landscape analysis was carried out to inform the development of proposals to improve water quality in the Bassenthwaite Lake and to assess the implications of any such restoration work. This identified the following sites within the study area as potentially important. In the river Derwent area, the immediate environs of How Farm, possibly of Scandinavian or Post-Conquest origin, the site of Armatrigg Hill was recorded whose name suggested a Scandinavian origin, plus remains of an earlier version of High Stock Bridge in its vicinity. Also noted was the line of the Cockermouth, Keswick and Penrith railway. The course of the possible Roman road along the east side of the river Derwent was traced on aerial photographs and cropmarks to the east of the river. At the area of Newlands Beck the line of the Keswick-Whinlatter Roman road, the environs of Bog House, the course of the former turnpike, early modern and possibly medieval road between Braithwaite and Portinscale were located. Also of importance was the Braithwaite Bridge settlement site (later called Newlands Beck Bridge) and the line of the Cockermouth, Keswick and Penrith railway. No evidence was found to substantiate the suggestion that the flood banks were created under the auspices of Fountains Abbey in order to expand the area of land under cultivation. [Au(adp)]

TYNEHEAD***A Survey of the Industrial Sites of Tynehead***

Brooks, G Carlisle : Graham Brooks, 2007, 36pp, colour pls, figs, refs, CD

Work undertaken by: Graham Brooks

A survey was of industrial sites of Tynehead was carried out. The area surveyed is the upper Tyne valley from south of its junction with Dorth Gill (NY 762 382) to the source of the Tyne (at approximately NY 754 353), including the east slope of round hill. From across the watershed to the river Tees following this to Crookburn Foot (NY 773 337). Then along Crook Burn to the bridge on the B6277 (NY 781 358), then along the road to opposite Dorth Gill Foot (NY 768 382). This area enclosed Tynehead Fell an area of open moor rising to over 2,000 feet. Historically this area was separate from Alston Moor and was part of the Priorsdale, which was split into six messuages in 1588. The area in this survey was part of the Hole Liberty and also the Hill Liberty. It was possible that some of the mines in this area were the original Carlisle mines noted for their high silver content and dating from the thirteenth century. [Au(adp)]

CRUTCHES FARM***Crutches Farm, Icklesham, East Sussex. A Character Appraisal & Conservation Statement***

Edwards, B Blandford Forum : Forum Heritage Services, 2007, 77pp, pls, figs, tabs, refs

Work undertaken by: Forum Heritage Services

None of the working buildings at Crutches Farm were Listed (the farmhouse, in separate ownership, was Grade II Listed). The farmstead group represented a characteristic group of buildings indicating the mixed farming economy of the area - hops, arable and cattle with the possible later use of part of the barn for fruit storage. The barn was of a relatively late date for the use of timber-framing. It was of a standard form found across much of the south-east of England and parts of the East of England. Non-traditional roofing material was used. The unconverted oast house was significant in that it was one of a limited number of unconverted oasts. It was understood that no internal features relating to the kilns survived. The stable is a characteristic building type but its significance was reduced by the loss of internal fittings and fixtures. The fattening lodge was a relatively common building type. Its hipped roof was a locally characteristic feature, but it did not retain any internal fittings or fixtures. [Au(adp)]

James, R Portslade : Archaeology South-East, 2007, 63pp, figs, tabs, refs

Work undertaken by: Archaeology South-East

A historic landscape survey of part of the Scotney Castle estate was carried out. The study area comprised an area of garden and associated woodland immediately around a Victorian mansion. The aim of the work was to produce a definitive and up-to-date review of the archaeological and historical development of the property. The work involved a review of readily available existing primary and secondary historical and archaeological sources and a landscape survey to identify and record features of archaeological significance within the property and its immediate environs. Each archaeological feature was described and photographed, and a statement of its condition made. [Au(abr)]

Fryer, H, Ritherford, S , Ballard, P, Collins, E, Dix, B, Littlemore, J, Panter, J & Wallis, B Nottingham : Parklands Consortium Limited, 2007, 163pp, colour pls, figs, tabs, refs

Work undertaken by: Parklands Consortium Limited

A study was carried out in order to assess the historic importance of the whole designed landscape, and to measure the deterioration of the structural fabric, tree cover and archaeological remains. The post-medieval mansion with adjoining stable block was a Grade II* Listed Building, and a former doorway form the house that later served as a gateway was also Listed. The adjacent iron fenced pleasure grounds and parkland were also important, both for their historical interest and as an appropriate setting for the mansion. [Au(adp)]

ROMANESQUE CRYPT BENEATH ST. STEPHEN'S CHURCH, EXETER

A Conjectural Reconstruction of the Romanesque Crypt beneath St. Stephen's Church, Exeter

Parker, R W Exeter : Exeter Archaeology, 2007, 6pp, refs

Work undertaken by: Exeter Archaeology

It was certain that there was an important Romanesque structure underlying at least the eastern part of the nave of St. Stephen's Church. The descriptions and illustration of the remains discovered in 1826 and 1865 were undoubtedly those of a crypt, probably of 12th century date. As no physical evidence of the crypt was visible on site the reconstructed plan of the crypt was highly conjectural. It showed the crypt extending as far west as the presumed entrance passage, but the crypt may well have been smaller than this, and was perhaps limited to the eastern part of the church only. Later crypts and cellars may have been added in the late medieval period, especially under the south aisle, but nothing was known of these. Although its extent and function remained in doubt, the crypt remained one of the most unusual and enigmatic features of Exeter's parish churches and a rare survival of the religious architecture of the Norman city. The presence of such a crypt may have shown that the 12th century St. Stephen's was

a church of greater importance than its later modest appearance suggested. The debris infilling the crypt, whether rubble from the fire-damaged church, collapsed vaulting and capitals from the crypt itself, or centuries of burials and rubbish, was also likely to be of the highest archaeological interest. TORQUAY OLD TOWN HALL, UNION STREET, TORQUAY

Torquay Old Town Hall, Union Street, Torquay. Conservation Plan

Bishop, H Torquay : Torbay Council, 2007, 42pp, colour pls, figs, refs

Work undertaken by: Torbay Council

A survey was made of the Old Town Hall and its environs in order to inform upon the conservation of the site. The building was built by a Mr. Dixon in 1851 and in 1892 became the headquarters of the new Torquay Borough Council. It remained the town hall until the opening of a larger town hall in 1913. The building was of two and three storeys with a principal 30 bay elevation to Union Street plus one bay to tower to the left. [Au(adp)]

NEWHALL VALLEY BURNT MOUND***Newhall Valley Burnt Mound Survey***

Nichol, K Edgbaston : Birmingham Archaeology, 2007, 10pp, colour pls, figs, refs

Work undertaken by: Birmingham Archaeology

A contour survey was undertaken on the Newhall Burnt Mound (SMR 20795) revealed that the mound was very well preserved (measuring 12.5m X 9.5m) and survived to a height of 0.56m above the surrounding floodplain of the Plants Brook. The waterlogged nature of the site meant that there was great potential for the survival of important environmental remains and ecological indicators such as pollen, charred plant, beetles and charcoal to survive on or in the vicinity of the site. Its location on the floodplain meant that there had been little plough activity on the site and there was therefore also a good potential for the survival of associated features around the monument. Due to the fragility of the remains, as well as their importance to the overall understanding of man's effects on the environment of Newhall Valley, it was recommended that the site be kept in its current waterlogged condition and that tree planting and vehicle access be prohibited in the area in order to maintain the monuments good condition. SOUTH STAFFORDSHIRE COALFIELD***Diploma course in Landscape Archaeology & Geomatics Module 3: Geomatics and Landscape Archaeology Modelling Locations of Early Coal Extraction in the South Staffordshire Coalfield***

Student number 0676286 Birmingham : University of Birmingham, 2007, 36pp, pls, figs, refs

Work undertaken by: University of Birmingham

An assessment was carried out by modelling locations of early coal extraction in the south Staffordshire coalfield. This study has examined how the combination of historical , geological and archaeological data in GIS could assist the investigation of the earliest coal mining in the area. Conclusions drawn were that a total of eight bell pits, which were used to extract coal in the medieval or post-medieval period, were recorded in the HER. The combination of archaeological data with geological information, however, allowed the author to question the interpretation of at least one of these locations. [AIP]

SALTWELLS PATH WORKS***Mineshaft Records Research Report. Saltwells Path Works (2 Volumes)***

Moorby, N Stourbridge : Johnson, Poole & Bloomer, 2007, 38pp, figs, tabs

Work undertaken by: Johnson, Poole & Bloomer

An assessment was carried out that covered a limited area of the overall nature reserve, with the works including the excavation of soil and the laying of a new stone/gravel path undertaken on the site. This report was based upon the study of mine plans and other records, which were associated with past mining and considered how they were projected to affect, in general, the future stability of the site. Research revealed that the shafts located within the area of the site were sunk to various seams including the Thick, Upper and Lower Heathen and New Mine Coal Seams. The area was generally shown to have been extensively mined over a long period, during much of which most of the mining was unrecorded. [Au(adp)]

DUDLEY TOWN CENTRE***Conservation Area Character Appraisal for Dudley Town Centre. Dudley Town Centre Conservation Area and Revised Castle Hill Conservation Area Supplementary Planning Guidance***

Dudley Metropolitan Borough Council Historic Environment Team Dudley : Dudley Metropolitan Borough Council Historic Environment Team, 2007, 91pp, pls, figs, refs

Work undertaken by: Dudley Metropolitan Borough Council Historic Environment Team

A Conservation Area character appraisal for Dudley town centre was carried out. Arising from the analyses contained in the Conservation Area character appraisal a Conservation Area boundary can clearly be defined that encompasses a wide area of townscape that is architecturally varied and distinctive but nevertheless coherent and that possesses quality overall and a special historic and architectural character. The Conservation Area has at its core and is literally underpinned but the essentially unaltered of the medieval planned town of Dudley. The architectural evolution of the medieval core itself allied with an ongoing gradual expansion beyond its' original boundaries has also created further distinctive cultural quarters. These form areas of high quality townscape reflective of the town's changing role through time. Dudley town centre is eminently worthy of Conservation Area status preservation in its own right and ongoing enhancement. [Au(adp)]

ST. PAUL'S ROAD, WEDNESBURY

Final Report Ironbridge Archaeological Series no.106 Historic Landscape Appraisal St. Paul's Road, Wednesbury January 2007 Revised Edition

Belford, P & Reeve, S Ironbridge : Ironbridge Archaeology , 2007, 208pp, colour pls, figs, tabs, refs
 Work undertaken by: Ironbridge Archaeology

A historic landscape appraisal was carried out at the site in advance of an application for planning permission. The southern part of the site has been continuously used as a forge since the late 16th century. Water power from the river Tame was harnessed for a finery and chafery in the early 17th century; the site was absorbed into the Foley partnership in 1656. Possibly the scene of early experiments with mineral fuels, the site was further expanded in the 18th century for the manufacture of gun barrels. The enterprising Willetts concern also produced saws. In 1817 the forge was taken over by the edge tool maker Edward Elwell. The occupancy of the eelwells lasted into the 20th century , they provided a church, housing and sports facilities for their employees as well as expanding the works considerably. The site was of considerable local and regional importance. Parts of the early forge complex were likely to be well preserved beneath the ground, and deposits could illuminate hitherto little understood processes which were crucial to understanding the development of the iron industry in the 17th and 18th centuries. Such deposits could be of national significance. The northern part of the site , formerly the premises of Bescot Drop forgings, was not built on until the first decades of the 20th century. However, the main pond supplying water to the forge-later known as elwell's pool- was located in this area probably from at least the 17th century. Elements of the water power system for wednesbury forge as well as the old bed of the river Tame will survive beneath the present ground surface. Recommendations have therefore been made for further evaluative work including trial trenching, geophysical survey, geotechnical survey and oral history. [Au(adp)]

SCHOLES MILL, TANSLEY, MATLOCK*Scholes Mill, Tansley, Matlock. Desk-based Assessment and Building Recording*

Brightman, J Bakewell : Archaeological Research Services, 2007, 82pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Research Services

An assessment and building recording exercise traced the site's development from enclosed agricultural and pasture land in the late 18th century to an industrial cotton small-ware mill. This was extended as the mill was converted to steam power, with the area containing the water-wheel becoming the steam house. [Au(abr)]

WIBBERN HILL FARMHOUSE, TISSINGTON*An Archaeological Building Appraisal of Wibbern Hill Farmhouse, Tissington, Derbyshire*

Sheppard, R Nottingham : Trent & Peak Archaeological Unit, 2007, 25pp, colour pls, figs, refs, CD

Work undertaken by: Trent & Peak Archaeological Unit

The building appeared to be one of several so called double-pile buildings in the village, with two parallel ranges with gable end roofs. A date stone of 1836 probably marked the completion of the original build, however, they had been expanded since then, including a new kitchen block and a hall. [Au(adp)]

Coutts, C Warwick : Warwickshire Museum Field Services, 2007, 47pp, colour pls, figs, tabs, refs

Work undertaken by: Warwickshire Museum Field Services

The factory comprised a number of brick structures of various heights, the earliest module of which dated to 1904. The factory was built as a lace-making manufactory and continued to be used as such until 1912. From 1922 to 1980 the site was responsible for the manufacture of gas tubing, and after this, storage. Many of the buildings had been demolished prior to the building recording exercise, including the first one built. Recording was carried out on the southern three-storey building only. [Au(adp)]

Jessop, O & Dawson, L Sheffield : ARCUS, 2007, 86pp, colour pls, figs, tabs, refs

Work undertaken by: ARCUS

An assessment of the site found that the first development was by a small company set up by George Stephenson in 1838 which included collieries, a pipe foundry, and ancillary structures. Periods of expansion occurred throughout the late 19th to mid 20th centuries, with extensive site clearance in the 1960s to 1980s relating to a change in function. The site closed in 2000. The identification of a large foundry hall proved to be the most significant discovery of this survey. [Au(adp)]

KING WILLIAM IV PUB

An Archaeological Standing Building Survey and Trial Trench Evaluation of the Former King William IV Public House, Main Street, Barsby, Leicestershire

Richards, G Leicester : University of Leicester Archaeological Services, 2008,

Work undertaken by: AOC Archaeology

University of Leicester Archaeological Services were commissioned by Darian Homes to undertake an archaeological standing building survey and trial trench evaluation of the former King William IV Public House, Barsby prior to demolition and redevelopment. An initial archaeological desk-based

assessment identified the building as possibly eighteenth century in date and of some historical interest and close to known archaeological sites. The Leicestershire County Council Senior Planning Archaeologist, as advisor to the planning authority requested that a standing building survey and trial trench evaluation be carried out. The building was in poor state of repair have suffered fire damage and been subsequently stripped of fixtures and fittings. The building survey suggests that the building is a twentieth century rebuild within the footprint of the earlier building. Despite its promising location on the fringe of the historic village core, nothing of archaeological significance was located during the archaeological evaluation. [OASIS(Au)]

Survey of Buildings at The Cottage, 35 High Street, Osbournby, Lincolnshire
Cope-Faulkner, PSleaford : Archaeological Project Services, 2007, 16pp, colour pls, figs, tabs, refs
Work undertaken by: Archaeological Project Services
A programme of building recording was undertaken on an extension at The Cottage, an important structure in terms of its local vernacular architecture. The main part of The Cottage dated from the 17th century. The recorded building was a 19th century wing, a simple rectangular building with a gabled red pantile roof. Originally, the structure may have been a two-roomed building with perhaps a washroom and a hallway allowing access to the older cottage. [Au(adp)]

Cope-Faulkner, PSleaford : Archaeological Project Services, 2007, 18pp, colour pls, figs, tabs, refs
Work undertaken by: Archaeological Project Services
 Building recording was undertaken on a chapel and a house associated with the former Caistor Hospital, constructed in 1802 and originating as a House of Industry, later becoming a workhouse for the surrounding area after the New Poor Law Act of 1836. Both recorded buildings were located to the south-west of the main hospital complex. The chapel was built in 1865 and continued in that function throughout the life of the workhouse and the hospital. Rowan House was likely to date until immediately before its appearance on the 1887 OS map, and may have been a dwelling for the master of the workhouse. [Au(adp)]

PERIO MILL*Archaeological Building Recording and Desk-based Assessment at Perio Mill, Fotheringhay*

Prentice, J Northampton : Northamptonshire Archaeology, 2007, 29pp, colour pls, figs, tabs

Work undertaken by: Northamptonshire Archaeology

The mill and millers accommodation at Perio was a multi-phase building, but the structure studied principally dated from the eighteenth and nineteenth centuries. A mill was recorded on or near the site since the eleventh century. Little remained internally of the machinery which it would have contained during its working life apart from a dressing machine used to grade the flour and occasional brackets, sockets and chutes. Nothing remained of the fixtures and fittings which were associated with paper making on the site between 1718 and 1851 when it reverted to being a corn mill. [Au]

MULBERRY HOUSE, 15 CHANCERY LANE, THRAPSTON

Archaeological building assessment at Mulberry House, 15 Chancery Lane, Thrapston, Northamptonshire

Soden, I Northampton : Northamptonshire Archaeology, 2007, 24pp, colour pls, figs, tabs, refs

Work undertaken by: Northamptonshire Archaeology

An archaeological building assessment was undertaken on an 18th-century cottage, Mulberry House, 15 Chancery Lane, which was greatly enlarged by the addition of a second floor, probably in the later 19th century. Few original features survived inside although many small alterations have left clear evidence in the fabric. For much, but not all of its life, the property had been linked with the adjacent house (not itself the study of this report), which possibly began as small cottages but were greatly extended and gentrified in the early 19th century. Work undertaken by: Trigpoint Conservation and Planning

Level 2 Survey carried out in advance of works to extend a Grade II Listed Building (Holly Farmhouse, Preston), and for the conversion of an adjoining stable block. Holly Farm is constructed from irregular coursed ironstone with a Welsh slate roof and is a good example of a lobby or baffle entry cottage. The stable stands to the west of the principal farmhouse, it is rectangular in plan and appears to have originally been used as a stable with a hay loft above. It is also constructed from irregular coursed ironstone with a Welsh slate roof. [OASIS(Au)]

4 AND 5 PEAS HILL, CAMBRIDGE

4 and 5 Peas Hill, Cambridge. Building Recording and Archaeological Observations

Dickens, A & Darrah, R Cambridge : Cambridge Archaeological Unit, 2007, 44pp, colour pls, figs, tabs, refs

Work undertaken by: Cambridge Archaeological Unit

The survey determined that most of what survived at the site related to a complete rebuild and conversion into two properties in the late 16th/early 17th centuries. Within and beneath the fabric, however, remained some evidence of the earlier occupation of the site both as surviving build in the cellars and as archaeological stratigraphy in "islands" between standing walls. BUMPSTEAD HALL FARM, HELIONS BUMPSTEAD

Bumpstead Hall Farm, Helions Bumpstead, Essex: Archaeological Record

Alston, L Colchester : Colchester Archaeological Trust, 2007, 45pp, colour pls, figs, tabs

Work undertaken by: Colchester Archaeological Trust

Bumpstead Hall occupies the site of a medieval manor of the same name, otherwise known as Earls Bumpstead. The present farmhouse was much altered during the mid 19th century, but preserved a well-framed mid to late 15th century jettied parlour cross-wing and a 16th century floored hall. Of the several farm buildings shown on maps of 1812 and 1841, only two substantial barns survived a major mid 19th century reconstruction which saw the addition of various cattle yards, shelters and sheds to the south of the barns and a range of brick sheds to the north. A second major refurbishment of the early 20th century saw the demolition of almost all the mid 19th century buildings to the south and their replacement with a new stable and a pair of open-sided shelter sheds. The 20th century shelters still survived, but the stable was demolished after the storm of 1987. The northern brick sheds of the mid 19th century still remained, as did early 20th century pigsties. The two timber-framed and weather-boarded barns remained fine examples of the early 16th and early 17th centuries respectively, despite extensive reconstruction and the replacement of both roofs in the early 20th century. THE MALTING AT GOWERS FARM, TUMBLERS GREEN, STISTED

The Malting at Gowers Farm, Tumblers Green, Stisted, Essex Historic Building Record

Letch, A Chelmsford : Essex County Council Field Archaeology Unit, 2007, 38pp, pls, colour pls, figs, tabs, refs

Work undertaken by: Essex County Council Field Archaeology Unit

Recording works were undertaken during office conversion works of a Grade II-listed early 19th century malting, formerly owned by Gowers Farm, located on the other side of the road.

The malting is a Ware pattern hybrid style, whereby the building layout reflects the process flow from barley to malt, but without a separate barley store. It has been noted as one of the best-preserved maltings of its type in Essex. The malting was built on the site of an earlier, 18th century building, according to map evidence. The malthouse roof was replaced in the late 19th century. It used traditional floor malting techniques until its closure, in or slightly before the 1920s, when the interior was stripped out to form a cattle shed/dairy for the farm. In recent years the building has been left empty and left to deteriorate. Recent works, carried out before the survey, involved stripping out of 1920s features and rebuilding the malthouse, attached late 19th-century outbuildings and the kiln roof. The germinating floors, furnace and roasting floor had already been removed. Although much is missing internally, the exterior retains the form of an early 19th-century malting in its conical kiln roof, two-storey growing floors, fuel store and half-timbered maltstore. In addition, its mellow brickwork and weathered tiled roofs marks it out as a rare and particularly attractive survival from the Industrial Age. [Au]

HIGH HOUSE FARM, WOODHAM ROAD, BATTLESBRIDGE, CHELMSFORD*An historic buiding survey at High House Farm, Woodham Road, Battlesbridge, Chelmsford*

Alston, A Colchester : Colchester Archaeological Trust, 2008, A4 comb-bound

Work undertaken by: Colchester Archaeological Trust

An historic building recording was ensued prior to the demolition of existing outbuildings and erection of the new B1 office development. High House farm has a weatherboarded exterior, characteristic of coastal Essex and thus has considerable historic significance. Its proportions and layout are typical of 18th and early 19th century farmhouses in the region. Its interior was heavily altered in the 1970's. The northern half of the structure survives from an earlier house on the on the site and appears to date from the late 17th or early 18th century, with walls consisting of re-used 16th century timbers. The farmyard to the west of the house contains a variety of 20th century block-work buildings of no historic significance, but includes two timber-framed structures of the mid 19th century. Archaeological Desk Based Assessment, Conservative Club, 76 High Street, Hoddesdon, Hertfordshire

Semmelmann, K Milton Keynes : Archaeological Services & Consultancy Ltd., 2007, 80pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Services & Consultancy Ltd.

An archaeological desk-based assessment and historic building assessment in response to development proposals for the site. The Conservative Club, which was a Grade II Listed Building, dated from the late 16th/early 17th century and had modern extensions to the rear and the north of the property. The early range, on the street front, retained some timber framing and the rear range of the first-half of the 17th century was brick built with segmental and triangular pediments. The interior of the building has a significant number of Jacobean features including a dogleg staircase with hollow obelisk pendants, panelled rooms and early examples of panelled doors. [Au(abr)]

WILSHERE-DACRE JUNIOR SCHOOL, FISHPONDS ROAD

An Assessment of the Buildings at Wilshere-Dacre Junior School, Fishponds Road, Hitchin, Hertfordshire

Wilcox, S & Ca-Fernandez, H Hertford : Beams Ltd., 2007, 20pp, pls

Work undertaken by: Beams Ltd.

An assessment was made of the buildings at Wilshere-Dacre Junior School. The main school building was built in 1928 along with a series of outbuildings such as two toilet blocks, which were demolished in 1977, and a bicycle shed. During the 1930s a small canteen was added to the rear which was demolished and replaced by a modern canteen, on the site of an earlier toilet block to the north-west of the main school building. Two buildings are significant to the history of the site as they were both original structures. The other modern buildings and, an additional free-standing classroom, were of little significance as they were not part of the original plan of the site. The school had a symmetrical design, comprising a series of classrooms set around a double courtyard, a central assembly hall and a wide symmetrical imposing façade. Most of its original plan survived along with many of its exterior and interior decorative features. However, small alterations were made to the plan and fabric of the building in the mid 1960s, 1970s and 1980s. The building was of local historic importance. It retained much of its original plan as well as external and internal decorative features. Although many of the alterations that were made to the school were small, the introduction of a large doorway to the former symmetrical front façade had the largest impact upon its architectural significance. TOWN CENTRE, LETCHWORTH GARDEN CITY***Historic Buildings Impact Assessment on Town Centre, Letchworth Garden City, Hertfordshire***

Ashworth, H & Hillelson, D Letchworth : Heritage Network, 2007, 52pp, colour pls, figs, tabs, refs

Work undertaken by: Heritage Network

As a contribution to the environmental impact assessment on proposed redevelopment of Letchworth Garden City town centre, a primary record of the buildings affected, and an overview of their development, together with recommendations for further recording work, was carried out before demolition. The study area lay within the town centre of Letchworth Garden City and was divided into two areas of focus. Many of the buildings affected by the development proposals were early Garden City shops or workshops which were likely to retain original features. The survey comprised the area between the rear of the Town Hall and the rear of the former Post Office and included parts of Eastcheap and Broadway. The buildings affected by the development proposals in this area consisted of largely of modern retail units, with blocks of flats above. Until 1903 the site of the Garden City formed part of the manor of Letchworth and lay in open fields to the north of Letchworth village. Since the early 20th century it had been subject to extensive development for commercial and residential uses. The study involved a basic visual survey of the exterior of all the buildings proposed for demolition. This allowed the identification of buildings that were deemed worthy of further record. They included early Garden City retail units and workshops. [Au(abr)]

WESTBURY PRIMARY SCHOOL, WEST VIEW, LETCHWORTH***An Assessment of the Buildings at Westbury Primary School, West View, Letchworth, Hertfordshire***

Wilcox, S & Cal-Fernandez, H Hertford : Beams Ltd, 2007, 40pp, colour pls, figs, tabs, refs

Work undertaken by: Beams Ltd

An assessment was made of the buildings at Westbury Primary School. Westbury School was built in two stages, with the first school building erected in 1924/25. The school was enlarged in 1930/31 with a second school building being constructed to the east. It was joined to the existing school by a link corridor. A toilet block, later used as a store, was also constructed at this time. The three buildings were significant to the history of the site as they were all original structures. Westbury School had a linear design. It comprised a long range of classrooms to the south of the main corridor, with a number of wings to the rear. Most of its original plan survived along with many of its exterior and interior decorative features. However, alterations were made to the plan and fabric of the building in the mid and late 1970s and 1980s. Westbury Primary School was a good example of the transitional building style between the dark Victorian school buildings and the more open plan, well glazed schools of the

late 1930s and those built from 1947 onwards. It had a special character relating to its local distinctiveness, and was also of local historic importance. It retained much of its original plan as well as external and internal decorative features. However, a number of internal alterations and rear additions to the original plan of the school have had an impact upon the architectural significance of its buildings. In particular the addition of a new link building joining two buildings along with the construction of the rear modern hall had significantly affected the external appearance of the building. Hilleson, D & Kaye, D Letchworth : Heritage Network, 2007, 29pp, colour pls, figs, refs

Work undertaken by: Heritage Network

Cartographic evidence indicated that the site was open land in 1750 but occupied by two buildings in 1834. Little of the original historic features were visible in the interior. The earliest feature observed consisted of a chamfered bridging beam with ricked stops, located in a room to the rear of the present dining room. At some time after 1873, the southern end of the house was remodelled, possibly to facilitate the installation of the 16th/17th century panelling and staircase which occupied the entrance hall. GRANARY, ORCHARD HOUSE, 5 THE PADDOCKS, DOG KENNEL LANE, CHORLEYWOOD

Historic Building Recording: Granary, Orchard House, 5 The Paddocks, Dog Kennel Lane, Chorleywood

Semmelmann, K & McLeish, J Milton Keynes : Archaeological Services & Consultancy Ltd., 2007, 27pp, colour pls, figs, refs

Work undertaken by: Archaeological Services & Consultancy Ltd.

A historic building recording was made of the former granary in response to proposals for the relocation of the building. The granary, which is a Grade II Listed Building that was converted to a

summerhouse in the 1980s, is a freestanding timber framed structure resting on stone staddles. The conversion works included the installation of doors, windows and insulation boards, but the bulk of the timber framing, roof and floor appear little changed. The heavily painted weatherboarding and new access stair gives the granary, which is likely to have dated from the late 18th/early 19th century, a more recent appearance, but the overall integrity of the building has not been excessively compromised. DUKE OF YORK PUBLIC HOUSE, 19 WATFORD ROAD, CROXLEY GREEN
Historic Building Recording, Duke of York Public House, 19 Watford Road, Croxley Green, Hertfordshire

Semmelmann, K Milton Keynes : Archaeological Services & Consultancy Ltd., 2007, 39pp, pls, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Services & Consultancy Ltd.

A historic building recording of Duke of York Public House was undertaken in response to proposals for the demolition of buildings on the site and the erection of seven dwellings with associated access and parking. The earliest reference to the pub was in 1869, when it was known as the Gladstone Arms. It was renamed in honour of a local councillor at the end of the 19th century. The present building was an amalgam of the 19th century core, an early 20th century frontage and extension to the west, and later 20th century extensions to the east, north-west and the north, replacing the earlier outbuildings to the rear. The interior retains very few early features other than the first floor windows, having been modernised as necessary in recent years. [Au(abr)]

EASTBURY FARMHOUSE , WOODFIELD AVENUE, NORTHWOOD

Historic Building Recording, Eastbury Farmhouse, Woodfield Avenue, Northwood, Hertfordshire

Semmelmann, K Milton Keynes : Archaeological Services & Consultancy Ltd., 2007, 55pp, pls, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Services & Consultancy Ltd.

A historic building recording of Eastbury Farmhouse was undertaken in response to proposals for the demolition of the existing house and outhouse and the erection of 3 houses, a detached garage and access drive. The farmhouse and outhouse were all that remained of the farm complex that stood on the site until very recently. The farmhouse was a 2-storey brick building with extensions to the north and east elevations, all of which had tiled roofs. The two-storey outhouse was of a similar build. The bonding timbers in the outhouse suggested that it dated from the early 19th century and a similar date was proposed for the farmhouse. The eastern range was thought to have been added later, certainly by 1898 and subsequently extended southwards in the mid-20th century. A single storey extension to the north elevation and a small two-storey extension to the east elevation were also of mid-20th century date. The house had seen considerable internal and external alteration since initial construction, resulting in the loss or obscuring of many original details. [Au(abr)]

Historic Building Recording at HMS Warrior, Northwood, Three Rivers District, Hertfordshire

Capon, L Twickenham : AOC Archaeology Group, 2007, 50pp, colour pls, figs, tabs, refs

Work undertaken by: AOC Archaeology Group

An historic building recording was carried out at the site of five buildings at Northwood headquarters in Hertfordshire. The oldest building was Sunset Cottage, which dated to the 19th century. This was one of the buildings associated with the grounds of Eastbury Lodge, established in the 18th century. The other four buildings were of post war date and related to the use of the site as a military base. These were two accommodation blocks from the 1970s, a social centre that was converted from a store, and a NAAFI building. While of recent date, the buildings were considered good examples of Cold War architecture. These buildings were to be demolished as part of a restructuring of the base. [Au(adp)]

BURY LANE GARAGE, RICKMANSWORTH

Historic Building Recording. Bury Lane Garage, Rickmansworth

Newman, C Oxford : Oxford Archaeology, 2007, 13pp, figs, refs

Work undertaken by: Oxford Archaeology

A building recording was undertaken on surviving buildings at Bury Garage. The outcome recorded that the buildings were of relatively limited historical or architectural significance. They were not listed and were not particularly old, probably dating to the 1950s and 1960s, but they will have served a function within Rickmansworth throughout the second half of the 20th century and will have been known locally. They were not of sufficient interest to warrant preservation in situ other than an outline record of the structures prior to their demolition. The work confirmed that one building probably dated to the 1950s, although it had been subsequently altered, and the other building probably dated to the 1960s. Both buildings still retained some original features contemporary with the construction date. In addition to two post-war buildings that have been demolished. The site also retained a section of wall of possible 18th century date and this will be incorporated into the new development. [Au(abr)]

Historic Building Recording, Baptist Church, The Green, Sarratt, Hertfordshire

Zeeprat, B Milton Keynes : Archaeological Services & Consultancy Ltd., 2007, 45pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Services & Consultancy Ltd.

A programme of historic building recording was carried out at Sarratt Baptist Church in advance of conversion and demolition works. According to historical sources, the present Baptist church in Sarratt was formed in 1857, and enlarged in 1874. From the survey, it was evident that the present church building dates from 1895. The church hall was added between 1898 and 1925. The church itself was well constructed, and appeared to have not been subject to any significant alterations during its lifetime. At the time of the survey it still retained its pulpit, baptismal tank and organ. In contrast, the hall has seen a number of changes to its access arrangements, possibly related to its use as a school or Sunday school. [Au(abr)]

HOLLY TREE FARM, THE GREEN, SARRATT***Desk-Based Archaeological Assessment and Historic Building Impact Assessment at Holly Tree Farm, The Green, Sarratt, Hertfordshire***

Winter, M & Hillelson, D Letchworth : Heritage Network, 2007, 44pp, pls, colour pls, figs, tabs, refs

Work undertaken by: Heritage Network

In order to investigate the archaeological risk posed by the extension of Hollytree Farm, a historic buildings impact assessment of the existing building and a desk-based archaeological assessment of the site as a whole were undertaken. An examination of the building demonstrated that it was a 17th century timber-framed structure, brick-faced and extended to the south in the mid-late 18th century, with a late 19th century lean-to out hut to the rear. A consideration of the available documentary and cartographic evidence demonstrated that there would be a low probability of encountering features and finds of prehistoric and Romano-British date during development on the site. The risk increased to moderate for the early medieval period and moderate to high for the medieval. A high probability of encountering post-medieval and modern remains was identified. [Au(abr)]

12 CHALK HILL*Historic Building Recording at 12 Chalk Hill, Watford*

Hunt, G London : L-P: Archaeology, 2007, 44pp, pls, figs, tabs. Refs

Work undertaken by: L-P: Archaeology

A historic building recording was undertaken on a proposed redevelopment which involved the demolition of number 12 Chalk Hill, Watford. The structure of 12 Chalk Hill was still intact, but had been modified in many ways. Principally, the internal arrangements had been entirely modified and all internal and external features had been removed. The windows and doors were also all modern and the roof covering was also modern. Whilst the building in its original condition would have had some local significance, in its current condition it had almost no historical or architectural value. It was deemed that given the absence of any historical features, there would be have been very little or no benefit in any further recording of the building. In general, the survey indicated that there were no buildings on the site of historical or architectural interest. The structure at No.12 Chalk Hill has been recorded in a brief photographic, sketch and written survey and no further recording work was recommended. [Au(abr)]

THE RED LION HOTEL, 88 GREAT NORTH ROAD, HATFIELD

The Red Lion Hotel, 88 Great North Road, Hatfield, Hertfordshire. Historic Building Recording

Collins, T, Prosse, L, Henry, K, Barton, T & Doyle, K Hertford : Archaeological Solutions, 2007, 59pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Solutions

Building recording identified that the historic core of the building had originally been a coaching inn. A building was shown to have been present on the site from as early as 1766, but the structure of the building was more consistent with the known relocation of the Red Lion in 1794. Additions were made throughout the life of the building, such as flanking ranges in the 19th century and a 1930s dance hall. Other phases of remodelling were discernable, dating through to the 1970s and 80s. [Au(adp)]

QUEENSWOOD SCHOOL, BROOKMANS PARK***Historic Building Recording at Queenswood School, Brookmans Park, Hertfordshire***

Williamson, A, Prosser, L, Henry, K, Lamprey, C & Sparrow, P Hertford : Archaeological Solutions, 2007, 34pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Solutions

A programme of historic building recording of a staff accommodation building at Queenswood School was undertaken. Queenswood School was originally established in Clapham, London, but relocated to Hertfordshire in 1926. The building was constructed in 1934 as accommodation for thirteen school-mistresses and was congruous in style with the other buildings existing elsewhere in the school. In style it reflected domestic architecture of the inter-war period, which, under the residual influence of the Arts and Crafts Movement combined traditional motifs with modern materials. Similarly the building reflected this form with the restrained use of simple render with tile-coursing and modern Crittall-type steel-framed windows. Since the 1950s, the building had apparently been extensively refurbished and remodelled into three self-contained flats for staff. Some reorganisation of internal spaces may have been discerned. Perhaps in the last ten years all original glazing, with a single exception, had been replaced with PVCu windows. Few internal features of interest survived. [Au(abr)]

TOLLGATE FARM BARN, BRUNWELL***Tollgate Farm Barns, Brunwell. Photographic Survey Record***

Feliden & Mawson London : Feliden & Mawson, 2007, 49pp, colour pls, figs, refs

Work undertaken by: Feliden & Mawson

A photographic survey was carried out on a group of two barns and two residential cottages. The proposed development made use of and "recycled" the existing building stock, without encroaching on greenfield land and contributing to the local community. The buildings themselves were typical of late post-medieval/early modern construction, with the main barn being of 19th century date and the tenanted cottages of early 20th century date. [Au(adp)]

CHURCH FARM, LINGWOOD

Church Farm, Lingwood. Assessment of Architectural Interest

Heywood, S Gressenhall : Norfolk County Council, 2007, 5pp, colour pls

Work undertaken by: Norfolk County Council

An assessment was carried out in response to proposals to convert a complex of farm buildings into holiday accommodation. The site consisted of several single story early and mid-19th century shelter sheds, indicative of a large cattle rearing enterprise which was typical of farming in the Broads area. The brick and pantile buildings followed an organised plan consistent with the 19th century improvements in the efficiency of farms. Church Farmhouse stood to the south and was separated from the farm buildings by a pond. [Au(adp)]

Honeysuckle Cottage, Front Street, Burnham Market. Analysis of Architectural History

Heywood, S Gressenhall : Norfolk County Council, 2007, 10pp, colour pls, figs

Work undertaken by: Norfolk Landscape Archaeology

The cottage was built in about 1840 to accommodate two small households. The building was extended to the rear later in the 19th century with a simple lean-to construction beneath a cranked cat-slide roof. The end walls were built onto the former boundary walls. Toward the end of the 19th century, the building was converted into a single house with doorways at each floor connecting the two halves. In the later 20th century repairs and refurbishment included rebuilding the west chimney shaft, felting and repairing the roof. [Au(abr)]

BARNINGHAM BARN, WISTERIA HOUSE, CONEY WESTON***Barningham Barn, Wisteria House, Coney Weston, Suffolk. Archaeological Record***

Alston, L Bures St. Mary : Leigh Alston Architectural Historian, 2007, 14pp, colour pls, figs, tabs, refs, CD

Work undertaken by: Leigh Alston Architectural Historian

Barningham Barn lay at the western edge of the village of Coney Weston on land that formed a large tract of open sheep walk until its enclosure and conversion to cereal production in 1798. The site lay in the parish of Barningham before 20th century boundary changes, and the buildings were absent from the Barningham enclosure map of that year. Wisteria House, which adjoins the site to the south, was built in 1911, according to a date plaque on its gable. As the barn was evidently built to serve a former sheep walk, newly ploughed in response to high Napoleonic grain prices in or soon after 1798, it could be dated with unusual precision. The structure of four bays was almost completely intact, although a porch had been removed from its western elevation, and is of considerable historic significance as it illustrated an important period of transition in English carpentry, combining the extensive use of pine timber with the medieval tradition of mortised tie-beam braces and jowled storey posts (as opposed to the bolted knee-braces and square posts of the 19th century). BARN, ADJACENT TO HAZEL STUBB FARM, BURTON END, HAVERHILL***Barns adjacent to Hazel Stubb Farm, Burton End, Haverhill***

Craven, J A Bury St. Edmunds : Suffolk County Council Archaeological Service, 2007, SCCAS monitoring report

Work undertaken by: Suffolk County Council Archaeological Service

A programme of building recording and archaeological monitoring was carried out during the conversion of barns at Hazel Stubb Farm, Haverhill. The three surveyed buildings all appear on the 2nd Edition Ordnance Survey of 1898. Building 1 has been extended since 1898 and the addition of stables to the original range was suggested in the fabric of the building. Building 2 is a good example of a mid-late Victorian model farm building with specifically designed features for the keeping of livestock. Finally Building 3 was probably originally constructed in the late 18th century or the early part of the 19th century. It reused timbers salvaged from a large and well-crafted oak-framed building, possibly of a medieval date, that may have once stood upon the site. Monitoring of groundworks identified a

roadside ditch, traces of earlier yard surfaces and the footings for another farm building shown on the Second Edition Ordnance Survey. [OASIS(Au)]

BUILDINGS A, B AND D, STABLES MARKET, CAMDEN

Buildings A, B and D, Stables Market, Camden

Capon, L Twickenham : AOC Archaeology Group, 2007, 31pp, colour pls, figs, tabs, refs

Work undertaken by: AOC Archaeology Group

The building recording and watching brief was carried out from 2006-2007. The watching brief revealed the extent of underground 19th century brick tunnels commonly named the catacombs. These structures housed traders and appear to have been used to store goods relating to the railways and associated businesses. The tunnels also provide a solid support for a widespread goods yard established in the 19th century. Of primary interest for the historic building record was the horse tunnel which crossed the site of building D and provided new access into the catacombs and the railway arches which were due for partial demolition due to impact of new buildings A and B. Similar structures survived elsewhere in Camden Stables Market, and housed shops and other retailers. An archaeological building recording exercise recorded these structures. [Au(adp)]

CHARLTON HOUSE, HORNFAIR ROAD, CHARLTON

Charlton House, Hornfair Road, Charlton SE7. Observation of contractor's groundworks, N Terrace disabled access ramp

Potter, G London : Compass Archaeology, 2007, 10 page spiral bound in-house report

Work undertaken by: Compass Archaeology

Observation during groundworks for a disabled access ramp at the northwest corner of this early 17th century house. Excavation into the raised terrace on which the House stands revealed the remains of an original east-west retaining wall. This was of brick with at least six courses surviving, and was 340mm thick stepping out to 450mm+ at base. Adjacent deposits to the south represent contemporary infill to construct the terrace, whilst those to the north probably date to the demolition of the wall in the ?later 17th century. Natural deposits were not expsed. [OASIS(Au)]

WORLD WAR II TRENCH SHELTERS, GLS DEPOT, FERRY LANE, TOTTENHAM

Historic Building Assessment. World War II Trench Shelters, GLS Depot, Ferry Lane, Tottenham

CgMs London : CgMs, 2007, 128pp, colour pls, figs, tabs, refs

Work undertaken by: CgMs

The shelters consisted of 12 "trenches" and interconnecting passages with features [assumed exit points] at each end. The rarity and significance of such shelters was hard to quantify due to private, factory civilian shelters being a relatively unstudied structure type. However, this type of shelter did appear to be quite rare. [Au(adp)]

CRANHAM HALL FARM, THE CHASE, CRANHAM, UPMINSTER

Cranham Hall Farm, The Chase, Cranham, Upminster: Historic Building Recording

Collins, T, Prosser, L & Peachey, A Hertford : Archaeological Solutions, 2007, A4 ringbound document

Work undertaken by: Archaeological Solutions

In October 2007, Archaeological Solutions Ltd (AS) carried out a historic building recording on Cranham Hall Farm, The Chase, Cranham, Essex (NGR TQ 5712 8612). The historic building recording was commissioned by Quadrillon Construction Ltd in response to advice issued by English Heritage Greater London Archaeological Advisory Service in order to satisfy a planning condition attached to redevelopment proposals for the site. The buildings comprising the study area epitomise the 19th century model-farm ideal. Many model farms often develop piedemeal, and are rarely as homogenous as we see at Cranham Hall Farm. It comprises a courtyard which is mostly enclosed and inward looking, with few windows or doors facing outwards to the surrounding countryside. The exception to this is the west range, which although much disturbed seems to form a partially symmetrical system of three open-fronted bays at either end with throughways to the exterior, flanked by single enclosed cells, possibly with the central part of the range pierced to the exterior and open-fronted. As a whole the site is constructed using high-quality and durable materials; normally with minimal unnecessary adornment, but reflecting a higher decorative standard on the public façade, where we see a small corner unit rise to a pyramidal roof, and gestures such as yellow brick voussoirs and a diocletian window, not seen elsewhere. In form it was designed for efficient transit and processing of livestock and farm produce, together with a safe store for equipment in barns, open-fronted sheds, stables, granaries and barns, ranged in around the courtyard. WEST MIDDLESEX HOSPITAL SITE, TWICKENHAM ROAD, ISLEWORTH

West Middlesex Hospital Site, Twickenham Road, Isleworth, London Borough of Hounslow:

a Historic Building Record

Capon, L Twickenham : AOC Archaeology Group, 2007, 47pp, colour pls, figs, tabs, refs

Work undertaken by: AOC Archaeology Group

A programme of historic building recording was undertaken on hospital buildings at part of West Middlesex Hospital in Isleworth, which was due for redevelopment. The hospital buildings that were recorded were formerly largely wards for patients, and had identical layouts and design, they varied from two to three-storey buildings. All were brick-built with decorative stonework and good quality internal finishes. The hospital developed from an Infirmary attached to the Brentford Union Workhouse which stood south of the site in the 19th century. Although not of any great age, these

buildings were good examples of high quality hospital buildings dating to the early 20th century that were part of a public health programme that saw hospital developments around Middlesex. [Au(abr)]

CLAPHAM PARK REGENERATION, LAMBETH

Clapham Park Regeneration, Lambeth. Historic Building Recording

Gill, J & Croxson, N Oxford : Oxford Archaeology , 2007, 84pp, pls, figs, refs

Work undertaken by: Oxford Archaeology

Clapham Park is a large housing estate in Lambeth, south London which had developed in several clear phases during the 20th century. In recent years the area had been blighted by a variety of social problems common to many similar inner-city areas and was about to undergo a major regeneration. This would involve the demolition of some of the blocks, the refurbishment of others and the construction of a series of new structures. Prior to the regeneration a programme of building recording has been undertaken to document the residential blocks and the overall form of the estate. The architecture in housing estates such as Clapham Park was generally unloved and the loss of these types of blocks was rarely mourned. However, estates such as these can teach us much about architecture and society in the 20th century and if they are going to be demolished then making a record of them prior to their demolition is a valuable exercise. This was rarely done and it is a building type that has been relatively little investigated in published studies or as buildings archaeology. Clapham Park is particularly of interest as it retains housing blocks from different period (particularly the 1930s, 1950s, and 1970s) so it is possible to draw comparisons between periods and to gain an indication of the changing architectural fashions in the field of social housing. CHAPEL COURT, EAST FACING ELEVATION, HAMPTON COURT PALACE

Chapel Court, North Facing Elevation, Hampton Court Palace. Historic Building Recording

Kelly, A Oxford : Oxford Archaeology, 2007, 50pp, colour pls, figs, tabs, refs

Work undertaken by: Oxford Archaeology

The west range of Chapel Court was partly built by Wolsey around 1515-1528 with the section on the west range housing one of a pair of large spiral staircases that served the adjacent T-shaped chapel. Decoration was also added to the brickwork consisting of red ruddling, pencilling and painted diaperwork. Henry VIII constructed council chambers beside the staircase in 1529, completing the two storey range. The range was heightened to three storeys sometime between 1710-1775 and 19th century repairs and refenestration completed the appearance of the elevation. The survey and recording work done upon the Chapel Court east elevation enabled a close study to be made of brickwork, pointing and the various mortar types connected with the changes to the elevation. The remains of Tudor decoration were found in several places on the Wolsey period part of the elevation where traces of the red wash and outlining of the joint in white plaster could clearly be seen. Using the Brick Typology Data Sheets and analysis of the different mortar types it could be seen that there were many different phases of work upon the elevation. These included the primary building phase under Cardinal Wolsey and then the addition of the council chambers by Henry VIII, the 18th century heightening of the range, the 19th century replacement of the plinth to the base of the elevation and the addition of black ash mortar pointing to the brickwork. ELVET WATERSIDE, DURHAM***Elvet Waterside, Durham. Archaeological Buildings Assessment***

Annis, R & Claydon, M Durham : University of Durham, Archaeological Services, 2007, 44pp, colour pls, figs, tabs, refs, CD

Work undertaken by: University of Durham, Archaeological Services

The present Baths building was opened in 1932, when it provided facilities for swimming, private bathing and laundry. It was of local interest and limited architectural merit. It was built cheaply, and so contained few decorative features or embellishments. The lack of substantial maintenance in latter years meant that while it still functioned effectively, the building was in a poor state of repair. It was photographed as part of this project, and a ground-floor plan and elevation drawings had been made by architects for the scheme. It

was not recommended that the building, which would be replaced by the new swimming pool at Freeman's Place, should be retained or converted as part of any redevelopment of the Elvet Waterside site. If it was thought desirable that an element of the building should be preserved, the sandstone columns at the north end of the main pool were the only candidate for such treatment. The vennel walls were of no historic, architectural or archaeological

significance. However, the lines of these vennels were important elements of the historic fabric of this part of Durham. This was particularly true of the east vennel, which was in existence by the first half of the 15th century. It was recommended that measures should be taken to ensure that this significance was reflected and retained in any proposed development of this site. [Au(abr)]

COPPERSMITH'S SHOP, STEPHENSON'S OFFICES AND VAULTED CELLARS, STEPHENSON'S QUARTER

Coppersmith's Shop, Stephenson's Offices and Vaulted Cellars, Stephenson's Quarter, Newcastle upon-Tyne buildings Recording

Parker, J Newcastle-upon-Tyne : Tyne & Wears Museum Archaeology Department, 2007, 47pp, colour pls, figs, tabs, refs

Work undertaken by: Tyne & Wears Museum Archaeology Department

This building recording was carried out in order to provide a permanent record of the historic standing of the building. Robert Stephenson and Co. started to develop the area in 1823 and by 1837 the office had been constructed with a yard to the north and east. A timber structure has been built within this yard by 1919. Within the first floor of this structure there was evidence of the 1934 fire, which caused the first floor of the office to be rebuilt. The Coppersmith's shop and vaulted cellars beneath had been constructed by 1846. The Coppersmith's shop originally had a yard to the north-west with an open aspect onto it. This yard had been covered over by 1896. Within the coppersmith's shop and vaulted cellars, no other major alterations were made, instead only minor alterations such as blocking windows and doors took place. [Au(adp)]

EAST FARM, BARLOW, BLAYDON***East Farm, Barlow, Blaydon. Report on Archaeological Recording of Farm Buildings***

Stewart, IJ Gateshead : Ian Farmer Associates, 2007, 46pp, colour pls, figs, refs

Work undertaken by: Ian Farmer Associates

An archaeological recording of farm buildings was carried out. It was understood that it was proposed to convert agricultural buildings at East Farm into four residential units. The research indicated the farm buildings dated to no earlier than the late 18th century with subsequent modifications in the last 250 years. These modifications related to both the repair of buildings and changes in farming practice. The final recommendation was that the building conversion should take place without any further archaeological input. [Au(adp)]

Work undertaken by: Pre-Construct Archaeology Ltd.

An archaeological desk-based assessment and programme of historic standing building recording were undertaken ahead of the proposed development on the site. The earliest structural fabric of the farm probably dates back to the late 18th-early 19th century, although it was possible that there may have been a farmstead at this location earlier than this date, given that there was a medieval village in the location of the present hamlet. The main range of buildings included the existing farmhouse and a group of Grade II Listed Buildings, namely a byre, threshing barn and hemmel/granary, these forming the easternmost portion of the main range. The group as a whole formed a linear farmstead typical of the area. All buildings to be converted as part of the proposed scheme were subject to a programme of

standing building recording, including compilation of a photographic record of the structures.

FORMER CANVAS WORKS AT 47-49 LIME STREET, OUSEBURN***Archaeological Photographic Recording of Former Canvas Works at 47-49 Lime Street, Ouseburn, Newcastle Upon Tyne***

Johnstone, M & Peters, C Alston : North Pennines Archaeology Ltd., 2007, 54pp, colour pls, figs, tabs, refs

Work undertaken by: North Pennines Archaeology Ltd.

A building recording exercise was carried out at the site. The first building on the site was thought to have been constructed between 1844 and 1861. The survey revealed three main buildings. Building A fronted Lime Street and comprised a Victorian red brick two storey building. Building B was an adjoining two storey building and building C referred to a single storey area that formed the rear courtyard building to the west of the site. Due to the significant evidence for early 19th century buildings on the site and the location of the development site within the Lower Ouseburn Valley Designated Conservation Area, a programme of archaeological mitigation prior to any development on the site was recommended. Goode, A & Taylor-Wilson, R Durham : Pre-Construct Archaeology Ltd., 2007, 32pp, pls, colour pls, figs, refs

Work undertaken by: Pre-Construct Archaeology Ltd.

Building recording of the site consisted of a trial trench evaluation and a historic standing building recording of a series of railway arches. Lying to the west of the site of the Roman fort of Pons Aelius close to the line of Hadrian's Wall and within the medieval town walls, the site had good archaeological potential. In addition railway arches at the site date from the mid-late 19th century and are associated with the viaduct of the East Coast Mainline Railway between the High Level Bridge Castle Garth and Newcastle Station. The railway viaduct was a Grade II Listed Building lying within the Central Conservation Area of the city. Accordingly, the arches at the site were considered to be of sufficient character and architectural merit to warrant recording before any internal alterations were undertaken. [Au(adp)]

Work undertaken by: Tyne & Wears Museum Archaeology Department

An archaeological building recording was carried out. The works entailed the conversion of the existing Irvin building site into 26 apartments, a restaurant, and office/studio space, with associated car parking and the construction of a new boundary wall. The lift tower, outhouses and existing boundary wall would be demolished and two floors added to the top of the warehouse. Construction of the warehouse building had been completed in September 1913, though the office block was not built until after 1915. An earlier gasometer was incorporated into the ground floor of the warehouse building and one of the outbuildings associated with the gas works was also still present on the site. [Au(adp)]

Parker, J H Hartlepool : Tees Archaeology, 2007, 39pp, colour pls, figs, tabs, refs

Work undertaken by: Tees Archaeology

The building recording was undertaken in advance of the regeneration of a large area of West Hartlepool containing over 300 properties. The first buildings on the site were constructed between 1900 and 1912, and took the form of brick-built terraces with stone lintels and sills. Between 1930 and 1939, two further phases of building took place, similar to the first phase but with brick lintels and sills. A third phase consisted of semi-detached and short terraces. The site as a whole provided a good example of early 20th century housing development, brought about by the need to house workers for the expanding ship-building industries. [Au(adp)]

VARIOUS BUILDINGS IN MIDDLESBROUGH

Middlesbrough Listed Buildings Survey 2006. A rapid assessment for the enhancement of the Historic Environment Record.

Rowe, P Hartlepool : Tees Archaeology, 2007, A4 bound document with CD-ROM appendix with full photographic archive.

Work undertaken by: Tees Archaeology

This rapid photographic survey entailed a site visit to each listed building within the district of Middlesbrough. Where access was possible the principal elevation was photographed and indexed on a photographic record sheet. The information was then used to enhance the Tees Archaeology Historic Environment Record. [OASIS(Au)]

SALTBURN VALLEY GARDENS***An Historic Building Survey of Greenhouses at Salburn Valley Gardens***

Sherlock, S J York : Stephen Sherlock, 2007, A report comprising twenty pages, spiral bound with information relating to a survey of greenhouses at saltburn by the sea. The report includes a desktop assessment, two figures to show the location of the site and direction of photographs. There are five

Work undertaken by: Stephen Sherlock

This project involves a historic building survey of two greenhouses, the survey was undertaken prior to their demolition. The survey found that one of the buildings had been built c.1863 as part of the creation of gardens at Saltburn by the Sea. The gardens were created by the Saltburn Improvement Company. The survey involved providing a photographic record of the buildings prior to demolition. In addition to the survey, a desktop assessment was undertaken examining the records at Tees HER, Teesside Archives and local publications and journals. The NMR was also consulted, but had no records of the greenhouses. [OASIS(Au)]

CROSS KEYS, LEVEN BANK ROAD, YARM***Historic Building Survey at The Cross Keys, Leven Bank Road, Yarm***

Walsh, D Barnard Castle : Brigantia Archaeological Practice, 2007, 35pp, colour pls, figs, tabs, refs

Work undertaken by: Brigantia Archaeological Practice

Building recording was undertaken prior to demolition of much of the site for a residential development. The condition of the surviving buildings on the site was precarious, having been subjected to vandalism and looting since their abandonment in the early 1980s. It was possible that a medieval mill stood somewhere on the site. It was known that one existed in 1637. Cartographic sources indicated that the buildings had been established on the site by 1771, and it was thought reasonable to assume that one of these was the Mill House, extant on the site. Leven House presented more of a problem to interpret, due to the rendering or removal of the external elevations. A single section of wall showed the earliest phase of construction to be contemporary with Mill House, during the middle of the 18th century. [Au(adp)]

Ridings, C Lancaster : Oxford Archaeology North, 2007, 37pp, colour pls, figs, tabs, refs

Work undertaken by: Oxford Archaeology North

The building investigation and rapid desk-based assessment revealed that the church was built in the early 20th century, with construction beginning in 1909 and the Lund Tower built two years later. Structurally, the design of the building changed very little and fell into disuse with the building of a new church in the area. [Au(adp)]

Morriss, R Bromlow : Richard K Morriss & Associates, 2007, 51pp, pls, figs refs

Work undertaken by: Richard K Morriss & Associates

The Hall as mainly of 18th and 19th century date and built of brick, but encapsulated some fragments of a medieval manor house. None of the farm buildings known to have existed both on and outside the moat island survived. The building was in a poor state and had been subject to vandalism and arson attack. There were plans to restore the building for residential use. The building was Grade II* Listed and the site was a Scheduled Ancient Monument. [Au(adp)]

Cracknell, P Cockermouth : Philip Cracknell, 2008, 1p

Work undertaken by: Philip Cracknell

A building survey was undertaken on a range of farm buildings prior to their conversion. The farmhouse itself was probably built in the second half of the 18th century but incorporated a datestone of 166(?) from an earlier house. An original stone-built barn was also found to be of 18th century date, while the remaining outbuildings were shown on maps of 1863 and 1900. The farm was used for a market gardening business and later a builders' yard after its closure in the 1950s. [Sec]

THE OLD STATION, SILLOTH***The Old Station, Silloth, Cumbria. Archaeological Building Investigation***

Taylor, K Lancaster : Oxford Archaeology North, 2007, 22pp, colour pls, figs, tabs, refs

Work undertaken by: Oxford Archaeology North

The building was found to date to at least 1856, when the Carlisle to Silloth railway was opened. There appeared to be four phases of building and alteration at the site, commencing with the construction of the station buildings prior to 1856. The layout appeared to have stayed much the same since. The doorway was widened, the roof recovered and the blocking of all doors and windows comprised the final three phases, all of 20th century date. [Au(adp)]

Tonks, D & Elsworth, D Lancaster : Oxford Archaeology North, 2007, 1p

Work undertaken by: Oxford Archaeology North

Research undertaken prior to the development of the site for leisure purposes found it had almost certainly been farmed by tenants of Furness Abbey in the medieval period. In the 20th century it was used as a World War II military base and then later occupied by squatters in the 1940s and 1950s. A building survey was conducted on the surviving remains of the military buildings. No significant evidence was found during a subsequent watching brief. [Sec(abr)]

THE FORMER CARLISLE STEAM LAUNDRY AND CARPET BEATING COMPANY BUILDINGS, RIVERSIDE, WARWICK ROAD

Carlisle: The Former Carlisle Steam Laundry and Carpet Beating Company Buildings, Riverside, Warwick Road

Wooler, F Carlisle : Fiona Wooler, 2007, 1p

Work undertaken by: Fiona Wooler

A survey undertaken prior to the demolition of disused steam-powered laundry and dry-cleaning buildings found that the premises were built in 1892, and grew to service the whole of Cumberland. Many of the original buildings were found to survive, built with considerable architectural detail, including moulded brick window heads, coping, bargeboards and shaped gables. The large chimney, which would have dominated the city, was removed sometime in the 20th century. The business ceased to function approximately 30 years ago, and the buildings were subsequently used as retail and office spaces. [Sec]

Longburgh Farmhouse, Longburgh, Burgh by Sands, Carlisle, Cumbria. Archaeological Building Recording Project

Wooler, F Carlisle : Fiona Wooler, 2007, 71pp, colour pls, figs, refs, CD

Work undertaken by: Fiona Wooler

An historic building recording exercise was carried out for the site of Longburgh Farmhouse prior to conversion to dwellings. The survey revealed that the 18th century brick built farm buildings which included a date stone of 1767 originally formed a courtyard, but two of the ranges had been demolished within the last thirty years. The buildings that survived include a former threshing barn, byres, stables,

cart shed with granary above and a good example of a dovecote. The two ranges that had been demolished appeared to have incorporated several cart sheds where locally it was believed brewing was undertaken, although documentary evidence could not confirm this. [Au(adp)]

BARN AT SCALELANDS FARM, PARKSIDE, CLEATOR MOOR*Report on an Historic Building Survey of a Barn at Scalelands Farm, Parkside, Cleator Moor, Cumbria*

Cracknell, P Cockermonth : Historic Building Survey and Archaeological Illustration (HBSAI), 2007, 36pp, colour pls, tabs, figs, CD

Work undertaken by: Historic Building Survey and Archaeological Illustration (HBSAI)

A historic building survey of a range of farm buildings at Scalelands Farm was carried out. The range consisted of a barn and two byres which were to be converted to a single residential unit with a workroom and the survey was completed prior to any building work at the site. There was a farm at the site from at least the second half of the seventeenth century, shown by one of the extensive collection of indentures, or sale contracts, that were in the possession of the present owners. The collection formed an apparently unbroken sequence of documents that detailed the owners of the farm and its development dating back to at least 1700. The farmhouse had probably developed from a cross-passage house, dating from between c. 1660 and c. 1790 in Cumbria, to the present Georgian building, which was remodelled at some date between c. 1770 and c. 1850 to resemble a fashionable house of that period. There was a barn listed among the farm buildings at Scalelands Farm in all of the indentures from 1700. However, this did not mean that the present barn was of that date. The two byres that had been added to the barn were of nineteenth and twentieth century date. The barn and the two byres were burnt down during the 1990s and, as a result, few original details remained. The walls of the barn were rendered both internally and externally and all of the roof timbers were replaced with modern oak. However, the original layout of the barn was still discernible and some original features had survived. The present barn probably dated to either the late eighteenth or early nineteenth century and was first clearly shown on the First Edition Ordnance Survey Map of 1863. It was possible that the barn was erected at the same date as the farmhouse was altered, between c. 1770 and c. 1850. The majority of the farm buildings that existed at the time of survey had been built by c. 1863. The one exception was the long byre adjoining the barn on the western elevation which was only built during the twentieth century. Scalelands Farm ceased to function as a working farm in 2002 and the majority of the buildings had been altered and modernised by the date of the present survey. [Au(adp)]

Barn at Beetham Hall, Beetham, Milnthorpe, Cumbria. Archaeological Building Investigation and Watching Brief
 Ridings, C Lancaster : Oxford Archaeology North, 2008, 17pp, colour pls, figs, tabs, refs
 Work undertaken by: Oxford Archaeology North

The building investigation concluded that the barn dated from the late-18th to early-19th century, and was part of an established farmstead by the mid-19th century. The phases of the barn reflected the change from arable to dairy farming throughout the late post-medieval and early modern periods. [Au(adp)]

Paddy End Dressing Floors, Coniston Copper Mines, Cumbria. Archaeological Survey Report

Schofield, P Lancaster : Oxford Archaeology North, 2007, 80pp, colour pls, figs, tabs, refs

Work undertaken by: Oxford Archaeology North

The survey was carried out to record those elements impacted by floods from a burst water pipe in 2005. The structure most severely affected was a smithy building, damaged and filled with rubble. Below this was a series of ore bins and an area of flagged flooring, both seriously damaged. The main mill building was adversely affected by the flooding and a number of adjacent leats were exposed and destroyed. [Au(adp)]

Although only three buildings survived on the site, physical evidence for the newly demolished No. 32 survived in the party wall of the adjacent building. This building was constructed in 1793 and included a cellar, with other buildings on the street added later. The buildings, especially No. 38 [a purposebuilt shop and warehouse], although unremarkable in style, demonstrated a close architectural link to the large industrial premises in the vicinity. Trippier, J M Preston : J. M. Trippier Archaeological and Surveying Consultancy, 2007, 49pp, colour pls, figs, tabs, refs, CD

Work undertaken by: J. M. Trippier

The subject building was a detached two storey stone structure later used for the stabling of horses. A mid 20th century single storey brick extension had been added to its western elevation. The barn was first shown in its current form on the OS map of 1849 although there appeared to have been earlier versions and the nearby farmhouse had a datestone of 1723.

The barn was a good example of a combination or "Lancashire" barn constructed in the first half of the 19th century. It demonstrated the way that farms were becoming smaller as agriculture gave way to industry, resulting in the replacement of the traditional three bay threshing barn with mixed-use buildings which also housed beasts and restricted grain storage facilities to the loft areas. RIVINGTON HALL BARN***Archaeological recording of the yard at Rivington Hall Barn, Rivington, Lancashire***

Trippier, J M & Price, S Preston : J. M. Trippier Archaeological and Surveying Consultancy, 2007, 41pp, colour pls, figs, tabs, refs, CD

Work undertaken by: J. M. Trippier

An archaeological recording programme was required as a condition of Listed Building Consent in respect of proposed engineering activities in the yard of Rivington Hall Barn. The programme comprised the making of a measured drawing of the yard and a photographic survey. The Barn and its curtilage was a Grade II Listed Building and formed part of a larger complex that included Rivington Hall itself. The yard was found to be a partially cobbled surface which would once have been a focal point for the manorial farmstead at Rivington Hall. It was noted that the cobbles in the south part of the yard were irregular in size, shape and density, whereas those in the northern part were much more regular and neatly laid, possibly in connection with restoration work at the barn in the early 20th century. Darwen Leisure Centre, Darwen, Lancashire. Archaeological Building Investigation

Ridings, C & Tidmarsh, MLancaster : Oxford Archaeology North, 2007, 22pp, colour pls, figs, tabs, refs, CD

Work undertaken by: Oxford Archaeology North

The survey revealed that the baths were built in 1932, and were intended to be used as swimming facilities in the summer months, and as an assembly and dance hall throughout the winter. Aside from minor cosmetic changes, the building remained unchanged till the late 1960s, when it became apparent that the use of the baths as a dance hall was no longer sustainable, as public interest had waned in the preceding decade. Subsequently, the baths offered year-round swimming facilities, and during the late 1970s, was extended to its present size, in order to provide a range of sporting and social activities. Despite the building reaching its Golden Jubilee in 1993, it was clear that the building was in need of investment to survive. In response, money was received during the mid 1990s from both the National Lottery and the local council, which accounted for the modern refurbishment encountered during the survey. [Au(abr)]

THE FARMERS ARMS

The Farmers Arms, Penny Street, Lancaster: Historic building survey report

Watson, C (edited by Sproat, D) Loanhead : AOC Archaeology Group, 2007, Standard historic building report with plans and plates. Bound with blue spine.

Work undertaken by: AOC Archaeology

AOC Archaeology Group were commissioned to undertake a programme of historic building recording at the Farmers Arms in Lancaster prior to its refurbishment. The public house was built as two separate hotels; the Alexandra and the White Cross in the early 20th century. The public house retained many of its original features including plaster ceilings and stained glass, therefore, precipitating the need for an historic building record. The survey comprised a full photographic, written and drawn record. [OASIS(Au)]

HELM MILL, FACTORY LANE, PADIHAM, BURNLEY

Report on an Archaeological Building Survey at Helm Mill, Factory Lane, Padiham, Burnley

Trippier, JM Preston : J. M. Trippier Archaeological and Surveying Consultancy, 2007, 58pp, colour pls, figs, tabs, refs, CD

Work undertaken by: J. M. Trippier

Helm Mill was a simple three storey rectangular stone-built vernacular building typical of the spinning mills that characterised the development of the factory based textile industry of the early 19th century. The upper floors were mainly carried by the load bearing external walls but there were examples of the early use of cast iron columns and a rare example of a beam-engine house although renovations had left little extant technical content. BARCROFT HALL, CLIVIGER

Farm Buildings at Barcroft Hall, Cliviger, Lancashire. Archaeological Building Recording

Haigh, SKeighley : Stephen Haigh Buildings Archaeologist, 2008, 36pp, pls, colour pls, figs, refs, CD

Work undertaken by: Stephen Haigh Buildings Archaeologist

The farm buildings at Barcroft Hall dated from the late 19th and early 20th centuries for the most part although the dominant building, the large barn, was probably remodelled in the 1870s from an earlier, smaller building and later contained a large shippin and stable outshot. The other outbuildings were a group of pig sties, a cart shed, and a former wash-house. The recording work was carried out as required by a condition of planning consent for alterations to Barcroft Hall and the conversion of the barn to dwellings, and comprised drawn, photographic and written records. DOVER FARM, BLACKBURN OLD ROAD, HOGHTON*An Archaeological Building Survey at Dover Farm, Blackburn Old Road, Hoghton, Lancashire*

Trippier, J M Preston : J. M. Trippier Archaeological and Surveying Consultancy, 2007, 59pp, colour pls, figs, refs, CD

Work undertaken by: J. M. Trippier

The building was found to be a stone-built Grade II Listed farmhouse containing a number of development phases beginning in the mid-18th century as a single depth two unit dwelling to which a rear stone-built wing was added resulting in a T-shaped building. Other additions comprised a single storey stone building to the north and a modern conservatory to the south. A stone built porch in the south-east corner may have been part of the original building. The chief interest lay within the original 18th century building which was a good example of a small tenant farmer's dwelling containing stone mullioned windows and massive stone surrounds to doorways and fireplaces. There was also a second floor or attic containing a raised cruck. It seemed likely that the north extension was used as a toll house for the Blackburn to Walton Turnpike of 1755. [Au(abr)]

Historic Building Reording at Accrington Old Fire Station, Manchester Road, Accrington

Trippier, J M Preston : J. M. Trippier Archaeological and Surveying Consultancy, 2007, 57pp, colour pls, figs, tabs, refs

Work undertaken by: J. M. Trippier

The Old Fire Station was a Grade II Listed Building and formed part of a larger complex, including Accrington Police Station and Magistrates Courts, designed by Percy Thomas (later Sir Percy Thomas) in the early 1930s. As such it was an important contribution to the public architecture of a town where 19th century buildings predominated. Taken together with the associated housing that immediately adjoined to the south, the whole complex formed an attractive architectural feature when leaving or entering the town from Manchester and the south. LUNESIDE EAST, LANCASTER***Luneside East, Lancaster. Historic Building Recording***

Mellor, London : Scott Wilson, 2007, 270pp, colour pls, figs, tabs, refs, CD

Work undertaken by: Scott Wilson

The historic buildings survey and historical research revealed that the St. George's Works were of historical importance as evidence for the development of the linoleum and the development of the local economy and industrial base of Lancaster. The works were also of local importance through a close association with Lord Ashton, a major figure in the political and social life of Lancaster in the late 19th and early 20th centuries. Archaeological evidence from the site supports documentary evidence suggesting the development of the site from a range of buildings along the quayside to an extensive site containing a number of mill buildings, warehouses, oil tanks and other facilities germane to the production of linoleum products. Several of the surviving buildings also showed evidence for rebuilding work and redevelopment, much of which may be related to fire damage at the site in the late 19th century. However, of the extant structures at the site, the majority had been heavily modernised or were in a derelict condition and consequently much of the evidence for the production process they once housed, the principal means of power transmission and other original features relating to the manufacture of linoleum had been lost. GREENFIELD YARD, COPY LANE, CATON, LANCASTER***Greenfield Yard, Copy Lane, Caton, Lancaster. Historic Building Record***

Vanner, A Lancaster : Ann Vanner, 2007, 15pp, colour pls, figs, tabs, refs

Work undertaken by: Ann Vanner

The site was made up of three stone barns and five prefabricated concrete garages and was surrounded by 1960s residential bungalows, with Copy Lane and the large stone building of Willow Mill to the south and mid-19th century cottages to the north and east. Historical map research indicated that some of these buildings may have dated from at least 1844-5. The function of the barns had over the years changed considerably. Since the 1970s the barns had been sub-divided and been used by a joinery firm,

an upholstery business and as a haulage yard. The barns include a large barn with attached shippens, a stable cart shed with loft and a small barn. All three are stone barns, 2 still with a slate roof. [Au(adp)]

THE FARMERS ARMS, PENNY STREET, LANCASTER

The Farmers Arms, Penny Street, Lancaster. Historic Building Survey Report

AOC Archaeology Group Twickenham : AOC Archaeology Group, 2007, 16pp, colour pls, figs, refs, CD

Work undertaken by: AOC Archaeology Group

The Farmers Arms was originally built in two phases as two separate hotels, the White Cross and (later and to the north) the Alexandra, both of which were built in the Edwardian Renaissance revival style. The building was a fine example of a large urban hotel of this period and reflected the prosperity at the turn of the 20th century in the tourism industry of Lancaster and its proximity to Morecombe Bay. The interior of the building had been refurbished in recent years which had concealed many of the original features such as former fireplaces, and later timber partitions and en suite bathrooms had altered the original layout of the building. However, the building still retained some of its original features such as some fine stained glass windows, moulded arched doorways and cornices. [Au(abr)]

THE CASTLE HOTEL, MAIN STREET, HORNBY

The Castle Hotel, Main Street, Hornby, Lancashire. Archaeological Building Recording

Elsworth, D Ulverston : Greenlane Archaeology Ltd, 2007, 89pp, colour pls, figs, tabs, refs, CD

Work undertaken by: Greenlane Archaeology Ltd

The building recording revealed seven clear phases of development of the site, the last six of which could have been clearly associated with standing elements of the building. The earliest corresponded to a datestone of 1687, but there was evident re-use of materials within this. The site grew quickly in the 18th and early 19th century, reaching almost its present extent, with the addition of first a purpose built inn and then a large function room. During the later 19th century only essentially agricultural buildings were added, and in the 20th century the majority of the alterations were relatively minor, although many were detrimental to the original character of the building. KIRK HOUSE

Report on a Archaeological Building Project at Kirk House, Over Kellet, Lancashire

Wooler, F Nenthead : North Pennines Archaeology Ltd, 2007, Bound report with plates and figures.

Work undertaken by: North Pennines Archaeology Ltd

In March 2007, North Pennines Archaeology Limited was commissioned by Walling UK Properties to undertake a Level 3 Building Survey at Kirk House, Over Kellet, Lancashire. The survey was concerned with redundant farm buildings, which are regarded as being of historical and archaeological interest, prior to their conversion to dwellings. The survey revealed that at least one of the buildings, an example of a 'Lancashire Barn', was present on the site in 1840, but probably dates to much earlier, possibly the eighteenth century. The Lancashire barn is a typical example of a combination barn having been used to house several functions, i.e. hand-flail threshing, storage of processed and un-processed crops and a cowhouse and root store with loft above. Two further buildings were added to the western side of the site in the nineteenth century, these included a cowhouse or stable with granary above, and a further barn possibly to store either machinery or crops. As well as the farm buildings that were the subject of the present survey, several other buildings on the site date to the nineteenth century or earlier including the farmhouse which has a possible re-used date stone of 1676, and a nice example of a folly which incorporated two pig sties and a hen house amongst other functions. Ridings, C Lancaster : Oxford Archaeology North, 2007, 108pp, colour pls, figs, tabs, refs

Work undertaken by: Oxford Archaeology North

An investigation of the 14 buildings making up the farm complex was carried out and concluded that the majority dated to the 20th century. However, three were singled out due to their architectural and historical merit, the Grade II Listed Building Four, dating to the late 17th century, whilst Buildings Five and Six, the farmhouses, were also worthy of note, potential dating to the late 18th century. It was advised that these three buildings should be retained and incorporated into the proposed park and ride scheme. [Au(adp)]

AGRICULTURAL BUILDINGS AT BURROW HEIGHTS FARM, BURROW HEIGHTS LANE, SCOTFORTH

Historic Building Record. Agricultural Buildings at Burrow Heights Farm, Burrow Heights Lane, Scotforth Lancaster

O'Flaherty, C J Preston : C. J. O'Flaherty, 2007, 49pp, colour pls, figs, refs, CD

Work undertaken by: C. J. O'Flaherty

The farmstead of Burrow Heights Farm comprised a collection of domestic and agricultural buildings set amidst rural fields. Principal amongst these buildings were two houses (later divided into two dwellings) dating from the seventeenth century. The northernmost house, known as the Burrow Heights Farm Cottages, retained purely domestic status, whereas the southern house remained part of Burrow Heights Farm which later managed a dairy herd. This farming activity, which was scheduled to cease, utilised some of the aforementioned agricultural buildings which mostly dated from the nineteenth century. These buildings included a barn attached to the house, a small combined shippon, cart shed and store, a separate barn with shippon and a small former stable block. [Au(abr)]

KING HENRY'S PARLOUR

King Henry's Parlour, Bracewell, Lancashire. Archaeological Building Recording

Haigh, SKeighley : Stephen Haigh Buildings Archaeologist, 2007, A4 comb bound report with A1 figures; also pdf version

Work undertaken by: Stephen Haigh

King Henry's Parlour is a barn converted from part of a high status house, probably of 15th century date and closely associated with the former Bracewell Hall, north of Barnoldswick (NGR: SD 86254840). Numerous early features survive within the building including stone doorway and window surrounds and early king-post roof trusses, but the layout of the original building remains uncertain. The recording was carried out for the owner Mr T Smeeth in October 2007, to inform an anticipated planning application for its conversion to a dwelling. [OASIS(Au)]

BARN AT NEW LAITH FARM, TRAWDEN***Historic Building Record. Barn at New Laith Farm, Trawden***

O'Flaherty, C J Preston : C. J. O'Flaherty, 2007, 28pp, colour pls, figs, refs, CD

Work undertaken by: C. J. O'Flaherty

Situated on open moorland within the Forest of Trawden, above and to the east of Hollin Hall, Trawden, the farmstead at new Laithe Farm comprised a two storey house with an attached stone built barn and a modern detached steel framed store structure. Historic map research revealed that buildings in the same position occupied the site in the mid-nineteenth century, however, the layout of those depicted did not appear to match the extant structures. Since mapping of the late nineteenth century seemed to correlate more closely with what remained on site, it was fair to presume that perhaps the house and/or the barn were altered during the latter half of the nineteenth century (indeed one or both may have been rebuilt). BARN AT OLD JOSEPH'S FARM, COLNE ROAD, TRAWDEN

Historic Building Record. A Barn at Old Joseph's Farm, Colne Road, Trawden

O'Flaherty, C J Preston : C. J. O'Flaherty, 2007, 28pp, colour pls, figs, refs, CD

Work undertaken by: C. J. O'Flaherty

Old Joseph's farmhouse exhibited features that suggested it may have been built during the early eighteenth century (or before). The barn, too, may have had parts that dated back this far, however, significant extension of the building, probably dating from the end of the nineteenth century, served to obscure the nature of the original form. Despite this confusion, the barn may be described as comprising six structural bays split into two three-bay parts by a central division wall. The eastern part, deeper than the western part, contained the remains of cattle stalls to its eastern bay (loft above removed), aside a central cart entry and western storage bay. The western part, lower and smaller, had been stripped of all interior features, its roof having collapsed, but also retaining evidence of mixed animal housing (possibly stabling) and storage use. Built of local stone, with gabled roofs covered in stone slate, the barn appeared not too dissimilar to buildings of similar age and function in the vicinity, albeit the nature of past development posed some unanswered questions as to the sequence of construction. WINEWALL FARM BARN, LANETOP WINEWALL, COLNE**Historic Building Record. Winewall Farm Barn, Lanetop Winewall, Colne**

O'Flaherty, C J Preston : C. J. O'Flaherty, 2007, 25pp, colour pls, figs, refs, CD

Work undertaken by: C. J. O'Flaherty

Winewall farm was situated in the hamlet of Winewall, a mile north of Trawden and two miles south east of Colne. Occupying an elevated hillside site immediately north-west of the former Winewall quarry, the farm was believed to date back at least to the seventeenth century and comprised a collection of buildings, including the farmhouse (probably 17th century, later sub-divided into separate cottages) and a range of barns and outbuildings. Principal amongst these agricultural buildings was an extended barn, of which the oldest part could well date back to the C18th. The barn comprised two distinct adjoined parts, both gable ended and rectangular in plan and of similar twin storey size. The northern of these was the oldest part and the southern was an extension dating from the nineteenth century. In addition, there was a further small shippon extension, and in more recent times, lean-to additions of a temporary nature had been removed. [Au(adp)]

Salvation Army Citadel, Russell Street, Nelson, Lancashire. Archaeological Building Recording

Haigh, SKeighley : Stephen Haigh Buildings Archaeologist, 2008, 31pp, pls, colour pls, figs, tabs, refs, CD

Work undertaken by: Stephen Haigh Buildings Archaeologist

As an example of a small, urban, late 19th century non-conformist chapel the building was largely typical, in that it appeared to have been built simply and plainly, probably both because of the congregation's limited financial means, and religious tenets. The fact that the chapel belonged to the Inghamites, a group with a regional identity, gave the building greater significance however, although this was not borne out architecturally, while the Salvation Army seemed to have left little mark on the building, other than its modernisation undertaken during their use of it over around half a century. 18 YORK STREET

18 York Street, Clitheroe

Taylor, K Lancaster : Oxford Archaeology North, 2007, A4 Document

Work undertaken by: Oxford Archaeology North

Proposals to develop No 18 York Street, Clitheroe, Lancashire (NGR SD 745 40) were judged to affect the original character of this Grade II Listed building (which is within the Clitheroe Conservation Area) and an archaeological condition was attached to the planning consent given by Ribbles Valley District Council. OA North produced a project design for an archaeological building investigation (Appendix 1) in response to a verbal brief issued by the Lancashire County Archaeological Services (LCAS), which was subsequently approved. The Ashworth Burke Partnership acting on behalf of The Grand (part of the Oasis UK Charitable Trust) commissioned Oxford Archaeology North (OA North) to undertake an English Heritage Level III-type building investigation, prior to development works. The subsequent map regression analysis and building investigation has revealed that the town house dates to at least 1847, when it is illustrated on the earliest available Ordnance Survey map which is of this date. It was apparent that the general layout of the house had not altered greatly since its construction and the only major changes were the addition of a rear extension and some minor changes to some of the internal rooms. There appeared to be three phases of building and alteration at 18 York Street commencing with the construction of the house sometime prior to 1847, and possibly some decades earlier than this. Phase two included the addition of the rear extension, which according to map evidence dated to between 1886 and 1912. Phase three consisted of minor modifications to some of the internal rooms and late twentieth century alterations. During the building investigation, no significant archaeological features or historical evidence was discovered which warrant further investigation. A recommendation has been made for a number of original features to be preserved in situ including a hob grate fireplace, a range in the kitchen, and original window, door and oven in the basement. KEARNS MILL, COWPE, NR WATERFOOT, ROSSENDALE*Kearns Mill, Cowpe, Nr Waterfoot, Rossendale in Lancashire. Archaeological Building Survey*

Trippier, J M & Baldwin, S J Preston : J. M. Trippier Archaeological and Surveying Consultancy, 2008, 48pp, colour pls, figs, tabs, refs, CD

Work undertaken by: J. M. Trippier

Prior to this survey there had been little detailed recording of sites associated with the dyeing and bleaching processes. Kearns Mill was built in c.1780, enlarged in 1830 and largely destroyed by fire in 1876. The survey provided an opportunity to add substantially to the body of knowledge on this branch of the textile industry. Evidence for twentieth century bleaching and dying at Kearns Mill was recorded and testimony from former employees described the process and confirmed that Blocks B, E, C, D and latterly A5 were used for dying wool mechanically and Blocks A and A1 were used for dying cotton. BRITANNIA MILL, MILL STREET, HOLDEN VALE, HASLINGDEN*Britannia Mill, Mill Street, Holden Vale, Haslingden*

Trippier, J M Preston : J. M. Trippier Archaeological and Surveying Consultancy, 2007, 64pp, colour pls, figs, refs, CD

Work undertaken by: J. M. Trippier

An archaeological building survey was carried out at the site, a former mill. The mill was found to have been built in the 1850s and comprised a cotton weaving shed with a 3 storey preparation and warehouse block, which was extended in the early 20th century, and a power plant comprising an engine house, boiler house and square stone built chimney. Although latterly used for the shoe trade the mill was a good example of the weaving mills that were being built at the height of the cotton trade expansion in the mid-19th century and was an evocative reminder of Haslingden's industrial past. Mike Griffiths & Associates Ltd York : Mike Griffiths and Associates Ltd, 2007, 48pp, colour pls, figs, tabs, refs

Work undertaken by: Mike Griffiths and Associates Ltd

The structure was built as a private house possibly in the late 18th century but was heavily remodelled in the 19th century, first to serve as the Brighton Proprietary School, and then as the Brighton Carlton Club. The latter change saw the demolition of a number of structures at the rear of the property to make way for the construction of a single storey billiard room and part glazed corridor. From 1928 the property was owned by the Sussex Motor and Yacht Club who were responsible for further internal changes to the layout of the ground floor and remodelling of the yard area in addition to changes to the upper stories. The application proposed to essentially refurbish the Listed Building with minimal impact to the historic fabric and a positive impact on the building as a whole. The proposal does not involve extensive groundwork which would have a potential impact on deposits outside the footprint of the current building. [Au(abr)]

Prentice, J, Soden, I, Walker, C & Harding, J Northampton : Northamptonshire Archaeology, 2007, 127pp, colour pls, figs, refs

Work undertaken by: Northamptonshire Archaeology

A building recording and analysis was conducted at New Inn Farm, an early 18th-century brick and timber-built farm and former lodging house. The farm was purchased by the National Trust in 2005 with a view to restoring it to the public attention. At the time of purchase it was in a state of near-dereliction and parts were in an advanced state of decay or total ruin, with only the main house and dairy fully roofed. The farm formed a compact rectangular group around a central courtyard with an ancillary courtyard adjacent. Previous recording through 2005 and 2006 had been undertaken to inform the compilation of a Conservation Plan for the property and to safeguard aspects of its structure which may not have survived stabilisation or conservation works without major alteration or intrusive consolidation. NEWTON BARN, LAVENDON MILL*Historic Building Recording and Watching Brief. Newton Barn, Lavendon Mill, Olney, Milton Keynes*

Simmelmann, K Milton Keynes : Archaeological Services & Consultancy Ltd., 2007, Bound A4 report

Work undertaken by: Archaeological Services & Consultancy Ltd.

In July 2005 Archaeological Services and Consultancy Ltd (ASC) carried out historic building recording of Newton Barn, Lavendon Mill, Olney, Milton Keynes in response to proposals for the conversion of buildings on the site. Newton Barn is a three bayed, aisleless barn built of Blisworth Limestone under a corrugated tin roof. It stands in an elevated position immediately to the north of the River Ouse. The architectural features of the barn suggest that it was built in the early 18th century. It would appear from the cartographic evidence that the mill went into decline in the late 19th century, when the structures adjacent to Newton barn were demolished. The barn was converted to animal shelters and subsequently vehicle storage in the 20th century. The lack of any surviving foundations or rubble from the earlier buildings to the east of the barn may be either due to their complete removal during demolition, or that the buildings were of a more superficial constructional form that would have left little in the archaeological record. The evidence from the watching brief, which was undertaken in 2006, suggests that there had been several episodes of ground disturbance, including terracing to the south of the property. This is likely to have destroyed any evidence for earlier human activity on the site. [OASIS(Au)]

YPRES TOWER, RYE*An Archaeological Interpretative Survey of Ypres Tower, Rye East Sussex*

Martin, D & Martin, B Portslade : Archaeology South-East, 2007, 121pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeology South-East

Recent accounts of Ypres Tower had been based upon earlier work, mostly unprovenanced, and upon un-referenced hearsay. In an attempt to re-assess the structural evidence, in 1996 Rye Museum Association commissioned a new archaeological survey of the building. This was programmed to coincide with repairs being made by the owners thereby allowing information to be recorded during the temporary opening up of the roof structure for essential repairs. Further targeted recording work was undertaken as part of a programme of limited alterations and repairs undertaken during the period 2005-2007. The three principal elements of these alterations were the heightening of the external walls to change the fall on the top, the re-opening of the original entrance doorway and the conversion of the late intruded entrance within the north-eastern turret back to a window. BUNCES, BLACKBOYS, FRAMFIELD

An Archaeological Interpretative Survey of Bunces, Blackboys, Framfield, East Sussex

Martin, D & Martin, M Portslade : Archaeology South-East, 2007, 21pp, pls, colour pls, figs

Work undertaken by: Archaeology South-East

An interpretive building survey was carried out Bunces, Blackboys. The house dated from the mid-16th century and was upgraded in the mid to late 17th century, when heating systems were added. In the second half of the 18th century two brick-built lean-to outshuts were added and the ground-floor part of the front wall was rebuilt in Flemish-bonded brickwork, the upper part was tile hung, and a two-flue chimney added. It may also have been at this date that dormer windows were inserted into the front slope of the roof, though this could have occurred subsequently. By the date of the 1840-41 tithe award, the house had been downgraded and converted into three cottages. [Au(abr)]

GRANGE FARM HOUSE, FRAMFIELD

An Archaeological Interpretive Survey of Grange Farm House, Framfield, East Sussex

Martin, D & Martin, B Portslade : Archaeology South-East, 2007, 27pp, figs

Work undertaken by: Archaeology South-East

A building survey was undertaken on Grange Farm House. The earliest recognizable phase of the house was no longer extant, its existence being evidenced by weathering courses built into the axial chimney. The original cottage was an exceptionally low single-storied structure which had its principal room on the eastern side of the chimney. The western end of the present house was constructed c. 1635. During the first half of the 18th century the two-storied main range was updated by the replacement of its timber-framed ground-floor walls in Flemish bonded brickwork, and the application of tile hanging to the timber-framed first-floor walls and stub gables. Little further work seem to have been carried out

on the house until the mid 19th century when the rear lean-to outshut was removed and replaced by a two-storied rear range housing two rooms on the ground floor with three chambers above. [Au(abr)]

LOUDWELL, TINKERS LANE, MAYFIELD

An Archaeological Interpretative Survey of Loudwell, Tinkers Lane, Mayfield, East Sussex

Martin, D & Martin, B Portslade : Archaeology South-East, 2007, 20pp, colour pls, figs

Work undertaken by: Archaeology South-East

A building survey was undertaken at Loudwell Farm. To the north of the building was a yard with a stable and modern garage, and until the late 20th century a traditional hip-roofed timber-framed barn and modern concrete-framed farm building also stood within the yard. To the north-west of the house and west of the former barn is a further farm building, later converted to domestic use. It was a two-storied 19th-century structure, principally brick built, of which the upper storey either represented the reconstruction in brick of a timber framed part or a heightening of the original. Externally the outhouse was of traditional appearance, but with all window frames replaced. Internally all features which may once have been of interest had been removed. [Au(abr)]

BROWNDOWN COTTAGE, HEATHFIELD

An Archaeological Interpretative Survey of Browndown Cottage, Heathfield, East Sussex

Martin, D & Martin, B Portslade : Archaeology South-East, 2007, 17pp, colour pls, figs

Work undertaken by: Archaeology South-East

An interpretive building survey was undertaken on Browndown Cottage, Heathfield. Based upon typological evidence, the present cottage was constructed around 1710. It was unusual in that three of its four external ground-floor walls were built in brick from the outset, though the wall facing the lane and all other elements of the structure were timber framed. It is a long, narrow, rectangular cottage with a hipped thatched roof. The house appears to have been divided into two unequal-sized cottages in the

19th century, at this time a northern end lean-to outshut was added, the chimney was mostly rebuilt and a bread oven constructed. In the 20th century the roof was removed from the northern end lean-to outshut and a second storey added, and number of minor internal alterations were made. [Au(abr)]

An Archaeological Interpretative Survey of the Middle House, High Street, Mayfield, East Sussex

Martin, D & Martin, B Portslade : Archaeology South-East, 2007, 33pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeology South-East

A building survey was undertaken on a timber framed double-cross winged house of modified "H" plan dating from the late 16th century. Around 1700 the house was upgraded by the construction of a stair turret, replacing a more cramped arrangement to the rear of the main chimney. At the same time a lean-to was added adjacent to the turret, to the rear of the hall, in order to give more service accommodation. All clerestory windows were blocked, the front gable over the main hall range was removed and replaced by a small rear gable, and the rear hip over the western crosswing was replaced by a gable. A low-end parlour chamber was increased in size slightly. In 1844 an "M-roofed" single storey extension was added and a small lean-to built against the chimney at the western end. [Au(abr)]

OASTHOUSE AT WALLAND, WADHURST

An Archaeological Interpretative Survey of Oasthouse at Walland, Wadhurst, East Sussex

Jones, G & Martin, M & Martin, B Portslade : Archaeology South-East, 2007, 15pp, colour pls, figs, refs

Work undertaken by: Archaeology South-East

A building recording was undertaken on the oasthouse at Welland. A rectangular farm building, which was itself probably used at least in part as an oasthouse, it was upgraded in the first half of the 19th century when two circular kilns were added. At an unknown date later that century (after 1873) a third kiln was added and the two circular kilns were. In 1912, following a decline in the market for hops, a successful application was made to convert to domestic use the kilns and the area immediately adjacent

to them. Before conversion the oasthouse was modified very substantially on three successive occasions and was then finally robbed of its association with hop-drying following its conversion sometime after 1912. Thereafter the part of the building which had remained unconverted was brought into cottage use; another room was added adjacent to the third kiln at a later date. [Au(abr)]

CHAPEL AT QUIDHAMPTON FARM, STATION ROAD, OVERTON

Chapel at Quidhampton Farm, Station Road, Overton, Hampshire

Rous, M Salisbury : Wessex Archaeology, 2007, 27pp, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

When constructed in the 11th century this simple single-cell flint chapel was likely to have had moulded stone around the door and windows. It was likely that the useful building material was stripped from the chapel and it was possible that it was used as stores or the housing of animals from the 16th-18th centuries. In the 19th century, repairs were made to the walls. [Au(adp)]

MOTE FARM, IGHTHAM*Interpretive Historic Building Survey of Mote Farm, Ightham, Kent*

Henderson, M Portslade : Archaeology South-East, 2007, 34pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeology South-East

A building survey was undertaken at Mote Farm. The farm buildings comprised an inverted U-plan series of brick buildings in three linked ranges arranged around a central courtyard with an earlier stone building occupying the south-western corner of the site. With the exception of the 18th century stone structure, the farm buildings represented a designed farmstead, purpose built to house stock, horses and associated equipment. There had originally been a fourth range just south of the centre of the farmyard which was demolished in the mid-20th century. [Au(abr)]

GARDENERS' BOTHIES, SCOTNEY CASTLE ESTATE LAMBERHURST*Interpretive Historic Building Survey at Gardeners Bothies, Scotney Castle Estate, Lamberhurst, Kent*

Henderson, M Portslade : Archaeology South-East, 2007, 31pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeology South-East

A building survey was undertaken at the Gardeners' Bothies that comprised a long, low, rectangular range of single storey structures built against the northern perimeter wall of an octagonal walled garden. The bothies were constructed in red brick in Flemish bond, the roof was of corrugated sheet metal. There were three phases of construction to the bothies. The first took place in the second quarter of the 19th century and comprised the construction of what is now the central block. The eastern block was added in the late 19th century and the western in recent years. The bothies were a significant part of a larger group of buildings and structures. The group comprised the walled garden, with glasshouses abutting the northern interior wall of the garden, the remains of a now ruinous peach house to the north of the bothies and a series of modern cold frames, greenhouses and poly tunnels all of which represented horticultural development since the early 19th century. HOME FARM BARN, SCOTNEY CASTLE ESTATE, LAMBERHURST*Interpretive Historic Building Survey at Home Farm Barn, Scotney Castle Estate, Lamberhurst, Kent*

Henderson, M Portslade : Archaeology South-East, 2007, 16pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeology South-East

A building survey was undertaken at the barn at Home Farm, a single storey, rectangular, five bay structure. The barn had a central bay (midstrey) originally providing cart access and threshing floor. The midstrey was flanked to the east by a low timber partition situated behind a pair of straight raking shores. The truss posts to the west of the midstrey bore empty sockets which would have housed additional straight shores, both sets providing storage facilities for crops. There was a small open-fronted lean-to built against the southern elevation at the east end of the barn. There were three main phases in the development of the barn, the first of which dated to the late 16th or early 17th century and was represented by the oak frame of the barn, the four trusses, walls and roof construction. The second phase included the addition of raking shores to the west end housed within joints at the front of the corner posts and modifications to the main body of the barn including building in the lean-to. The third phase of development involved the relocation of the barn. Although the barn was of late 16th or early 17th century origin, further developed in the 18th century, was later a 19th century structure re-built from the near complete frame of an earlier barn and associated lean-to directly related to Edward Hussey III's remodelling of the estate in the mid-19th century. AOC Archaeology Group Twickenham : AOC Archaeology Group, 2007, 92pp, colour pls, figs, tabs, refs

Work undertaken by: AOC Archaeology Group

A desk-based assessment suggested that archaeological remains dating to the Roman period may have existed to the rear of the properties as well as evidence dating from the medieval period and post-medieval period, relating to early industrial activities within the burgrave plots of the properties ranging from local to regional significance. A building appraisal suggested that the buildings appeared to be in good condition, having been well maintained. The irregularity of the interior floors, particularly at No. 19, did not appear to affect the stability of the properties. There were a few detailed decorated elements in the properties and No. 17, appeared to have lost one or more of its chimneystacks. [Au(adp)]

THE ABBEY, SUTTON COURTENAY

The Abbey, Sutton Courtenay. Historic Building Investigation and Recording

Underdown, S Oxford : Oxford Archaeology, 2007, 65pp, colour pls, figs, tabs, refs

Work undertaken by: Oxford Archaeology

A programme of historic building investigation and recording was carried out at The Abbey, Sutton Courtenay. This related to a series of interventions made through the render cladding of the building to investigate key points in the underlying timber frame and other historic fabric. This was not designed specifically as an archaeological intervention but was undertaken to enable the architect and engineer to design a programme of conservation and repair. Archaeological recording was necessary as this was a Grade I Listed Building and some interpretation and analysis of the exposed fabric was also requested to add to the information available for formulating the plan of conservation works. The investigation had given valuable information about the condition of the structure and also about the nature of the surviving historic fabric, identifying primary and later phases of framing in some places and different phases and types of infill panel. CHURCH GATE HOUSE, THATCHAM

Church Gate House, Thatcham, Berkshire. Historic Building Assessment

Davis, BSalisbury : Wessex Archaeology, 2007, 28pp, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

The assessment of the Grade II Listed Building revealed several key phases of development, including part of a possible 14th century timber frame. The second phase occupied the west half of the front of the house and was built up against the then existing medieval frame. The house was extensively remodelled in the 18th century, giving it's present form and appearance. It was further extended to the south-west and the east side was raised in height in the early 20th century. [Au(adp)]

47 PARK LANE, SLINDON

An Interpretive Building Recording at 47 Park Lane, Slindon

Martin D & Martin, B Portslade : Archaeology South-East, 2007, 61pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeology South-East

An interpretive building survey was undertaken at Park Lane, Slindon. The building retained the scant remains of an earlier structure of c.1700, incorporated into the end gable walls, and this included the inglenook fireplace and possibly, the main roof. In the late 18th century the house was all but rebuilt with loftier storey heights. The design chosen was classic of its type and period, with a totally symmetrical façade incorporating a central doorway and having end chimneys to its gables. The map evidence indicated that between 1841 and 1876 an added outhouse was demolished from the western end and replaced by a new outhouse built against the garden wall to the east. Almost certainly the attached privy dates from the same period. During the same general period minor alterations were made within the house and the structure was thoroughly overhauled. How much of this occurred at the same time as the outhouse was rebuilt, and how much subsequently, was uncertain. Save for essential repairs and the application of later coverings, few alterations had been made subsequently. None warranted individual note. [Au(abr)]

DUNCTON WATER MILL

Barlavington, West Sussex. Duncton Water Mill Report

Martin, R G Saltdean : Sussex Industrial Archaeological Society, 2007, 14pp, colour pls, figs, refs

Work undertaken by: Sussex Industrial Archaeological Society

Building recording was carried out on the mill. The earliest recorded building on the site was an early mill, constructed between 1347 and 1373, with the later version built in the late 18th century. Milling

ceased in 1920. The structure contained some unusual features, such as the use of brick facing to the lower part of the north and south walls. The grain dust along the ceiling of the stone floor was also unexplained. In general, the three-storey masonry structure of the mill was in excellent condition. [Au(abr)]

Work undertaken by: Archaeology South-East

The Snowhill paddock colt house at Petworth Park was surveyed in February 2007, in order to update the existing vernacular building survey and in doing so to inform the repair of the building. The colt house was square in plan and subdivided into two equal areas. It was constructed of stone with a crenulated parapet on the principle east and west elevations. The north and south elevations were built of coursed square rubble on a stone plinth. It was a single storey structure with a hay loft located within the central part of the building. The building was in a ruinous state with the majority of the roof and loft floor lost. The colt house was built in the mid-19th century along with another colt house of similar design, which was located nearby. These replaced earlier colt houses constructed on the estate. [Au(abr)]

THE GEORGE, HIGH STREET, CRAWLEY

An Archaeological Interpretative Survey of the George, High Street, Crawley, West Sussex

Martin, D & Martin, B Portslade : Archaeology South-East, 2007, 44pp, pls, figs

Work undertaken by: Archaeology South-East

Building recording was carried out on The George. The building had been in continuous use since it was built in the late 14th century. The modern internal layout bears little relationship to the original layout of the building and by the fact that the majority of historical fabric was masked from view behind later, mostly modern plaster wall finishings. Some historical timber framing remains were exposed, particularly, but not exclusively, within the ceilings of the ground-floor rooms. This timbering was visually compromised by archaic-looking fabric which had been introduced into selective areas in modern times. [Au(abr)]

Prosser, L, Collins, T, Henry, K & Barton, THertford : Archaeological Solutions, 2007, 42pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Solutions

Nearby Hall Place dated at least from the early 17th century, and was depicted on a map of 1609. The assessment site had a long association with Hall Place, being called Hall Place Farm throughout much of its history. The buildings comprised a narrow range including livestock shelters and stores. This, along with the eastern extent of the range, represented a single building phase with later modifications and alterations. Its construction was in keeping with a mid-19th century date, confirmed by the historic map evidence which indicated a date range between 1843 and 1889. The range preserved characteristics of model farm construction, prevalent during the 19th century. Several interesting structural features survived, including Baltic bracking marks on many roof timbers, giving a Polish origin for the timber used on the principal roof trusses. The side-sliding window form was of interest and a well preserved example was observed. [Au(abr)]

114 ST. MICHAEL'S HILL, KINGSDOWN, BRISTOL***114 St. Michael's Hill, Kingsdown, Bristol. An Historical Building Report***

Whittingham, S Bristol : Dr. Sarah Whittingham, 2007, 17pp, colour pls, figs, tabs, refs

Work undertaken by: Dr. Sarah Whittingham

The site was located on a main route from medieval Bristol towards Gloucester and Wales. It was developed from the 15th century, and during the 17th century a number of garden houses were built. Further development was followed by demolition and redevelopment of much of the site after the Second World War, with the inappropriately large and bulky modern intrusion of St. Michael's Hospital constructed in 1975, as well as pressure from other hospital and university building plans. Number 114 was located within the St. Michael's Hill and Christmas Steps Conservation Area. [Au(adp)]

THE KEEP, TREGANTLE FORT

The Keep, Tregantle Fort, Anthony, Cornwall. Building Recording and Investigation

Mumford, J Oxford : Oxford Archaeology, 2008, 142pp, colour pls, figs, tabs, refs, CD

Work undertaken by: Oxford Archaeology

Tregantle was constructed between 1859 and 1864 and it was intended to be one of three forts on the Antony line defending the western side of Plymouth Dockyard. Only two of these forts were constructed, the other one being Scraesdon. The fort was intended to be armed with 87 guns but it appeared that a relatively small proportion of these were actually fitted. By 1895 it was known that six 64 pdr rifled muzzle-loading guns had been installed in the Keep, five of which were on the roof and the other is thought to have been fitted in Room 16A to cover the drawbridge. In 1903 the Fort became an infantry battalion headquarters and in the Second World War it was used by the US Army. [Au(abr)]

PARISH CHURCH OF ST. JAMES, TORPOINT

Archaeological Assessment of the Parish Church of St. James, Torpoint, Cornwall

Manning, P Exeter : Exeter Archaeology, 2007, 4pp, refs

Work undertaken by: Exeter Archaeology

An archaeological assessment was made of the proposed interior works at the parish church of St. James. The church was Grade II Listed. The only element of the proposed works that might have had an archaeological impact was the re-siting of the font, which necessitated the excavation of a small drainage pit at the new location. It was possible that evidence of former internal structural features or fixtures, including earlier floors, could be encountered, but the work involved was so small-scale that this was unlikely to cause any significant damage. ST. ANDREW'S CHURCH, FENITON***Initial Archaeological Report on the South Aisle Roof of St. Andrew's Church, Feniton***

Allan, J Exeter : Exeter Archaeology, 2007, 4pp, refs

Work undertaken by: Exeter Archaeology

A building recording was undertaken on the roof of the church, The evidence was that the primary roof over the south aisle, built c.1520-55, survived largely intact, however, much of its moulded timber ceiling had been concealed or removed. It was possible that further examination could reveal a more complex picture. Either repairs to the trusses and purlins, or the removal of the original boarded ceiling, perhaps even both, may have reflected undocumented repairs before the 1870s. It was also possible that the medieval roof would prove to consist of more than one phase of work. All these possibilities should be capable of resolution by more extensive and detailed examination. Wakeham, C S Exeter : Exeter Archaeology , 2007, 9pp, refs

Work undertaken by: Exeter Archaeology

A building assessment was undertaken prior to redevelopment. The building had previously been identified as being a former tannery, but this was erroneous. Only a small portion of pre-1841 stone walling could be identified. The bulk of the structure dated to the period 1841-1888 when it was probably built as a boot and shoe factory although an extension to the bakery premises was another possibility. The building range did contain a number of construction phases, although all but one of them were dated post 1841. [Au(abr)]

WESTCOTT BARTON, THELBRIDGE, NEAR TIVERTON

Dr

Allum, C Wincanton : Context One Archaeological Services Ltd 2007,

Work undertaken by: Context One Archaeological Services Ltd

Westcott Barton is an important example of a Devon farmstead with late medieval to early post-medieval origins. The farmhouse originates as a cross-passage house probably dating from the 16th century, consisting of a hall, with an inner room to the west and a cross-passage to the east. The service end to the east of the cross-passage is probably part of the original building, with a pegged jointed cruck roof, which is almost identical to that exposed above the first floor rooms over the hall and inner room. Although the service end may be slightly later, the byre and hayloft is certainly contemporary with it. The recently exposed roof trusses in the first floor rooms above the hall and inner room are heavily smoke blackened. However, the farmhouse was most likely a partially open rather than a fully open hall. Seventeenth century additions include the addition of a chimney in the northeast corner of

the hall, the first floor and northern stair turret. Later alterations include the construction of the brick bread oven and smoking chamber at the northern end of the cross-passage; the late 18th/ early 19th century western extension; the 19th century dairy, and the raising of the eaves by several courses in the late 19th century. The south range byre and linhay probably date from the 17th century, whilst the north range linhay barn attached to the east of the farmhouse is thought to be 17th to 18th century. The farmbuildings have undergone numerous alterations, additions and demolitions. [OASIS(Au)]

Green, T & Laing-Trengrove, D Kentisbury : South West Archaeology , 2007, 20pp, colour pls, figs, tabs, refs
Work undertaken by: South West Archaeology
A building was known on the site since before 1833, however, the extant structure was not all dated to one period. Although the footprint of the building appeared to have remained the same since the early 19th century, the form and function of the building had changed over time and may have altered from domestic to agricultural use. UMBERLEIGH BARTON, ATHERINGTON
Archaeological Recording of Redundant Agricultural Buildings at UMBERLEIGH BARTON, Atherington, Devon
Watts, M Cullompton : Martin Watts, 2007, 38pp, pls, figs, refs
Work undertaken by: Martin Watts
The group of traditional agricultural buildings represented several phases of farming activity over a period of at least 250 years. The buildings were used for grain processing and storage as well as livestock, predominantly cattle, and reflected the system of convertible husbandry that was dominant in Devon over this period. The buildings were of stone and cob, with most originally having thatched roofs, later replaced with corrugated metal sheeting. The carpentry of the roofs and floors was generally rustic in appearance, using locally sourced timber with interesting and distinctive structural features. [Au(adp)]

FARDEL MANOR, CORNWOOD*Initial Report on the Medieval Chapel at Fardel Manor, Cornwood*

Allan, J Exeter : Exeter Archaeology, 2007, 17pp, figs, refs

Work undertaken by: Exeter Archaeology

In a county where little church fabric survived from the 13th century, the presence of the entire shell of the chapel at Fardel in a form little altered from the day it was built was a remarkable survival, and one whose significance had not been recognised by architectural historians of the church in Devon. The rather tentative Listing description and the brief note by Pevsner (1989) hardly did justice to the building, as perhaps the best-preserved 13th-century church in Devon. Prior to restoration in 1960, a feature was its primitive common rafter roof with scissor braces, which was likely to have been contemporary with the early 13th century fabric of the chapel. THE TOWER AND SPIRE OF ST. MARY'S CHURCH, DIPTFORD*Devon Archaeological Society Proceedings No. 65 2007, The Tower and Spire of St. Mary's Church, Diptford pp 105-121.*

Allan, J & Wakeham, C Exeter : Devon Archaeological Society, 2007, 17pp, pls, figs, refs

Work undertaken by: Exeter Archaeology

In 2007 the tower and spire of St. Mary's Church of Diptford parish church were stripped of modern cement exposing their medieval fabric and allowing them to be examined in detail. Architectural drawings of their structure were made and a study of the geology of their fabric was carried out. Contrary to some earlier accounts the study concluded that the tower and spire had been built together, probably in the early 14th century. The western window in Perpendicular style and the label above the western doorway were found to be subsequent insertions. [Sec(adp)]

PARADISE COTTAGE, TOTNES

Archaeological Building Survey of Paradise Cottage, Totnes, Devon

Bell, J S & Wakeham, C S Exeter : Exeter Archaeology , 2007, 12pp, tabs, refs

Work undertaken by: Exeter Archaeology

A building recording was undertaken on Paradise Cottage, Totnes prior to alterations. The complex evolution of Paradise Cottage was owed, in part, to the premises' creation from multiple burgage plots. The main part of the building probably originated as a small outbuilding, perhaps only single storey, for the merchant's house facing onto Fore Street. The building was enlarged to create either a larger two-storey warehouse, or some form of service or industrial building. This in turn appeared to have been enlarged with two extensions to the west. The first of these extensions was later raised in height and it was probably at this stage that the building was converted to a dwelling. Some areas of stonework were not exposed and if these were to be investigated in the future, further interpretation may be possible. [Au(abr)]

NORTH HARTON FARM, LUSTLEIGH*An Archaeological Assessment of North Harton Farm, Lustleigh, Devon*

Allan, J Exeter : Exeter Archaeology , 2007, 4pp

Work undertaken by: Exeter Archaeology

A building survey was undertaken which provided information about the date of the northern end of the house, and to consider the possibility that this may have incorporated parts of the traditional farmhouse, notably the shippin. The northern end of the farmhouse was undoubtedly a modern addition— either of late 19th or early 20th-century date. Its features suggested a likely date as late as c. 1900–30. This conformed with the map evidence. The remainder of the farmhouse was a well-preserved example of the early modern farmhouse with a three-room-and-cross-passage plan, for which a date between the c. 1550 and 1650 was thought probable. LEATHERTOR FARM, WALKHAMPTON*Survey and Report on the Ruined Leathertor Farm, Walkhampton*

Wakeham, C S Exeter : Exeter Archaeology , 2007, 26pp, refs, index

Work undertaken by: Exeter Archaeology

Lowery barn was a tall, imposing, gable-ended structure (of 8.2m in height to the apex) with fine granite quoins. These characteristics may also have been present at Leathertor. The ground floor was composed of shippin, feed passage and root store, entered via five equally spaced doorways. The rear wall featured two openings, a slit window and a root chute/turnip hole. Above was the threshing barn with opposing doorways and typically entered via a bank behind. It had a slit window in either gable end. It was also fitted with two date stones, reading "M.L." (Massey Lopes) and "1873" in similar script to that of Leathertor farmhouse. Leathertor barn would probably have had at least one inscribed stone. [Au(abr)]

CANNOP FOUNDRY, CINDERFORD

Cannop Foundry, Cinderford, Gloucestershire. Historic Building Survey

Sims, M Oxford : Oxford Archaeology, 2007, 40pp, pls, figs, refs

Work undertaken by: Oxford Archaeology

The work was commissioned in advance of the proposed redevelopment of the site, which would involve demolition of all the former foundry buildings. The site was originally constructed for "The Bilson Gas Light Co." in the 1880s before being vacated in the 1940s and Cannop Foundry acquiring the site in 1957. There were eight buildings surviving, some of which had acquired major extensions during the life of the foundry. They range from small stores to very large brick and stone built workshops, of which three were originally part of the earlier gasworks. One of the workshops was constructed using coursed limestone blocks for the first 3 m of height with later brick courses added to increase the height and rebuild the gables. The second workshop was built using only brick with a series of 20 round topped windows along the top of each side. The larger workshops display signs of continuous adaptation and alteration over their working life. Their original roofs have been replaced with steel roof trusses and asbestos sheeting, probably during the same time as the extensions were added. [Au(abr)]

THE STILL ROOM WITHIN THE PLYMOUTH GIN DISTILLERY, SOUTHSIDE STREET***An Architectural Survey of the North East Corner of the Still Room Within the Plymouth Gin Distillery, Southside Street, Plymouth***

Jones, P Exeter : Exeter Archaeology, 2007, 4pp, colour pls, refs

Work undertaken by: Exeter Archaeology

The proposed work involved the removal of small amounts of stonework to house the terminals of a number of horizontal steel supports within both wall elevations. None of the stonework that would be affected was associated with any features recognisably earlier than the 19th century, and such features that were visible appeared to be industrial rather than domestic. The irregularly coursed limestone walling that was projected to be removed in the course of the works could well have formed part of the primary fabric of the building, which may be of 16th-century date, but the lack of any diagnostic features within these walls meant that the proposed works would not mean the loss of fabric essential to the future interpretation or understanding of the structure. 25-29 COMMERCIAL STREET*25-29 Commercial Street, Birmingham. Building Recording and Documentary Research*

Hislop, M Edgbaston : Birmingham Archaeology, 2007, 40pp, colour pls, figs, refs

Work undertaken by: Birmingham Archaeology

The study area, together with the adjacent No. 31 Commercial Street, appeared to have been developed as a saw mill and timber yard c.1862. Amongst the principal components of the complex was a late 19th century sawmill building, in existence by 1888, and possibly to be identified with some of the additions made to the works in 1878 and 1882. The ground storey of this building was open to the north, south and east, the west side forming the boundary with No. 31 and containing blocked carriage and pedestrian entrances. The other main building was the street range of 1899, a mainly three-storey structure of open-plan shopping and first-floor office, designed by the Birmingham architect, G.R. Faulkner. At the east end of this building was a small cellar with early concrete ceiling reminiscent of contemporary construction techniques recorded in 2006 at the former Adamant Works at Nos. 37-45 Commercial Street. QUEENS HOSPITAL BUILDINGS, BATH ROW, EDGBASTON*Queens Hospital Buildings, Bath Row, Edgbaston, Birmingham. Historic Building Assessment*

Hewitson, C Edgbaston : Birmingham Archaeology, 2007, 28pp, colour pls, figs, refs

Work undertaken by: Birmingham Archaeology

A historic building assessment of the surviving Grade II Listed Buildings of the former Queen's Hospital was conducted. Two buildings were assessed, the earlier of which, Block K, was originally built in 1841 as a purpose built hospital of three storeys over basements, extended to the rear in the 1870s. The other building, Block J, was a two-storey, purpose built hospital extension of 1873, built in Italianate style by the Birmingham architect J H Chamberlain. Both buildings were found to retain elements of their original plans but had been significantly altered internally to provide student accommodation. Building J retained its original roof structure and decorative wooden panelling at first floor level. [Au(abr)]

Work undertaken by: University of Leicester Archaeological Services

A survey was carried out on the buildings at the site after a desk-based assessment had identified them as being of some archaeological importance. A variety of buildings were surveyed, the majority of which were mid to late Victorian in date, the "boom time" for industrial Birmingham. Closer examination revealed that some earlier buildings had survived, incorporated into the fabric of later buildings. As a group, the buildings represented the industrial development and decline of Birmingham. [Au(adp)]

JAMES GROVE & SONS, BLOOMFIELD WORKS STOURBRIDGE ROAD, HALESOWEN

James Grove & Sons, Bloomfield Works Stourbridge Road, Halesowen, West Midlands, Historic Building Record and Ornamental Audit

Tyler, R Edgbaston : Birmingham Archaeology, 2007, 46pp, colour pls, figs, refs

Work undertaken by: Birmingham Archaeology

A programme of historic building recording and an ornamental audit was carried out at the surviving office block of the former Bloomfield Works of James Grove and Sons Ltd., button manufacturers. The street elevation in particular was recorded in detail including the animal head motifs at the head of the applied brick pilasters which articulate the elevation. The structure as recorded represented an interesting though unremarkable example of an early 20th century office building. The recent demolition of the remainder of the associated factory complex had served to remove the building almost completely from its historical context, and to reduce the contribution it formerly made to its contemporary streetscape. The building has lost its original exterior fenestration and an elaborate entrance porch, illustrated on original architect's drawings. Internally, however, the building was found to survive much as built, and retained a high proportion of original fittings including carpentry detailing and brass door furniture. [Au(abr)]

Straits House, Tennyson Road, Lower Gornal, Dudley, West Midlands. An Ornamental Audit and Building Record

Hislop, M Edgbaston : Birmingham Archaeology, 2007, 22pp, colour pls, figs, refs

Work undertaken by: Birmingham Archaeology

An ornamental audit and building record was made of Straits House, a former house, latterly a public house, dating from around 1820-30. The work was occasioned by a condition attached to planning permission to demolish part of the building and to convert the main element to residential apartments. The exercise recorded a significant Regency period gentleman's residence, which had been

substantially altered during its time as a public house, including an unsightly extension, and internal remodelling, but which nevertheless retained a good deal of its original character, including the ornamental stucco treatment, the bow windows, and small-pane sashes. Original features to have survived internally include moulded window and door architraves, window shutters, plaster cornices, the principal staircase (lately vandalised). [Au]

WORDSLEY HOSPITAL, STREAM ROAD, STOURBRIDGE

Wordsley Hospital, Stream Road, Stourbridge, West Midlands. Historic Building Recording

Hislop, M, Kelleher, S & Lobb, M Edgbaston : Birmingham Archaeology, 2007, 89pp, colour pls, figs, refs

Work undertaken by: Birmingham Archaeology

Building recording and an ornamental audit was undertaken at Wordsley Hospital in advance of demolition and redevelopment of the site. Wordsley Hospital was originally the Stourbridge Poor Law Union Workhouse. Three principal construction phases were included in the recording programme. Phase 1 was represented by the one surviving 19th century building (The Guardians' Boardroom) dating from c. 1874. Phase 2 comprised the bulk of the recorded buildings, which dated from a general rebuilding of the workhouse between 1903 and 1907 to the designs of Arthur Marshall of Nottingham, architect of workhouses at Wolverhampton and Nottingham. The surviving buildings from Phase 2 included the master's block and associated clock tower, the workshops, the stables, engine room/boiler house, maternity and nursery block, isolation block, nurses' centre, infirmary, and accommodation blocks. Phase 3 consisted of a series of annexe wards dating from c. 1940. The Phase 1 and 2 buildings were recorded to a standard commensurate with Level 3, and the Phase 3 buildings to Level 1. The buildings of 1903-07 displayed a good deal of uniformity of constructional detail being constructed of red brick, laid in Flemish bond, with blue brick plinths, sandstone ashlar dressings and hipped tiled roofs. The windows of the domestic areas were timber-framed single-pane vertical sashes with sandstone lintels and sills, resting on a course of chamfered blue brick. Fenestration consisted of horizontal sashes in the domestic areas and metal-framed multi-paned windows in the service areas. The interior retained brown glazed brick to midheight in the corridors, and bullnose brick surrounds to door and window openings. This uniformity of detail extended to Marshall's other workhouses at Nottingham and Wolverhampton, and the three complexes were also linked by a marked similarity of plan. [Au(adp)]

MILL HOUSE, TUTBURY MILL, ROCESTER

Mill House, Tutbury Mill, Rocester. Historic Building Recording

Kelleher, S Edgbaston : Birmingham Archaeology, 2007, 32pp, pls, colour pls, figs, refs

Work undertaken by: Birmingham Archaeology

A recording was made of the early 19th-century mill. Mill House was used as the foreman's house at Tutbury Mill from at least the mid-19th century. Tutbury Mill was a site with a long history of the production and processing of textiles, and seven distinct and separate phases of construction were previously identified there. The mill complex contained structures built by, and associated with, Richard Arkwright, one of the key personalities and catalysts of the Industrial Revolution. It was found that the main block of the house, which was constructed in the late 18th/early 19th-century, retained some its original fixtures and fittings such as moulded cornices, skirting boards, fireplaces, and staircases. Further domestic quarters were added to the rear in the mid to late 19th-century, whilst subsequent additions and alterations were carried out during the 20th century. [Au(abr)]

NIPHON WORKS, LOWER VILLIERS STREET, BLAKENHALL, WOLVERHAMPTON***Nippon Works, Lower Villiers Street, Blakenhall, Wolverhampton, West Midlands. Historic Building Assessment***

Tyler, R Edgbaston : Birmingham Archaeology, 2007, 55pp, colour pls, figs, refs

Work undertaken by: Birmingham Archaeology

The Nippon Works was established at the Lower Villiers Street site by Robert Stroud in c.1865 and the surviving buildings represented a notably complete and relatively intact example of mid-late Victorian industrial complex. The principal western elevation onto Lower Villiers Street formed a focal point of the contemporary streetscape and represented an important link with the area's industrial heritage. The

earlier, lesser ranges around the courtyard were more utilitarian in nature though they retained, to a significant degree, their original exterior appearance, structural alterations having been confined largely to the ground floor level. A characteristic and definable architectural vocabulary was used throughout, adding to the unified effect of the complex as a whole, which extended to a series of buildings further to the east, beyond the scope of the current study, but forming a part of the historical Nippon Works. Few original interior fittings and fixtures appear to have survived. [Au(abr)]

SUNBEAMLAND WORKS, PAUL STREET, BLAKENHALL, WOLVERHAMPTON
Sunbeamland Works, Paul Street, Blakenhall, Wolverhampton, West Midlands. Historic Building Record and Assessment

Tyler, R Edgbaston : Birmingham Archaeology, 2007, 113pp, pls, colour pls, figs, refs

Work undertaken by: Birmingham Archaeology

The historic building assessment comprised a programme of documentary research and an on-site recording of the standing buildings themselves. Companies owned by Edward Perry and Co. and John Marston and Co. Ltd. (Sunbeam) occupied the Paul Street works between 1835-1871 and 1871-1935 respectively. The buildings of the Sunbeamland Works were shown to retain elements of the historic development of the site from the mid-19th century down to the middle years of the 20th century. No part of the Edward Perry's original Japanning works survived above ground, though structures remained from the time when John Marston took over the works in 1871. The manufactory has undergone periodic refurbishment and sometimes radical alteration, the most drastic of which occurred in the 1930s, when a large section of the 19th-century fabric of the central block was demolished. The Sunbeamland Works represented one of the most important surviving monuments relating to the transport and motor heritage of the City of Wolverhampton. Despite having been removed to a considerable extent from its historical context by redevelopment of the immediate area during the later 20th-century, the Sunbeamland Works nonetheless remained a landmark building on one of the principal access corridors leading into the City centre. GOODYEAR TYRE FACTORY, WOLVERHAMPTON
Goodyear Tyre Factory, Wolverhampton. Historic Building Record

Tyler, R Edgbaston : Birmingham Archaeology, 2007, 105pp, pls, colour pls, figs, refs

Work undertaken by: Birmingham Archaeology

A total of 20 buildings were examined, ranging in date from the early 20th century to the early 1990s, tracing the development of the factory site from its acquisition by Goodyear in the mid-1920s. The phasing of the site had been greatly enhanced by a series of dates design drawings and photographs held at the Wolverhampton Archives and Local Studies collection. A number of the recorded structures were found to be remnants of a former enamelware manufactory, established on the site by the Scottish company of Macfarlane and Robinson in the early years of the 20th century, and included a four-storey clock tower which is to be retained within the proposed development of the site. The site was chosen by Goodyear, when it decided to set up a British manufacturing plant in 1927, both for its central geographical location and due to the pre-existence of suitable factory buildings. Phases of rapid expansion were evident in the early years of Goodyear ownership, in the period following the Second World War, and again in the late 1960s and 1970s. The complex developed using a fairly repetitive, modular pattern of factory ranges, adopting what appeared to be a consistent site style. Expansion

continued down to the recent past, with the latest recorded building dating to the middle 1990s, with the later buildings becoming increasingly utilitarian in nature. [Au(abr)]

The Bagot Arms, Abbots Bromley, Staffordshire, Historic Building Record
 Tyler, R Edgbaston : Birmingham Archaeology, 2007, 28pp, colour pls, figs, refs

Work undertaken by: Birmingham Archaeology

A building survey of a post-medieval public house and outbuildings comprised a Level 1 record and consisted of a black and white negative and colour digital photographic record, supplemented by a summary written description and the generation of representative sketch elevations and sections based upon pre-existing survey drawings. No documentary research was undertaken as part of the current project, although a rapid map regression exercise proved useful in illuminating more recent changes to the buildings. Although recent use for storage and other uses has removed much of the original arrangements of the ranges, the opportunity was taken to record the overall layout of the buildings and what survived of the internal fixtures and fittings. THE WELLINGTON INN, HIGH STREET, UTTOXETER

The Wellington Inn, High Street, Uttoxeter, Staffordshire. Desk-based Assessment and Historic Building Evaluation

Tyler, R Edgbaston : Birmingham Archaeology , 2007, 38pp, colour pls, figs, refs

Work undertaken by: Birmingham Archaeology

A building survey comprised a rapid visual appraisal of the site and buildings, and a summary written description supplemented by a colour digital photographic survey. A rapid map regression exercise of all Ordnance Survey editions for the development area proved useful in illuminating more recent changes to the buildings. The main block of the Wellington, fronting onto High Street, represented the earliest structure on the site, probably dating to the early 18th century. To the rear of the main block, were a series of extensions, mainly of 20th century date, although including a range of late 18th/early 19th century origin. The development site had the potential for below ground archaeological remains due to its location within an area of medieval and post-medieval activity. [Au(abr)]

GRANGE FARM, COVEN

Grange Farm, Coven. Historical Buildings Assessment

Simons, E Stourbridge : AOC Archaeology Group , 2007, 31pp, colour pls, figs

Work undertaken by: AOC Archaeology Group

An archaeological building survey found that the house was a fine example of late 16th century framing which included elements of its roof and floor. There was a suggestion that the north wing was somewhat older than the south and may have contained an open hall. The house underwent numerous later phases of alteration and addition, most notably in the 19th century. [Au(abr)]

ST AUGUSTINE'S CARE HOME, COBRIDGE, STOKE-ON-TRENT***Archaeological Building Recording at St. Augustine's Care Home, Cobridge Road, Stoke-on-Trent***

Sutherland, Z & Cleverdon, F Stoke-on-Trent : Stoke-on-Trent Archaeology, 2007, Spiral-bound document with card and acetate cover. Sixty-three pages in total, including contents and appendix.

Work undertaken by: Stoke-on-Trent Archaeology

A programme of archaeological building recording was undertaken at St Augustine's Care Home, Cobridge Road, Stoke-on-Trent (NGR SJ 8750 4848). St Augustine's was built in 1902 by the Little Sisters of the Poor as a care home for the aged poor. It continued in use as a care home for one hundred years, latterly under the management of Prime Life Ltd. Recently the building was used as a hostel for asylum seekers until its closure in 2004. The building recording identified a main east to west range with a wing at either end and a chapel at the rear. The project confirmed the chronological development of the building as is shown on the OS maps of 1899 to the present day. Some idea of the original layout and use of the individual rooms was also achieved. In the context of similar institutions of the time, St Augustine's seems to have offered relatively comfortable accommodation and, unsurprisingly, to have provided for spiritual as well as physical needs, possibly with a great deal of tolerance towards non Catholic faiths. The later alterations that took place at St Augustine's concentrated upon the subdivision of rooms and illustrate an increased regard for residents' individuality and privacy. [OASIS(Au)]

CHURCH END FARM, NETHER WHITACRE

Church End Farm, Nether Whitacre. Historic Building Report

Meeson, B Tamworth : Bob Meeson, 2007, 26pp, colour pls, figs, tabs, refs

Work undertaken by: Bob Meeson

Church End Farm contained several timbers that were originally part of a medieval cruck-framed hall house. The timbers were re-used in a 17th century timber-framed building. A threshing barn was built soon afterwards, along with a link including a covered wagonway. The house was remodelled in the Regency period, and again c.1970. Subsequent lack of maintenance left the building in urgent need of repair, and a substantial refurbishment was carried out. The highly significant elements of the medieval cruck-framed building were potentially among the oldest remains of their kind in England. [Au(abr)]

LAND AT LEICESTER ROAD, RUGBY

Land at Leicester Road, Rugby, Warwickshire. Phase 1 Building Assessment

Wessex Archaeology Salisbury : Wessex Archaeology, 2007, 38pp, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

The former BTH works occupying the site were considered to be an important piece of local historical interest, having at one point employed 20000 local people. The functional lifetime of the engineering works spanned almost the entirety of the 20th century, however, site clearance in the 1980s ensured that only one building out of nine had survived, a turbine factory. It was assessed that the importance of

the buildings that had occupied the site lay in their function, not form, and as most had been destroyed the site was of little archaeological value. [Au(adp)]

MacHugh, G Worcester : Worcestershire County Council Historic Environment & Archaeology Service, 2007, 95pp, colour pls, figs, tabs, refs

Work undertaken by: Worcestershire County Council Historic Environment & Archaeology Service

The buildings recorded in this survey consisted of a threshing barn, stable and animal sheds now enclosing a yard. The barn and stable appeared to predate the animal sheds and may have dated from the 17th century, but more probably were 18th century. The seven-bay barn retained roof trusses and bay divisions, a threshing floor and original square oak wattle panelling above red sandstone coursed rubblestone walls with two types of ventilation holes. Adaptations to the north wall and remaining metal fixtures may have related to a horsepowered threshing machine and housing. The stable was of similar construction without panelling. It contained a three-horse manger and hay chutes leading from an upper floor hayloft and a separate loose box with small tack room. The construction of the 19th century animal shed completed enclosure of the farmyard and the roof trusses were of King Post type with metal bolts between tie beam and post with some details of the animal stalls remaining. The adaptations and repairs visible in the buildings reflected the changes in agricultural processes and practices in this area throughout the period. [Au(adp)]

THE MORDAUNTS, CROWLE

The Mordaunts, Crowle, Worcestershire. Historic Building Recording and Analysis

Lobb, MEdbaston : Birmingham Archaeology, 2007, 53pp, colour pls, figs, tabs, refs

Work undertaken by: Birmingham Archaeology

The work was carried out as part of a proposal to convert the unused farm buildings to residential accommodation. The group of buildings, which included a Grade II Listed barn, were found to have dated from the seventeenth century onwards, with the large barn possibly incorporating part of an earlier timber-framed aisled barn. The site also included a late seventeenth or early eighteenth century upper cruck building, which were comparatively rare in an agricultural context in Worcestershire. Significantly all timber-framed buildings encountered on site were constructed from elm. It was proposed, given the possible presence of an aisled barn, that below ground archaeological investigation take place prior to any ground works, in an attempt to locate the footings of the sill-beams or outer walls of the aisles of the building. Bluntington Farm House, Chaddesley Corbett, Worcestershire. Historic Building Recording and Interpretation

Hewitson, C Edgbaston : Birmingham Archaeology , 2007, 46pp, colour pls, figs, tabs, refs

Work undertaken by: Birmingham Archaeology

A measured survey of the timber-frame, plans and a photographic survey of the building were made, together with a written description of the existing structure. Historical research and map regression analysis was undertaken confirming the 17th century date of the house. The timber-frame survived throughout much of the house but was in need of repair and conservation. Alteration to the internal areas of the house had been limited and the house maintained substantial elements of the original layout as well as the overall character of the building. The original layout conformed to a two-cell main range and northern wing. The north wing displayed decorative ashlar sandstone around the ground floor whilst the remainder of the original build was in square timber-frames, four panels high. Later alterations included 18th century replacement of the wattle and daub with brick nogging and the addition of 19th century brick-built extensions to the west. [Au]

RAYWELL HOUSE

Further Recording at Raywell House

Rawson, D P Kingston-upon-Hull : Humber Field Archaeology , 2007, 55pp, colour pls, figs, tabs, refs

Work undertaken by: Humber Field Archaeology

An architectural and archaeological record of the building was made prior to the conversion of the building to apartments. The house was built c.1803, and had been very largely denuded of its original internal details, although the early 19th century staircase was largely intact. The associated stable block had undergone substantial alterations. [Au(adp)]

THE PHEASANT INN/88-90 HIGH STREET, DODWORTH, BARNLSLEY

Archaeological Desk-based Assessment of the Pheasant Inn/88-90 High Street, Dodworth, Barnsley, South Yorkshire

Stenton, M & Dawson, L Sheffield : ARCUS, 2007, 54pp, colour pls, figs, tabs, refs

Work undertaken by: ARCUS

An archaeological desk-based assessment and building recording was carried out at the site. There was no evidence for development prior to 1806, when the site contained a public house, cottages, shops, carpenter's workshops, a stockyard nursery and outbuildings. The original Pheasant Inn was demolished and replaced by the present day public house between 1906 and 1931. The stable block and nos. 88 and 90 High Street were extant in 1806, although both had been remodelled by 1855. [Au(adp)]

PAINTHORPE HOUSE, PAINTHORPE LANE, CRIGGLESTONE***Painthorpe House, Painthorpe Lane, Crigglestone. Archaeological Photographic Building Recording***

Swann, A Morley : Archaeological Services WYAS, 2007, 81pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Services WYAS

A photographic survey was carried out in advance of the demolition of the buildings at the site. The Painthorpe Estate was known to have held a dwelling from the late 13th century. The core building was found to have been constructed in three main phases between the late-17th century and the middle of the 19th century. Incorporated into the later country club buildings was a mid-19th century dovecote. The house fell into decay at the end of the Second World War. It was purchased in the 1960s and became part of a country club. [Au(abr)]

Historic Building Survey. Analysis and Interpretation. 81 and 82 Bondgate, Ripon, North Yorkshire

Deadman, J York : Jen Deadman, 2007, 43pp, pls, figs, refs

Work undertaken by: Jen Deadman

In its first phase, the building which comprised Nos. 81 and 82 Bondgate was a linear timber framed structure, of possible 16th century date, of three or possibly four bays. Its original function was unknown. Latterly, it comprised two shops, with a passageway between, providing pedestrian access to the rear yard, where a range of single storey outhouses was sited against the northern perimeter wall. By the end of the 19th century, most of the timber frame had been replaced with brick. The building evidenced several phases of building activity. [Au(adp)]

Swann, N & Annis, R Durham : University of Durham, Archaeological Services, 2007, 47pp, colour pls, figs, tabs, refs, CD

Work undertaken by: University of Durham, Archaeological Services

Seventeen buildings were recorded. Four of these dated from the original development of Gaza Barracks in the 1920s and 1930s, and were typical of the style adopted by the War Office at that time. Two of these buildings, the Sandhurst block and the officers' mess, were to be retained in the redevelopment of the site. The fourth, building 16, was to be demolished. The other 13 buildings that were recorded dated from the period after 1930. None were of any architectural or historic interest, other than as part of a group representing the past uses of Gaza Barracks. [Au(abr)]

Former Grosmont Ironworks, Grosmont, North Yorkshire

Richardson, S & Dennison, E Beverley : Ed Dennison Archaeological Services Ltd., 2007, 51pp, colour pls, figs, tabs, refs

Work undertaken by: Ed Dennison Archaeological Services Ltd.

The Grosmont ironworks were established in 1862 by Charles and Thomas Bagnall, subsequently closing in 1891 when most of the plant was demolished. Almost nothing remained above ground, partly due to the reworking of the area in the 20th century. The main visible elements were the chimney base and the lower part of the third and latest blast furnace as well as a tramway bridge. Several other railway abutments survived, as well as a wharf structure on the river. It was thought that the remains of all three of the blast furnaces would have survived underground below the upper car park at the site. Further research into the scale and scope of the site would shed light on the site. [Au(adp)]

THE WALLED GARDEN, THICKET PRIORY, THORGANBY*The Walled Garden, Thicket Priory, Thorganby, North Yorkshire. Architectural Assessment*

Richardson, S & Dennison, E Beverley : Ed Dennison Archaeological Services Ltd., 2007, 34pp, colour pls, figs, tabs, refs

Work undertaken by: Ed Dennison Archaeological Services Ltd.

The assessment found no evidence for surviving structures relating to the late 12th century Benedictine priory within the walled garden. The earliest surviving structure was an L-shaped section of wall with a moulding string, possibly of late 16th or 17th century date. The north-west corner incorporated the remains of a house built c.1700, with associated gardens. After the mansion house was built in 1844-7, elements of the 18th century designed landscape were remodelled to create the walled garden that was assessed. [Au(adp)]

122 STRENSALL ROAD, HUNTINGTON*Archaeological Observation Investigation and Recording at 122 Strensall Road, Huntington*

Rawson, D Kingston-upon-Hull : Humber Field Archaeology, 2007, A4

Work undertaken by: Humber Field Archaeology

A programme of architectural and archaeological observation, investigation and recording was undertaken prior to and during demolition of farm buildings, and the groundworks associated with the construction of six dwellings at 122 Strensall Road, Huntington, York. The farm buildings had been largely constructed in the later 19th century around a foldyard, the yard being covered in the 20th century. Other buildings showed evidence of adaptation to 20th-century farming practices, such as the addition of a small building housing a vacuum pump, to the south side of the cow shed. No archaeological features were observed that predated the construction of the farm. A small assemblage of glass and pottery was recovered from the site, these items spanning the period from the late 19th to the mid-20th century. [OASIS(Au)]

Bonding Warehouse, Skeldergate, York. Archaeological Desk-based Assessment and Building Assessment

Pollington, M & Swann, AMorley : Archaeological Services WYAS, 2007, 29pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Services WYAS

The assessment discerned that the site stood on the former line of the medieval wall, together with part of the Skeldergate Postern. Prior to its construction the Bonding Warehouse was occupied by a late 17th century or early 18th century house, and a post-medieval warehouse. The northern end of the building was probably the medieval "common crane". There was potential for the survival of archaeological remains. [Au(adp)]

LAND AT STENSON FIELDS, DERBY

Land at Stenson Fields, Derby. Geophysical Survey

Archaeological Services WYAS Morley : Archaeological Services WYAS 2007, 18pp, figs, tabs, refs

Work undertaken by: Archaeological Services WYAS

A magnetometer survey was carried out on land at Stenson Fields in advance of a proposed residential development. The survey covered approximately 17 hectares and was constrained by a railway line to the north-west and Stenson Road to the south-east. Open fields bounded the site to the south-west. However, besides limited evidence of ridge and furrow ploughing no archaeological anomalies were identified. On the basis of the geophysical survey, the site was considered to have a low archaeological potential. [Au(abr)]

CODNOR CASTLE**Geophysical Survey Report. Codnor Castle**

Wood, EThornton : GSB Propection, 2007, 15pp, figs, tabs, refs, CD

Work undertaken by: GSB Propection

Mining activity was likely to be the cause of the majority of the anomalies within the magnetic data. A handful of potential archaeological features were noted, some of which were excavated and found to be associated with the castle. Considerable ferrous disturbance was present in the data masking any archaeology within the immediate vicinity. Resistance and GPR datashowed anomalies associated with Codnor Castle, including a fireplace and wall

foundations. A zone of both high resistance/amplitude to the immediate north-west of the castle was found to be a section of the curtain wall and presumed garden features. [Au(adp)]

Chester, F Thornton : GSB Propection, 2007, 14pp, figs, tabs, refs, CD

Work undertaken by: GSB Propection

The majority of anomalies of archaeological potential were located in the immediate vicinity of the Lubbesthorpe DMV. These included a sinuous band of responses to the north which may have indicated a former boundary or stream, which had been filled in with waste material. Some regular anomalies and trends to the east could have represented trackways and other activity. The possible site of a medieval brick kiln had been located to the east of Lubbesthorpe DMV in Field 8 and further potential industrial activity, of indeterminate age, was identified to the south of Hopyard Farm in Field 12. However, the possibility that this was motorway debris could not be discounted. A former field boundary and other agricultural activity such as ridge and furrow cultivation, ploughing and field drains were identified in many of the survey areas. Although some of the weak trends may have had archaeological potential, more recent agricultural practices were most likely to account for these responses. [Au(adp)]

Geophysical Survey Report. Knave Hill, Leicestershire

Wood, EThornton : GSB Prospection, 2007, 12pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

The main discovery of the magnetic survey was a Dshaped enclosure, which on excavation proved to be Iron Age in date. A number of pits and ditches, presumed to be of a similar date, were also recorded. Ridge and furrow cultivation responses could be seen throughout the data. While some of the responses could clearly have related to Anglo Saxon features all of those excavated turned out to be Iron Age in date. As such it was impossible to be confident about assigning any dates to features identified in the geophysics. [Au(adp)]

M1 JUNCTION 21-30 IMPROVEMENT

M1 Junction 21-30 Improvement – Report on Geophysical Survey at Copt Oak

Chester, F Thornton : GSB Prospection, 2007, 12pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

Numerous pit type anomalies and trends of archaeological potential have been identified in the survey areas. Two linear alignments may have indicated former field boundaries, however, it was more likely they corresponded to field drains. The majority of the other responses in the data were weak and isolated and did not form any coherent patterns, therefore their archaeological potential was limited. Natural variations in the subsoil or agricultural practices could equally account for all, or some, of these responses. Modern features were responsible for the gaps and large ferrous responses in the data. These comprised wire fencing, pipes, manure heaps, a vehicle and a telegraph pole. [Au(adp)]

Work undertaken by: GSB Prospection

Scanning indicated little by way of fluctuations in magnetic response across the site with only a few archaeological type responses being identified and targeted for further, detailed, survey. Detailed survey supported the findings of the scan but identified a portion of two possible enclosures and potentially a small area of industrial activity, although this interpretation was tentative. Four former field boundaries were highlighted, two of which could be identified on old maps and the potential remains of a demolished building were also apparent in the data. Elsewhere other trends and anomalies may have been of some archaeological interest, however, an agricultural or natural origin was equally possible for all or some of these responses. Parallel linear anomalies throughout the data indicated ploughing activity, both current and past, which had taken place on this site. Two pipes, one a large bore gas pipe, traversed a significant proportion of the application area and the response from these will have obscured any weaker, archaeological type anomalies, should they have been present. Chester, F Thornton : GSB Prospection, 2007, 15pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

A large quantity of pit type anomalies were noted close to Junction 24a, however, although their form was archaeological, they could equally have indicated pockets of natural gravels. Further south, a sinuous band of anomalies at the base of a slope could also have been natural, however, an archaeological or industrial origin for these responses was also a possibility. A small rectangular enclosure was noted and other anomalies and trends close by may have pointed to a former track. Several potential former field boundaries were also identified and other agricultural activities, such as ploughing trends and headlands, were also apparent in the data. It was likely the majority of these responses related to current agricultural practices, however, some may have corresponded to ridge and furrow cultivation. Other anomalies and trends in the data were generally weak and isolated and were therefore considered unlikely to be of significance. Many of these would be also due to agricultural activities or natural variations in the subsoil. Modern features, such as pipes, fences and pylons, had also left their imprint in the data as large ferrous responses which obscured any weaker, potentially archaeological responses in their vicinity. THE PROPOSED BOURNE TO GUTHRAM WATER MAIN***Fluxgate Gradiometer Survey. The Proposed Bourne to Guthram Water Main, Lincolnshire***

Bunn, D & Jefferson, N Saxilby : Pre-Construct Geophysics, 2007, 9pp, colour pls, figs, tabs, refs

Work undertaken by: Pre-Construct Geophysics

The survey identified a series of interconnecting ditch-like anomalies in Area 1, possibly small sub-enclosures. A low number of small anomalies may have been a reflection of prehistoric salt production. There was minimal geophysical evidence of archaeological remains in Area 2, with the possible exception of a curvilinear ditch-like anomaly. Magnetic traces of existing services were recorded in both areas. In Area 2, the survey detected traces of known boundaries and possible demolition debris associated with post-medieval buildings. LAND AT LANGHAM***Geophysical Survey Report. Land at Langham***

Wilkins, I Thornton : GSB Prospection, 2007, 14pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

The survey identified what appeared to be natural deposits with evidence of more recent interventions such as a pipe and drainage systems. The broad positive responses seen in most datasets were thought to be natural marine alluvial deposits. Although of a strength and character similar to that recorded over pit-like features, the size, shape and distribution of these anomalies was more in-keeping with natural deposits, and this response pattern had been recorded on a number of alluvium covered sites. There was an outside chance that some of the stronger anomalies were related to salterns, or associated briquetage deposits, and it may have been that if a broader area was investigated these responses could show a more defined pattern of distribution, but from the data available this seemed unlikely. That said, the last two sites showed spreads of increased magnetic response, characterised by the "mottling" in the greyscales and "spiking" in the XY traces, but both these areas were in field corners and as such this could quite easily be from relatively modern materials in the topsoil. WEST BURTON GAS PIPELINE***Geophysical Survey Report. West Burton Gas Pipeline, Lincolnshire***

GSB Prospection Thornton : GSB Prospection, 2007, 12pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

Whilst in general few definitively archaeological responses were recorded, the central section of Area 1 (Area 1E) revealed potentially significant results. Within a zone of increased magnetic response, a number of very strong anomalies could have indicated industrial activity such as kilns. Whilst it was possible that modern material had been dumped here, the presence of Roman pottery kilns in the area added potential significance to the results. Demolition material from a farm (shown on 19th century maps), but since removed, had produced a spread of magnetic disturbance in the east of Area 1, whilst across much of the western end of the survey corridor, presumed natural anomalies have been recorded. Areas 2 and 3 revealed little other than modern agricultural practices. An area of increased response in the east of Area 2 was likely to be a natural accumulation of enhanced material within a hollow, visible at the time of survey. Sporadic accumulations of enhanced material at the western end of Area 3 were thought to be remnants of ridge and furrow cultivation. Some potential pit-like features and enhancement of ploughing anomalies were tentatively identified at the eastern end. However, these features probably lay within the easement of the current gas main, running down this edge of the field. These could therefore be due to modern intervention. [Au(adp)]

Geophysical Survey Report. The Robson Land, Radstone Fields, Brackley, Northamptonshire

Chester, F Thornton : GSB Prospection, 2007, 29pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

Scanning indicated broad fluctuations in response across the site with some disturbance around the edges. A few "hotspots" were identified for further, detailed, survey. Detailed survey revealed two potential ring ditches, one of which lay close to the edge of the field and therefore had not been completely defined. Other ditch and pit type anomalies lay in the vicinity of the potential ring ditches and they may have indicated associated features or plough damage. Other possible rings were also highlighted but the results were not as clear and hence an archaeological interpretation was less confident. Elsewhere other trends and anomalies may have been of some archaeological interest, however, an agricultural or natural origin was equally possible for all or some of these responses. Parallel linear anomalies throughout the data indicated the ploughing activity which had taken place on this site, although it was grassland at the time of survey. [Au(adp)]

THE ROBSON LAND, RADSTONE FIELDS, BRACKLEY***Geophysical Survey Report. The Robson Land, Radstone Fields, Brackley***

Chester, F Thornton : GSB Propection, 2007, 18pp, figs, tabs, refs, CD

Work undertaken by: GSB Propection

Scanning indicated the general levels of background response across the site were quite low. Several areas of archaeological potential were noted and a few isolated anomalies were identified across the application area. Detailed survey was positioned both to cover all the anomalies and test magnetically "blank" areas. Detailed survey revealed nine ring ditches and three penannular, or possibly D-shaped, enclosures in three locations, separated by magnetically blank areas of field. Several of the enclosures had clearly defined ditch terminals suggesting entrance ways. In all three areas other archaeological type anomalies indicated the possibility of further ring ditches and enclosures but they were incomplete and therefore the interpretation could not be as precise, although it was likely all three areas indicated settlement or occupational activity. Two groups of pits in Field 1 were probably associated with the settlement in this field, though they may have indicated an area of planting. Parallel linear trends in many of the survey areas indicated former ploughing activity, some of which may have related to ridge and furrow cultivation. These responses were strongest in the areas containing the settlement activity, probably due to the agricultural action damaging the more magnetic deposits. Other archaeological type anomalies and trends have been recorded in many of the survey areas, including a possible area of quarrying in Field 8. Although the responses may be of some interest, they were generally weak and isolated, therefore, definitive conclusions could not be applied. Natural variations or agricultural activity were equally likely to account for some of these responses. [Au(adp)]

THORPE MANDIVILLE TO GREATWORTH PIPELINE***Archaeological Geophysical Survey Anglian Water Services, Thorpe Mandeville to Greatworth Pipeline, Northamptonshire***

Clements, P Northampton : Northamptonshire Archaeology , 2007, 24pp, pls, figs, tabs, refs

Work undertaken by: Northamptonshire Archaeology

A magnetometer survey was undertaken along an easement of a new pipeline between Thorpe Mandeville and Greatworth. The survey identified several areas of archaeological constraint, including two enclosure complexes of probable later prehistoric or Roman date, two isolated enclosures, and several linear ditches representing boundaries and trackways. Traces of medieval ridge and furrow cultivation were ubiquitous. [Au(abr)]

TOWCESTER VALE

Geophysical Survey at Towcester Vale, Northamptonshire

Butler, A Northampton : Northamptonshire Archaeology, 2007, 25pp, pls, figs, tabs, refs

Work undertaken by: Northamptonshire Archaeology

Geophysical survey comprising 145ha magnetic susceptibility reconnaissance and 22ha targeted detailed magnetometry were carried out at Towcester Vale, encompassing the southern hinterland of Towcester town. Five areas of interest were identified. Follow-up survey revealed a 5ha palimpsest of possibly late prehistoric curved enclosures, roundhouses, pits and linear ditches west of Watling Street. A probable occupation site including an ovoid enclosure and roundhouses was identified central to the west of the survey area. Other small enclosures and ditches were found around the area, including a probable part of the medieval Wood Burcote. [Au]

UPPER REDHILL, WELLINGBOROUGH

Geophysical Survey Report. Upper Redhill, Wellingborough

Smalley, R Upton-upon-Severn : Stratascan, 2007, 18pp, figs, tabs, refs

Work undertaken by: Stratascan

The reconnaissance magnetic susceptibility survey highlighted a number of areas of magnetic enhancement which may have been related to archaeological activity. The detailed gradiometry survey located a number of anomalies that may have been of an archaeological origin. Positive linear anomalies indicated the presence of cut features, with negative linear anomalies suggesting former earthworks or banks. Discrete positive anomalies were interpreted as pits of possible archaeological origin. [Au]

Stephens, C Thornton : GSB Propection, 2007, 11pp, figs, tabs, refs, CD

Work undertaken by: GSB Propection

There was a considerable variation in the levels of background magnetic signal across the evaluation area, with the western end of the site being especially noisy. Although an archaeological cause for this apparent enhancement could not be dismissed entirely, nothing in the detailed datasets would support this interpretation and a natural cause seemed more likely. Scanning revealed only a few targets of possible archaeological interest and these were all isolated. The detailed survey confirmed these observations. The majority of the anomalies recorded by the survey were parallel linear features indicative of ploughing. In one field (Area 2) these could be related to modern ploughing. As the remaining fields were under pasture, the responses could equally indicate ridge and furrow cultivation or more recent agricultural practices. No definitive archaeological anomalies were detected and, although most of the samples contained a few pit-type anomalies and trends which might be of interest, the responses were isolated and formed no coherent patterns. Given these factors an archaeological interpretation was tentative. Natural, agricultural or modern origins were perhaps more likely. [Au(adp)]

AWS RUTLAND WATER HABITAT CREATION

Detailed Gradiometer Survey for the Proposed AWS Rutland Water Habitat Creation. Interim Report

Butler, A Northampton : Northamptonshire Archaeology, 2007, 7pp, figs, tabs, refs

Work undertaken by: Northamptonshire Archaeology

The survey was split into two areas, north and south. The survey in the north identified several ditches, a sub-rectangular enclosure and associated round house, probably dating to the Iron Age or Roman period. There was also extensive ridge and furrow cultivation evidence. Survey in the southern section located an enigmatic semi-circular feature, a pair of possible large pits and ditches. Further survey in the south remained to be carried out. [Au(adp)]

Adcock, J Thornton : GSB Propection, 2007, 12pp, figs, tabs, refs, CD

Work undertaken by: GSB Propection

The results from this survey were difficult to interpret. The dataset indicated a high level of background magnetic noise that was difficult to explain. It would seem that the field had been subjected to extensive plough damage and this was likely to have removed both earlier field boundaries (known to have been present on the 1838 Tithe map) and possible archaeological features (the presence of which was hinted at in the data). There appeared to be several potential pits in the results, one being possibly linked with a small enclosure and former field system. However, the magnetic evidence was tentative and alternative explanations for the anomalies, as opposed to archaeology, were equally plausible. [Au(adp)]

FLAG FEN AREA ONE***Archaeological Geophysical Survey in Peatland Environments, Case Study Survey at Flag Fen, Area One Pilot Project, September 2007. Preliminary Report***

Armstrong, K & Cheetham, P Bournemouth : Bournemouth University, 2007, 38pp, figs, tabs, refs

Work undertaken by: Bournemouth University

Four different geophysical instruments were employed to survey a small area near to the former excavations at Flag Fen, an important Bronze Age site. The site consisted of a post alignment and associated large platform with probable ritual or ceremonial functions, constructed from timber in a wetland during the Bronze Age. The timbers remained in remarkably well preserved condition below sealing peat and alluvium. There were also features from the Neolithic on the drier margins of the site, and Iron Age and Romano-British features within the fen and on the fen edges, the most important of these being a Roman road that ran across the site in the same direction as the post alignment. Willkins Thornton : GSB Propection, 2007, 11pp, figs, tabs, refs, CD

Work undertaken by: GSB Propection

No definitive archaeological anomalies have been identified by the survey. A truncated ditch type response may have been of interest, while the interpretation of a short curving anomaly was complicated by modern factors. Two possible former boundaries had been highlighted, together with numerous responses suggestive of ridge and furrow cultivation. The remainder of the anomalies detected by the survey relate to modern features (e.g. fences) and landscaping associated with the golf course. [Au(adp)]

Chester, F Thornton : GSB Prospection, 2007, 12pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

None of the features identified in the aerial photographs were clearly defined by the survey. Several areas of magnetic disturbance lay in the region of the purported windmill and one of these may have indicated the location of such a structure, however, a former field boundary also followed this line and this was a more likely origin for the responses. All three survey areas contained responses consistent with former field boundaries and cartographic evidence supports this interpretation. Field drains and variations in the background geology were also evident in the gradiometer data and although isolated anomalies and trends had been identified, natural or agricultural origins were also more likely for these responses.

Magnetic susceptibility survey showed little variation across the three survey areas and although there were some individual higher readings the data indicate they were isolated and no significance should be attached to them. Plots indicated the field drains and elements of the former field boundaries would have been detected through scanning. [Au(adp)]

Hancock, A Milton Keynes : Archaeological Services & Consultancy Ltd., 2007, 28pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Services & Consultancy Ltd.

A geophysical survey was carried out at the site consisting of a detailed magnetometer survey. The northern part of the survey defined the location of part of a large ring ditch previously identified from crop marks. Other magnetic anomalies indicating the presence of a trackway and possible enclosure or field system ditches were identified north-east, east and south-east of the ring ditch. The presence of a smaller ring ditch also identified from cropmarks in the southern part of the survey was not substantiated by the magnetometer survey although short sections of two parallel ditches which may have defined a trackway or small enclosure were evident near its suggested location. A number of magnetic anomalies defining the location of superimposed palaeochannels were present at the south east of the survey. [Au(adp)]

CEDARS PARK, CODDENHAM***Topographic and Geophysical Surveys. Cedars Park, Coddendam, Suffolk***

Hancock, A Milton Keynes : Archaeological Services & Consultancy Ltd., 2007, 33pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Services & Consultancy Ltd.

Detailed topographic and magnetometer surveys were carried out over 20.5 hectares of a Scheduled Ancient Monument. The topographic survey characterised the natural topography and defined earthworks resulting from recent agricultural activity. The magnetometer survey defined the location of a boundary/enclosure ditch, settlement/funerary activity and a possible flanking ditch of a Roman road at the south-east corner of the survey area. A settlement, trackway and field system were identified at the south-west of the site. Other possible archaeological anomalies were identified, spread across the southern half of the survey area. [Au(adp)]

SHIRE HALL COMPLEX, BURY ST. EDMUNDS*Geophysical Survey Report. Shire Hall Complex, Bury St. Edmunds*

Adcock, J Thornton : GSB Prospection, 2007, 29pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

Anomalies potentially relating to remains of features associated with the Abbey were tentatively identified in the northern half of the Shire Hall car park. A similar interpretation was applied to a confined anomaly abutting the south side of the Precinct wall. A far more cautious interpretation had been cast upon a rectilinear spread of anomalies in the southern half of the Shire Hall car park owing to them being partially aligned with relatively well-defined service-type anomalies. It was not possible to identify the overburden/sub-soil depth or reliably and consistently map any palaeosurfaces that might have indicated the former topography of the floodplain. That said, there was a certain increase in the depth of deposits towards the east of the site, to around almost 3.0m. In a small number of sections a possible surface was recorded dipping to the west but was set back some 15.0m from the current waterway. The vast majority of recorded reflections and responses appeared to be from services and variations in surface materials/construction. [Au(adp)]

Wood, EThornton : GSB Prospection, 2007, 14pp, colour pls, figs, tabs, refs

Work undertaken by: GSB Prospection

A clear trend running through the centre of the data coincided with a former field boundary, marked on old maps, which was no longer visible within the field. Banding visible in the data was thought to be a natural, pedological effect while striping corresponded with recent ploughing trends. There was little evidence for archaeology within the data although some small potential pits were apparent. [Au(adp)]

Work undertaken by: University of Durham, Archaeological Services

The proposed development area contained a considerable amount of ferrous debris, though this did not prevent identification of potential archaeological features. Traces of probable former ridge and furrow cultivation aligned broadly north/south were detected across the two large survey areas, Areas A and B. One possible ditch feature was detected in each of Areas A and B. A group of probable soil-filled pits, each 2-3m in diameter, was detected in the central southern part of Area B. Changes to the magnetic background or "texture" evident in the survey results corresponded to former smaller land parcels and different former land uses. [Au(abr)]

Wilkins, I & Stephens, C Thornton : GSB Prospection, 2007, 15pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

Magnetometer and resistance surveys carried out at the site revealed anomalies relating to the mapped earthworks, with the data representing a combination of banks and ditches. In addition, numerous anomalies of possible interest were identified suggesting the presence of enclosure ditches, trackways and pits, as well as denuded banks, building platforms and foundations. Possible garden features were also recognised. Both data sets showed several periods of activity, but it was not possible to associate groups of responses with specific phases. Some of the features may also have been re-used. [Au(adp)]

GSB Prospection Thornton : GSB Prospection, 2007, 12pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

The GPR survey within the confines of the enclosure seemed to successfully define the limits of an excavated floor surface, but revealed little else of interest. The magnetic and resistance survey, also within the enclosure, showed past ridge and furrow cultivation and the location of an antiquarian trench. A former field division in a field to the east of "The Castles" was highlighted in the gradiometer results, and another two linear features of a similar response were also noted, which could be given the same origin. A number of pit type anomalies have also been identified to the east which may have had a connection with the enclosure but may simply have reflected former trees. [Au(adp)]

BINCHESTER ROMAN FORT***Geophysical Survey Report. Binchester Roman Fort, County Durham***

Wood, EThornton : GSB Prospection, 2007, 14pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

The gradiometer results complemented the earlier geophysical survey carried out by Geoquest and provided further information on the layout of the vicus (including evidence for a large associated boundary ditch). Earlier fort ditches were also mapped along with the course of DereStreet to the west of the fort and a further Roman road heading northeast out of the fort. Perhaps one of the most interesting finds was a series of mausolea that appeared in the magnetic results but more clearly in the GPR data, which identified entranceways and internal features. Potential industrial activity was noted outside of the northern entrance of the fort. The results clearly demonstrated the potential geophysics, and in particular GPR, contained for providing detailed information about the fort and environs at Binchester. [Au(adp)]

Hale, D & Attwood, G Durham : University of Durham, Archaeological Services, 2007, 30pp, colour pls, figs, tabs, refs

Work undertaken by: University of Durham, Archaeological Services

The surveys determined part of the course of a former wagonway that served mines in the area in the early 19th century. The course of the wagonway followed a gentler gradient than its successor, an inclined railway built in 1845. Whilst some of the anomalies in Area 2 may have represented rubble and footings from former buildings, there had been so much disturbance there that it was difficult to

identify features with certainty. Former buildings, allotments, field boundaries, sewage pipes and possibly also the wagonway all contributed to the palimpsest of anomalies detected there. Possible traces of medieval/post-medieval ridge and furrow cultivation were detected in several locations, principally in Area 3, and the remains of former field boundaries may have been detected in Areas 2, 3 and 7. The only other features identified which may be of archaeological interest comprised miscellaneous possible ditches in Areas 3 and 6. [Au(abr)]

Geophysical Survey at Murton Lane, Easington Lane, Sunderland

Biggins, J A Newcastle : TimeScape Surveys & T & W Museums, 2007, 40pp, colour pls, figs, refs

Work undertaken by: Tyne & Wears Museum Archaeology Department, TimeScape Surveys

A geophysical survey was carried out and consisted of a high resolution magnetometer survey over two distinct transects with a combined survey area of c.18ha. A number of linear features were detected within field 1 which could have had prehistoric origin. In addition a small building was found, purpose unknown, but possibly a powder store for the nearby Easington Colliery. Evidence of well preserved medieval ridge and furrow was detected in the north-east sector of the site. Field 2 presented a very complex mixture of linear features most of which probably relate to relatively modern agricultural practices. Sufficient evidence was found to indicate that additional investigation should be conducted in the area where the desktop assessment indicated WWII military features. Some evidence was found which may have indicated the location of possible prehistoric features. In addition several of the linear anomalies may not have related to farming, but could be associated with military activity. [Au(adp)]

HETHPOOL BELL

Hethpool Bell. A Geophysical Survey of a Hilltop Enclosure in the College Valley, Northumberland National Park

Bell, A Durham : Aiden Bell, 2007, 27pp, colour pls, figs, tabs, refs

Work undertaken by: Aiden Bell

A magnetometer and resistivity survey was carried out at the site in order to answer research questions pertaining to the nature of the site. The report concluded that the enclosure was probably symbolic in nature, owing to the lack of internal features encountered by the survey. A ceremonial or ritual purpose was thought to be the most likely explanation for its existence. The enclosure was thought to date from the Early Iron Age, however, the ideas behind its construction overlapped with those of the Late Bronze Age. [AIP]

MIDPOINT 18 PHASE III

Geophysical Survey Report. Midpoint 18 Phase III

Chester, F Thornton : GSB Prospection, 2007, 10pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

Scanning found the general background magnetic levels to be low across much of the application area with a few isolated anomalies of archaeological potential. Detailed survey confirmed the results of the scan. Several linear anomalies of archaeological potential were identified, however, the majority were likely to represent former field boundaries and/or field drains. Responses indicating field drains dominated the northern part of the survey area. Evidence for ploughing activity was noted throughout the data and an agricultural origin or natural variations in the subsoil were likely to account for all or some of the isolated, weaker anomalies. Pipes and metal fencing also contributed to a large number of ferrous anomalies in the data. [Au(adp)]

NORTH-WESTERN EXTENSION TO TENDLEY QUARRY, BRIGHAM*North-western Extension to Tendley Quarry, Brigham, Cumbria. Geophysical Survey*

Gidman, J & Webb, A Morley : Archaeological Services WYAS, 2007, 17pp, figs, refs

Work undertaken by: Archaeological Services WYAS

A detailed magnetometer survey covering 0.8ha was carried out in advance of a proposed extension to Tendley Quarry near Cockermouth. Although numerous discrete anomalies and several linear anomalies have been identified all are thought on balance to be more likely to be due to agricultural practice modern activity or to infilled natural features than to archaeological activity although the latter possibility should not be discounted. The possibility of the presence of unidentified graves was not dismissed. [Au(adp)]

HOLME CULTRAM ABBEY*Geophysical Survey Report. Holme Cultram Abbey, Investigation of Part of the Churchyard and Abbey Interior.*

Wilkins, I Thornton : GSB Prospection, 2007, 15pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

The GPR data showed what was believed to be the extent of the former abbey north wall within the churchyard. The potential early foundations lay under one of the proposed positions for the crane base (the one closest to the church) and although no voids had been identified in this area there was the possibility that heavy machinery could damage the suspected underlying archaeology. The second more central potential crane location seemed more favourable in that the GPR data showed a more uniform layering, although there was some concern at the lack of data below the existing tarmac path. A number of potential unmarked graves and changes in ground conditions were identified elsewhere. These should be noted if the proposed crane position were to be altered or if additional heavy machinery employed. The interior of the abbey contained at least two areas of suspected former building foundations and remains with a strong indication of at least two building phases. Two linear anomalies have been identified which could have been active or redundant utilities. Three tentative positions were identified as suspected grave remains or isolated foundation remains. Oxford Archaeology North Lancaster : Oxford Archaeology North, 2007, 93pp, colour pls, figs, refs

Work undertaken by: Oxford Archaeology North

An series of archaeological works were undertaken on the site, these include a desk-based assessment, a topographical , a photographic and a geophysical survey. No evidence of the Roman road could be identified within the resistivity and gradiometer surveys, this might be due to alluvial deposits across the site. Evidence for the mill race and possible structural remains and debris associated with the paper mill has been identified within the gradiometer and resistivity surveys. Large areas of strong magnetic debris and disturbance situated across the north of Area 2 may have obscured the identification of additional anomalies of archaeological origin. Although no clear structural remains were identified

associated with the glassworks site, the GPR survey clearly identified an area of strong complex and discrete anomalies probably associated with the structural remains of the glassworks and later shipyards. A linear anomaly possibly representing a service was identified running north to south across the survey area. [Au(adp)]

GSB Prospection Thornton : GSB Prospection, 2007, 12pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

Concentrations of potential archaeological responses have been detected in two of the five survey areas. Three possible ditches were identified in Area 2, together with a number of strong pit type responses that may have indicated material associated with former coal working, although this interpretation was tentative. The continuation of the possible 18th century "Deer Park" boundary was recorded in Area 5, and several other linears were present which could represent former field divisions. Elsewhere, only a few isolated pit type responses were highlighted, for which an archaeological interpretation was highly speculative. Anomalies suggesting former ridge and furrow cultivation were noted in Areas 2 and 5 and in the latter, two different alignments were present. Most of the ferrous anomalies identified by the survey could be related to modern factors, but some larger discrete responses in Areas 3 and 5 might have represented capped or infilled coal pits. HMP HAVERIGG

Geophysical Survey Report. HMP Haverigg. GPR Survey to the Perimeter of the Existing Weaver's Shop

Adcock, J Thornton : GSB Prospection, 2007, 10pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

Numerous utilities have been identified on all sides of the Weaver's Shop, primarily within 1.0m of the current ground surface. Some of these may well have been redundant and it was also likely that smaller services such as cabling or small-diameter plastic pipes existed but were not clearly detected. A clear reflector toward the south-western extent of the survey area, lying at a depth of over 2.0m, was considerably deeper than any of the identified utilities and the possibility that this could be part of a disused culvert or void was considered. However, an isolated geological feature could not be discounted as being the cause. The survey areas outside the northern perimeter wall also indicated a small number of service lines. It had not been possible to fully characterise an enigmatic distribution of reflections (at a depth of circa 0.8m) across the main survey block, in the area proposed for crane operation. They appeared to be unnatural, relatively flat buried surfaces and may have been due to landscaping or represented a remnant of features associated with the site's history as an RAF station. LAND AT SALKELD ROAD, PENRITH***Archaeological Desk Based Assessment , Visual Site Inspection and Geophysical Surveys of Land at Salkeld Road, Penrith, Cumbria***

Railton, M Alston : North Pennines Archaeology Ltd., 2007, 41pp, figs, tabs, refs

Work undertaken by: North Pennines Archaeology Ltd.

A desk-based assessment, visual inspection and geophysical surveys were carried out on the site. The desk-based assessment indicated that the surrounding area has been exploited in the prehistoric and Roman period. Finds of Neolithic and Bronze Age date and the discovery of possible Bronze Age cist burials in an adjacent field had suggested that prehistoric remains have the potential to exist within the study area. There were also crop marks in an adjacent field which are potentially prehistoric or Romano-British in date. There was good evidence that the Roman road between Brougham and Old Penrith, shown on Ordnance Survey Map, survived within the study area. This was identified as a low bank during site inspection. Previous excavations indicated the make-up of the road. The site lay in the periphery of the medieval and post-medieval town and very few developments have taken place since. The site was maintained as agricultural land up to the present, the only significant developments being the gradual removal of field boundaries to make the four larger fields seen today. Four geomagnetic surveys were undertaken and detected a number of sub-surface linear anomalies close to the presumed line of the Roman road, though it was thought that the surviving road had been heavily truncated by ploughing. A number of former post-medieval field boundaries had also been detected and a series of

linear features which were interpreted as the furrows of former ridge and furrow cultivation. A series of modern water pipes, evidence of modern ploughing and a possible fired feature of unknown date were also detected. [Au(adp)]

Ordsall Hall, Salford. An Archaeological Geophysical Survey

Grimsditch, B, Gregory, L & Kenyon, A Manchester : University of Manchester Archaeological Unit, 2007, 23pp, figs, tabs, refs

Work undertaken by: University of Manchester Archaeological Unit

An archaeological geophysical survey was carried out at the site and revealed several anomalies. A long linear low resistance anomaly running parallel to the western side of the hall possibly the remains of the eastern arm of the moat. Several low and high resistance anomalies were perceived in Squares 5, 6 and 7. These may well have been the result of the later 19th and 20th century intrusion in the form of drains and utilities and late 20th century below ground investigations. Other high and low resistance anomalies were encountered at the western side of the grid to the south-west of the hall and outside the perceived moated platform. After consultation of the map of 1891 it is possible that though confusing, they represented the remains of the now demolished Rixton Street and associated housing. [Au(adp)]

HMP LANCASTER CASTLE

HMP Lancaster Castle. GPR & Resistance Survey of Existing Governor's Garden Area Ahead of Proposed Replacement Stand-by Generator

Adcock, J Thornton : GSB Propection, 2007, 14pp, figs, tabs, refs, CD

Work undertaken by: GSB Propection

Three areas of ground disturbance were identified that could have had an archaeological origin. These were confined to the southern half of the Governor's Garden. There was a distinct possibility that one area of disturbance (between ~0.45m and 0.9m below ground level) was associated with mapped utilities, which it lay beneath and adjacent to, however, given the context of the site an archaeological interpretation must also be considered. The second area of disturbance (apparent between 0.45m and 0.75m BGL) suggested a partial rectilinear distribution with depth and lay near a formerly identified buried stone surface. The final area, from around 0.9m BGL across the southern third of the garden, may also have been a buried surface although whether it was natural or anthropogenic was difficult to determine. Numerous potential service routes and utilities have also been identified, some of which may well have been redundant. The fact that this area had been a garden for some time prior to survey complicated the interpretation. Some of the features identified may have related to former layouts or disturbance from larger plant root systems. [Au(adp)]

LAND FROM DARWELL RESERVOIR TO HASTINGS

Fluxgate Gradiometer Survey of Land from Darwell Reservoir to Hastings, East Sussex

Tibble, M & Cole, J Portslade : Archaeology South-East, 2007, 55pp, figs, tabs, refs

Work undertaken by: Archaeology South-East

A detailed fluxgate gradiometer magnetic survey was carried out between the Darwell Reservoir and Hastings along a proposed water pipeline route between the two locations. The survey area was limited to the pipeline route as this was the area to be affected by development. The fluxgate gradiometer magnetic survey had picked up magnetic anomalies related to modern disturbance and possible archaeological origins. Positive linear anomalies may have indicated the presence of features cut into the ground such as ditches, whilst negative linear anomalies may represent former earthworks or banks. Discrete positive anomalies may represent possible pits, whilst dipolar anomalies may represent ferrous objects. The data seems to suggest possible archaeological activity throughout the length of the pipeline route with localised concentrations. [Au(abr)]

SOUTH CROWBOROUGH TO COTTAGE HILL MAIN

South Crowborough to Cottage Hill Main. Archaeological Reconnaissance and Geophysical Survey

Network Archaeology Lincoln : Network Archaeology, 2007, 69pp, figs, tabs, refs

Work undertaken by: Network Archaeology

This archaeological field survey report related to a proposed pipeline route between South Crowborough and Black Hill Reservoir. Field reconnaissance achieved a 100% cover of the route. Geophysical survey covered 2.8km, accounting for two-thirds of the route. Collectively, the reconnaissance and geophysical surveys revealed nineteen sites of archaeological importance. Eighteen were of local importance and one was upgraded. However, only fifteen of these were directly impacted upon by the proposed pipeline (The impacts on eleven sites were indeterminate, one was minor, two were major and one was severe). Recommendation was made for a targeted watching brief during construction. [Au]

HAZARDS GREEN TRANSFER

Hazards Green Transfer. Report on Archaeogeophysical Survey of Proposed Water Pipeline 2007

Cottrell, P M North Leigh : Bartlett-Clark Consultancy, 2007, 15pp, figs, refs

Work undertaken by: Bartlett-Clark Consultancy

Only a few of the magnetic anomalies detected by the survey were distinctive enough to be identified as potentially archaeologically significant. These included linear anomalies in fields 13 (D) and 19 (A), a distinct, strongly magnetic anomaly in Field 19 (B), and an indistinct group of anomalies that have the shape of an enclosure or pond in Field 13. A slight, linear cultivation pattern was detected

in Field 17. Scatters of indistinct small magnetic anomalies were present throughout the survey, and were probably of geological, or of a non-archaeological origin. These were more prevalent in Fields 14-18, where there appeared to be more background magnetic noise than elsewhere. [Au(adp)]

GROOMBRIDGE TO LANGTON GREEN

Groombridge to Langton Green. Report on Archaeogeophysical Survey of Proposed Water Pipeline 2007

Cottrell, P M North Leigh : Bartlett-Clark Consultancy, 2007, 13pp, figs, tabs, refs

Work undertaken by: Bartlett-Clark Consultancy

Very few of the magnetic anomalies detected by the survey were distinctive enough to be identified as archaeologically significant. Those that had magnetic responses, most resembling pit-like features of potential archaeological interest, were perhaps slightly more concentrated than elsewhere. None of these appeared to be distinct clusters of findings of a kind that would clearly suggest the presence of an ancient settlement site, although the possibility that more isolated archaeological features may be present could not be excluded on the survey evidence alone. An area of magnetic disturbance in the middle of Plot 4 might have represented a former field boundary, but could have been remains of a livestock feeder or trough. Former cultivation effects were noted in Plots 16, 18, and 19. Scatters of indistinct small magnetic anomalies were present throughout the survey. The scatter of small anomalies near the southern boundary of Plot 3 was probably modern debris, but may have related to the former farm said to have existed nearby. [Au(adp)]

Elks, D Upton-upon-Severn : Stratascan, 2007, 12pp, figs, refs

Work undertaken by: Stratascan

The data showed evidence of a prehistoric landscape including a cluster of five barrows with two others located towards the extent of the site, and numerous possible pit features. Superimposed on to this seems to be a medieval pattern of field boundaries, and more recent extensive ploughing activity. No evidence was found of the possible Roman military camp which had been interpreted from a previous geophysical survey carried out in February 2007 to the immediate south of the site. [Au]

ST. GERTRUDE'S CHAPEL, WINCHESTER***Earthwork and Geophysical Surveys at St. Gertrude's Chapel, Winchester, Hampshire***

Marter, P Winchester : ARCA, 2007, 17pp, colour pls, figs, refs

Work undertaken by: ARCA

An earthwork (total station) and geophysical survey (resistivity) was carried out at the site. The surveys were carried out as part of a scheme to enhance the interpretation of the site and inform its future management the chapel was probably founded in the 12th or early 13th century and was linked to Hyde Abbey, on the outskirts of Winchester. Earthwork survey was able to characterise the physical nature of the surface remains and the geophysical survey revealed additional evidence of a more extensive complex. The combined results of the surveys suggest that the site of the chapel consisted of a simple single celled chapel probably with an apsidal east end. It had an enclosed area of yard immediately adjacent to its southern wall that was surrounded by a bank and a ditch. This ditch probably drained into the nearby water channel which surrounded the raised ground on which the chapel stood. The entire complex seemed to have been protected by a revetment or bank that shielded it from encroachment by the nearby watercourses. On the northern edge of the site this bank appears to have been doubled up to protect the site from the in turning bend of the nearby river Itchen access to the chapel was gained via a metalled track which connected the site to the nearby Pilgrim's Route located on what later became Nun's Walk. Graham, C Upton-upon-Severn : Stratascan, 2007, 20pp, colour pls, figs, refs

Work undertaken by: Stratascan

A ground penetrating radar survey was carried out at the site primarily to investigate the route of a Roman aqueduct thought to cross the site in a north-south direction. The survey was unsuccessful in detecting the Roman aqueduct. The GPR survey identified a number of inclined events which may have represented a buried horizon of either geological modern or archaeological origin. There was a lot of near surface complexity within the data which may have been representative of the geology but may possibly have been archaeological in origin. [Au(adp)]

THANET SUPPLY SCHEME II***Geophysical Survey Report. Thanet Supply Scheme II***

Adcock, J Thornton : GSB Propection, 2007, 16pp, figs, tabs, refs, CD

Work undertaken by: GSB Propection

A small number of potential pit-type anomalies have been detected across the three survey areas but nothing of any greater archaeological significance was recorded. This was perhaps surprising given the proximity of Richborough Roman Fort and settlement; however, the data were consistent with the results of the previous geophysical survey conducted as part of this project , demonstrating the reliability of the survey. The data showed numerous small-scale ferrous responses (assumed to be relatively modern debris within the topsoil) and some faint trends (likely to be natural or of an agricultural origin) again demonstrating the functionality of the instrumentation. The purported ring ditch was not shown, but its existence was based solely on secondary evidence (an AP transcription as opposed to the original image) and as such was not an effective test of the technique. LAND NEAR MARGETTS PIT, BURHAM*Fieldwalking and Geophysical Surveys: Land near Margetts Pit, Burham, Kent*

Hancock, A Milton Keynes : Archaeological Services & Consultancy Ltd., 2007, 34pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Services & Consultancy Ltd.

Fieldwalking and geophysical surveys were carried out for the site consisting of a magnetometer survey. Seventy struck flints were recovered during the fieldwalking two are tentatively dated to the Neolithic period and the remainder were probably Bronze Age/Iron Age. A small assemblage of other artefacts predating the late post-medieval and modern eras was recovered but other than illustrating past manuring regimes was not considered archaeologically significant. The geophysical survey has located two parallel curvilinear alignments of pits or ditch segments which could define part of a Neolithic causewayed enclosure previously identified beyond the western limit of the survey area on an aerial photograph. The magnetometer data also defined a larger appended enclosure. Other magnetic anomalies to the west of the enclosure ditches may define further cut and infilled features although an archaeological origin for these anomalies was less certain. [Au(adp)]

KINGSNORTH POWER STATION*Geophysical Survey Report. Kingsnorth Power Station (E.ON UK). Site of Proposed Supercritical Generating Units*

Stephens, S Thornton : GSB Prospection, 2007, 36pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

The eastern third of the application area was not fully investigated. Due to adverse ground conditions, only a partial scan was possible. Some responses of possible interest were observed during scanning but their exact nature could not be determined by detailed survey. Neither the presence nor absence of archaeological features in this part of the site could be established. Elsewhere, the survey did not produce any definitive evidence for intact kilns, industrial sites or settlement. While some strong responses were detected which may suggest burnt/fired material they did not form coherent archaeological patterns and may have been the result of more recent landscaping. A few isolated ditch and pit type responses and trends may have been of archaeological interest. If so they seemed likely to reflect former agricultural land use, for example field division, drains and canalised creeks. [Au(adp)]

Chester, F Thornton : GSB Prospection, 2007, 2pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

Away from the field boundaries and large ferrous pipe, scanning found the background magnetic levels to be low. Several isolated anomalies were identified as having some archaeological potential and a single block of detailed survey was positioned to cover these responses. Detailed survey confirmed the presence of some archaeological type anomalies. Numerous other ditch and pit type anomalies were also noted but they did not form any coherent patterns. Alternative explanations, such as geological variations in the subsoil and agricultural activity may also have accounted for these responses. However, given the archaeologically rich nature of the area immediately to the south, an anthropogenic origin was perhaps favoured. A ridge, clearly visible on the ground, left no record in the magnetic data. [Au(adp)]

CAVERSHAM COURT RESTORATION PROJECT***Geophysical Survey Report. Caversham Court Restoration Project***

Adcock, J Thornton : GSB Prospection, 2007, 26pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

The resistance survey was the most successful technique. On the Upper Terrace it identified an area of high resistance thought to be an in-situ surface, demolition spread or in-filled cellar. Further rectilinear trends extending out from this seemed to indicate the former wall lines of one or more phases of the house. It had been suggested that the site was extensively cleared after demolition and that this had reduced the clarity of the responses and made defining the footprint of the house difficult. However, it was predicted to become clearer when the results were compared with contemporary plans of the houses. The data from the Middle and Lower Terraces indicated that the main body of the lawn was split into sections with some form of dividing wall, kerbing or paths. There was tentative evidence for features within these lawns such as formal planting and ornamental features. At the eastern end of the site the remains of the glasshouse were thought to have been detected and, extending from this down towards the river, what appear to be responses pertaining to a formal layout of beds or footpaths. This terminated in a broad unnatural high resistance zone of uncertain origin. Natural responses derived from mature trees, potential river gravel deposits and zones in which the water table was thought to be nearest the surface were also recorded. Due to extensive disturbance, the magnetic survey revealed no further information than gleaned from the resistance survey. [Au(abr)]

A3 HINDHEAD***A3 Hindhead, Surrey***

Heard, H Upton-upon-Severn : Stratascan, 2007, 17pp, figs, refs

Work undertaken by: Stratascan

A detailed gradiometry survey was carried out along seven separate survey areas either side of the A3 in Hindhead. Evidence for possible archaeological activity was identified throughout the survey areas in the form of linear and discrete cut features. A number of positive linear anomalies may represent cut features or ground disturbance of archaeological origin. The majority of these anomalies were faint and disjointed and constituted weak evidence of archaeological activity. Discrete positive and area responses were also identified, indicating additional cut features, although a number of these anomalies may have been pedological in origin. [Au(abr)]

Tibble, M Portslade : Archaeology South-East, 2007, 12pp, figs

Work undertaken by: Archaeology South-East

A detailed fluxgate gradiometer magnetic survey was carried out over a total area of 1.3 ha on a sports field. The survey area was limited to the western edge of the sports field as this is the area affected by development. The survey picked up magnetic anomalies most of which are relate to the drainage and levelling of the sports field. [Au(abr)]

CISSBURY RING HILLFORT, FINDON*A Detailed Topographical and Geophysical Survey of Land Outside the Eastern Entrance of Cissbury Ring Hillfort, Findon, Sussex*

Tibble, M Portslade : Archaeology South-East, 2007, 29pp, pls, figs, tabs, refs

Work undertaken by: Archaeology South-East

A detailed topographical survey and a fluxgate gradiometer geophysical survey were carried out on land located outside of the eastern entrance to Cissbury Ring hillfort, Findon. The topographical survey mapped and recorded features within the surveyed area and the geophysical survey, although hampered by vegetation, identified some anomalies that may have been of archaeological interest. MARKSBURY, HUNSTRETE GRAND MANSION***Marksbury, Hunstrete Grand Mansion***

GSB Prospection Thornton : GSB Prospection, 2008, 1p

Work undertaken by: GSB Prospection

A geophysical survey was carried out locate any remains associated with Hunstrete Grand Mansion. The work formed part of a wider archaeological assessment carried out by Channel 4's Time Team. Survey methods used were resistance, ground penetrating radar (GPR) and gradiometer. Remains of Hunstrete Grand Mansion are still standing (Scheduled Monument number DBN2467). The first written evidence of a building in Hunstrete is a survey dated to 1258. In 1994 an archaeological assessment was carried out by Bath Archaeological Trust, in which a substantial revetment wall was discovered. Both resistance and GPR surveys detected remains of the mansion, which was confirmed by excavation, however, neither technique provided a clear plan of the walls due to the large quantities of demolition debris. The GPR data do show a clear building footprint in the deeper slices. Magnetic survey away from the main complex failed to find any definite archaeological responses associated with another possible building shown on early maps. However, resistance survey did reveal what may be the edge of a rectilinear structure. [Sec]

PRISTON, GREAT CROFT***Priston, Great Croft***

Lawes, JBath : Bath & Camerton Archaeological Society, 2008, 1p

Work undertaken by: Bath & Camerton Archaeological Society

A full geophysical survey of the field known as Great Croft, to the north of Priston village, was undertaken between October and November 2007. This consisted of resistance and magnetic surveys with a contour survey of the field using an EDM. The survey was undertaken for Priston Civil Parish as part of a Millennium Project. The field was chosen because of the discovery of a Roman coffined burial in 1917. In 1953 William Wedlake of the Bath & Camerton Archaeological Society undertook a small scale evaluative excavation, though a complete report was never produced. In recent years some information about this excavation has been found in Bristol Museum and this helped with interpretation of the recent work. Both surveys were entirely complementary. The magnetic survey showed that the field was divided into a series of enclosures whereas the resistance survey showed only the stone banks and some very faint traces of the buildings. The banks are visible on the ground, but continuous cultivation of the field is making them much less distinct. The clearest ditched enclosure is that of Bank 2 curving south into Bank 8 and meeting Bank 6 to the north (see illustration). The Bank numbers have been used from Wedlake's excavation records and this work has enabled this information to be related to the surveys. This area was investigated by Wedlake and he concluded, from the finds, that the activity was related to early Romano-British occupation. His excavations did not reveal any positive buildings, but the survey does show three possible buildings (b1-3). These are clearer on the magnetic survey and may be of timber origin although the corresponding areas are indicated on the resistance survey, which may indicate ploughed out footings. The location of the coffined burial was resurveyed using the original measurements given by Chas. J Calvert. It was apparently located within a small enclosure to the east of the activity around b3. There may be more burials here as there are a few magnetic anomalies in this enclosure. From this enclosure there is a wide double ditched track leading northeast to another possible building and a narrow track running north. All these features are suggestive of Romano-British occupation, supported by Wedlake's evidence. The only other site of a possible building lies at the northern extremity of a road that runs alongside Bank 6. This road was

excavated by Wedlake and had had a metalled surface and was enclosed by walls on either side, these can be seen on the resistance survey. In the south-west corner of the field there appeared to be the corner of a double ditched enclosure. This was not investigated by Wedlake, although it was visible on the ground as a slightly raised platform. This may have been the site of earlier occupation and may help to explain why Wedlake found a number of residual Early Iron pottery sherds in his excavations. The banks and ditches running from east to west, but shown very faintly, were of later date and were probably associated with medieval field boundaries. There were many well preserved strip lynchets in the Priston area. [Sec(abr)]

CAMELFORD SCHOOL

Geophysical Survey Report. Camelford School, Cornwall

Wilkins, I Thornton : GSB Prospection, 2007, 12pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

Archaeological and potential archaeological features were identified in several of the survey areas. These included clear evidence for ring ditches, an enclosure and field systems. Most of the archaeological features were located just to the north and south of the school buildings on the playing fields. Unfortunately, both these areas contained modern ferrous anomalies that hindered a full analysis of the data. The high magnetic background level, which was attributed to the geology of the area, may have masked some archaeology. Suspected ridge and furrow together with modern ploughing was visible in the survey areas. [Au(adp)]

TRENCREEK, NEWQUAY***Geophysical Survey Report. Trencreek, Newquay, Cornwall***

Adcock, J Thornton : GSB Prospection, 2007, 15pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

A number of linear anomalies were highlighted across the application area. In the west, these appeared to form a potential rectilinear enclosure and possible trackway features. In the eastern half of the site, north-south linear anomalies were assumed to be agricultural (a result of improving the pasture), whilst pairs of strong linear features in the south were thought to be archaeological, possibly even forming a second enclosure. However, interpretation was hampered by not being able to see the wider context of the results. A pair of potential ring ditches has been recorded in the western half of the application site, and they represent the most coherent of a number of arcing trends, seen throughout the central portion of this area. While some of these may well be further ring ditches, interpretation is complicated by either their weaker response or disturbance from the agricultural practices undertaken across the fields. BERRY BALL HILLFORT, NEAR CREDITON***Geophysical Survey Report. Berry Ball Hillfort, near Crediton***

Stephens, C Thornton : GSB Prospection, 2007, 18pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

The survey provided little new evidence for the hillfort enclosure. The north-west outer ditch was identified, adjacent to extant earthworks. Suggestions of an inner ditch were detected on the north-west, north-east and south-west sides. This may have been a quarry scoop associated with construction of the rampart. Within the hillfort, although a few anomalies and trends were highlighted which formed roughly circular/curving patterns, they were weak and/or ill-defined and could not be definitively interpreted as settlement features. The area immediately adjacent to known excavated features could not be properly assessed because ferrous disturbance from the pipe(s) had obscured all weaker archaeological responses. Natural/geological factors resulted in elevated levels of background magnetic response which hampered the identification and interpretation of smaller pit-type anomalies and weaker trends both within and outside the hillfort. While some of these may have been of interest, the lack of any clear archaeological patterns precluded any firm interpretation and natural or agricultural origins should also be considered. THE SEARCH FOR SAXON CREDITON***Geophysical Survey Report. The Search for Saxon Crediton***

Adcock, J Thornton : GSB Prospection, 2007, 21pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

The results of the GPR survey suggested that the Saxon cathedral shared a similar footprint to the present day Church. There did not appear to be any substantial structural remains in the grounds aside from small burial vaults and potentially the remains of former buildings which the churchyard later encompassed. Within the church, anomalies were highlighted in the nave (just north of the entrance porch and toward the pulpit) and from the south aisle into St. Nicholas's chapel. Of these, the latter

were perhaps of most interest, correlating well with Norman sections of the church walls. It was not uncommon for Norman construction to be directly on top of Saxon remains and as such these GPR reflections were perhaps significant. The anomalies within the nave appeared to have an orientation quite different to the present church which may have suggested that they were not of an ecclesiastical origin. The best results were obtained in the churchyard, car park and lower lawn of the Rectory but much of what had been detected could be attributed to features mapped on 19th century plans, suggesting that they were unlikely to be of Saxon origins. That said, in places there had been significant re-use of footprints (i.e. the footprint of the collegiate buildings was still discernible up to the late 19th century) and it was the latter phases of these which had probably been detected. Whilst many of the remaining survey areas showed isolated anomalies that could have been of interest, their distribution and form were too ambiguous to assign a definitive interpretation. Numerous services, relatively modern features and effects of surfacing variations have all been recorded. [Au(adp)]

HOD HILL

A Geophysical Survey at Hod Hill, Stourpaine, Dorset. Supplementary Study of the Archaeological Remains***Supplementary study of the archaeological remains in the western section of the Iron Age Hillfort and Roman camp.***

Stewart, D Bournemouth : Stewart, D, 2007, 17pp, figs, tabs, refs

Work undertaken by: David Stewart

Earth resistivity corroborated previous magnetometry results showing intensive habitation across the whole area. However, detailed mapping of internal features remained speculative. No evidence was found to substantiate or disprove the possible razing of the southern slope by the occupying Roman force. Ground-penetrating radar failed to reproduce the clarity shown on other parts of the site. Combination of this with resistivity data suggested that terracing of hut platforms into the slope combined with plough damage to mask the shape of structures. There was also a strong probability that two distinct types of circular structure may have been found on the site. Some further magnetometry was undertaken to replace missing and poor quality data from previous years. A limited program of test excavation was recommended to answer questions it has raised and test conclusions it has drawn. [Au(abr)]

LAND AT WOODSFORD (I)***Land at Woodsford, Dorset. Pilot Geophysical Survey***

Stephens, C Thornton : GSB Prospection, 2007, 11pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

Two core areas of occupation were identified by the survey. The responses in these zones tended to be relatively strong and coherent. Away from these settlements, a relatively large number of weaker linear anomalies and faint trends have been detected which were likely to reflect peripheral features such as field systems. Although some of these responses were barely visible above background levels, it was worth noting that a fair number were very coherent and readily identifiable in the data. The overall results indicated that detailed gradiometry could be usefully employed to assess the archaeological potential of the evaluation area as a whole. [Au(adp)]

LAND AT WOODSFORD (II)

Land at Woodsford, Dorset. Phase II Geophysical Survey

Stephens, C Thornton : GSB Propection, 2008, 16pp, figs, tabs, refs, CD

Work undertaken by: GSB Propection

Anomalies of clear archaeological interest were detected in four of the five fields within the study area. Three potential settlement sites have been located (suggested by the strength of the magnetic anomalies). A fourth group of anomalies, although weaker, might have reflected settlement activity, but could equally have indicated an overlapping pattern of field systems. Elsewhere, two relatively strong and well defined rectangular enclosures were detected. They did not appear to form part of a complex and their precise function remained uncertain. Several weaker, less coherent rectangular and sub-rectangular enclosures had been highlighted but the interpretation for these was more tentative. The remaining anomalies of archaeological interest were likely to relate to former field systems which extended across much of the study area. The anomalies were on varying alignments and some of them overlapped, suggesting two or more phases of activity. [Au(adp)]

GOULD'S HILL RESERVOIR

Geophysical Survey Report. Gould's Hill Reservoir [B0140]

Adcock, J Thornton : GSB Propection, 2007, 14pp, figs, tabs, refs, CD

Work undertaken by: GSB Propection

An unscheduled barrow (shown on 1st edition OS maps) was recorded, along with a short length of ditch, in the east of the survey area. Five broad pit-like features were detected across the northern side of the site, although some of them could have been colluvial material within natural hollows. One such feature lay within an area, to the north, where responses (potential pits, trends and ferrous anomalies) appeared to be slightly more concentrated. Ploughing striations and small potential pits were recorded across the site as well as a single linear response, potentially of an archaeological origin. Strong responses in the west of the site were assumed to be modern in origin, given that the context of the site

would make industrial archaeological features unlikely. Certainly this was true of those nearest the mast and reservoir. It was not possible to assess the potential archaeological deposits in the southern areas, owing to disturbance from features relating to the reservoir. [Au(adp)]

Armstrong, K & Cheetham, P Bournemouth : Bournemouth University, 2007, 31pp, figs, tabs, refs

Work undertaken by: Bournemouth University

The surveys at Canada Farm detected an anomaly, interpreted as being the Sweet Track. The anomaly was interpreted as a bog oak, preserved in the peat. The surveys at the Old Peat Works did not detect anything that could be interpreted as the track but did show some anomalies potentially related to prehistoric occupation of the drier parts of the site. Adcock, J Thornton : GSB Prospection, 2007, 11pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

In the western section of the survey, a possible 20m sub-rectangular enclosure was identified along with a small number of short, potential ditch anomalies and some pit-like features. A strong ditch section delimited a general increase in response and numerous trends in the western 100m of data,

coinciding with an elevated section of the field. Although this end of the corridor was in the vicinity of a Deserted Medieval Settlement, there was also local evidence of quarrying and as such any interpretations within this 100m should be viewed with caution. In the eastern section, potential archaeological features amounted to a small number of pits, a very tentative concentration of fired material and a well defined section of ditch running into the corridor in the easternmost area. This ditch turned through 90° and then quickly petered out. A further linear anomaly was cautiously interpreted as part of the same ditch system. Evidence of ploughing, or possibly ridge and furrow, field drains and natural water channels and geological/pedological features was also identified. [Au(adp)]

LAND AT HARTNELL'S FARM, MONKTON HEATHFIELD, TAUNTON

Land at Hartnell's Farm, Monkton Heathfield, Taunton, Somerset. Magnetometer Survey

Sabin, D & Donaldson, K Chippenham : Archaeological Surveys, 2007, 31pp, figs, tabs, refs

Work undertaken by: Archaeological Surveys Ltd

A magnetometer survey was carried out across approximately 14.5ha (36 acres) of land. The survey located a small enclosure within the south-eastern part of the site and a series of anomalies within the vicinity of a previously identified cropmark. It was likely that these anomalies represented an increased archaeological potential within the southern part of the site. Magnetic anomalies located in the central and northern parts of the site were associated with agricultural features, removed field boundaries, buried services and quarries or marl pits. The very low magnetic contrast of anomalies and relatively high levels of magnetic noise were attributed to the characteristics of the underlying geology and soils. [Au(abr)]

FAIRFIELD HOUSE

Geophysical Survey Report. Fairfield House, Somerset

Gater, J Thornton : GSB Prospection, 2007, 9pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

The survey located a complex of resistance responses that, individually, were difficult to interpret. Some represented earlier building foundations, others paths and formal garden features. Drains, service trenches and pipes were also visible in the data. A number of responses may have been associated with a former moat and possible pond feature but such an interpretation, based on the geophysics results alone, was at best tentative. Intriguing results have been obtained in the area to the east of the present house. [Au(adp)]

Elks, D Upton-upon-Severn : Stratascan, 2007, 23pp, figs, refs

Work undertaken by: Stratascan

A detailed magnetic survey, resistance survey and radar survey were carried out over two areas of land. The detailed magnetic survey data showed mainly weak responses making it difficult to write a clear interpretation. The resistance survey showed high contrast linear and area responses forming rectilinear anomalies indicating the preservation of building remains in both Area 1 and Area 2. This had been supported by linear features observed within the radar data and numerous isolated discrete responses which suggested there may have been an amount of small material debris buried at the site. CASTLE COMBE CASTLE***Castle Combe Castle. Geophysical Survey***

Sabin, D & Donaldson, K Chippenham : Archaeological Surveys, 2007, 38pp, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

A combination of techniques were carried out at the site. Earth resistance survey revealed masonry structures within the inner baileys of the site, whilst magnetometry suggested that the outer bailey may have been largely free from development. A large ditch-like feature was located to the north of the northern defences suggesting an infilled outer defensive ditch that was no longer visible as a topographic feature. The survey also suggested some complexity to the northern defences. Magnetic susceptibility was not considered to be a reliable indicator of anthropogenic activity across the soils of the locality as tests away from the site indicated high level of natural enhancement. Access was impeded to the site in some areas by dense vegetation, and also the presence of a golf course. [Au(adp)]

SAREHOLE MILL

Sarehole Mill: Geophysical Survey

Kincey, M Edgbaston : Birmingham Archaeology, 2007, 23pp, figs, refs

Work undertaken by: Birmingham Archaeology

A geophysical survey was carried out in the car park area at Sarehole Mill. The survey was undertaken to determine whether remains of a mill predating the 18th century were on a different site to the existing mill and survive under the modern car park. The survey used a ground-penetrating radar

system with a 400 MHz antenna and calibrated survey wheel. A number of features of possible archaeological origin were revealed, along with some which were clearly due to the modern land use of the site. A series of high amplitude linear features possibly indicated the presence of below ground structural remains. [Au(abr)]

BARR BEACON, WALSALL

Barr Beacon, Walsall: Geophysical Survey June 2007

Breeze, P Edgbaston : Birmingham Archaeology, 2007, 33pp, colour pls, figs, tabs, refs

Work undertaken by: Birmingham Archaeology

Geophysical investigation, in the form of resistance survey, was undertaken within Walsall Council land on the southern summit of Barr Beacon, Walsall. Three areas were surveyed, two upon the summit itself, and one on the western slope of the beacon. Despite constraints imposed by the local geomorphology, survey revealed a series of potential features across the area. Primarily, substantial possible structural remains were identified on the south-eastern summit, in the form of a large (15m²) regular high resistance square, potentially indicative of a structural footprint, foundations or floor. A further potentially structural area of high resistance was identified to the south, with evidence of later truncation by a series of negative features. A series of responses correlating to visible earthworks, which were identified as the remains of medieval ridge and furrow, cross the area, along with several potential field boundaries. An unusual series of three high resistance regular arcs was identified within the area, of unknown origin, and of interest for future investigation. Survey has indicated the potential for the preservation of archaeological features at shallow depths upon the southern summit. The geophysical survey of the western slope failed to identify any features of possible archaeological origin. Recommendations based upon the results of this investigation were proposed, primarily that identified features may benefit from targeted trial excavation. The topography and geology of the area suggests the site would form the basis for a successful community-based project. [Au]

LAND AT OLDPORT FARM, OSWESTRY*Geophysical Survey Report. Land at Oldport Farm, Oswestry, Shropshire*

Chester, F Thornton : GSB Prospection, 2007, 12pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

A clearly defined trench system, believed to be indicative of front line and communication trenches and a redoubt, has been identified in Area E, believed to have dated to the First World War when the adjacent Park Hall was a military training camp. A potential access track and other pit type responses may have been associated with the trench system, but their form was not clear. Therefore, alternative explanations for their origins, such as agricultural practices or geological variations, could not be discounted. Area B contained anomalies potentially associated with the entrance to Old Oswestry Fort but they were not well defined and were more likely to reflect natural variations in the subsoil. This was also true of other trends and archaeological type anomalies in the data, although given the proximity of the Iron Age hillfort, an archaeological interpretation was a possibility. Modern features such as pipes, overhead cables, pylons, fences and tracks had all contributed to the data and were noted as such. The route of the Vyrnwy Aqueduct was clearly defined in Areas A and E and former field boundaries had been identified in Areas C and E. [Au(adp)]

Stephens, C Thornton : GSB Prospection, 2007, 21pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

The magnetic data were dominated by ferrous anomalies/areas of magnetic disturbance and had provided little information regarding the potential archaeology at the site. The resistance survey revealed a number of responses of possible archaeological interest, suggesting areas of building debris and in situ structural remains. Some anomalies within the Inner Bailey (Area 1) could be related to known historic features. The origin of the potential features in the Outer Bailey (Areas 2 and 3) was less certain; while some were likely to have related to the main periods of occupation at the site (11th to 17th centuries), others may have been the product of later post-medieval activities. Additionally some responses had been identified which reflected modern land use. [Au(adp)]

CURBOROUGH NEW SETTLEMENT

Curborough New Settlement. Archaeological Survey

Wilkins, I Thornton : GSB Prospection, 2008, 16pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

The scanned area and pre-defined detailed survey blocks displayed varying levels of magnetic disturbance. Where the ground was ploughed dense concentrations of brickwork, machine parts, wire and scrap metal were all visible. This material will have clearly contributed to these elevated magnetic levels. Where the magnetic disturbance was particularly strong (and well defined) the assumption was made that aircraft remains could have been present. Thus, five potential aircraft dumps were identified (four within the pre-defined blocks and one outside) together with three locations where ferrous material appeared more concentrated. The numerous ferrous responses will have masked any archaeological remains if present. [Au(adp)]

Sabin, D & Donaldson, K Chippenham : Archaeological Surveys, 2007, 21pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Surveys

Magnetometry and earth resistance surveys were carried out at the National Herb Centre near Warmington. Magnetometry revealed a complex pattern of former ditches representing land boundaries and enclosures. Earth resistance survey located structural remains probably associated with former Roman buildings. The complex and extensive nature of the magnetic anomalies suggested a long period of occupation and development. [Au(abr)]

ST. MARY & ALL SAINTS CHURCH, KIDDERMINSTER***Geophysical Survey Report. St. Mary & All Saints Church, Kidderminster, Worcestershire***

GSB Prospection Thornton : GSB Prospection, 2007, 36pp, colour pls, figs, tabs, refs

Work undertaken by: GSB Prospection

Potential structural remains were indicated by a broad spread of strong reflectors between the modern day flowerbed and rockery, some 30m north of St. Mary & All Saints Church. This correlated well with previously documented parch marks. Although perhaps not on the scale of a Minster, the responses were clearly of archaeological interest. It was just possible that a zone of weak responses north of the rockery related to robbed-out remains, in which case the total spread of response would be

nearer the size expected of a Minster. However, this remained a highly tentative interpretation. Numerous burials and services had also been identified along with shallow trends and responses assumed to relate to landscaping and former churchyard layouts. It had not been possible to comment on the former topography of this part of the site. In the northern survey area, responses relating to former buildings shown on the early edition OS mapping have been identified. One of these was most likely to be a cellar beneath the former inn site, whilst other deep reflectors were either small cellars or remains of split-level properties that dropped down from today's Clensmore Road. There was some evidence to suggest that the yards behind the properties were terraced, rising up towards the south. The generally quiet time-slices suggested that the current land surface was made up of relatively homogeneous material rather than coarse demolition rubble. [Au(abr)]

Geophysical Survey Report. Land North of Spring House Farm, Barmby Moor

Chester, F Thornton : GSB Prospection, 2007, 11pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

The majority of anomalies noted in the data were recent in origin. These comprised field drains and areas of magnetic disturbance caused by the ferrous component of piles of modern rubbish. A few anomalies of archaeological potential had been identified in the data, however, they were isolated and did not form any coherent patterns, therefore an archaeological interpretation must be treated with caution and an agricultural origin or natural variations in the subsoil may also account for them. There was no evidence in the magnetic data for the Roman road which was purported to cross the application area. [Au(adp)]

Work undertaken by: GSB Prospection

The site was affected by severe magnetic disturbance. The presence of building materials, including a large metal storage container, and the possible remains of previous buildings were evident on the ground surface. The background magnetic levels were extremely high due both to these factors and the suspected made ground which was possibly created using the rubble from a previous building that once

stood on the site. Any potential archaeology, if present, was masked by the strong magnetic background. [Au]

SKIRLAUGH SEWAGE PUMPING STATION AND RISING MAIN*Skirlaugh Sewage Pumping Station and Rising Main, Skirlaugh, near Beverley. Desk-based Cultural Heritage Assessment and Geophysical Survey*

Cooper, O Barnard Castle : Northern Archaeological Associates, 2007, 25pp, colour pls, figs, tabs, refs

Work undertaken by: Northern Archaeological Associates

The cultural heritage assessment determined that the proposed pumping station was not thought to affect any archaeological remains due to its situation within an existing treatment works. The associated rising man and gravity sewer at the northern end of the pipeline route was likely to impact upon the remains of prehistoric or Roman occupation sites and burials, and there was the potential for previously unrecorded archaeological remains to be recovered. The survey identified a number of anomalies that may have been archaeological in origin, but equally may have been of a geological nature. The anomalies proved difficult to interpret, however, there was thought to be a clustering of anomalies to the western end of the corridor adjacent to a possible barrow cemetery. The significance of this was uncertain. A watching brief was recommended. [Au(adp)]

FIELD SITE, NEAR WETHERBY*Geophysical Survey Report. Field Site, Near Wetherby, North Yorkshire*

Wilkins, I Thornton : GSB Prospection, 2007, 10pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

A few responses of archaeological potential were identified in the survey. There was a linear anomaly and an area of increased magnetic response that appeared archaeological in origin. The linear was likely to be a ditch, with the increased magnetic response possibly representing separate features. Another area of potential pits and trends may also have been archaeological in nature though they also lacked any clear definition. Numerous linear trends were detected throughout the survey. The general north-south alignment of the trends was thought to be an indication of past agricultural practice, with one diagonal trend crossing the survey strips perhaps indicating a former boundary. However, this was not aligned with boundaries visible on the 1850 map. Agricultural activity may also account for the few curvilinear trends identified, although an archaeological or even natural origin could not be discounted. [Au(adp)]

MORPHY RICHARDS HEADQUARTERS

Geophysical Survey Report. Morphy Richards Headquarters, GPR Survey of Distribution Warehouses.

Wilkins, I Thornton : GSB Prospection, 2007, 22pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

Overall good spatial coverage of the site was obtained given that both warehouses were in constant use. The technique identified potential voids, areas of disturbed ground (which could be prone to subsidence) and flooring slabs that may have moved over time. However, it was suspected that in some cases the apparent movement was due to the contrast between different types of flooring being used and did not imply that subsidence was currently taking place. Generally Areas 1 and 2, in the southern warehouse, appeared to be stable with ground disturbance attributed to the construction of the building and in-filling of a suspected loading bay. In the northern warehouse, Area 3 had a general concentration of anomalies towards the centre and several anomalies along the southern wall appeared to be voids and disturbed ground. The shelved areas, 4 and 5, showed a more regular pattern of disturbed ground. A number of potential voids have been identified. A few anomalies appeared to relate to past usage of the site. These included a strong reflector that may have been a natural or manmade surface, the remains of the suspected railway line, and a number of anomalies which may have represented machine bases or building foundations. ASSELBY TO PANNAL NATURAL GAS PIPELINE***Asselby to Pannal Natural Gas Pipeline. Supplementary Archaeogeophysical Survey Report***

Bartlett, A D H North Leigh : Bartlett-Clark Consultancy, 2007, 34pp, figs

Work undertaken by: Bartlett-Clark Consultancy

A geophysical survey was carried out at the route of the proposed pipeline. The coverage achieved in this phase of the project included three potential re-routes (RRs 42,44,57) others having been done previously as part of the 2006 survey. This second phase of fieldwork gave findings consistent with those of the 2006 survey. There were only a limited new findings from beet fields and other locations in the low lying eastern part of the route but there was a strong response to cropmark enclosures and other features on the Magnesian Limestone further to the west. Archaeological features detected here (in the vicinity of Aberford Dykes) included ditched enclosures and boundaries in fields 20/2-3 and 20/8 (where ditches associated with the Scheduled earthworks were also detected). A further linear features or enclosure was seen to the west of the A1 in 22/2. it remains uncertain whether pit-like features (perhaps indicating settlement sites) are also present at locations including 20/8 and 22/4, or whether these responses were natural. Asseby to Pannal Natural Gas Pipeline, Second Supplementary Archaeogeophysical Survey Report, Off Easement Geophysical Surveys

Bartlett, A D H North Leigh : Bartlett-Clark Consultancy, 2007, 16pp, figs

Work undertaken by: Bartlett-Clark Consultancy

A geophysical survey was carried out at the site of a disused Burn Airfield, at Dawson's Wood and Aberford Yard. The surveys detected linear features which correlated with the cropmarks at the Dawson's Wood and Aberford sites but only a limited number of other findings. There were magnetic anomalies of a kind which could suggest such features as silted pits at each of these two sites, but they are sparsely distributed. There was a strong magnetic response on the Magnesian Limestone geology of this section of the route and the magnetic anomalies may well have represented only minor natural or non-archaeological disturbances. They suggested that either site represented a major focus of archaeological activity. [Au(adp)]

ABLE HUMBER PORTS FACILITY, M456 SURVEY AREA

Geophysical Survey Report. Able Humber Ports Facility, M456 Survey Area

Wilkins, I Thornton : GSB Prospection, 2007, 11pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

An unusual circular anomaly was identified in Area 1. The ferrous nature of this response suggested a modern origin, possibly military or agricultural. The other three fields showed evidence of past ploughing and former field boundaries. Of archaeological importance was a small enclosure located at the western edge of Area 4. A weaker set of parallel ditches extended to the east from the main enclosure. In addition a number of pit-like responses were identified in three of the fields some of which may have represented burnt/fired material.

A former watercourse ran through the north-east corner of the site, the strong response from this anomaly possibly masking any weaker archaeological responses if present. [Au(adp)]

MALTON ROMAN FORT, MALTON

Malton Roman Fort, Malton, North Yorkshire. Report on Geophysical Surveys, July-August 2007

Horsley, T J Bradford : University of Bradford, 2007, 50pp, colour pls, figs, refs

Work undertaken by: University of Bradford

An geophysical survey was conducted over parts of the Roman fort at Malton including an area within Orchard Field and an area not previously investigated within the walled garden behind the lodge. This survey provided clear evidence for buried structural remains and roads within the fort and allowed internal arrangement to be identified with some certainty. There was evidence for rows of barracks or stable blocks on the north-western and south-eastern ends of the fort, and a range of larger buildings across the centre including possible granary. Along the fort defences there was good correlation with Corder's observations during the 1927-30 excavations including the removed fort wall on the north-eastern side. To the north-west the Earth Resistance measurements suggested structural features in the area of the double ditch which required further investigation. Despite quite considerable disturbance from more recent activities in the walled garden, including a regular arrangement of pathways, it was possible to identify the continuation of roads within the fort and additional rows of structures. In orchards field the result also provided evidence for the layout of buildings in the associated Vicus. [Au(adp)]

NEWBRIDGE QUARRY EXTENSION, PICKERING

Newbridge Quarry Extension, Pickering, North Yorkshire Geophysical Survey

Webb, A Morely : Archaeological Services WYAS, 2007, 16pp, tabs, refs

Work undertaken by: Archaeological Services WYAS

A magnetometer survey covering 19 hectares was carried out on arable farmland north of Newbridge Quarry in advance of a proposed northward extension to the current quarrying operation. The survey clarified the extent and morphology of the system of fields, trackways and enclosures that had previously been identified as cropmarks. The survey also clearly demonstrated the continuation of the pattern of settlement and enclosure revealed immediately to the south during the several excavations undertaken in advance of the quarries phased northward expansion. The survey showed that archaeological activity seemed to be confined to the western half of the proposed extension area with little or no evidence of activity in the eastern part of the site. CAWOOD CASTLE GARTH, CAWOOD*Cawood Castle Garth, Cawood, North Yorkshire. Geophysical Survey*

Harrison, T S & Webb, A Morley : Archaeological Services WYAS, 2007, 32pp, colour pls, figs, tabs, refs

Work undertaken by: Archaeological Services WYAS

A geophysical survey was carried out at three locations within the Castle Garth at Cawood Castle. The survey of Area 1/Gill Green did not identify any anomalies that suggested either that New Cut continued to the east or turned to the north. The majority of anomalies suggested extant features. In Area 2, there was no evidence to suggest that the linear earthworks mapped to the east of the garden continued into/across the area to the south of Castle House. Areas of variable magnetic response were given a tentative archaeological interpretation. No significant anomalies were recorded in Area 3. Overall, the results were a little disappointing from an archaeological standpoint, and it was thought that ultimately, intrusive investigation was the only way to significantly increase the understanding of the site. GSB Prospection Thornton : GSB Prospection, 2007, 21pp, figs, tabs, refs, CD

Work undertaken by: GSB Prospection

The resistance survey revealed a number of anomalies which matched the layout of mid 19th century paths depicted on the 1910 OS map. The responses varied in form and definition and this could have indicated different states of preservation of these former paths, however, interpretation of the less well defined anomalies and trends was cautious. Several other responses of possible archaeological interest had been identified which appeared to respect the paths and might, therefore, have related to formal

garden features (again the interpretation was inconclusive). Additionally there was some extremely tentative evidence for features that were not associated with the 19th century garden. The magnetic data were dominated by ferrous responses and magnetic disturbance, which will have masked any weaker, potentially significant anomalies. Some of the strong responses could be related to former paths, indicating highly magnetic material used in their construction (e.g. brick or cinders), but the majority were attributed to modern surface features and unstratified ferrous/strongly magnetic debris. Geophysical Survey Report. A1237 Moor Lane Roundabout, York

Brolly, M Thornton : GSB Propection, 2007, 11pp, figs, tabs, refs, CD

Work undertaken by: GSB Propection

Apart from a few weakly defined trends, no archaeological type anomalies were recorded. To the east of the existing road an anomaly with a magnetic response measuring approximately 20m in diameter was detected. This anomaly was likely to be a large buried ferrous feature, possibly agricultural in origin, or perhaps a borehole. There was a remote possibility that it was related to World War II bombing raids on York and it may have been unexploded ordnance. Elsewhere, a large pipe was detected and is seen to dominate the data. A known field boundary running through Area 2 produced a ferrous-natured response and features such as wire fencing, gates, and dumping had produced similar effects. [Au(abr)]

SS MENDI***SS Mendi, Archaeological Desk-based Assessment***

Scott, G & Gribble, J Salisbury : Wessex Archaeology, 2007, 124pp, pls, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

An archaeological desk-based assessment was carried out for the SS Mendi, a South African Native Labour Corps troop ship, which sank on the 21st of February 1917. The sinking resulted in the loss of 649 lives, the majority of them non-combatant black labourers from South Africa en route to the Western Front in France. The loss of the Mendi drifted into obscurity and for much of the 90 years since the event, it has been largely forgotten. Now English Heritage commissioned a desk-based assessment in order to assess the state of the knowledge relating to this event. Apart from surveying the physical wreck, both primary and secondary sources were consulted. [Au(adp)]

SOUTH COAST REGIONAL ENVIRONMENTAL ASSESSMENT

South Coast Dredging Association. South Coast Regional Environmental Assessment. Archaeological Data Scoping Report

Wessex Archaeology Salisbury : Wessex Archaeology, 2007, 21pp, figs, tabs, refs

Work undertaken by: Wessex Archaeology

A total of 1305 data records were identified from the United Kingdom Hydrographic Office wreck database, with a further 20875 from the local HER databases. The NMR reported 8000 records. It was noted, however, that many of these would have fallen within the terrestrial zone of the area. [Au(adp)]

Scott, G Salisbury : Wessex Archaeology, 2007, 59pp, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

An assessment was carried out in response to proposals for the construction of an offshore pipeline and storage scheme. 28 wrecks, 49 geophysical anomalies, 8 obstructions, 17 dead or lifted wrecks, 2 anchorages, 193 recorded losses with no seabed remains, 30 terrestrial sites and 15 findspots were identified. There was also potential for undiscovered Palaeolithic remains to be encountered. Appropriate mitigation was proposed. [Au(adp)]

PORTLAND MARINA***Portland Marina Development. Data Audit and Archaeological Assessment of Geophysical Data***

Tizzard, L Salisbury : Wessex Archaeology, 2007, 14pp, figs, tabs, refs

Work undertaken by: Wessex Archaeology

A geophysical data audit and archaeological evaluation of existing geophysical data was carried out in order to assess its suitability for the archaeological assessment of the proposed Portland Marina development area. The marina development area was situated within the Portland Inner Harbour, approximately 0.6km to the west of Portland Port Q Pier. Two datasets were analysed, one dating from 1995 and one acquired during 2006. A ground investigation report undertaken within the vicinity of the proposed marina development was also assessed. The 1995 dataset comprised side scan sonar and sub-bottom profiler data. However, the data was acquired north of marina development area and therefore it was not possible for it to be used for the archaeological assessment. The 2006 dataset comprised side scan sonar data and single-beam bathymetric data. Both datasets were of good quality and therefore could be used for the archaeological assessment. However, there was not full coverage of the area by the side scan sonar data and therefore not all of the area could be assessed. Ten isolated anomalies were identified within the data provided. It was noted that the side scan sonar anomalies would benefit from further investigation to confirm their character, extent and archaeological importance. Although it was not possible to fully characterise the nature of the side scan sonar anomalies, all anomalies are small and generally isolated. It should be noted that the archaeological assessment only applied to the coverage of the side scan sonar data which equated to around 45% of the development area. Given that there were anomalies of potential interest in the area surveyed, it was considered likely that further anomalies would be identified in the remainder of the area. Borehole data from the area indicated the presence of fine-grained sediments containing peat that may have been of palaeoenvironmental interest. [Au(abr)]

AREA 481***Area 481. Aggregate Dredging Licence Application. Archaeological Assessment***

Auer, J Salisbury : Wessex Archaeology, 2007, 39pp, colour pls, figs, tabs, refs

Work undertaken by: Wessex Archaeology

A desk-based assessment was carried out in preparation for a licence application for aggregate extraction from the site, off Lincolnshire. Although the Study Areas were likely to have been inhabitable during the Late Upper Palaeolithic and Early Mesolithic, artefacts and sites dating to these periods were unlikely to survive in primary contexts. The existence of such remains in secondary context could not be precluded. The study areas contained evidence of maritime activity in the form of two known live wrecks and one dead wreck. Seven documentary references to shipping losses and four side scan anomalies have been identified. The two known wrecks dated to the First World War and were believed to represent vessels of a common type. Three of the four geophysical anomalies were located within the application areas. Of these, two were almost certainly of anthropogenic origin and might have represented unknown wreck sites. One was located in the buffer zone of Area 481 West and could have been associated with the wreck of the Norwegian steamer Freidig. One of the anomalies was classed as being of possible anthropogenic origin and further survey work would be necessary to clarify its nature. The majority of documentary losses reflected the coastal trade in the 18th century. A review of shipping activity on the east coast routes and the Southern North Sea suggested that there was potential for as yet unrecorded sites dating from the Mesolithic onwards. There was a noticeable absence of recorded aircraft losses in an area heavily frequented by aircraft throughout World War Two which could be explained by the absence of an NMR named location in the data retrieval area. The discovery of aircraft wreckage in several dredging areas off the English east coast showed the high potential for the presence of such remains on the seabed around the British Isles. Exclusion zones were proposed for anomalies identified in the assessment. [Au(abr)]
